European Aviation Safety Agency

COMMENT RESPONSE DOCUMENT (CRD) TO NOTICE OF PROPOSED AMENDMENT (NPA) 2009-02B

for an Agency Opinion on a Commission Regulation establishing the Implementing Rules for air operations of Community operators

and

draft Decision of the Executive Director of the European Aviation Safety Agency on Acceptable Means of Compliance and Guidance Material related to the Implementing Rules for air operations of Community operators

"Part-OPS"

CRD c.1 – Comments received on NPA 2009-02b

I. Comments received on NPA 2009-02b

(General Comments)	-

comment *997* comment by: *Sky Service Netherlands BV*

We are an small compagny in the Netherlands with 1 Cessna 172.

We make seight seing flights(not longer than 60 minutes) from our field EHTE.

The flights we make are always VFR by day light. The flights are singel pilot operations with a commercial pilot (cpl) license.

Now the European EASA has ordered that we shall commit on the EASA OPS NPA'S 2009-02 a,b,c,d,e and f, and also NPA'S 2008 22 a,b,c,d,e and f and also OPS 2008-22 C we can not en may not make these flights without an AOC.

From the 37 small compagny's already 33 compagny's can not make these flights any longer because off these rules.

I urgent ask you to give us permission to make these seight seing flights in a Cessna 172 in the same way we did the last 25 years without an AOC.
In Germany the do not use these rules and that small compagny's may do this flights with out an AOC. In the Netherlands it is forbidden to make these flights without an AOC.

We ask you to make the rules for aeroplanes like the cessna 172 (three passengers) different from the rules for a Boeing 747 and make exemptions for the small operators like me (1 person).

I can not have a AOC and an CAMO because the ruels are to difficult and the price is to high !!

Please help us !!!!!

comment *1039* comment by: *AECA helicopteros.*

Acoording BR Article 1.2 SAR appears to be defined as "similar service" - i.e. not covered by EASA Parts, and thus subject to national regulation. This has not been notified formally.
What is the position?

comment *1041* comment by: *AECA helicopteros.*

The BR/ER indicates that the commander must have this authority, an IR is required to assign it.

comment *1043* comment by: *AECA helicopteros.*

Text in JAR OPS 3085 and IR 6.b l required the commander to "ensure that the pre-flight inspection has been carried out"
It should still be covered in an IRs because, as it is contained within "6. Continuing Airworthiness", it is not clear that there is still an obligation on the PIC to ensure it has been done (and in some cases, it will be the responsibility of the PIC to do it).

comment *1373* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

- **Concern Detail:**

Missing possibility to introduce general comments into CRT.

Comment / Proposal:

The CRT offers no possibility to introduce general comments e.g. on structure or systematic approach. Results of consultations might not display real concerns as these can not be expressed in an adequate form. CRT must be given a special part for general comments.

- **Concern Detail:**

Systematic approach according category of adressee not fully implemented.

Comment / Proposal:

The idea of structuring EASA regulation alongside the specific category of adressee (authority, operator, organisation etc.) has not been realised in a constant manner. Regulation should be reviewed in this regard in case this systematic approach would be maintained.

- **Concern Detail:**

Quality of provisions partly poor.

Comment / Proposal:

Formulations have to be reviewed and be brought in more precise form. Moreover, terminology must be streamlined as it is higly inconsistent all over the NPA. Definitions must be coordinated. Definitions shall be extracted in a special part of regulation which should apply tho the whole of european aviation regulation.

- **Concern Detail:**
  Too many definitions like "suitable", "properly qualified", "acceptable to the authority".

Comment / Proposal:

Constitutional principles of rulemaking and democracy demand for clear,

understandable formulations with a previsible content. If for technical reasons a certain felxibility in details should be given to the competent authority, then at least the criteria used for the assessment must be provided in the formal law. It would be very difficult also for the administrative courts to take legal decisions on appeal.

- **Concern Detail:**

EASA goes beyond the mandate it has been given from the Commission. It creates additional burden on industry and authorities without any measurable progress in safety. Such overboarding rulemaking is detrimental to the european industry policy and the development of competitive aviation service providers in Europe.

Comment / Proposal:

The political mandate of EASA was to transpose existing JAA standards and projects as well as ICAO SARPs into equally binding and clear Community law. The project presented in NPA 2009-02 by EASA goes beyond this clear mandate in several points and puts addidional burden on the industry and the authorities. With this approach the competitiveness of the european industry on the global scale is hampered (e.g. there was never forseen a regular medical examination or attestations for cabin crew). Such additional standards would be costly and useless in terms of safety. EASA has to streamline the project and to delete regulations that go beyond the mandate in order to safeguard a level playing field for the european airline industry on a global scale and, thus, to foster the global development of a competitive european aviation industry.

- **Recommandation:**

Back to JAR-structure or electronic tool to see JAR-structure. Stick to ICAO.

Comment / Proposal:

The EASA OPS-regulation in its present form is too complex to be fully and clearly understood by the majority of the target group in aviation. Though, it does not meet the constitutional principle of clear and understandable rulemaking. We would strongly emphasize to structure the EASA rules along the system of ICAO Annexes and the SARPs therein. This makes the rules clearly understandable on a global scale.

comment *1460* comment by: *E.W.Guess (Holdings) Ltd*

Dear Sirs,

I would like to add my comments as to the proposal, we mainly operate our helicopter on company business with only our company employee's as crew and we are all fully aware of the risks involved in helicopter operations as are our families, I personally have been flying since 1966 totalling 6,000+ hours and have never suffered an in flight incident requiring a PAN or MAYDAY response.

I think you should look carefully into the statistics as regard to light helicopter failures, especially over water, and to which types have repeatedly

failed, before you apply a BLANKET ruling an all types.

Furthermore, helicopter opperations rarther than risking lives SAVES LIVES and rightly so helicopters involved in search and rescue should and do comply with your proposal.

I personally feel the proposal will add additional cost which is totally unnecessary, and is yet another restriction of our personal choice and liberty.

Yours, Ray Guess Ceo

comment *1462* comment by: *ECA - European Cockpit Association*

Several draft NPAs have been taken into account in NPA 2009-02. Several shortcomings, much needed clarifications and amendments to bring the operational regulations in line with certification specifications, notably runway state definitions, have been proposed by the JAA Performance Subcommittee in DNPA-OPS 47. By not considering the proposals from DNPA-OPS 47 inconsistencies existing in the operating rules are not properly addressed. Furthermore, by not incorporating DNPA-OPS 47 the proposed operating rules are not in line with latest scientific knowledge and as such do not reflect state-of-the-art or industry best practices as indicated in NPA 2009-2a.

comment *1481* comment by: *Airbus*

In this case of complete re-codification of rules, it is especially important to have sufficient explanatory material and traceability of requirements.
Although the cross-reference tables between EU OPS 1 / JAA TGL 44 and the proposals of NPA 2009-02 are helpful, there are a number of requirements added, or modified, or with modified applicability, that are not explained and cannot be traced back. The reasons for those changes should be explained, as noted in our comments on some paragraphs.

comment *1492* comment by: *Charles MCCANN*

I am the owner of a Robinson R44 Raven II G.CMCC and have over 1000 hours on type.

EASA consultation document entitled NPA No. 2009-2b is a serious inhibition to the freedoms I currently enjoy and its proposals are a significant threat to fairness as the proposals are entirely disproportionate to the risks particularly to over-water flight.

In the West of Scotland we have over 300 islands, some just a few miles

from the mainland, others as much as 50. It would be impossible to continue the quantity of flying I do within these, which during about 9 months of the year I will fly regularly. For example, I take visitors to a castle and restaurant on the Isle of Skye about 8 times in the summer; this is a two-hour flight from Glasgow with about 40 minutes over water between islands. It would take 7 hours to drive the distance with much of it on single-track island roads.

I also fly guests to the Isle of Islay for golf or whiskey distillery tours. The withdrawal of this and other similar flights would directly affect the high spending tourist industry in Scotland and damage rural communities' income.

In August 2007 I and a co-pilot flew a Robinson R44 from Long Beach California to Lanark in Scotland, a distance of around 7,000 miles, almost 1,800 of which was over the sea between Canada-Greenland-Iceland and Scotland. The helicopter was fitted with a long-range fuel tank, and non-automatic ELT and a radio-ground altimeter. Other than these items, it was a 'non-complex helicopter'. The sea trips were without incident and even in relatively poor weather we completed the longest sea journey of 580 miles from Iceland to Scotland safely. We raised £100,000 for charities (mainly Royal National Lifeboat Institution) on the back of this event.

Your proposals would make either of the above scenarios impossible to continue or be repeated, and I urge you to reconsider and listen to helicopter owners and clubs who would be so adversely affected if your proposals were implemented.

Thank you

Charles McCann

comment *1981* comment by: *Duncan Lee*

The European Parliament states "any new requirements should not inhibit existing recreational flying activities"
The proposals in this document are un-necessary and if implemented will severely inhibit recreational flying.

comment *2241* comment by: *Airbus S.A.S.*

Definite measure values should always be expressed as numbers.
The proposed text contains several measures expressed in words.

comment *2243* comment by: *Airbus S.A.S.*

For consistency reasons, the proposed text should adopt a unique primary measure unit; in example, altitudes are sometimes expressed in "m (ft)", others in "ft (m)".

comment *2244* comment by: *Airbus S.A.S.*

In AMC OPS.CAT.225.A(c) (3)(a), EASA proposes to use the term "Supplementary (S)TC" instead of "Supplemental Type Certificate (STC)" as defined in IR Part 21, Subpart E. It has to be kept in mind that FAR 21 also uses the term "Supplemental Type Certificate (STC)".

To ensure consistency within the EASA regulatory system, and in international certification activities, Airbus proposes to use terms and acronyms that are in accordance with already established implementing rules. A complete check of proposals in NPAs 2009-01, 2009-02 et al may be necessary.

comment *2502* comment by: *Royal Aeronautical Society*

General

There are many references to 'motor-powered *aeroplane(s)'*, yet the definition of 'Aeroplane' on page 22 is, 'An engine-driven fixed-wing aircraft heavier than air that is supported in flight by the dynamic reaction of the air against the wing'. This definition makes the phrase 'motor-powered aeroplane' tautological. **It is suggested that 'motor-powered aeroplane' should, where it appears, be replaced by the single word 'aeroplane' unless the term 'motor-powered *aircraft*' is intended.**

comment *2608* comment by: *JTS Aviation Ltd*

It is difficult to see or understand the rational behind the proposed increased equipment and restrictions for the small private pilot and operator using the 'non complex helicopters'. Specifically the compulsory fitting of floats to small helicopters and fitting of ELTs.

Who is drafting these proposals, is it a body of people who work in a land locked office and only time see water once a year when they fly to Croatia on the annual holiday. Do they understand the implication of people flying in England? Do they realise that putting this restrictions would further restrict where people can fly therefore further congesting the airways available for people to fly? Do they realise the extra costs and

My objections are three fold.

First, just the basic complexity and cost of installing this equipment in relation to the construction of the machine. What value will this add in comparison to the benefits? Frankly I would suggest it is detrimental both to safety as it would add further restrictions as to what can be done with a machine, more to go wrong, more to have to learn to use, more to service and more for EASA to have to inspect. Basically self perpetuating increase in costs and complexity which can not benefit anyone.

Second, what makes you think installing this equipment would make things safer? Have you done the statistics of incidents that would have saved life versus the hours flown in a helicopter for private use? Is it worth it, i.e. benefits vs cost (complexity)?

Third, just because you have fitted floats what makes you think that the helicopter will land and stay upright? If the ELT is fitted to a R44 or R22 in the usual place and the machine turns up side down is it any use, do you get a signal? I suspect not.

Ok, now we have all this stuff fitted and assuming we can take off and we can afford it, the unsuspecting pilot and EASA regulator may be lulled into a false sense of security, somehow thinking that flying excessive periods over is safe and a good idea. Chances are you probably have more accidents anyway.

This leads me to my last point. I am a PPL(H) of 9 years and now training to be a CPL(H). I take safety of paramount importance and frankly I do not like flying over water. So I take practical steps to minimise the risks. I carry 2 personal EPIRBS and I carry a small liferaft. I have done the ditching training, I always pick the shortest route over water and I never do it when the weather is marginal.

My point is that if you don't get into difficult situations in the first place you will not need any of this extra stuff. Therefore why don't you concentrate on education and training, providing better weather reports and generally make pilots safer.

In the end no matter how much equipment you have installed it will be the pilots responsibility and will be likely to be blamed if it doesn't work out.

comment *2609* comment by: *jim reeve*

i am a s ppl h with 50 hours.my hughes 300a is often short of power,and the adittion of any extra weight would be most dangerous.my asi is marked for vne so i fail to see any safety benefit in which units it is calibrated in.an automatic elt would add weight which would detract from flight safety rather than adding to it.for over water flight floats are not available for my aircraft.if they were the extra weight would be far more detrimental to flight safety than any benefits. for night flight again the weight penalty of proposed extra equipment would result in a net reduction in flight safety

comment *2610* comment by: *Richard Reeve*

I have been flying various aircraft for over 50 years and have never had an accident or near accident due to engine failure in flight. Low fuel caused an emergecy landing at an airfield 1n 1967. This was entirely pilot error. Cross water and night flying have been carried out useing appropriate auxiliary equipment. Torches, life jackets, PLBs etc.. I feel therefore, that these proposals are entirely nu-necessary and will not aid flight safety.
Richard Reeve.

comment *2628* comment by: *AOPA-Sweden*

A list of acronyms should have been very supportive.

comment *2629* comment by: *AOPA-Sweden*

AOPA-S has a feeling this ruling is directed to organizations or enterprises, with a flight department and unlimited resources to produce manuals. A small business will not have a chance to follow this ruling.

comment *2630* comment by: *AOPA-Sweden*

Article 8.3, Basic Regulation opens for some alleviations for non-commercial operators of complex aircraft. AOPA-S inquires such a relief for owner of VLJs.

comment *2812* comment by: *Axel Ockelmann + Manfred Poggensee Commercial Balloon Operators Germany*

There is not any clear definition in the basic regulation or the implementing rules, that says commercial ballooning is Commercial Air Transport. ICAO is defining Commercial Air Transport as international Transport. From our point of view commercial ballooning is a commercial operations other then CAT, which means a new category, because it is onlý partwise "aerial work";but not commercial air transport.
The position of EASA-proposals did not consequently follow the rules ,if commercial ballooning is commercial air transport, why they are not defining a special category of air transport for ballooning. Is it too complicated? Following EASA philosophie "make the rules proportional to the scale and scope and risk of the operation".

EASA has to find lower requirements for the operation of balloons.Balloons are the simplest aircrafts ever and the pilots are doing pleasure-flights normally inside the dimension of 10-20 miles with a flighttime of 1-2 hours. Balloonpilots are not flying for up to 10-14 hours, or at night, or over timezones. So this commercial operation is rather different to the other commercial air transports.
For the technical requirements we can see the EASA is finding differentiated requirements, why not also following that way for Operations? Following that reduced way, there must be also differentiated requirements for Age, Flight- and Resttime, Medical (is actually Class 2, which is o.k.for us) etc.

comment *2886* comment by: *UK CAA*

Page No:

Whole document with regards to performance matters.
Paragraph No: AMC & GM paragraphs relating to performance.

Comment: The Section 1 material from EU-OPS 1 / JAR-OPS 1 which has been transferred to AMC and GM should be transferred (back) to rule material.

Justification: Performance requirements contain important quantitative parameters and criteria (such as climb gradients, definitions and field length factors), which must be complied with unconditionally in order to achieve the intended level of safety. This will not be achieved by relegating them to advisory or guidance material because the resulting "flexibility" and "introduction of alternative creative solutions" will bypass this objective. Obvious examples are the definitions of Classes A, B and C, and the landing distance factors. Both of these requirements are examples of cornerstone operational parameters which need to be upheld uniformly across all MS if the uniform and high level of protection in civil aviation objective of EC Regulation 216/2008 are to be realised. Being relegated to AMC/GM implies that they are open to 'local negotiation' with Member States' oversight system, which will inevitably result in uneven implementation between operators and MS.

Proposed Text (if applicable): EU/JAR-OPS 1 'section 1' rule text should be reinstated as implementing rule material.

comment *2897* comment by: *jim reeve*

pilot steerable night light ! it is a job when autorotating from 2000ft to get half way through emergency checklist,let alone adjust gadgets. what if previous pilots have left it badly positioned? at least a fixed one points in the

right direction.more stuff to manage during an emergency will kill far more people than it saves! extra weight will also cause more fatalities in light helis.

comment *2975* comment by: *CAA-NL*

Comment CAA-NL:

The CAA-NL proposes to EASA to use the definitions related to dangerous goods as identified in ANNEX 18 and the Technical instructions for the safe transport of dangerous goods by air. Part I chapter 3.
(ICAO doc 9284 AN/905).

comment *2987* comment by: *AEA*

Comment:

NPA 2009-02B is a major departure from EU-OPS both in content/concepts and structure. Those major changes cannot be justified on safety grounds and would lead to unjustified costs and additional complexity for the airline industry. The confusing structure and unclear drafting of this NPA will not provide legal certainty.

We note that this NPA is also not in line with the mandate which was given to EASA by the EU legislator which clearly referred to the need for EASA rules to build on EU-OPS and the JAA heritage. In this context, the AEA would like to make reference to the clear concerns expressed by the European Commission and EASA Member States at the June 2009 EASA management board meeting. The AEA therefore urges EASA to stick to its safety role and the clear instructions from its Management Board that this NPA should be withdrawn and realigned with EU-OPS.

Proposal:

Relalign the NPA with EU-OPS

comment *2988* comment by: *AEA*

Comment:

The various EASA NPAs (NPA 2008-17, NPA 2008-22, NPA 2009-1, NPA 2009-2 and the NPA TCO) are all closely linked. The fact that they are not open for consultation in one NPA package leads to the fact that some elements of this NPA cannot yet be fully commented (due to missing elements) and that some additional comments might have to be provided after the closure of the NPA comment deadline.

Proposal:

Have a second round of consultation once all elements are available

comment *2989* comment by: *AEA*

Comment:

The whole NPA package is more than 3000 pages to be checked in detail within a very limited time-frame. For that reasons, the submitted AEA comments to this NPA should be considered as the major concerns from AEA to this NPA but additional comments/concerns might be identified after the closure of the NPA comment deadline.

Proposal:

EASA should take on-board all AEA concerns to these NPAs even when they have been identified after the closure of the NPA comment deadline. For commercial air transport we already have EU-OPS as a safe and practical regulation available. Therefore there is no justification to completely redraft the rules as suggested by EASA through this NPA and there is no matter of urgency.

comment *3532* comment by: *Trevor Wilcock*

I am commenting as an owner of an Annex 2 light aircraft and as a sailplane pilot.

comment *3578* comment by: *Light Aircraft Association of the Czech Republic*

This is the answer of the Light Aircraft Association of the Czech Republic.
During the work of MDM032 following conclusion was agreed and passed to the OPS WG:
- 1. For aircraft below 2000 kg MTOM the Essential Requirements should be applied directly except for 3 additional Implementing Rules (COM/NAV equipment, safety equipment, fuel reserves)
- 2. For aircraft above 2000 kg MTOM OPS 0 should be applied
see MDM032-DOC082 MoM 2007-04-17-19 Final Version.doc
Why this agreement was rejected?

Proposal: Just follow the recommendation of the MDM032 group.

comment *3596* comment by: *PPL/IR Europe*

Our comments relate solely to non-commerical operations and our general comments are:

1. We recognise the complexity of the task of EASA OPS, and we believe that the NPA, in the main, addresses this task effectively.

2. Our main concern is that there are a small number of areas in which non-commercial IFR is unduly restricted by regulations which read as written primarily for commercial operations, although falling under the "GEN" section. This has been the focus of our comments. We are opposed to the "creep" of commercial regulation into non-commericial operations, especially given EASA's commitments to good, proportionate regulation and recognition of the negligble third party risk posed by aircraft under 5.7t. We recognise the instances of this may be the resulting of text drafting rather than intent.

3. A futher concern is that some of the "complex aircraft - non-commercial" regulations are unnecessarily restrictive on the operation of light (under 5.7t) multi-engine turboprop aircraft, that have different certification requirements from jets or aircraft over 5.7t. We do not see any safety rationale for why a non-commericially operated twin-engine turboprop under 5.7t should need to meet performance criteria more restrictive than those in its type certification and approvals. These TC performance criteria have applied for non-commerical operations throughout the entire history of such aircraft, in Europe and elsewhere, and we believe that the safety record of such aircraft is better than non-complex piston or single-engine turbine equivalents in comparable operations. Therefore there is no 3rd party or any other safety case to recommend such restrictions for non-commerical operations.

comment *3893* comment by: *Austro Control GmbH*

General Comment to NPA 2009-02:

Referring to the explanatory notes in NPA 02a and to the remarks concerning AMC and GM Austro Control generally emphasizes that a distinction between requirements of hard and soft law has very carefully to be done. In case of doubt "essential safety elements" have to be regulated by rules and not by AMC.

Member States of the Austrian/Suiss/German legal systems are used to work with rules and explanations, but not with soft law as it is foreseen in the draft IRs. Besides that, European aviation law with AMC may cause problems with standardisation and national administrative law, especially from the

aspect of legal force (of national decisions and approvals) and legal remedy; this has to be considered.

Furthermore Austro Control states that many items that should be regulated in the rules for safety objectives have disappeared in the AMC and GM. It is feared that the "highly praised" level of flexibility will end in a legal uncertainty. The consideration of flexibility is appreciated but can also be reached by the provisions of Art 14 of the Basic Regulation, what also grants a better involvement of Member States in the rulemaking process.

The transfer of some requirements to "non binding soft law" risks an effect of altering them and causing undesirable effects.

For example standardisation items (forms, reports…) and definitions have to be regulated by the rules and can never be in AMC for a uniform application; as many of the Annex 1 provisions of EU-OPS/JAR-OPS have safety related matters, they shall be in the rules. Generally much more of the AMC provisions have to be retransferred to hard law and the performance based approached has to be moderated.

The more is regulated by hard law, the more legal certainty, standardisation, efficiency and harmonisation will be reached.

The AMC procedure provided by the new EASA rule means a long time expensive administrative burden and bureaucracy for the Member States, EASA and the whole aviation community. Besides that legal certainty and a uniform legal basis are not assured for all stakeholders.

CS, AMC and GM should not be more than guidance and AMC should in every case be limited to really non essential implementation aspects.

Therefore it is urgently recommended that proposed AMC and GM are reviewed and checked if – in the interest of safety impacts – they may be re-transferred to the rules.

Concerning the new structure Austro Control criticizes that its readability and its transparency have to be improved. It is not very easy to understand and makes it very hard (in spite of e-tool) to find all relevant provisions of the concerned stakeholders. E.g. there a three parts to read to find all relevant requirements for cabin crew, there are 5 parts to read HEMS relevant requirements and the risk to overlook relevant requirements is high.

The proposed requirement for Helicopters to carry floats while over water fails to equitably balance all relevant risk factors,

1 Typically most non CAT and many CAT Helicopters are over water Less than 1% of hours flown, the deterioration in flight performance by 5-10% in range and speed with decreased power to weight and handling performance reduction through an increase in drag and weight when floats are carried, this must result in a global reduction in flight safety, offsetting any apparent safety benefit of floats,

2 It is not practicable to fit floats to many Helicopters and the cost where floats can be fitted is not in proportion to clamed benefit particularly in view of point 1.

Floats cannot easily be detached and re fitted or it may not be practicable to do so and even if they could this may not avoid the safety problems of performance reduction described in point 1,

The increase in flight duration of 5-10% caused by the drag / weight impediment of floats results in greater safety risk than any safety benefit gained from the very limited utility of floats,

Have a second round of consultation once all elements are available

comment *4434* comment by: *Deutsche Lufthansa AG*

Comment:

NPA 2009-02B is a major departure from EU-OPS both in content/concepts and structure. Those major changes cannot be justified on safety grounds and would lead to unjustified costs and additional complexity for the airline industry. The confusing structure and unclear drafting of this NPA will not provide legal certainty.

We note that this NPA is also not in line with the mandate which was given to EASA by the EU legislator which clearly referred to the need for EASA rules to build on EU-OPS and the JAA heritage. In this context, the AEA would like to make reference to the clear concerns expressed by the European Commission and EASA Member States at the June 2009 EASA management board meeting. The AEA therefore urges EASA to stick to its safety role and the clear instructions from its Management Board that this

NPA should be withdrawn and realigned with EU-OPS.

Proposal:

Relalign the NPA with EU-OPS

comment *4435* comment by: *Deutsche Lufthansa AG*

Comment:

The various EASA NPAs (NPA 2008-17, NPA 2008-22, NPA 2009-1, NPA 2009-2 and the NPA TCO) are all closely linked. The fact that they are not open for consultation in one NPA package leads to the fact that some elements of this NPA cannot yet be fully commented (due to missing elements) and that some additional comments might have to be provided after the closure of the NPA comment deadline.

Proposal:

Have a second round of consultation once all elements are available

comment *4438* comment by: *TAP Portugal*

Comment:

The whole NPA package is more than 3000 pages to be checked in detail within a very limited time-frame. For that reasons, the submitted AEA comments to this NPA should be considered as the major concerns from AEA to this NPA but additional comments/concerns might be identified after the closure of the NPA comment deadline.

Proposal:

EASA should take on-board all AEA concerns to these NPAs even when they have been identified after the closure of the NPA comment deadline. For commercial air transport we already have EU-OPS as a safe and practical regulation available. Therefore there is no justification to completely redraft the rules as suggested by EASA through this NPA and there is no matter of urgency.

comment *4453* comment by: *Deutsche Lufthansa AG*

Comment:

The whole NPA package is more than 3000 pages to be checked in detail within a very limited time-frame. For that reasons, the submitted Lufthansa comments to this NPA should be considered as the major concerns from Lufthansa to this NPA **but additional comments/concerns might be identified after the closure of the NPA comment deadline.**

Irrespectively of what the consultation rules say, it is unacceptable to force stakeholders to make detailed, constructive, and comprehensive comments on such a big package which is a MAJOR deviation from the current rules.

Proposal:

EASA should take on-board all Lufthansa concerns to these NPAs even when they have been identified after the closure of the NPA comment deadline without claiming that the public consultation period has run out. For commercial air transport we already have EU-OPS as a safe and practical regulation available. Therefore there is no justification to completely redraft the rules as suggested by EASA through this NPA and there is no matter of urgency. The task given to EASA by the Commission was to build upon the heritage of EU-OPS as close as possible. Under this condition, the

consultation rules could have easily been met.

comment *4891* comment by: *CEV (French Flight test Centre)*

CEV "french flight test center" general comment to NPA2009-02b

It is CEV opinion that flight test operation are specific and should need a special section in this NPA.

Following paragraphs provide a proposal which is consistent with nowadays flight test operations.

Proposal

Introduction of a new subpart which has the same format than subpart D

Subpart E Flight test operations

OPS. FTO.001. Competent authority

Notwithstanding OPS.GEN.005, for the purpose of this subpart, the competent authority for flight test operation shall be the authority designated by the member state where the aircraft is registered.

OPS.FTO.002 Flight test operation non applicable paragraphs

Notwithstanding OPS.GEN.005, following paragraphs are not applicable:

OPS.GEN.100

OPS.GEN.105

OPS. GEN.145 to OPS.GEN200. FTOM will define accordingly the flight test policy

OPS.GEN.425 to OPS.500. FTOM will define the safety equipments necessary for safe operation in flight test operations.

OPS.GEN.600

OPS.GEN.605

OPS.FTO.005. Scope

This part establishes the requirements to be met by an approved flight test organisation to qualify for the issue or continuation of flight test operational approval

OPS.FTO.025. Privileges of a approved flight test organisation

The scope of the flight test activities that the flight test organisation is approved to conduct shall be specified in the flight test operational manual

OPS.FTO. 035 Continued validity of a specific approval

Approval shall be issued for an unlimited duration. It remains valid subject to ***a valid DOA and/or POA.***

OPS. FTO. ? Authorised flight test operations

Flight test operations shall be conducted as described in the FTOM

OPS. FTO? Crew member for flight test operation

The composition, the competence and experience of the crew must comply with the requirements contained in FCL for the pilots or the Appendix XII to part 21 for flight test engineers and of pilots engaged in categories 3 and 4 of flight testing.

Part-OR

Chap 1

OR.OPS.100.GEN Operator responsibilities : to be adapted

Section II – Manuals, Logs and Records

OR.OPS.015.MLR Operations Manual : to be replaced by FTOM

OR.OPS.020.MLR Minimum Equipment List (MEL) : to be deleted

Section IV – Air operator certification : to be replaced by DOA/POA

Section V – Flight Crew: To be replaced by FTOM

Chap 3

Additional requirements for commercial operations other than commercial air

Transport

OR.OPS.240.FC Recurrent training and checking Operator

Proficiency Check? : to be discussed in the future flight test group

Section VI – Cabin crew : ASD to check if applicable (Airbus?)

Section VII – Technical crew member in HEMS, HHO and NVIS operations

Section X? – Technical Flight test engineer

OR.OPS.005.FT Scope

(a) This Part establishes the requirements to be met by Flight test engineer in flight test activities.

(b) ***A flight test engineer is assigned by the operator to duties in the aircraft for the purpose of monitoring flight test activities and/ or assisting the pilot in the operation of the aircraft and its systems during those flight test activities****.*

OR.OPS.015.FT Conditions for assignment of technical crew to duties

(a) Flight test engineers in flight test activities shall only be assigned duties if they:

(1) are at least 21 years of age;

(2) are physically and mentally fit to safely perform assigned duties and responsibilities;

(3) are periodically assessed for medical fitness, based on aeromedical best practice, to safely exercise their assigned safety duties;

(4) have been checked as proficient to perform all assigned duties.

OR.OPS.020. FT Initial training

Before being first assigned to operate, each technical flight test engineer shall complete all training required by the Appendix XII to PART 21 for flight test engineers.

OR.OPS.045.FT Checking

(a) Following the completion of training, each flight test engineer shall undergo a check to demonstrate his proficiency in carrying out his flight test duties.

(b) Training and checking shall be conducted for each training course by personnel suitably qualified and experienced for the subject to be covered.

comment *4963* comment by: *Deutsche Lufthansa AG*

Relevant Text:

All chapters, applicable to various elements, for example (this means, there are more):

AMC1 OPS.GEN.100 Ice and other contaminants

AMC2 OPS.GEN.100 Ice and other contaminants

GM1 OPS.GEN.100 Ice and other contaminants

GM2 OPS.GEN.100 Ice and other contaminants

GM3 OPS.GEN.100 Ice and other contaminants

GM2 OPS.GEN.150.A Instrument Flight Rules (IFR) operating minima

AMC OPS.SPA.001.RVSM(b)(2)(ix) Operations in RVSM airspace

GM OPS.SPA.001.RVSM(b)(2) Operations in RVSM airspace

GM1 OPS.SPA.001.LVO Low visibility operations (LVO)

GM2 OPS.SPA.001.LVO Low visibility operations (LVO)

AMC OPS.SPA.001.LVO(b)(1) Low visibility operations (LVO)

Comment:

Such material is in opposition to the concept of "performance-based rulemaking". It is all detailed procedure description, but not a rule to comply with. The flexibility promised by EASA through the "performance-based rulemaking" is odd: It is true that the Implementing Rule **seems** to be leaner now than before, but all the details and in many cases even new texts have been added to the AMC (which are factual rules) and GM (which are factual audit basis).

As presented, the concept of "performance-based rulemaking" fails to convince.

Proposal:

Keep the **Implementing Rules as close as possible to EU-OPS (as having been tasked),** and refrain from detailed and/or extended procedure descriptions in AMC and GM.

comment *5100* comment by: *Swiss International Airlines / Bruno Pfister*

Comment:

The various EASA NPAs (NPA 2008-17, NPA 2008-22, NPA 2009-1, NPA 2009-2 and the NPA TCO) are all closely linked. The fact that they are not open for consultation in one NPA package leads to the fact that some elements of this NPA cannot yet be fully commented (due to missing elements) and that some additional comments might have to be provided after the closure of the NPA comment deadline.

comment *5109* comment by: *M. LOMBARDI*

I REALLY AGREE WITH YOUR PHILOSOPHIE, ALSO I AM IN LINE WITH THE POINTS YOU DISCUSS IN THE EASA.

comment *5155* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment:

The overall structure of the OPS-regulation makes the regulation too complicated for private operations of non complex aircraft.

Proposal:

Consider a new structure and divide the IR into categories and single out what is applicable for operations with sailplanes, helicopters, aeroplanes, balloons etc.

comment *5157* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment: EASA should closely follow the publication of ICAO State letters about Annex 6 in order to implement changes within the required time frame.

comment *5162* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment: There is no balance between hard law (basic regulation and implementing rules) and soft law (acceptable means of compliance and guidance material) e.g. in the case of rules about aircraft performance and operating limitations. Some rules that today are considered to be of a mandatory nature, such as ICAO standards and rules that are put into EU-OPS, are in this proposal degraded to AMC or GM.

Proposal: Recognising the need to have a flexible approach in some cases, a restructuring of the proposal and balancing crucial flight safety rules in IR instead of AMC or GM is needed.

comment *5166* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment: The NPA lacks a reference to Part M

Proposal (including ***new text***):

(a) An operator shall not operate an aeroplane unless it is maintained and released to service by an organisation appropriately approved/ accepted in accordance with Part 145 except that pre-flight inspections need not necessarily be carried out by the Part 145 organisation.

(b) Aeroplane continuing airworthiness requirements needed to comply with the operator certification requirements in ~~OPS 1.180~~ (insert new reference***) are those set up in Part M.***

comment *5173* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment: There is no reference in the NPA to a nominated post holder responsible for the management and supervision of the Maintenance system.

comment *5180* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment:

According to Swedish regulations for non-commercial airplanes, start or landing is not allowed in cross wind exceeding the maximum demonstrated cross wind component stated in the Pilot's Operating Handbook.

Private pilots generally do not have the same skill and judgment level as commercial pilots. Hence there is a need to guide their decision making via a

regulation.

Proposal (including ***new text***):

Insert in the OPS.GEN section:

AIRPLANES

For non-commercial operations with non-complex airplanes, start or landing is not allowed in cross wind exceeding the maximum demonstrated cross wind component stated in the Pilot's Operating Handbook.

comment *5234* comment by: *Civil Aviation Authority of Norway*

Comment:

The Civil Aviation Authority of Norway (CAA-N) feels that Part OPS is incomplete as long as there is no Specific Approval for offshore operations conducted more than 10 minutes away from shore.

Norway – among with Great Britain, Ireland, Denmark and the Netherlands – has extensive operations of helicopters between the mainland and oil- and gas-installations. Each of these countries have national regulations aimed especially at these operations. The regulations are designed to minimise the extra risks affiliated with the operation.

Among the subjects that need to be regulated are

- supplementing operating procedures
- performance requirements
- operating minima
- crew training and experience requirements
- crew composition requirements
- equipment requirements

Regarding equipment requirements CAA-N feels it is of the utmost importance that helicopters are equipped with some extra form of Flight Following-system that can inform national FlightServices about its exact position (longitude, latitude and altitude) in real-time. This is the best way for SAR to find an aircraft after an accident and gives the best chance of survival for crew and pax.

CAA-N notes that EASA, when writing Part OPS, has tried to incorporate all the rules in JAR-OPS 3. From what we can understand, EASA has not proposed any regulation on Offshore Helicopteroperations due to the fact that no such rules were to be found in JAR-OPS 3. This is only partly correct.

The JIP for JAR-OPS 3, Section four, Part 2; Operations, describes how the AOC and Operations Spesification is to be compiled. In pages 51 and 55, under the label E) Special Authorisations/Approvals, it is assumed that any operator wanting to perform Offshore Helicopter Operations needs such a Special Authorisation/Approval. The basis for this Authorisation/Approval has

been national legislation.

We therefore feel that the Part OPS does not truly reflect the necessary levels of safety from JAR-OPS 3 unless an SPA for Offshore Helicopter Operations is included in the rules.

comment *5297* comment by: *Light Aircraft Association UK*

The LAA would like to point out that a number of the rules included in this proposal would not be achievable in older types of aircraft [e.g. OPS.GEN.205c), OPS.GEN.405a)1), OPS.GEN.410b), OPS.GEN.430, OPS.GEN.455] and therefore due consideration must be given to the potential impact on the operation of these types if they move out of Annex II in the future.

comment *5340* comment by: *Danish Balloon Organisation*

General Comments:

We suggest that Commercial Ballooning is moved from Subpart B Comercial Air Transport to Subpart C Comercial operations other than Comercial Air Transport.

Justification: Comercial Ballooning should not be regarded as Comercial Air Transport because the nature of this operation is more in line with "other commercial operations".

comment *5377* comment by: *peter barker*

1. I have fully read the detailed comments submitted by the Helicopter Club of Great Britain (HCGB) and agree with every comment made.

2. I attended the HCGB annual general meeting at which there was much discussion regarding the proposed new EASA rules; the following is a very brief summary:

i) There was 100% support for the comments submitted by HCGB to EASA.

ii) There was great concern that EASA, in putting forward the proposed new rules, has demonstrated a fundamental lack knowledge regarding the operation of light helicopters.

iii) In considering the submission by HCGB, members were anxious that EASA should recognise that the HCGB represents a third of all UK and Irish helicopter owners, and several hundred UK and Irish helicopter pilots, and should give proper weight to the HCGB submission.

iv) The proposed new rules were considered to be unfair and

discriminatory to UK pilots, in that, Britain and Ireland are island countries unlike the countries of mainland Europe.

3. With regard to item 2 ii) above it is imperative that, when considering rules relating to light helicopters, EASA employs people who have real expertise and experience with them and their operation. In particular, EASA should take special notice of the solid body of experience in the HCGB and consider very seriously the concerns voiced in the HCGB submission.

comment *5395* comment by: *Swiss International Airlines / Bruno Pfister*

Comment:

NPA 2009-02B is a major departure from EU-OPS both in content/concepts and structure. Those major changes cannot be justified on safety grounds and would lead to unjustified costs and additional complexity for the airline industry. The confusing structure and unclear drafting of this NPA will not provide legal certainty.

We note that this NPA is also not in line with the mandate which was given to EASA by the EU legislator which clearly referred to the need for EASA rules to build on EU-OPS and the JAA heritage. In this context, the AEA would like to make reference to the clear concerns expressed by the European Commission and EASA Member States at the June 2009 EASA management board meeting. The AEA therefore urges EASA to stick to its safety role and the clear instructions from its Management Board that this NPA should be withdrawn and realigned with EU-OPS.

Proposal:

Relalign the NPA with EU-OPS

Therefore there is no justification to completely redraft the rules as suggested by EASA through this NPA and there is no matter of urgency.

comment *5637* comment by: *ERA*

European Regions Airline Association Comment

- There are numerous examples of changes leading to cost impact on the airline industry without any obvious safety gain i.e. the changes proposed by EASA related to the In□Flight Relief of the Pilot□in□Command requiring a command course/Commander for the in□flight relief of a Commander whereas EU□OPS allows for a suitability qualified First Officer above Flight Level 200.
- The new rule□structure is very confusing and not user friendly. More explanations are needed from EASA regarding the changes to EU□OPS and the concepts and reasons behind the changes.
- This NPA is the major part of a package of NPAs that have been put out for comment over a similar time frame with an important underlying relationship between them. The particular size of this NPA and the other related individual NPAs has made it almost impossible to fully appreciate or comprehend the changes proposed and obviously their eventual implication on the operators concerned. This unfortunate state of affairs has been compounded by two additional factors not experienced before.

The first is the addition of the different phraseology in this and the other NPAs that has, unless you're a lawyer, made it very difficult to carry out any meaningful comparison between the new and old regulations. Certain reassurances that have been made regarding this NPA reflecting the latest edition of EU-OPS are not borne out by examples in the NPA. In many aspects fundamental differences have been introduced compared to EU-OPS. There is no legal basis and no safety justification for EASA to fundamentally alter the EU-OPS requirements.

The second factor concerns the fact that this NPA is a 'catch all' rule encompassing for the first time a wide spectrum from Commercial Air Transport to Ballooning operations. This makes it a leviathan in terms a regulatory document and a monumental multi task operation in extracting the relevant regulation appertaining to Commercial Air Transport operations. Despite the EASA e-tool [arriving on the scene far too late] a co-operative

way of working is needed to produce a better regulation. Would it not be an improvement to retain EU-OPS for the moment? This is a regulation already in place for Commercial Air Transport and is accepted by the individual authorities. EASA could then concentrate on the other operators covered by the IR-OPS that as yet have no common operations rule. Amendments to EU-OPS could be made by individual IR changes to the individual subparts over a period of time? This would enable a greater understanding of the proposed changes, reduce confusion and go some way to resolving the concern amongst smaller operators that they may have missed important fundamental changes that could impact them in the long run.

comment *5650* comment by: *bmi*

It is the opinion of bmi that EASA should consider the comments submitted by the United Kingdom CAA and the Association of European Airlines (AEA). bmi concur with the opinions submitted by these organisations.

comment *5760* comment by: *Julian darker*

Dear Sir,

I am a helicopter pilot with a PPL(H) and 700 hours gained privately over the last 17 years and I have owned an R22 for 5 of those years and now returned to renting R22 and R44 types.

I have flown all over Britain and lots of the continent and have always carried an ELT with 121.5 and for the last 3 years have carried a McMurdo GPS beacon.I also seem to remember I objected to plans to fit fixed beacons and floats etc about 4 years ago so why are we having to do it again when it is demonstrably not a safety issue by any informed observer and the costs and weight issues make these ridiculous proposals.

I mostly fly R22 helis and enjoy going overnight somewhere but there is absolutely no room for any extra equipment

with a passenger and bags-imagine having floats and a cylinder on an R22 even if they could be retro fitted-which they can't.

I go across the English Channel by the shortest route about twice a year and as I pilot I am prepared to take the small risk

of that crossing taking maybe 18 minutes - if the helico I was in had a fixed beacon and I had an engine failure over the water

it would sink with the aircraft and be useless which is why I have my beacon attached to my lifejacket so that I can activate it in an emergency.

Please take note of the vote in the European Parliament on 3 February 2009 on the Resolution on an 'Agenda for a sustainable Future in General and Business Aviation'- there was a huge vote in favour- it requires legislators to promote GA, ensure a fair deal through 'proportionate regulation' and encourage rather than restrict activity.

So no more helico legislation- they are just as safe as fixed wing (probably more so) and treat them as you would the ones with wings as they have the same engines after all and nobody needs to make things MORE EXPENSIVE.

Regarda

Julian Darker

comment *5868* comment by: *Norsk Luftambulanse*

Longer commenting period requested

Links to AMC should be added

Avoid vague or complicated wording

As a principle rule training should always be possible under the same alleviations that are applicable to the operation

comment *5882* comment by: *Michael Taylor*

I have found it very difficult to establish what the proposed rule changes are for helicopters.

The document would be greatly simplified if divided into separate sections for each aircraft type and operation.

Most of the definitions section is burdened with fixed wing requirements, which have little relevance to helicopter operations. Rather than having to wade through all of the definitions, I feel that they should be moved to the end of the document and sub divided by aircraft type and operation.

comment *6265* comment by: *DAeC LV NRW e.V.*

Introduction

The Deutscher Aero Club Landesverband Nordrhein-Westfalen (DAeC LV NRW) e.V. is the association of about 250 aviation clubs in the state of Nordrhein-Westfalen in the west of Germany. About 165 of these clubs (non profit) instruct about 2.000 Studentpilots on aeroplanes, sailplanes, micro lights, balloons and parachutes.

This is honorated and supported by die government which installed schoolsportgroupes- In NRW we do have about 75 "Schülerfluggemeinschaften".

By far the most activity in general aviation is happening in these clubs. Here pilots are under close observation and exchange lots of information. Aircraft belong to all members and are often not insured against damage or even complete loss. This leads to quite rigid supervision between the members. This setup contributes largely to the safety consciousness in general

aviation.

It is important to maintain this infrastructure and make sure it is supported by the regulations. This importance is also emphasized in the *„An Agenda for Sustainable Future in General and Business Aviation* COM(2007) 869".

We have structured our comments to the various paragraphs in up to four parts as appropriate:

Full reference to the passage (FCL.nnnn.XX (x)(n)(n))

Wording in the NPA

Here we repeat the passage from the NPA which we are specifically commenting

Our proposal

Here we specify how to change the wording of the NPA. This is either:

Add: for an addition of a passage

Change: changes in the original wording marked in red

Delete: delete a passage

Issue with current wording

A one sentence description of the problem

Rationale

A detailed reasoning why we think the change is needed or perhaps why we support the proposal in the NPA.

Our following general comments apply to many of the rules in this proposal. We therefore gather them here with detailed rationales and will then refer to them in our comments to the individual rules. This avoids repeating the rationales in multiple comments.

General Comments

1. commercial operations

Issue with current wording

According to the definition in Article 3 (i) of the basic regulation any operation with remuneration is a commercial operation. Already in previous comments it has been discussed that operations where the remuneration is limited to cost sharing should not be considered as commercial operations. In case this can not be distinguished some of the defined regulations are not appropriate for operations with non complex aircraft e.g. gliders, touring motor gliders or non complex airplanes.

Our proposal

Either state that Article 3 (i) of the basic regulation does not apply to cases where only costs are shared or compensated and there is no intention to make profit or introduce a class of commercial operations on non complex aircraft and define appropriate regulations for this class.

Rationale

Clubs in Germany have to be open to a certain extent to the communities

where they operate and offer passenger rides. This is necessary for the acceptance and integration of the clubs and their airports by the public. The clubs though can not afford to offer passenger rides for free but must ask for cost sharing or compensation. This should though not lead to the situation that all proposed regulations for commercial operations proposed in this NPA need to be followed. Either these passenger rides can be conducted as non commercial flights or less extensive regulations should apply. E.g. OPS.GEN.310(c) is not appropriate for the described class of operations.

comment *6273* comment by: *Baden-Württembergischer Luftfahrtverband*

Introduction

The Baden-Württembergischer Luftfahrtverband (BWLV) is the association of about 200 aviation clubs in the state of Baden Württemberg in the south west of Germany. About 160 of these clubs instruct on aeroplanes, sailplanes, micro lights, balloons and parachutes.

By far the most activity in general aviation is happening in these clubs. Here pilots are under close observation and exchange lots of information. Aircraft belong to all members and are often not insured against damage or even complete loss. This leads to quite rigid supervision between the members. This setup contributes largely to the safety consciousness in general aviation.

It is important to maintain this infrastructure and make sure it is supported by the regulations. This importance is also emphasized in the *„An Agenda for Sustainable Future in General and Business Aviation* COM(2007) 869".

Our following general comments apply to many of the rules in this proposal. We therefore gather them here with detailed rationales and will then refer to them in our comments to the individual rules. This avoids repeating the rationales in multiple comments.

General Comments

1. commercial operations

Issue with current wording

According to the definition in Article 3 (i) of the basic regulation any operation with remuneration is a commercial operation. Already in previous comments it has been discussed that many activities of non commercial organizations or private persons can not be considered commercial although payments are accepted but only for cost sharing. The Regulations for commercial operations in this NPA must not be applicable for these activities. Burdening clubs with the regulations for commercial operations would severely endanger their role in providing affordable flying for interested persons.

Our proposal

Either state that Article 3 (i) of the basic regulation does not apply to cases where only costs are shared or compensated and there is no intention to make profit or introduce a class of "commercial" operations on non complex

aircraft and state that this class is excluded from the regulations defined for commercial operations.

Rationale

Several activities of private or club operations can not be considered as commercial operations although a certain amount of compensation is paid to share costs. For example clubs in Germany have to be open to a certain extent to the communities where they operate and offer passenger rides. This is necessary for the acceptance and integration of the clubs and their airports by the public. The clubs though can not afford to offer passenger rides for free but must ask for cost sharing or compensation. This should though not lead to the situation that regulations for commercial operations proposed in this NPA need to be followed. These passenger rides should be treated like non commercial flights. E.g. OPS.GEN.310(c) is not appropriate for the described class of operations. An example for other non commercial activities where payments for cost sharing may be involved is the air tow of sailplanes after landing at a site of another club or helping out with tow planes.

comment *6470* comment by: *DGAC*

0 General Comments:

We would like to take advantage of this NPA 2009-02, to confirm previous comments concerning NPA 2008-22, that is to say: the new structure is hard to understand, the reading is complex and an overall view is missing. In France, despite many informatory meetings, stakeholders have had great difficulty in understanding these propositions. This is especially true for the small organizations which experience problems in understanding the measures which are applicable to them. It is indispensable that the simplified measures should be very explicit and that a dedicated consultation should take place.

The new regulatory structure does not seem to be well adapted; at least it appears, in our opinion, to be very far from being mature and we confirm our preference for to an activity-based approach.

We consider this NPA as an advanced NPA

It would have been appropriate to keep the old widespread JAR's structure with JAR OPS 0 (Gen), 1 (Plane), 2 (Corporate), 3 (helicopter) and 4 (aerial work), completed by the modern Safety Management Systems concepts and also to create, as necessary, new ones concerning balloons and other aircrafts (such as UAV, sailplanes…).

A great deal of work needs to be done on the definitions linked to "commercial"

The proposed requirements must not prevent a member State from carrying out, apart from the SAFA programmes and methods, ground inspections of

foreign aircraft on its territory, as specified by the directive 2004/36 item 2 article 1.

The BR 216/2008 5 and 7 recitals allow the member States to deal directly with certain local based operations as local flights, this possibility must be used

The transition measures must be extensive and gradual in scope according to the areas concerned.

1 Structure:

- Here are some examples which show the difficulties in reading those proposals, for the industry as for the Authorities, and which demonstrate the need for a return to a more classical activity-based regulation.
- Equipment: paragraphs are very long, divided by aircraft types, even mixed with activities (airplane & helicopter vs carriage of parachutists), and too complicated to understand which kind of seat belt/harness is required: OPS.GEN.405 "Equipment for all aircraft", items (a) (3) and (a) (4), then OPS.GEN.400 "Seat belts and harnesses" which should contain previous items, but we have to reach the third line to understand that it's only applicable to commercial air transport.
- A lot of time is uselessly spent trying to understand where the relevant information is to be found, and what is applicable to whom.
- The Agency's holistic approach leads for the reader and the future user, to a far less holistic vision of the applicable rules.
- In spite of the Agency's promise (§24 NPA 2009-02a Explanatory Note) to conserve the whole EU-OPS & JAR-OPS 3 dispositions', many differences crop up throughout the proposition, which leads the reader to doubt the rest of the dispositions, and these differences require a careful analysis, which has not been successfully completed yet because of the lack of time.
    - For example: the disappearance of the "commander" (we need to know who is legally responsible on board, during a flight), and the emergence of the "pilot in command" (PIC); moreover, the PIC can delegate only to another PIC, including above the FL 200, which was not the case in the EU-OPS. This new curtailment appears in AMC, which is somewhat out of place/..

All of this leads to, a very partial study of the dispositions, and the necessity to convert this NPA into an A-NPA. The Agency, after studying the comments/ , shall publish a complete NPA which should encompass the 3 NPAs 2008-17, 2008-22, 2009-02.

2 Definitions:

Serious work must be undertaken on the definitions:

(a) The substance:

CAT: a definition is needed consistent with other European rules. On the one

hand, the NPA 2009-02 (point 53, pages 34/123) refers for CAT to the ICAO's annex 6 definition of "commercial air transport operation" which is not consistent with the "commercial operation" definition contained in the basic regulation article 3)i). On the other hand, the EC 1008/2008, chapter II, article 3)3) b) excludes local flights from the obligation to hold an operating license. We propose to define the "commercial air transport" concept by using the BR's (article 3i)) definition of "commercial" and the concept of "air transport" as transportation from A to B, with A different from B, as the EC 1008/2008 suggests.

AMC/CS: Following the Agency's seminar organized on June 23rd, and the large number of explanations asked for, it seems to be necessary to introduce those definitions in the AR.

"Organization": this term shall be defined. Is it an organism or simply the fact of being organized?

(b) The form:

There is a discrepancy with other European Rules (cf previous), which could lead to a legal uncertainty.

Lack of definition: in this case, either we take the ICAO's definitions or we propose one. For example, "flight crew is defined nowhere, whereas "cabin crew" is only defined in Part CC and *"for the purpose of this part"*; so, we do not know which definition should be taken into account for Part OPS. Finally, we have no definition of the *"technical cabin crew"*.

We have found definitions at many different regulation levels, sometimes in IR, AMC, or GM. For example: the list of definitions begins in the IR section, and suddenly ends, to be continued in the GM section.

Sometimes, a definition is given in the AMC section whereas it is used in IRs.

Generally speaking, definitions should be gathered in only one IR "Part Definition" (except, if it were used in a single paragraph). This way, definitions can be used in other parts, allowing for more homogeneity.

3 Security

Some dispositions proposed by the EASA do not seem to be compliant with other Community Regulations already in force about security. The Agency should verify compliance.

4 Part CC (IR personnel annex V) and Medical CC (IR personnel annex II)

We would like to give full support to the Agency's proposition on both CC's certification and medical requirements.

5 Ramp inspections (IR AR section IV)

The exact scope concerning "ramp inspection" should be clarified.

We understand that the dispositions introduced for ramp inspections are taken in application of the article 10.2 of BR 216/2008 which says that a Member State must, on his territory, conduct ramp inspections on aircraft the general supervision of which he doesn't have the responsibility of, and that these inspections must be conducted by following agency-specified

methods, and this would therefore replace the scope of directive 2004/36.

We haven't found any basic regulatory specification in BR 216/2008 to justify the application of Community methods to ramp inspections conducted by a Member State on aircrafts used by operators that it oversees. All references to inspections on all but foreign aircraft must be removed from the agency's proposition in terms of Ramp Inspections.

In addition, the proposed dispositions must not prevent a Member State from conducting, without following the SAFA program (and its methods), ramp inspections of foreign aircraft, as described in paragraph 2 of article 1 of directive 2004/36.

6. Flexibility (use of paragraphs 8.2 and 8.3 of BR216) and subsidiarity

Articles 8.2 and 8.3 make provision for certification of commercial operations and declaration of non commercial operations of complex aircraft "unless otherwise determined in the implementing rules". EASA hasn't made use of this possibility in its propositions whereas we see at least two points where such dispositions could have been made use of.

(a) Fractional ownership and Shared ownership: these two concepts should be better defined. We understand that the agency's propositions do not make provision for a control of air operations conducted under these concepts (except declaration in the case of complex aircraft). We wish that specific dispositions be made.

Regarding fractional ownership, CEAC recommended, a few years ago, that the future European regulation take its inspiration from the American Part 91-K, that imposes conditions on the number of aircraft in the fleet and on the owners, and organises contractual dispositions between the administrator and the co-owners, and between the different co-owners.

(b) Aerial work: as a first step, it seems reasonable to certify only those aerial work activities that are considered as generating the most risk (everything that involves low altitudes: crop-spraying, line surveillance), the rest could be subjected only to a declaration.

(c) Furthermore, certain activities that are restricted to a very small geographical area, should remain in the domain of subsidiarity, taking into account the absence of any competitive aspect and technical requirements linked to a European recognition need.: such as local flights (from A to A, with both time and range limited), and initiation flights. This proposition follows the BR 216/2008's recital n°5, which was initially drawn up to introduce annex 2.

7 FTL

We have found only 4 of the 5 points specified in the article 8.4 of the CR 3922/91 (OPS 1.1105 point 6, OPS 1.1110 points 1.3 and 1.4.1, OPS 1.1115, and OPS 1.1125 point 2.1); the "reduced rest arrangement" is missing.

From our point of view, it seems clear that both the numeric values and the five points specified in article 8.4 should be in the IRs' section. CSs should allow the application of those 5 points. The Agency itself reminds, in the NPA 2009-02-a, that the sub-part Q's substantive provisions shall be included in

IR, according to article 22. Moreover, as specified in the NPA 2009-02-a, page 51 paragraph 41, numeric values are considered as "substantive provisions".

Last but not least, we wish, according to the Agency's statements, national provisions, implemented in compliance with article 8.4, to be taken into account and acceptable for further regulation.

8 Transition measures

The propositions contained in the NPA 2009-02 modify requirements significantly concerning certain kinds of stakeholders; which is the case for aerial work (COM non CAT), that are today, in most member states, under a declarative system (which is changing for a certified system).

Those operators are either badly or insufficiently organised and represented and they are faced with numerous problems to read and comment on those texts (not translated into French). Under those conditions, measures to facilitate an acceptable transition must be scheduled (by giving time and the appropriate means to understanding).

According to the BR 216/2008, the IR must be published before April 2012, but the actual putting into practice may occur later

Taking into account:

- The new rules' structure
- Modifications in existing regulations (EU-OPS/JAR OPS 3)
- A wider scope
- The crisis that airlines are facing

The adopted transition measures should be as long as possible and scheduled depending on the areas. We consider that the requirements for the non commercial air transport activities (areas generally not so strongly regulated), should be delayed.

A two-year period after the 8th April 2012 seems reasonable before applying the requirements concerning commercial air transport, and it is our considered opinion that a schedule should be drawn up on an individual basis for all the other activities.

9. Code share

The IR-OPS toughen the conditions by which European airlines will be able to conclude code share agreements with non-European airlines because the candidate must prove (by initial and regular in situ audits) to its Authority that the airline approached for the code share agreement observes the ER (the foreign airline will furthermore have to be TCO authorized) and certain dispositions of IR OPS. The medical fitness required of cabin crew could for example prevent the agreement.

French airlines are worried about the possible repercussions of these propositions on code share agreements that are already in force.

While we understand the legitimate concern that leads to clarifying the conditions associated with code sharing, we consider it not appropriate to

prevent such operations with a major airline that is supervised by a country that is recognized in terms of safety, on the ground that the non-European country does not conform to such and such disposition of IR OPS.

10. Work priority

If the process cannot be finished within the given time, France proposes that the following domains be treated in the following order from highest to lowest priority:

1. CAT airplane and CAT helicopter
2. Corporate aviation: complex aircraft and fractional ownership
3. other types of aerial work (airplane & helicopter)
4. all other domains

comment *6520* comment by: *BMVBS (MoT Germany)*

The Federal Republic of Germany cannot accept the text of the entire NPA 02-2009 as proposed. The text does not fulfil the requirements set out by the Regulation No. (EC) No 216/2008 of the European Parliament and of the Council of 20 February 2008.

First Reason: Endangering a high uniform level of civil aviation safety in Europe

In Article 1 of this Basic Regulation it is stated:

"1. The principal objective of this Regulation is to establish and maintain a high uniform level of civil aviation safety in Europe."

The Agency proposed in its draft an approach of so called "performance-based rulemaking" in order to provide a higher level of flexibility to fulfill the technical requirements of the implementing rules and to incorporate technical innovations more easily. While Germany supports the objective of this approach we have strong concerns that the way it is implemented will have negative consequences on the level-of-safety of European aviation.

The Agency proposes to express safety objectives by means of indefinite terms at the level of binding implementing rules. These indefinite legal terms are substantiated by "Acceptable Means of Compliance" (AMC) which are not legally binding. According to German administrative law, the NAA can only enforce binding law. The Agency or the NAA can publish AMCs and require the applicants to fulfill them as prerequisite e. g. for a certificate. If the applicant does not fulfill the requirements of the AMC the NAA would not issue the certificate. If the applicant does not accept the decision of the NAA he or she might go to court. In this case, the judge of the administrative court will decide whether the requirements set out by the written and binding law are fulfilled by the applicant or not. If the binding law contains indefinite legal terms the judge has a high level of freedom for his or her decision.

The consequence might be that a level-of-safety which is lower than that incorporated within the AMC is acceptable to the court. Moreover, courts of

different member states might come to different decisions. The result would be a level-of-safety which might be lower than today and which is certainly not uniformly applied. Therefore, the drafts of the NPA do not conform to the Basic Regulation.

In order to establish and maintain a high uniform level of civil aviation safety across Europe it is necessary to provide clear and unambiguous rules which conform to the standards of legal certainty. If a higher level of flexibility for the means to fulfill the binding law is desired the concept of performance-based rulemaking as proposed by ICAO might be used. In order not to compromise the level-of-safety, it is essential that performance objectives within the rules are clearly determined by either quantitative or qualitative terms. An indefinite legal term is too generic and is certainly not appropriate for this purpose.

The approach of performance-based rulemaking should be applied with care since even ICAO has identified risks for the conversion of prescriptive rules into performance-based ones. Except for the State Safety Program and the Safety Management Systems concept ICAO has not yet incorporated the performance-based approach into the standards. Therefore, Europe would be one of the pioneers when establishing of performance-based rules and must ensure that the States can still fulfill their obligation to comply with ICAO standards.

Second Reason: Unnecessary Deviation from EU-OPS

In Article 8 Paragraph 4 and 6 as well as in Article 22 Paragraph 2 (a) it is clearly stated that at least for the application area of commercial transport in aeroplanes the implementing measures of the Commission shall initially be based on the common technical requirements and administrative procedures specified in Annex III (EU-OPS) to Regulation (EEC) No 3922/91.

The new structure of the proposed rule text does not, by status and content, mirror the current operational rules, i.e. in EU-OPS and JAR-OPS 3. In case of an enforcement of the proposed rule, AMC and guidance material, the industry as well as NAAs would need to change well established checking survey plans, procedures, manuals and records. We do not see any justification for introducing a new rule structure, especially with the view of enhancing safety. In so far, the RIA to the NPA does not really justify the step taken by EASA to entirely change the structure of future European requirements. It is not understandable why EASA did not consider these inputs, as similar objections were raised by other NAA's as well as by industry's representatives. Initially, EASA argued with legal implications a duplication of rules (such as in OPS 1 and 3) would impose. Hence, so EASA, i.e. only one requirement for an AOC can be enforced, leading to a disruption of the well established EU-OPS/JAR-OPS 1 and 3 requirements. The same applies to the proposed licensing requirements. Legal experts throughout Europe very much questioned the legal position expressed by EASA, and meanwhile, it is very clear that similar requirements in different EU – Regulations are acceptable and, in fact, existent. For example, almost identical Authority requirements apply for EU Regulations 1702/2003 and 2042/2003.

Germany, therefore, proposes not to implement the proposed rule structure for OPS, but to develop dedicated requirements for every single air

operations application, such as JAR-OPS 1, 3 and draft JAR-OPS 2 and 4. We have to accept duplications in order to provide a separate book for each separate application. So, we also have to accept that in case of the need for changing similar requirements by an NPA, it is the task of EASA to steer the associated rule making work as well as to maintain and update the material as required.

Moreover, there is neither the obligation nor the mandate for EASA within the Basic Regulation to promulgate higher requirements for cabin crew attestations or flight time limitation rules than the ones which are already included in EU-OPS.

The way forward:

The quality of a regulatory amendment is highly dependent on the level of maturity of the draft as published for consultation. Ideally, the consultation process should help the Agency to perform mainly a fine tuning to optimize the final rule. The Notice of Proposed Amendment (NPA) No. 2009-02, however, is far from mature. It contains major conceptual mistakes. In consultation with the German aviation industry it has been assessed that the introduction of the proposed amendment would not only undermine aviation safety due to unclear or incomplete requirements, it would also erode the competitiveness of the European aviation industry at large.

The situation is considered extremely startling and the German government is increasingly concerned about these developments. We do not consider the proposed amendment suitable to support a process that would converge towards a consensus in the Committee phase of the regulatory procedure with scrutiny, and therefore would strongly advice EASA to re-consider the NPA as an "advanced" NPA that would be followed by a second round of consultation once a consensus on the conceptual approach has been reached. It is already clear at this stage, that this NPA will have to undergo substantial modification to an extent that would require a second round of consultation, if the principle of "better regulation" was to be respected.

In our view the proposed amendment not only fails to achieve the objective to base the implementing rules as much as possible on existing JAA material, it also fails to safeguard the highly important regulatory continuity, thereby creating incalculable risks for affected stakeholders potentially jeopardizing their very existence.

Against this background the Agency would be well advised to apply a sound change management strategy keeping the risks induced by the regulatory changes for the European aviation industry in mind.

Due to the extent and complexity of this rulemaking proposal the deadline of 31st July 2009 was still insufficient to coordinate a complete response by the German MOT. The German Ministry of Transport therefore generally endorses and supports the comments brought forward by the Luftfahrt-Bundesamt and German aviation stakeholders whose comments could not be collated and reproduced in due time.

comment *6533* comment by: *European Gliding Union (EGU)*

General Comment

Situation:

According to Article 3 (i) of the Basic Regulation "'commercial operation' shall mean any operation of an aircraft, in return for remuneration or other valuable consideration, which is available to the public or, when not made available to the public, which is performed under a contract between an operator and a customer, where the latter has no control over the operator."

In earlier comments in regards to Pilot Licensing and Authority Requirements we have mentioned that operations were the remuneration is limited to cost sharing should not be considered as commercial operations. In case this can not be distinguished some of the defined regulations are not appropriate for operations with non complex aircraft e.g. gliders, touring motor gliders or non complex airplanes.

Rationale

Clubs in Germany have to interact to a large extent with the communities where they operate and offer passenger rides. This is necessary for the acceptance and integration of the clubs and their airports by the public. The clubs are unable to offer passenger rides for free but must ask for cost sharing. This must not lead to the situation that all proposed regulations for commercial operations have to be followed. Either these passenger rides can be conducted as non commercial flights or less extensive regulations should apply.

Our proposal

Either state that Article 3 (i) of the basic regulation does not apply to cases where only costs are shared or compensated and there is no intention to make profit or introduce a class of commercial operations on non complex aircraft and define appropriate regulations for this class.

6549 comment by: *EPFU is the European Union of national powered flying organisation from the 10 main European countries*

European Powered Flying Union, or EPFU, is an European Organisation grouping National powered flying organisation of ten European countries :

Austria, Denmark, Finland, France, Germany, Norway, Luxembourg, United-Kingdom, Sweden and Switzerland.

EPFU acts at all European level to promote and defend the powered flying as a private sports and recreational flying activity. As a consequence, EPFU is involved in non complex aeroplanes operations and private flights.

EPFU comments are written in order to support general topics and principles agreed by its members, leaving them to comment directly to EASA their own detailed opinions and comments.

comment

6584 comment by: *FNAM (Fédération Nationale de l'Aviation*

Marchande)

The NPA 2009-02 introduces many changes in comparison with EU-OPS that are not justified regarding safety.

The comments hereafter SHALL BE considered as :

·A identification of some of the major issues FNAM asks EASA to discuss with third-parties before any publication of the proposed regulation, consistently with, and prior to, the above common and constructive approach In consequence, the comments hereafter SHALL NOT BE considered : As a recognition of the third-parties consultation process carried out by EASA · As an acceptance or an acknowledgement of the proposed regulation, as a whole or of any part of it · As complete : the fact some articles refer to not yet-published (or even not yet-established) pieces of regulation or are not self-consistent prevented FNAM to understand and comment them · As exhaustive : the fact some articles (or any part of them) are not commented does not mean FNAM has (or may have) comments about them, neither FNAM accepts or acknowledges them All the following comments are thus limited to our understanding of the effectively published proposed regulation, not withstanding their consistency with any other pieces of regulation, including with the Basic Regulation 216/2008, giving mandate from the Commission and Parliament to EASA.

comment *6585* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Small organizations should know how and in which way they will benefit of less complicated requirements. This must be more explicit and a part should be dedicated to this type of operators as when reading the whole legislation, it is really confusing to understand what they are expected to do.

comment *6587* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Publishing Part TCO (Third Country Operators) after the end of the consultation period of NPA 2009-02 (Part-OPS) does not allow stakeholders to fully comment this NPA. This implies that comments induced by this new publication may interfere with comments from NPA 2009-02 (part OPS). As a result , EASA should make a commitment to stakeholders to keep on taking into account OPS comments during the period of consultation of PArt-TCO as there are many interconnections between those legislations.

comment *6693* comment by: *Icelandair*

Comment:

NPA 2009-02B is a major departure from EU-OPS both in content/concepts and structure. Those major changes cannot be justified on safety grounds

and would lead to unjustified costs and additional complexity for the airline industry. The confusing structure and unclear drafting of this NPA will not provide legal certainty.

We note that this NPA is also not in line with the mandate which was given to EASA by the EU legislator which clearly referred to the need for EASA rules to build on EU-OPS and the JAA heritage. In this context, the AEA would like to make reference to the clear concerns expressed by the European Commission and EASA Member States at the June 2009 EASA management board meeting. The AEA therefore urges EASA to stick to its safety role and the clear instructions from its Management Board that this NPA should be withdrawn and realigned with EU-OPS.

Proposal:

Relalign the NPA with EU-OPS

comment *6694* comment by: *Icelandair*

Comment:

The various EASA NPAs (NPA 2008-17, NPA 2008-22, NPA 2009-1, NPA 2009-2 and the NPA TCO) are all closely linked. The fact that they are not open for consultation in one NPA package leads to the fact that some elements of this NPA cannot yet be fully commented (due to missing elements) and that some additional comments might have to be provided after the closure of the NPA comment deadline.

Proposal:

Have a second round of consultation once all elements are available

Comment:

The whole NPA package is more than 3000 pages to be checked in detail within a very limited time-frame. For that reasons, the submitted AEA comments to this NPA should be considered as the major concerns from AEA to this NPA but additional comments/concerns might be identified after the closure of the NPA comment deadline.

Proposal:

EASA should take on-board all AEA concerns to these NPAs even when they have been identified after the closure of the NPA comment deadline. For commercial air transport we already have EU-OPS as a safe and practical regulation available. Therefore there is no justification to completely redraft the rules as suggested by EASA through this NPA and there is no matter of urgency.

comment *6796* comment by: *EFLEVA*

General Comment

The EFLEVA points out that a number of the rules included in this proposal

could not be met by some older types of aircraft. Many of these types are presently Annex II, but may be moved out of Annex II to come under EASA control at a later date.

e.g.

OPS.GEN.205c), "Fuel reserves" 30 minutes reserve would restrict some of these types to local flights only.

OPS.GEN.405a)1), "Carriage of Fire Extinguishers". Not of much use in an open cockpit. Additional weight of onboard equipment.

OPS.GE.430, "carriage of ELTs", Additional weight.

OPS.GEN.455, "First Aid Kits". Further added weight.

comment *6815* comment by: *DCAA*

Draft Opinion and Decision Part - OPS

It is our oplnion that Part OPS shall be a complete mirror of EU-OPS and JAR OPS.

Denmark cannot support the NPA in the actual version.

comment *7047* comment by: *British Airways Flight Operations*

British Airways Flight Operations department has been actively involved with the industry working groups which have been assessing NPA 2009-02, both within the United Kingdom and internationally. In general, our opinions about the material presented in NPA 2009-02 agree wholeheartedly with those of the Association of European Airlines (AEA), which, we note, has submitted several hundred comments. We have also worked closely with the UK Civil Aviation Authority, which has also submitted several hundred comments.

We have decided to submit this general comment about NPA 2009-02 so that EASA will be aware, unambiguously, of British Airways' concerns about the material presented in the NPA. It is our opinion that NPA 2009-02 in its entirety is unfit for the purpose for which it is intended and must be withdrawn and reconsidered. The reasons for this conclusion will be discussed below. As well as making this general comment, British Airways has also submitted many individual comments about the NPA, from a number of different sources within the company; however, all should be seen in the light of this opinion: **that NPA 2009-02 in its entirety is unfit for the purpose for which it is intended and must be withdrawn and reconsidered.** In making other comments British Airways does not seek to endorse NPA 2009-02, but rather to limit the damage which would be done to the industry if the material was adopted into implementing rules.

As the Chairman of the EASA Management Board is on record as saying: the Agency has set out to produce idealistic, holistic perfection; regrettably, it has failed in that task. British Airways' first concern is with the structure of

the rule material presented. It is undeniably the case that safety proceeds from simplicity, not complexity. Therefore, for EASA to choose to move from a clear and unambiguous set of rules – published in one or two volumes (EU Ops / JAR Ops 1) – to a complicated and diverse set in many volumes causes us great concern. Furthermore, we note it was specifically the Agency's own decision to create a rule set based on the GERT: NPA 2009-02A makes it clear that neither the SSCC nor the AGNA endorsed that decision. We are also aware from conversations with some of the Agency's Rulemaking Officers that they were specifically instructed to use a different rules structure from that which had gone before "because EASA had to be different." We think such a policy decision - essentially to try to destroy the JAA heritage - by senior personnel from the Rulemaking Directorate (both those formerly employed and those still employed by the Agency) constitutes a serious error of judgment. We believe rules for commercial air transport should be published altogether in one volume, and not mixed with rule material for other types of aviation operations.

Another consequence of the Agency's desire to have one set of rules covering all types of operations is the combination of rule material for aeroplane operations and helicopter operations in the published NPA. Having had experience of the JAA rulemaking processes for Sub Parts D and E, we are aware that helicopter operations were never considered in the development of JAR Ops 1 material, and neither should they have been, by definition. Therefore, to propose rule material which is applicable to both types of operation in one document constitutes a serious mistake, which could give rise to what is called colloquially in English 'the law of unintended consequences'; in this case unintended, adverse, safety consequences. We are aware that one of the arguments the Agency has advanced for putting all rules in one place is the need for legal certainty in rulemaking. We are also aware that the Agency believes the same type of activity should not be regulated in more than one place. However, we believe those arguments are flawed: if rules were to be published separately for 'helicopters' and 'aeroplanes' they would be mutually exclusive and unambiguous, even if they contained similar material.

Many comments will doubtless be received by the Agency expressing disquiet that the material in NPA 2009-02 has departed greatly from EU Ops. We are very concerned that the Agency appears to have forgotten its mission – to promote SAFETY – and strayed into areas of social policy. Much new material has been introduced with no safety justification and with little, if any, meaningful regulatory impact assessment.

Leaving aside the concerns expressed above, much of the material proposed in NPA 2009-02 seems ill thought out and lacking in maturity. We are aware that the Agency has expressed concerns to the European Commission about its resourcing for the rulemaking tasks associated with the extension of scope to Air Operations. Of course, if EASA is really short of resources, it would have made much more sense for the Agency to base its rulemaking on the existing EU Ops material rather than branching off in new directions. We are aware this latter opinion is shared by the European Commission. Furthermore, we would have expected rule material to be presented in a mature form; instead, we see rule proposals which seem like early drafts rather than finished material. It seems ungracious to say "we told you so"; however, the Agency will be aware that the AEA in particular expressed

concern about the scope of the work required of the Agency versus the amount of time and resource available to it, and suggested the establishment of stakeholder working groups to help with the rulemaking tasks. Of course, those suggestions were firmly declined.

Throughout the rulemaking processes which lead to the publication of NPA 2009-02 *et al* various bodies have been engaged with EASA to offer help with its task and, latterly, to express concerns about the direction in which the rulemaking was proceeding. In particular, the AEA has been very proactive in discussing its thoughts and concerns with the Agency. Furthermore, we know the Agency's Executive Director has recently visited the CEOs of several major European operators to discuss issues of concern. Therefore, the Agency should be under no illusions that there is major dissatisfaction among the operators with the direction in which the rulemaking task has proceeded (although we are concerned that some people within the Agency still do not seem to have acknowledged or accepted that fact). Overall however, the Agency has resolutely refused to engage with the operators; has refused to acknowledge that its rulemaking proposals might be flawed; and has failed to understand its responsibilities to the organisations for which it is creating regulations. This lack of accountability is a major cause for concern.

Lastly, we are very concerned that we are being expected to comment on a large amount of new material, to tight timescales, but without all the relevant material having been published. Since EASA has produced a large amount of interdependent material, it is unacceptable for us to be expected to assess that material without all of it being available. The quality of the comments which the Agency receives will undoubtedly be adversely affected thereby, because interested parties are not in possession of all the relevant information.

Therefore, to summarise British Airways' position. We are greatly concerned with the material presented in NPA 2009-02 because:

- It is presented in many volumes in a way which makes it difficult to understand.
- It mixes material for helicopters and aeroplanes in the same document.
- It departs greatly from EU Ops and introduces new material with no safety justification.
- It is ill thought-out and not mature.
- It demonstrates a lack of accountability to operators by the Agency.
- It relies on unpublished material.

In isolation, any of these issues would give us significant cause for concern. Taken together, they lead us to conclude, unreservedly, **that NPA 2009-02 in its entirety is unfit for the purpose for which it is intended and must be withdrawn and reconsidered.** All of the comments which will be entered by British Airways Flight Operations will be suffixed to that effect.

comment *7097* comment by: *Embraer - Indústria Brasileira de Aeronáutica - S.A.*

There are references to OPS.CAT.435, OPS.CAT.435 - Table 1, OPS.CAT.435 - Table 2, and AMC OPS.CAT.435(c)(3) in the EU/JAR-OPS/EASA references in NPA 2009-02f, but these items are missing in NPA 2009-02b

comment *7148* comment by: *Fédération Française Aéronautique*

The "Fédération Française Aéronautique", FFA, represents some 600 powered flying aero-clubs or associations in France and 45,000 private pilots. Almost all those aero-clubs offer flight training to their members up to VFR SEP PPL(A). The FFA is the national largest powered flying federation within the European Community.

comment *7194* comment by: *AIR FRANCE*

Comment :

This NPA contains several changes in term of structure, new concepts and content in comparison with the EU OPS which leads to additional complexity. The various NPAs (2008-17, 2008-22, 2009-01, 2009-02 and the NPA TCO) which are all closely linked have been open for consultation at different dates which make the reading difficult as some elements were missing. It means that additional comments may be provided after the closure of the NPA comment period. Moreover the size of these NPAs (more than 3000 pages) and the limited period of time left for reviewing this material make it impossible to review everything into details. Therefore the comments provided cannot be comprehensive.

The proposed structure which mix type of aircraft and type of operations add a lot of complexity and leads also to difficulties of understanding.

Proposal :

Consider a second consultation of the whole package following this consultation

comment *7219* comment by: *Peter Moeller*

As the people who have to comment and later on transfer the regulation into real live are also busy in daily business the commenting period for such a huge set of rules seems to be too short.

Wording is often vague and very complicate. It will open doors for future interpretations among the NAA and the operators

Training for HEMS, HMS HHO must be possible with same alleviations that are applicable to the operation.

comment

7255 comment by: *EPFU is the European Union of national powered flying organisation from the 10 main European countries*

EPFU is of the opinion that some equipments must be required only if they are necessary in the airspace to be used.

So EPFU is of the opinion that it must be possible in some areas, as uncontrolled airspace, to fly without useless equipments (for example, radio communication or transponder, etc.). It must be up to the operator to decide the use of its aeroplane and to install equipments needed for that use.

comment

7344 comment by: *K Franzen*

The overall structure of the proposed operational regulation is too complicated for private operation of non-complex aircraft.

comment

7377 comment by: *A. Mertz*

Definition von "commercial operation"

Die Einstufung von Flügen, die von nicht kommerziellen Organisationen oder Privatpersonen durchgeführt werden, und für eine Vergütung ausschließlich zur Kostendeckung /Kostenteilung anfällt, als "commercial operation" einzustufen, ist nicht angebracht und widerspricht der Zielstellung der EU, den Luftsport zu fördern.

Besonders schädlich wäre diese Einstufung bei Flügen zum Schleppen von Segelflugzeugen und bei Passagierflügen in Flugzeugen mit nicht mehr als 4 Sitzplätzen, wie sie von den Flugsportvereinen zur Nachwuchswerbung durchgeführt werden.

comment

7413 comment by: *David ROBERTS*

These comments are in a personal capacity, though the reviewers will know my role as President of Europe Air Sports, Chairman of the Royal Aero Club of the UK and immediate-past 1st Vice President of the European Gliding Union, and past Chairman of the British Gliding Assocation.

I have focused primarily on issues in these proposed IRs for gliding and power flying, leaving to other specialists in ballooning and helicopter operations to comment. I would however draw your attention to the submission by the Helicopter Club of GB and the associated submission from the European Private Helicopter Alliance. Their concerns are serious; the costs implications enormous, and must be taken on board by EASA if that sector of private aviation is not to be crippled by some of the proposed rules.

Obviously I support the comments made by Europe Air Sports, the European Gliding Union and the British Gliding Association (these being the response

documents I have seen at a late draft stage).

I have focused on a few issues. Some of my comments refer to matters on which I made strong representations during the drafting stages, through the MDM.032 working group. It is disappointing to see that some of those draft rules are still in the texts, despite my clear exposition of why they would be inappropriate or impractical (e.g. carriage of documents, especially flight manuals, in sailplanes)

It is essential that when these comments (and the many others that no doubt EASA will receive from the S&RA sector) are reviewed, that they are screened against the criteria laid down by the Parliament when endorsing the Commission's paper on a Sustainable Future for General and Business Aviation. Such criteria as 'proportionality' and 'cost' in particular. The danger with the EASA approach of using a single template for all forms of civil aviation, from CAT to S&RA - something that EASA was 'warned against a long time ago - is patently obvious when reading the proposed OPS rules.

EASA should take on board the constructive criticms from many quarters over the last few years, and now determine to produce rules that meet the critaria referred to above, work more closely with the relevant 'industry' sectors in a partnership mode, and aim to 'get it right first time'. Any failure to do this will lead to considerable annoyance by 'industry' with EASA. That is not the basis of a healthy and respectful relationship between the regulator and regulated.

comment *7417* comment by: *European Sailplane Manufacturers*

The European sailplane manufacturers have two fundamental obervations regarding all of NPA 2009-02.

1) Adding more and more layers of regulation will not improve safety levels in non-commercial aviation like recreational and sporting aviation.

Here motivation would be a much better tool than regulation and punishment.

For a more elaborate comment about this observation see our comment No. 7418.

2) Using the same approach of regulation and actually identical rules for commercial air transport and small aviation is disproportionate ad will impose unneccessary burden upon small aviation.

Main reason is that ICAO regulation was never intentend for small aviation conducted locally with small aircraft on a non-commercial basis.

Application of such ICAO regulation into this context makes no sense.

More about this observation in our comment No. 7431.

For these reasons the European sailplane manufacturers oppose the principal method of application of such complicated community law into such a diverse community as small aviation.

Furthermore special proposed regulations are not practically within the

gliding context and this is commented accordingly in the regarding parts of this NPA.

comment *7418* comment by: *European Sailplane Manufacturers*

The European sailplane manufacturers do not agree with the RIA in regard to sailplanes.

Adding additional layers of regulation will not improve flight safety or lower accident rates.

Contrary to commercially driven variants of aviation the only really sustainable effect to get improvement in recreational aviation is by motivation and not by punishment.

Quite contrary adding new regulation will demotivate the most important people like the flight instructors, club presidents and other persons instrumental for looking after safety issues.

If the effort and money spent for regarding rulemaking and law enforcement actions would be spent into efforts to inform about safety aspects and to create incentives to promote safety this would have a much better impact than any type of new regulation.

As long as only the options "do nothing" and "regulate more" are compared always the "do nothing" variant will not be favoured.

(Because who wants to be accused of doing nothing?)

Therefore a "promote something" option should be added.

Forseeing all the money, efforts, frustration and uselessness in creating more and more regulations the manufacturers cannot agree with this RIA and the proposed regulations in the OPS NPA 2009-02.

If the European Community, the European Commission and the EASA are really interested to promote small aviation including gliding in order to give aviation a better position they should decide to asist by adding incentives and not to to hinder by adding regulation.

If EASA claims that it can only add new regulation then it should be considered either to give EASA the option also to offer incentives or to give the job to another type of organisation.

comment *7431* comment by: *European Sailplane Manufacturers*

(i)

Reference GM OPS.GEN.400(b)

The European sailplane manufacturers share the views of the Helicopter Club of Great Britain regarding application of the proposed regulation upon small aviation – in our case application to gliding.

Therefore the comment of HCGB was modified accordingly and now fully

reflects our opinion:

Our following objections are primarily based on the fact that the proposals do not distinguish enough between private flying (i.e. recreational and sport aviation) and commercially motivated operations.

Private, non-commercial operations should be regulated with a lighter touch than CAT. Consequently we consider that some of the EASA proposals are unnecessary, disproportionate, burdensome and costly and have no basis in accident history. There is no safety case for them.

The proposals referred to in our following comments to the consultation would severely and detrimentally affect the majority European sailplane owners and pilots, for no perceptible benefit. Matters that EASA should consider are:

The proportionality of the proposals as regards sailplane use

The lack of legal necessity of ICAO compliance

The unreasonableness of ICAO standards as applied to private operations.

The safety benefit of the proposals, if any

The practicality of the equipment which is proposed to become mandatory

The cost of the equipment which is proposed to become mandatory

The need as perceived by a substantial majority of glider pilots

The arbitrary and discriminatory nature of parts of the NPA as applied to sailplanes

(ii)

Proportionality

European Parliament resolution of 3 February 2009 on an Agenda for Sustainable Future in General and Business Aviation (2008/2134(INI)

Proportionate regulation and subsidiarity

2. Stresses the need to take into account the interests and specificities of general and business aviation in the development of future air transport policy initiatives, with a view to strengthening its competitiveness; in this respect calls on the Commission to ensure the application of the proportionality and subsidiarity principles in the design and implementation of both existing and future aviation legislation;

3. Reminds the Commission of the need to carry out, on a systematic basis, segmented impact assessments to provide for differentiation of regulations affecting different categories of undertakings and airspace users, if necessary and in so far as this does not compromise safety;

4. Calls on the Commission when adopting implementing rules on aviation safety, to ensure that they are proportionate and commensurate to the complexity of the respective category of aircraft and operation;

32 Considers as essential the promotion of recreational and sport aviation, as well as of European aero clubs, which constitute an important source of professional skills for the entire aviation sector

33 Calls on the Commission to take account of the important role that this aviation sector plays and can continue to play in the development of vocational training for pilots.

(iii)

EU Commission statement

Brussels, 11.1.2007COM(2007) 869 final

3.3. "One size does not fit all" – the importance of proportionate regulation

31. Many General and Business aviation stakeholders have expressed concerns related to the proportionality of regulations affecting them.32. Diversification of General and Business aviation as well as high proportion of SMEs and not-for-profit organisations in this sector calls for special vigilance in proper application of proportionality and subsidiarity.

33. The basic EASA Regulation16 and Commission's proposal for its amendment are good examples of the new proportionate rulemaking approach. Only the essential requirements are applicable to all operators while more stringent standards are added subsequently, if justified on the basis of the relevant criteria. This approach should be used in future rulemaking initiatives like aerodrome safety or air traffic management.

34. The Commission will monitor the application of the principles of subsidiarity and proportionality, to ensure that not only the policy and rulemaking processes but also the actual interpretation and implementation of the Community law has due respect for these principles. This monitoring will cover also technical mandates given by the Commission to specialised agencies, such as Eurocontrol.

(iv)

The EU Parliament has also stated that:

'Any new requirements should not inhibit existing recreational flying activities' and 'Implementation of the proposals should not impose significant additional costs on domestic private flying'.

(v)

ICAO Compliance.

EASA perceives the need to comply fully with ICAO standards. However, Article 37 of the Chicago Convention states " Each contracting State undertakes to collaborate in securing the highest practicable degree of uniformity in regulations, standards and procedures...." and Article 38 of the Chicago Convention states "Any State which finds it impracticable to comply in all respects with any such international standard or procedure (.....) shall give immediate notification to the International Civil Aviation organisation of the differences between its own practice and that established by the international standard". The emphasis being what is practicable.

There is no suggestion that ICAO standards are in some way superior to current member state law, or safer. Actually any statistical accident data for gliding suggest that the safety in our type of aviation depends much more on geographical differences (e.g. mountainous regions) than the different

types of regulation existing in the different states.

Whilst ICAO Contracting States are obliged to notify differences to International Standards under Article 38 of the Convention, they are only invited to 'extend such notification to any differences from the Recommended Practices….when the notification of such differences is important for the safety of air navigation.

Thus the picture emerges that there is no necessity for total ICAO compliance. The actual safety case does not support the proposed equipment fit changes or other proposed regulations for gliding.

(vi)

The unreasonableness of ICAO standards as regards private helicopter operations.

Private non-commercial sailplane operations were certainly not though after when the ICAO standards and recommended practices were written, and ICAO make no provision for such operations to be more lightly regulated.

Whilst there is a clear and large distinction between the ICAO standards applicable to the public transport and non public transport operations of fixed wing aircraft, there is no such clear and large distinction for gliding.

This is clearly unreasonable and disproportionate. Proper, less stringent, provision for gliding has not been made in the ICAO standards. The ICAO standards used are simply not fitting, and do not take into account present day sailplane operational safety and reliability.

(vii)

The safety benefit of the proposals (if any)

EASA does not suggest anywhere in the consultation letter that the safety of the current gliding regulations is in any way deficient. Indeed there is a complete lack of proven statistical useful data (e.g. accident data based on the number of aircraft or number of take-offs or flight hours.

Examples from different gliding communities within Europe point into the direction that not increased regulatory effort but better information coupled with incentives for safe operations would be of much higher value.

The proposed more stringent rules will in the contrary lead towards less motivated people like flight instructors or other decision makers in the gliding community thereby actually being detrimental for the safety case.

Additionally also motivation for the pilots will be affected leading possibly to less flying and thereby lowering the training status also clearly a detrimental effect.

(viii)

The need as perceived by a substantial majority of helicopter pilots

There is no perceived need for these additional requirements as proposed

There is overwhelming opposition amongst the members of the gliding community within Europe to these proposals. Our typical member is a high achieving and intelligent person, well used to evaluating risk. Where there is no risk to third parties, they are content to make their own informed choices

regarding their own flight safety. They recognise that the proposals in NPA 2009 2b are not based on any safety case, and are not made in response to an existing problem.

The role of authorities should not be as being to protect the private pilot from himself. We trust EASA will follow this example.

(ix)

Summary

The European sailplane manufacturers strongly oppose the proposed regulations commented upon herein. It is simply grossly unreasonable to impose such a heavy burden of compliance when no safety case exists. We thus urge EASA to either withdraw these proposals entirely, or to amend them accordingly.

comment *7465* comment by: *ADAC Luftrettung GmbH*

Eine längere Kommentierungsphase ist dringend notwendig!!

Über 1000 Seiten mit zum Teil sehr schwer verständlichen und oftmals ungenauen Sprachgebrauch, und das nicht in der Muttersprache geschrieben, da braucht es mehr als die zur Verfügung gestellte Zeit.

Viele Zusammenhänge sind so komplex (z. B. Helicopter Operation without safe forced landing capability) , dass eine Kommentierung im vorgesehenen Umfang nicht ausreicht. Hier braucht es Arbeitsgruppen, die - besetzt mit Spezialisten aus allen Bereichen (nicht nur Offshore) - in erster Linie sichere aber auch praktible und wirtschaftliche Lösungen erarbeiten.

Ein wichtiger Punkt, der gemeinsam mit den anderen EHAC Mitgliedern erkannt wurde ist der, dass es möglich sein muss, das geforderte Training unter den gleichen Erleichterungen durchzuführen zu können, wie die jeweiligen Einsatzprofile (HEMS, HHO, NVIS etc.)

Es wäre von Vorteil, wenn in den zukünftigen Entwürfen (Hyper)Links zu den jeweiligen AMC, GM geschalten werden, um ein ständiges hin- und herblättern zu vermeiden! Die Studie der Vorschrift wäre dadurch wesentlich einfacher.

Ich möchte schon hier auf die Problematik der geforderten Leistungklassen in HEMS hinweisen. Auch mit den modernsten nach CAT A, CS 27/29 zugelassenen Hubschraubern ist nicht unter allen Umgebungsbedingungen PC 1,2 möglich. In Workshops zur Kommentierung der NPA 2009-02 wurde deutlich, dass es europaweit Probleme mit der Umsetzung dieser Leistungsklassen über das gesamte Einsatzspektrum von HEMS gibt (HEMS Operating Site, Hospital Landing Site). Diese Problematik wurde selbstverständlich in den jeweiligen Vorschriften kommentiert.

comment *7477* comment by: *Norwegian Air Sports Federation, Gliding Section*

The Gliding Section of the Norwegian Air Sports Federation supports the comments submitted by the European Gliding Union.

comment *7495* comment by: *D.Weatherhead ltd.*

We have owned and operated a Westland Gazelle helicopter G-CBGZ based in England for the past 8 years.

We have read the above documents and believe the proposals are unnecessary and will be expensive to install and operate, also that the proposals do not distinguish between private and commercial use.

We are members of the Helicopter Club of Great Britain and have read their comments, we wholeheartedly agree with their comments to you. Rather than writing all this out again in a very similar vein PLEASE ACCEPT D.WEATHERHEAD LTD'S INDEPENDENT BACKING to the Helicopter Club of Great Britain comments to you.

comment *7496* comment by: *Daryl Willcox*

I fully support all commenrts made by the Helicopter Club of Great Britain and add that these proposals are disproportionate and unecessary when applied to private helicopters.

I would go so far as to say that these proposals, if ther were to be implemented, would prevent many pilots from gaining relevant experience in over-water and night flying (as suitable aircraft would be very

scarce) and therefore the rules would have a potentially negative effect on safety overall.

comment *7512* comment by: *Christian Taylor*

I currently own a share in a light helicopter which has limited power. Firstly I would like to say that costs in owning a helicopter are already astronomic, without adding further unnecessary costs, for instance with all the proposed regulations regarding flights over water. How come EASA think that helicopters have to have all this extra regulation whereas fixed wing owners do not have to have such onerous rules? Why should we have to pay and the fixed wing owners don't? It's not even as if the fixed wing flights are any safer. Another concern with all this extra equipment is how do EASA expect my already ridiculously underpowered aircraft to cope with more sophistication and more weight? It would never leave the ground, let alone make it to another country! AND that's always assuming that there is room to fit all this extra gear in, there's certainly no room for a second attitude indicator, let alone a life raft, having a life raft flapping around in the cockpit is likely to cause an accident defeating the whole object.

Anyway it's nearly midnight here now and I want to get this in by the end of

the 31st July, so my point is to please note the problems and costs involved in running a light helicopter that's 35 years old, and at least change your paper so that private light aircraft like mine are allowed to continue flying as they are already. After all, this system has worked fine for years and years!

comment *7546* comment by: *AOPA UK*

A list of acronyms is very important for better understanding.

AOPA UK sees this ruling is directed towards organisations with flight departments and large resources to produce manuals. A small business will not have the same ability to follow this requirement.Article 8.3, Basic Regulation allows for some alleviations for non-commercial operators of complex aircraft. AOPA UK requires a consistent approach towards all non commercial operations.

comment *7637* comment by: *Bettina Schleidt*

I am private helicopter pilot and actually work towards my professional helicopter licence and have a PhD in psychology and engineering. This just for your information about my background and what kind of profession private helicopter pilots can have.

From my point of view flying helicopter on a private basis in Europe and especially in Germany is compared to e.g. the US a very expensive, complex and highly restricted affair. In addition to the strong reglementations private pilotes have to fullfill a lot of requierements and have to pass strong and very professionally oriented examinations on their way to become a private pilot. If I compare the effort I had with my private licence and compare it with what I learn in the professional helicopter training I don't see so many differences.

If now - on top - new regulations make our hobby helicopter flying even more expensive and complex this is from my point of view one more point that will lead to a reduction of private owned helicopters and private helicopter pilots. If this is the goal behind the NPA 2009-02b you are on the right way.

I recommend a revision that differentiates stronger between private and professional usage of helicopters and hereby protest against the NPA 2009-02b.

TITLE PAGE p. 1

comment *15* comment by: *George Knight*

Ambiguities

There are ambiguities in these regulations with respect to Powered Sailplanes. There are essentially three categories:

- Self-sustaining sailplanes (turbos) which are incapable of launching under their own power but which may sustain themselves for relatively short periods using a retractable engine or propeller. With the engine and/or propeller retracted they have the characteristics of sailplanes.
- Self Launching Sailplanes (SLMGs) that have retractable engines or propellers. They are able to take off under their own power and sustain themselves for relatively short periods. With the engine and/or propeller retracted they have the characteristics of sailplanes.
- Touring Motor Gliders that do not have retractable engines or propellers.

It is not clear from the proposed regulations which of the above should be treated as sailplanes and which should be treated as aeroplanes.

The regulations should make it clear throughout that self-sustaining and self-launching sailplanes (powered sailplanes) should be treated as if pure sailplanes and that TMGs should be treated as aeroplanes.

comment *16* comment by: *George Knight*

IMC and sailplanes

The definition of Visual flight includes the limitation that to remain in VMC the aircraft must, when above 3,000', remain 1,000' vertically and 1,500 metres horizontally from cloud with a flight visibility of 5 km up to 10,000' and 8 km above 10,000'.

The nature of soaring flight is that the best thermal, wave and frontal lift is often to be found in the vicinity of clouds. Forcing gliders to remain VFR as defined above at all times excludes them from those parts of the atmosphere where the best lift are to be expected for much of the time. A sailplane pilot should be permitted to fly less than 1,000' vertically from cloud and within 1.5 km horizontally, with a reduced flight visibility, as long as he remains clear of cloud – even if above 3,000 feet.

It is probably not within then scope of this NPA to consider if a sailplane **pilot** should be permitted to fly within 1,000' vertically of a cloud when above 3,000', but it does address the equipment to be fitted to a sailplane should pilot licensing rules permit a sailplane pilot to do so.

To require a sailplane or powered sailplane to be equipped for IFR as laid down in the rules proposed within this NPA are extreme and unjustified.

comment *1022* comment by: *British Gliding Association*

These comments are the view of the British Gliding Association.

EASA operational regulations, which will replace existing rules for commercial and complex aircraft, are not relevant to the sport of gliding within which appropriate, requirements have been uniformly developed through international bodies, for example the IGC and FAI. We know of no safety or operational case for the application of these implementing rules to gliding. The requirements are disproportional and will introduce an unacceptable layer of bureaucracy and increased costs. All comments within this response are made with this position in mind.

comment *1473* comment by: *John Henshall*

Overall, these proposals discriminate against GA helicopters. There are sensible relaxations for Aeroplanes used for GA flight which have not been applied to helicopters. They must also be applied to helicopters. Categorisation could be by way of weight - ie below 3,175kg.

The rules are disproportionate to the risk. Helicopters below 3,175kg not involved in commercial work should not be subject to such draconian measures, some of which they simply cannot comply with - floats on an R22, for example, are impossible. The cost of these ideas makes the "no significant cost" statement in the impact assessment nonsensical for GA aircraft. For my machine (which has fixed parts for floats, but not the bags) purchase and installation of flaot bags, ELT, raft etc is over Euro 60,000.

These proposals could add risk. Requiring an ELT for helicopter is not sensible as a single PLB would be of more benefit. Multiple ELT/PLB interfere (as shown in recent N Sea accident) so it is snsible for helicopters to carry a single item of equiment most likely to be of benefit in a real emergency - a PLB.

comment *2249* comment by: *Charles Barratt*

Floats cannot be fitted after.

How do I get my helicopter to France if I want to sell it.

What would it be worth??

I have not been trained to fly a helicopter fitted with floats.

How can the cost be justified when I do not fly over water that often

With all this equipment proposed to be fitted will I be able to take off??

comment *3405* comment by: *George Knight*

These operational regulations may be appropriate to replace existing rules for CAT and complex aircraft, but they are not relevant to the sport of

gliding and in most cases flight in simple single engined piston aircraft.

There are no operational or safety reasons to apply these disproportionate rules to gliding. They will increase cost and bureaucracy with no beneficial impact on safety whatsoever. These proposals discredit EASA which claims to be a Safety Agency.

The remaining responses are made within this context.

comment *3450* comment by: *Aero-Club of Switzerland*

The Aero-Club of Switzerland is of the opinion, that many elements of this NPA are well prepared, but also thinks, that some requirements proposed simply cannot be fulfilled for technical reasons, and that some increase the burden on the shoulders of its members by adding more bureaucracy to something that is intended to make fun.

We think the Agency wishes to create a perfect system, consequently costs will rise and, especially within clubs, less will be flown, to the detriment of safety.

Too strict regulations on gliding and on helicopter operations will in the end reduce glider flying on the one hand, reduce the number of available helicopters and of well trained helicopter pilots, simply because the Agency's proposals are, in our view, not well balanced and not based on operationally proven facts. We furthermore think, that it is not appropriate to propose the same rules for a light, a medium weight or a heavy helicopter.

We also think that the contents of the Commission Paper COM 2007/869 have to be taken into consideration, as well as the European Parliament Resolution of February 3, 2009 on an Agenda for a Sustainable Future in General and Business Aviation.

Very often we miss the necessary proportionality of the rules and we think that the helicopter industry is dealt with in an unhappy manner.

In reading the Agency's proposal several times to understand it our most important conclusion is that this one size does really not fit all.

Aero-Clubs and other organisations with the same scope create safety, constitute an important source of skills, are socially important to thousands of aviatiors. Unproportional rules will have negative impacts. safety will decrease when too much money has to be invested in equipment not really necessary instead of investing it in flying hours, and if the density of regulation will further increase aviation as a whole, GA in particular, will no longer attract young people looking for a promising career.

Our comments are written with these elements in mind.

comment *5099* comment by: *Swiss International Airlines / Bruno Pfister*

Comment:

NPA 2009-02B is a major departure from EU-OPS both in content/concepts and structure. Those major changes cannot be justified on safety grounds and would lead to unjustified costs and additional complexity for the airline industry. The confusing structure and unclear drafting of this NPA will not provide legal certainty.

We note that this NPA is also not in line with the mandate which was given to EASA by the EU legislator which clearly referred to the need for EASA rules to build on EU-OPS and the JAA heritage. In this context, the AEA would like to make reference to the clear concerns expressed by the European Commission and EASA Member States at the June 2009 EASA management board meeting. The AEA therefore urges EASA to stick to its safety role and the clear instructions from its Management Board that this NPA should be withdrawn and realigned with EU-OPS.

Proposal:

Relalign the NPA with EU-OPS

comment *5639* comment by: *ERA*

European Regions Airline Association Comment

- NPA 2009-02B is a major departure from EU-OPS both in content/concepts and structure. Those major changes cannot be justified on safety grounds and would lead to unjustified costs and additional complexity for the airline industry. The confusing structure and unclear drafting of this NPA will not provide legal certainty.

- The ERA Directorate note that this NPA is also not in line with the mandate which was given to EASA by the EU legislator which clearly referred to the need for EASA rules to build on EU-OPS and the JAA heritage. In this context, we would like to make reference to the clear concerns expressed by the European Commission and EASA Member States at the June 2009 EASA management board meeting. We therefore urges EASA to stick to its safety role and the clear instructions from its Management Board that this NPA should be withdrawn and realigned with EU-OPS.

ERA propose to re-align the NPA with EU-OPS.

comment *6069* comment by: *Mike Chadwick*

I consider myself to be a responsible private helicopter owner and pilot, and accept the need for a strict regulatory structure to protect the welfare of myself and others.

However, regulation is only effective where the rules can be applied in a practicable, usable and enforceable framework.

Having studied NPA 2009-02b, I have to conclude that the proposals

relating to the fitments of floatation equipment, elts and the extensive night flying equipment would be prohibitively onerous and of no clear benefit to most operators of light helicopters.

Reference to the air accident records should confirm that the cost and implementation of these measures would bear no relationship to the minimal risk reduction that might be achieved. Surely the rules for light, non-complex, private helicopters should be the same as fixed wing light aircraft?

I believe the Helicopter Club of Great Britain have studied these proposals in detail and their assessment, and my own view, in consultation with other helicopter operators, supports the same conclusions.

EASA should adopt option 4C, as defined in para 2.9 of notice of Proposed Amendment no. 2009-02G.

I sincerely trust that this consultation process recognises the flaws in these over-zealous proposals, and EASA are able to apply a workable, common sense policy that is respected by the very conscientious helicopter community and serves everyone's best interests.

comment *6320* comment by: *EUROPEAN GLIDING UNION*

These comments are the view of the European Gliding Union (EGU).

comment *6432* comment by: *Hugh Edeleanu*

The proposals in this respect regarding floats over short stretches of water are totally unnecessary and unworkable. Private fixed wing aeroplanes are allowed to fly over water and there is no significant difference in the risk of failure during flight between a correctly maintained helicopter and a correctly maintained fixed wing aircraft. There is absolutely no safety case whatsoever for this proposal.

The cost implications of the necessary work to comply with these proposed regulations are absolutely out of all proportion with the negligible increase in safety that would apparently follow.

comment *6457* comment by: *andy ballantyne*

I am writing to object to these proposed regulations which are absolutely crazy! The cost of completing the appropriate modifications which include the addition of floats as well as the modifications required for night flying are out of all proportion. I know of no instances where these measures would have been effective and if these rulings come into place then this will add a significant unnecessary cost to helicopter operations, including maintenance. I absolutely object to these proposals which are totally unreasonable.

comment *6462* comment by: *darren kinslow*

These proposed standards are unreasonable and discriminate against private helicopters. There is also no genuine safety reason that I can see as floats are a troublesome item, add weight to the helicopter, increase drag, increase cost and increase maintenance cost. In the unlikely event of the floats having to be needed these would often prove to be totally ineffectual due to sea conditions etc. I totally appose these proposed rules.

comment *6467* comment by: *Linda Champion*

I wish to lodge a seveer compliant against these proposed ridiculous new rules. The requirement to carry a life raft if the flight is more than three minutes from land when flying over water is crazy, This should be at the discretion of the pilot and would obviously also depend upon the time of the year, sea temperature and conditions and swimming ability of the occupants of the helicopter. In the event of ditching in the sea, I severely doubt that a life raft would be of any use in the circumstance. Mandatory floats for private flights over short water crossings are also unworkable and would be prohibitively expensive to retro-fit on most private helicopters. I would object strongly to the implementation of these proposed regulations.

comment *6532* comment by: *European Gliding Union (EGU)*

TITLE PAGE

These comments are the view of the Deutscher Aero Club e.V..

EASA operational regulations, which will replace existing rules for commercial and complex aircraft, are mostly not relevant to the air sports community. The requirements of the NPA are disproportional and will introduce an unacceptable layer of bureaucracy and increased costs to the voluntary work of the German Aero Clubs federations and local clubs. All comments within this response are made with this position in mind.

TABLE OF REFERENCE FOR NPA 2009-02 p. 2

comment *1876* comment by: *Aeromega*

This is a classic example of EASA attempting to implement legislation to simplify its own task without adequate research or justification. Safety Legislation must be propotionate to the risks involved and therefore be statistically lead. Proposing regulation without adequate statistical justification is a mis-use of EASA's powers. It is not EASA's remit to regulate small helicopters out of operation. The ICAO standards are unreasonable,

dispropotionate and wildly excessive in relation to small non commercial helicopters. They are not appropriate to be applied to private or training flights.

It is, at best, misleading and at worst, a blatent lie for EASA to state that there are no significant additional costs of compliance - for an R44, the cost of additional equipment could run to £50,000. For other types it may not even be possible to fit the proposed additional equipment.

comment *5262* comment by: *bmi REGIONAL*

It is the opinion of bmi regional that EASA should seriously consider the recently submitted comments made by the CAA and those of the AEA and we align our opinion with those submitted by these organisations.

comment *7324* comment by: *Europe Air Sports, VP*

Europe Air Sports is commenting on NPA 2009-02 because we are the only pan European Organisation for recreational and air-sports aviation. Of course, we trust the competence and expertise of our members and therefore ask to consider and incorporate the inputs of the following organisations as delivered on behalf of EAS:

Those organisations are:

Austrian Aero Club

Danish Aero Club

German Aero Club

Swiss Aero Club

Norwegian Aero Club

European Gliding Union

British Gliding Association

British Helicopter Club

German Helicopter Club

PPL IR Europe

We have evaluated the contributions and found them in line with our position, representing and endorsing our opinion.

TABLE OF CONTENTS FOR NPA 2009-02B p. 3-21

Titles of AMCs

The index can contain, for some rules, many AMCs with identical titles; it is therefore not possible to see/understand what the content of each individual AMC might be; for an example see the series of AMCs associated with OPS.GEN.150 (17 almost identical titles - i.e. "Instrument Flight Rules (IFR) operating minima").

Each of these AMCs (GM) does contain its own title - e.g. "AERODROME MINIMA - TAKE-OFF MINIMA"; "AERODROME MINIMA - NON-PRECISION, CATEGORY 1 AND APPROACHES WITH VERTICAL GUIDANCE"; "AERODROME MINIMA - CRITERIA FOR ESTABLISHING RVR/CMR" etc.

It is this subject title that should appear in the index - not the rule title.

comment *1153* comment by: ***Stefan Huber***

Art.16 : When this difficult subject was considered previously, it was decided that any regulation for Aerial Work (AW) had to include non-commercial operations. Hence the scope of JAR-OPS 4 did not exclude that activity. AW now appears to have been included in the scope of 'Commercial operations other than Commercial Air Transport' thus excluding non-commercial AW. There are no requirements for non-commercial AW other than those contained in Subpart GEN; whilst this category of AW might not be large, it probably should be regulated and also be permitted the derogations from some requirements contained in Subpart GEN.

comment *1154* comment by: ***Stefan Huber***

Art.47 : The definition of 'non-complex operations' could be VFR day with an aircraft with a MPSC of 9 or less (with the specific exclusions contained in the appendices); 'local' could be (non-complex) operations within a limited and defined area (which would have an AMC attached) which start and end at the same location within the same day.

The definition and substitution of these terms within the text would permit simplified rules and resolution of the errors of omission and commission seen in the draft.

comment *1155* comment by: ***Stefan Huber***

Art.36 : Because CAT and AW are both also undertaken with non-complex aircraft, a more basic GEN would permit construction of any higher regulation to be undertaken in a much more logical way - without the necessity for the 'notwithstanding' and 'except that' constructs which are now required. Whilst it is accepted that all aircraft will have to comply with a

rule for basic GA for non-complex aircraft, attempting to construct requirements in CAT for non-complex aircraft, and requirements for AW with all aircraft, from a GEN text that is addressed at complex (where these aircraft are performing mostly Corporate Transport) as well at non-complex aircraft, is much more difficult.It has long been accepted that the regulation of AW - i.e. the working of aircraft on specific tasks, is of a different order to that where passengers are carried. Most understand that the prime objective for the regulation of AW is the protection of the environment and third parties; the protection of the crew is important but does not approach that required for fare paying passengers - the crew know and understand the risks involved.

comment *1156* comment by: *Stefan Huber*

Most AW operations are subject to individual risk assessment which will produce a mitigated work regime; attempting to apply the passenger-related requirements that are currently in Annex 6 Part II Section 3 - i.e. for complex aircraft, may not be appropriate. A revision of the model to have only basic GA rules in GEN, would assist in the production of a proportionate regulation for AW when inheritance is taken into consideration.It is suggested that the regulation be re-partitioned so that GEN addresses basic GA with non-complex aircraft; Complex Aircraft, CAT and AW should be addressed in additional requirements that sit, in parallel, above GEN and inheriting from its requirements.

comment *1663* comment by: *Fferm Abergelli*

I wish to object to the new EASA rules proposed as this would create very high costs for basic private helicopters.

Such costs are not sustainable for private operators in view of the low risks of visual flight over water and for night flying, if these rules are enforced then I can see many operators having to sell their aircraft myself included.

comment *3204* comment by: *Austro Control GmbH*

General Comment to the Content:

OPS.SPA.

It is suggested to add a Section X for ETOPS operation.

The key requirements from the ETOPS AMC shall be mentioned here; a requirement in the rules is in the interest of safety and legal certainty.

comment *3552* comment by: *Walter Gessky*

General comment to the content: OPS.SPA.

It is recommended to add a Section X for ETOPS operation. The key requirements from the ETOPS AMC shall be mentioned here, a requirement in the rules is in the interest of safety and legal certainty.

comment *4128* comment by: *DGAC*

Proposal:

Delete the following line :

"GENERAL-COMMERCIAL AIR TRANSPORT……128"

Justification:

Those words are only a subtitle for "AMC OPS.GEN.125 Portable electronic devices" and therefore should not appear in the table of content.

comment *7329* comment by: *Europe Air Sports, VP*

Again the repeat of a comment already stated earlier. Due to the huge number of items in the content the document is consisting of a huge number of pages making it nearly unreadable. As it was said by the Agency itself the user should benefit, therefore we again recommend to develop separate books for different categories of aircraft.

A private balloon pilot who wants to comply with the rules has to study 57 pages of the General Requirements to find out that most of the requirements are of no concern to him

B. I. Draft Opinion - Part-OPS p. 22

comment *1157* comment by: *Stefan Huber*

SAR appears to be defined by EASA as "similar service" - i.e. not covered by EASA Parts, and thus subject to national regulation. This has not been notified formally. SAR shall stay a state regulation due to diversity of systems (gov, private, fundation) and geography (sea, mountain, etc).

comment *2914* comment by: *Pietro Barbagallo ENAC*

1) General Comment: With the new set of regulations, consisting of different Parts, it may be difficult for the applicant to establish an easy compliance with the applicable requirements. It is necessary to go through different Parts and find which requirements are applicable. It could be better to

have, like it is today, specific set of regulations for each kind of operation. This is more significant if the search of the applicable requirements through the electronic tool box (available on EASA web site) is not a certified result.

Justification: It may be difficult for the applicant to establish compliance with applicable requirements.

2) General Comment: Several of present requirements included in EU OPS and JAR OPS 3 amend. 5 will be moved to AMC and GM.

Justiifcation :opening up to a wide range of alternative AMCs throughout the EU before the Agency can assess their validity in such a potentially wide range of applications and with an even longer lag before standardisation audits can sugggest remedial actions, seems us to carry a significant safety and business risks. The NPA does not suggest that the Agency should give prior approval to alternative AMCs to be adopted by NAAs, and recognise that this would not be approriate given the legal responsability to member States to ensure relevant implementation of the relevant Essential Requirements and Implementing Rules. However, if alternative AMCs are to be widely developed and promulgated throughout the community, it seems to us that the Agency and the NAAs should explore urgently what kind of processes could be developed to provide that, as far as possible, the Agency is able ot carry out its assessment before alternative AMCs are authorised by an applicant.

3) General Comment: a list of definitions is shown on each Part and relevant guidance material. It could be more useful to have a unique list of definitions because a term may be referred in more than one Part while its definition is provided only in one specific Part.

comment *2919* comment by: *Pietro Barbagallo ENAC*

General Comment: Consideration should be taken for including in Part OPS the operation of a single-engine turbine-powered aeroplanes at night and/or in Instrument Meteorological Condition (ref. ICAO Annex VI ch.5 emend. 31 dated 22/11/07).

Justification: Implementing rules for commercial air transport by aeroplanes are based essentially on EU-OPS. However some changes have been proposed through NPA 2009-02 to align, as far as possible, the forthcoming regulation to the correspondent provisions already contained in ICAO Annex VI. Anyhow the alignment to provisions of ICAO Annex VI is partial for obvious reasons. Having said that, we would like to draw to the attention of the EASA Rulemaking to take into consideration the possibility to include in the regulation for air operations also "additional requirements for the operation of a single-engine turbine-powered aeroplanes at night and/or in Instrument Meteorological Condition" as defined in the ICAO Annex VI, chapter 5. National stakeholders are in favour of such kind of operation, especially for cargo operations, because they have several business opportunities which couldn't be developed within current regulation framework.

comment *3553* comment by: *Walter Gessky*

1. **OPS.GEN** shall include a generic point with regard to reporting like EU-OPS 1.420 where parts are responsibility of the pilot in command. For the moment reporting is spitted in different parts. Commander reporting according EU-OPS shall than be mentioned at least under OPS.GEN.015 or 020.

comment *3768* comment by: *KLM Cityhopper*

Comment:

NPA 2009-02B is a major departure from EU-OPS both in content/concepts and structure. Those major changes cannot be justified on safety grounds and would lead to unjustified costs and additional complexity for the airline industry. The confusing structure and unclear drafting of this NPA will not provide legal certainty.

We note that this NPA is also not in line with the mandate which was given to EASA by the EU legislator which clearly referred to the need for EASA rules to build on EU-OPS and the JAA heritage. In this context, the AEA would like to make reference to the clear concerns expressed by the European Commission and EASA Member States at the June 2009 EASA management board meeting. The AEA therefore urges EASA to stick to its safety role and the clear instructions from its Management Board that this NPA should be withdrawn and realigned with EU-OPS.

Proposal:

Re-align the NPA with EU-OPS

comment *6157* comment by: *EUROPEAN GLIDING UNION*

Sailplanes are not covered by the paragraph? Should say for example "other than complex motor-power aircraft".

comment *7432* comment by: *Axel Schwarz*

I strongly suggest to include Annex II - aircraft in the scope of Parts OR and OPS (and also Part FCL). While different regulations in the areas of certification and continuing airworthiness are necessary due to the nature of Annex II aeroplanes, the operation of these aircraft (and also the competency elements and proficiency required of flight crews of such aircraft) does not differ.

Should certain aspects of Parts OPS and FCL prove to be not suited for certain Annex II aircraft, a general provision, enabling the Competent Authority to make exceptions could ensure the required flexibility.

Excluding Annex II aircraft would make any approvals obtained under Parts OR, OPS or FCL only national approvals, thus creating an uneven playing field for pilots and operators. Also several aircraft now normally included in JAR-FCL and OPS 1 provisions (e.g. PA-18 as part of the rating SEP(land)), would have to be excluded from such ratings, without sufficient justification for such a differentiation.

B. I. Draft Opinion - Part-OPS - Subpart A p. 22

comment *4129* comment by: *DGAC*

The use of "shall" and "may" is not consistent throughout the text. [comment also made about NPA 2008-17 Part FCL]

For instance, in OPS.GEN.010, some definitions read "XX shall mean YY", while others read "XX means YY"

- See OPS.GEN.330.A (misuse of "may")

Justification:

- "shall" should be used for requirements only, not for statements.

- "may" should be used only for options or recommendations.

Proposal:

Check out the whole document

comment *4130* comment by: *DGAC*

Many paragraphs in OPS GEN apply only to complex aircraft or aircraft operated in CAT or in COM. This makes the text difficult to read. For example in OPS.GEN.155 Selection of alternate aerodrome, there is a specific requirement in paragraph (d) for helicopters in CAT. It should be in sub-part CAT.

Proposal:

Create a specific section containing the requirements applicable to complex aircraft used in non-commercial operations. (similar to A-NPA JAR-OPS 2), and gather the requirement for CAT in CAT section, for COM in COM section.

B. I. Draft Opinion - Part-OPS - Subpart A - Section I p. 22

comment *3184* comment by: *Austro Control GmbH*

OPS.GEN shall include a generic point with regard to reporting like EU-OPS 1.420 where parts are responsibility of the pilot in command. For the moment reporting is spitted in different parts Commander reporting according EU-OPS shall than be mentioned at least under OPS.GEN.015 or 020

comment *6056* comment by: *DGAC*

We do not understand the rationale for mentioning R 216/2008 in the scope of part OPS subparts GEN, CAT & COM and not mentioning it in the scope of both part OR subpart OPS and part OPS subpart SPA?

If, as explained by EASA, the mere application of those subparts is not enough to ensure compliance with the BR, then mentioning the BR in the scope should be avoided as it is confusing and misleading.

"OPS.GEN.005 Scope

This subpart establishes the requirements to be met by an operator to ensure that air operations are conducted in compliance with Article 8 in conjunction with Annex IV to Regulation (EC) No 216/2008 (Essential requirements for air operations)."

B. I. Draft Opinion - Part-OPS - Subpart A - Section I - OPS.GEN.001 Competent authority p. 22

comment *118* comment by: *AgustaWestland*

In accordance with NPA2009-02a page 26 at Para 3 the heading of

OPS.GEN.001 shold be **Scope** and **OPS.GEN.005 Competent authority.**

comment *671* comment by: *ECA - European Cockpit Association*

Comment onOPS.GEN.001: change as follows:

For the purpose of this subpart, the competent authority shall be **responsible**:

Justification:

The first sentence is incomplete.

comment *678* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.001: add the following text:

Each aeroplane shall be operated in compliance with the terms of its certificate of airworthiness and within the approved limitations contained in its aeroplane flight manual.

Justification:

Missing requirements from EU OPS 1.005 (c).

comment *906* comment by: *CAA-NL*

Comment regarding:

b) for the oversight of commercial operations and non-commercial operations of complex motor-powered aircraft, the authority designated by the Member State where the operator has its principle place of business.

Suggetion CAA-NL:

Definition of competent Authority needs more clarification.

comment *1005* comment by: *KLM*

The inclusion of Helicopter requirements make this a mess and very difficult to find a requirement and whether a requirement is applicable for what kind of aeroplane.

Split the different types into separate parts.

comment *1021* comment by: *British Gliding Association*

comment *1390* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

for non commercial operation ~~of non complex motor-powered aircrafts~~…

Comment / Proposal:

Oversight over non commercial operations only possible based on the registry. Moreover: Duplication with OR.GEN.001 (NPA 2008-22c). Not necessary in OPS.

comment *1391* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

Definitions in general.

Comment / Proposal:

All definitions used in european aviation regulations should be listet in a separate comprehensive volume. Moreover, many definitions have already been set in other regulations and should not be duplicated in OPS.

comment *1751* comment by: *Swedish Soaring Federation*

Sailplanes are not covered by the paragraph? Should say for example "other than complex motor-power aircraft".

comment *2631* comment by: *AOPA-Sweden*

It can not be taken for given that an operator of a complex aircraft has a business, the aircraft can be owned as a non-complex aircraft and used in the same way. Such an owner does not have a "place of business" as defined in OPS.GEN.010 (60). This paragraph is not clear which competent authority has the over-sight responsibility. Shall an entity with a place of business outside Europe go to that authority? Also compare with rules for OPS.SPA.001.GEN, where it is stated the State of registry is responsible for those approvals, coordination is needed.

comment *2722* comment by: *Southern Cross International*

Would a commercial operator other than CAT, for which any Member State ensures oversight of operations, still be able to conduct a contracted one-time test flight or ferry flight assignment with a (complex motor-powered) aircraft registered in a third country and owned cq operated by a non-Community operator? Is the Operator Certificate applicable for these kind of operations?

Example: maintenance carried out within or outside the Community by a MRO-provider and the associated test/ferry flights carried out (or contracted) by the MRO-provider.

comment *2887* comment by: *UK CAA*

Page No: 22

Paragraph No:

OPS.GEN.001 and OPS.GEN.005

Comment:

According to OPS.GEN.005 this subpart is intended to establish the requirements to be met by an operator to ensure compliance with Article 8 of 216/2008. That Article covers the operation of aircraft referred to in both Article 4(1)(b) and (c). However, the definitions for "competent authority" in OPS.GEN.001 do not appear to establish clearly such an authority in any Member State capable of overseeing compliance by operations covered by Article 4(1) (c).

Justification:

Since all aircraft covered by Article 4(1) (c) are registered in a third country, no Member State would be able to designate a competent authority for the oversight of non-commercial operations in accordance with OPS.GEN.001 (a). As for operations covered by 001(b), it is not certain that an operator "established or residing in the Community", as described in Article 4.1(c) of 216/2008, will necessarily also have its "principal place of business" in the Community.

It would appear that the Implementing Rules are expected to cover the operation of aircraft referred to in Article 4(1)(c), since Article 8(6) specifically refers to such measures in its last indent. Clarity is required as to how this is to be achieved.

comment *3183* comment by: *Austro Control GmbH*

(b) for the oversight of commercial operations and non-commercial operations of complex motor-powered aircraft, the authority designated by the Member State where the operator has its ***principle place of business****.*

Comment:

It is recommended to add a definition for the "principle place of business" since not all operators are effected by Regulation (EC) 1008/2008.

It has to be mentioned that the definition of this term is different in EC 1008/2008 and EC 2042/2003 (new version).

comment *3275* comment by: *Aero-Club of Switzerland*

We do not find the sailplanes under (a)!

Please change the text into "...operations of other than complex motor-powered aircraft..."

Justification: In doing so, the sailplanes are included.

comment *3554* comment by: *Walter Gessky*

2. OPS.GEN.001 Competent authority

"(b) for the oversight of commercial operations and non-commercial operations of complex motor-powered aircraft, the authority designated by the Member State where the operator has its **principle place of business**."

Comment:

It is recommended to add a definition for the "principle place of business" since not all operators are effected by Regulation (EC) 1008/2008.

It should be notified that the definition of this term is different in EC(1008/2008 and EC 2042/2003(new version accepted by the Committee at the meeting on 7.7.2009)

comment *4131* comment by: *DGAC*

Proposal : Rewrite the beginning of the paragraph as follows :

"For the purpose of this ~~sub~~part, the competent authority shall be…"

Justification : the competent authority is not only used in subpart GEN of Part OPS but also in subparts CAT & COM without the terms "competent authority" being redefined at the beginning of those subparts.

comment *4132* comment by: *DGAC*

Some cases are not addressed by this paragraph (although IR OPS are meant to be applicable to those cases) :

Who shall be the competent authority in the following cases ?

(i) (i) operations of aircraft registered in a Member State when the operations take place outside of the Community

(ii) (ii) operator established in the Community, performing non commercial operations of aircraft registered in a third country (ex. US registered aircraft)

comment *4133* comment by: *DGAC*

Amend the text as follows to take into account the fact that the term "principal place of business" is not adapted to private owners, except in the case of fractional ownership where this term could apply to the principal place of business of the program manager:

"For the purpose of this subpart, the competent authority shall be:

(a) for the oversight of non-commercial operations of non-complex motor-powered aircraft, the authority designated by the Member State where the aircraft is registered; and

(b) for the oversight of commercial operations and non-commercial operations of complex motor-powered aircraft :

(i) **when the aircraft is managed by a third party mandated by the owner**, the authority designated by the Member State where the operator **or the manager** has its principle place of business,

(ii). **when the aircraft is not managed by a third party mandated by the owner, the authority designated by the Member State where the aircraft is registered**

comment

4857 comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment:

Spelling error in (b).

Proposal (including ***new text***):

(b) for the oversight of commercial operations and non-commercial operations of complex motor-powered aircraft, the authority designated by the Member State where the operator has its ~~principle~~ ***principal*** place of business.

comment

5113 comment by: *Ryanair*

This defintion of "competent authority" to be used throughout the IRs/AMCs/GM.

comment

5312 comment by: *Norwegian Air Sports Federation*

Sailplanes and balloons are not covered by the paragraph.

comment

5880 comment by: *Civil Aviation Authority Finland*

Comment:

The Competent Authority supervising the non-commercial operations of non-complex motor-powered aircraft and also the commercial or non-commercial operations of hot-air balloons and gliders is missing.

The Competent Authority for this kind of operations shall also be defined.

Justification:

We have in EU States many operators, training organisations, flying clubs and private aerial work operators using continiously leased aircraft registered in other States, also in third countries. The Authorities of these

other States and third countries do not have practical means to supervise this kind of operations based in another State. This may lead to unsupervised wild operations, also non-legal commercial commercial air transport operations, as we have in some cases found.

comment *5981* comment by: *Konrad Polreich*

For some SPA's, the state of registry provides the competent authority. Here may exist a conflict of authority, when the operation is based in one member state and the aircraft is registered in another member state. This duplicates some administrative work for the operators and authorities.

Suggestion:

For operators, which have their principle place of business in a Member State (EASA-member) and operate aircraft registered in another Member State, the competent authorities shall agree about delegation of the oversight or issuance of SPA's to only one authority.

comment *6407* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Comment

"Competent authority" is not consistently defined. "Competent authority" is defined in OPS-GEN.001, but the definition is restricted to "the purpose of this subpart" (General operating and flight rules).

Proposal

We suggest a specific part or the EASA regulation framework may contain a comprehensive and exhaustive list of definitions, applicable to the whole EASA regulation, which is the best way to provide consistent definitions.

Justification

This might be a legal issue regarding the scope of understanding and cause problems of reading

comment *6692* comment by: *Finnish Aeronautical Association - Kai Mönkkönen*

Paragraph (a) does not include sailplanes but we can not see any specific purpose for such exclusion. We suggest the paragraph (a) to be modified for example: "…*of non-commercial operations other than complex motor-power aircraft*."

comment *7429* comment by: *David ROBERTS*

The scope definition in sub part (a) excludes non-powered aircraft (sailplanes / gliders) and balloons. If this is intended, then no other comments on the rest of the document are necessary. But I suspect that is not the case.

Proposal: include in (a) 'and non-powered aircraft (and balloons?)'

comment *7547* comment by: *AOPA UK*

It can not be taken for granted that an operator of a complex aircraft has a business, the aircraft could be a non-complex aircraft and used in the same way. Such an owner does not have a "place of business" as defined in OPS.GEN.010 (60). This paragraph is not clear which competent authority has the over-sight responsibility. Any entity with a place of business outside Europe should go to which authority? Also compare with rules for OPS.SPA.001.GEN, where it is stated the State of registry is responsible for those approvals. Better coordination is needed.

B. I. Draft Opinion - Part-OPS - Subpart A - Section I - OPS.GEN.005 Scope p. 22

comment *118* comment by: *AgustaWestland*

In accordance with NPA2009-02a page 26 at Para 3 the heading of

OPS.GEN.001 shold be **Scope** and **OPS.GEN.005 Competent authority.**

comment *672* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.005: change as follows:

This subpart establishes the requirements to be met by an operator ~~**to ensure that air operations are conducted in compliance with Article 8 in conjunction with Annex IV to Regulation (EC) No 216/2008 (Essential requirements for air operations).**~~

Justification:

Everything necessary to comply with the BR must be found in the IR/AMC/GM. Reference to BR 216/2008 is inappropriate. See also comment 678.

comment *1386* comment by: *EUROCOPTER*

This Regulation should not apply to Flights performed by aircraft manufacturers (Development flight tests, Production flight tests, Technical

check flights following maintenance, demonstration flights for sales support, …) as this activity is already regulated in PART 21. Eurocopter wish that EASA conducts an action towards the European Commission in order to modify the Basic Regulation 216/2008 in this way.

comment *3185* comment by: *Peter SCHMAUTZER*

In this implementing rules for air operations is also included the operation of sailplanes. Gliders are mainly used for sporting activities and not for commercial operations.

The basic regulation stipulates that the operation of simple designed aircrafts is excluded from EASA competency. This new regulation will cause higher costs for the glider sporting community.

According to Article 1 2. this regulation shall not apply to military … or similar service. Therefore it should be made clear that fire fighting and HEMS operations performed on behalf of a government is not regulated under Part-Ops.

CRD:

It is forbidden to use not installed equipment in flight. This obviously refers to GPS or COMS which are carried on board as a backup. To forbid generally the use of this equipment will cause a safety hazard and is against the standards, e.g. That a pilot should take all the help he can get (CRM).

comment *3536* comment by: *Trevor Wilcock*

Throughout the document there are features which seem relevant to commercial and/or complex aircraft operation but which have been extended to embrace all aeroplanes. These are often disproportionate and would have an adverse impact on the cost and flexibility of operation with no obvious benefit to operational safety. I will make comment on the more significant of these, but I am sure that the representative organisations for light aviation and sailplanes will assess in full detail.

comment *4134* comment by: *DGAC*

This paragraph shall be adapted to reflect the fact that the sole application of this subpart does not guaranty that "air operations are conducted in compliance with Article 8 in conjunction with Annex IV" of the BR.

Some provisions of article 8 or of Annex IV are not implemented in subpart GEN but in subpart CAT, COM or SPA. Moreover, some of those provisions are even implemented in Part AR or OR (for instance article 8.2/8.3 related to certification/declaration).

comment *4135* comment by: *DGAC*

Some paragraphs of Subpart GEN are definitely not applicable to certification flights (e.g. : OPS.GEN.105 Simulated abnormal situations in flight)

comment *5006* comment by: *AS Miller*

OPS.GEN.005 Scope

Sport flying in gliders already has a well established body of requirements, developed through bodies such as the IGC & FAI.

Why on earth replace them with this body of rules designed for complex and commercial aircraft?

There is no safety or economic case for doing this.

The exceptions made within the text for sailplanes are inadequate.

Proposal *Sailplanes (including Self Sustaining Sailplanes (SSS) and Self Launching Sailplanes (SLS)) must be excluded from NPA 2009-2.*

comment *5976* comment by: *Irish Aviation Authority*

Comment:

The basic regulation and scope make no mention of SAR & fire-fighting operations being excluded from this regulation. The enclosed text below needs to be added at the end of the existing text.

Proposed text:

This regulation shall not apply to the operation of aircraft for the purpose of search and rescue (SAR) and fire-fighting operations.

comment *6025* comment by: *Aero-Club of Switzerland*

We think the scope as written under this paragraph is correct for CAT, it is partly correct for operator of CMPA, but it is not correct for most of the General Aviation (GA) flight operations.

Justifications: Many times, the proportionality of the proposals of the Agency are not given for GA operations.

We do not find safety benefits, however we find more bureaucracy and, especially looking at the regulation ideas in the helicopter segment, proposals of standards which will bring private operations of helicopters to a standstill because of increased cost due to the obligation to equip the machines to reach standards not necessary for the kind of operations.

Many of the new requirements will have a negative effect on recreational flying activities. This is not in line with a statement of the European Parliament saying that new requirements should not inhibit these activities.

comment *6551* comment by: *Sloane Helicopters Ltd*

It appears that private operations are expected to adopt the same safety regulations as Commercial Air Transport (CAT) Operators. This is totally disproportionate as CAT operators have a responsibility to their fare paying passenger to ensure all safety regulations are in place. However, the CAT operator is able to off-set these safety measure costs against the operation. ie: the customer ultimately pays for the privilege. Private operators do not have that privilege therefore should not be expected to operate to the same level of safety standards.

Should EASA insist on pressing ahead with the proposed amendments, Helicopters which hold certification for current operations should be allowed to continue to operate under Grandfather rights with a run out date. Beyond that date any future designed helicopter would have to be capable of meeting the EASA requirements.

There appears to be a failure to recognise that there are many European Islands including the UK with it's own Off-Shore Islands that will be severely restricted should these proposals be implemented. It would also have a severe effect on manufacturers of single engine helicopters that do not have the physical space, weight and C of G to carryout modifications let alone the incredible costs involved. Distributors will have products no longer saleable. It will be a total disaster for the private aviation industry.

Summary

Sloane Helicopters Ltd agrees with the comments made by The Helicopter Club of Great Britain and is strongly opposed to the proposed regulations.

It is simply not in the interests of private aviation to impose such a heavy burden of compliance with no safety review carried out. We thus urge EASA to either withdraw these proposals entirely, amend them as suggested, define a MTOM weight limit below which they would not apply (e.g. 3175Kg or 2000Kg), or simply apply the fixed wing proposals to helicopters. Other practical mitigation measures could be exemptions for helicopters under 2000kg MTOM, for non-complex helicopters, or for helicopters in private flight..

B. I. Draft Opinion - Part-OPS - Subpart A - Section I - OPS.GEN.010 Definitions p. 22-27

comment *4* comment by: *KLM*

Definitions (1) 3% en route alternate (ERA) aerodrome has to be changed to become:

Fuel enroute alternate aerodrome (Fuel ERA) means an ERA selected with the purpose of reducing contingency fuel.

Fuel policies based on statistical data are using this same enroute alternate but that does not imply a reduction to 3% but will reduce the amount of contingency fuel.

Therefore the explicite figure of 3% has to be deleted from this definition and be generalised to make clear that the purpose is to decrease fuel.

comment *17* comment by: *George Knight*

-59 Does SAILPLANE include POWERED SAILPLANE (self-launching and self-sustaining sailplanes)?

comment *49* comment by: *KLM*

Definitions

There should be added the defintion of:

non-complex motor-powered aircraft and

complex motor-powered aircraft.

It is not stated anywhere what is exactly meant with these statements and where to draw a line between the two.

In general the list of defintions is not complete; all used terms and names have to be defined and included in this list.

comment *50* comment by: *Robert R McGregor*

(12) 'Congested area'

Although the definition is the same as in Annex 6 Part III, it is difficult to understand.

1. If the words 'congested' and 'area' are taken literally, then their 'meaning' according to the Oxford English Dictionary is that of an area which is completely 'full-up' or 'choked'; in this case with persons and property i.e. there are no open spaces available in which a helicopter could perform a forced landing. This is not the meaning of the term 'congested area' as it is used in aviation regulations.

   The definition should avoid use of the phrase "Congested area means…". We know what the words mean, but this is a specialist

term concerned with safety and the environment of urban areas, which can contradict the normal meaning of the word 'congested'. Consequently, the definition should be re-written as follows:

"Congested Area is a specialist term for the area enclosed by the bounds of a city town or settlement, which is substantially used for residential, recreational or commercial purposes, and which may, or may not, depending upon circumstance, contain unobstructed spaces."

comment *51* comment by: *Robert R McGregor*

The formatting should be revised to align with definition (41) 'Hostile environment', as shown below:

(52) 'Non-hostile environment':

(i) An environment in which:

(A) A safe forced landing can be accomplished;

(B) The helicopter occupants can be protected from the elements; and

(C) Search and rescue response/capability is provided consistent with the anticipated exposure.

(ii) Those parts of a congested area with adequate safe forced landing areas shall be considered non-hostile.

comment *52* comment by: *Robert R McGregor*

(56) 'Performance Class 1'

The definition is inferior to the corresponding definition in Annex 6 Part III where it is entitled "Operations in Performance Class 1". The EASA definition in the NPA:

(i) does not make it clear that it is the 'operation' that is performance class 1 rather than the helicopter itself;

(ii) does not deal adequately with engine failure after LDP;

(iii) does not relate the performance level to the essential points TDP and LDP.

The definition should be replaced by the definition contained in Annex 6 Part III:

comment *53* comment by: *Robert R McGregor*

(57) Performance Class 2 should be re-titled, "Operations in Performance

Class 2" so as to make the definition the same as that in Annex 6 Part III.

comment

54 comment by: *Robert R McGregor*

(58) Performance Class 3 - the definition is inferior to that in Annex 6 Part III.

It should be re-titled "Operations in Perfomance Class 3" as per Annex 6 Part III.

The EASA definition is also wrong, because if the helicopter is truely operating in PC3, a power unit failure will result in a forced landing even if it is a multi-engine helicopter i.e. there is no 'may' about it.

comment

55 comment by: *Robert R McGregor*

(5) Aerodrome:- There is no need to restrict the meaning of 'Aerodrome' to an area which has been, "especially adapted". The definition in ICAO Annex 6 is superior.

comment

56 comment by: *Robert R McGregor*

(3) 'Adequate Aerodrome':- There is no merit in defining an 'adequate' aerodrome. An aerodrome will either be 'adequate', or 'not adequate' and that is the responsibility of the operator of the aircraft on the day.

comment

58 comment by: *Air Southwest*

Is it intended to issue a complete set of definitions?

comment

59 comment by: *Air Southwest*

JAR OPS and EU OPS placed the responsibility and authority in Commercial Air Transport on the 'COMMANDER' rather than the 'Pilot-in-Command. Over the recent past the distinction between the two has been emphasised with the introduction of cruise relief crew and the introduction of complex international law regarding the authority of the Commander. The status of the Pilot-in-Command is a function of the Rules of the Air (the pilot who is responsible for the time being for the compliance with the rules of the air) rather than the 'Captain' of a crew and authority (representative of the State of Registry) on board an aircraft carrying passengers and/or cargo. I suggest that throughout OPS.CAT etc... 'Commander' replaces Pilot-in-Command in all cases except where the intent is compliance with the Rules of the Air.

I also suggest that a definition is included for both Pilot-in-Command and Commander.

comment *61* comment by: *Air Southwest*

Definition 68 defines SVFR. This is inaccurate as it implies that SVFR is only applicable in conditions less than VMC. SVFR is permitted in a CTR. A CTR can be Class A where IFR is mandatory. So even in conditions of unlimited VMC a SVFR clearance would be required to fly in a Class A CTR without compliance with IFR. This needs to be amended.

comment *113* comment by: *Ingmar Hedblom*

This definition of "night" is not appropriate and detrimential to VFR operation in northern Sweden with long morning and evening twilights during the summertime.

Furthermore, it is not the same definition as used in the FCL NPA 2008-17.

There must be the same definiton for OPS and FCL use. The definition for FCL is supported. Introduce the definition from NPA 2008-17: Night' means the period between the end of evening civil twilight and the beginning of morning civil twilight, or such other period between sunset and sunrise as may be prescribed by the appropriate authority, as defined by the Member State.

comment *124* comment by: *Loganair Limited*

Attachment #1

Item (a)(24) Definition of Dry Runway. What is meant by the phrase "effectively dry" braking action is not clear. Until recently the majority of European Operators have used this to allow the use of Dry Runway Performance in Wet conditions where the runway is published as grooved. The UK CAA issued FODCOM 03/2009 stating that this is not the case, but it appears to be a UK only view.

To further complicate the situation CS-25.109(d) (And FAR-25) allow for specific Wet Grooved runway performance to be published in Aircraft Flight Manuals. The requirement in CS-25 is a straight transfer from JAR-25 and was first published in JAR-25 in 2003, a significant time after the JAR-OPS "effectively dry" criteria was published.

CS-25.109(d) is based on a Wet Grooved runway giving 7 times better braking action than a smooth wet runway, whereas a dry runway has braking action 10 times better than a smooth wet runway.

Clarification is required as to whether dry performance can be used for a grooved or porous runway where Wet grooved runway performance is not specifically available.

comment *125* comment by: *Rega / Swiss Air-Ambulance*

OPS.GEN.010 Definitions

Scope:

Add the definition of "Aeroplane Emergency Medical Service (AEMS)"

Text to be added:

"Aeroplane Emergency Medical Service (AEMS) flight" shall mean a flight by a dedicated ambulance aeroplane operating under an EMS approval, the purpose which is to facilitate emergency medical assistance, where immediate and rapid transportation is essential, by carrying:

(i) medical personnel; or

(ii) medical supplies (equipment, blood, organs, drugs); or

(iii) ill or injured persons and other persons directly involved.

Proof:

Swiss Air Ambulance Type(s) of Operation according the Operation Specification defined by the NAA are **"A3 Emergency Medical Service"**. To be in line with the Operations Specifications issued by the NAA in accordance with the Council Regulation (EEC) No 3922/1991 Annex III (EU-OPS) the term Emergency Medical Service for aeroplanes shall be defined under "Subpart A, General operating and flight rules, Section I - General Requirements" to emphasize the special type of operation.

Background:

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. Its services range from providing medical advice to repatriating patients to/from Switzerland or any other point of the world. Swiss air-ambulance is a private, non-profit organisation, which operates in accordance with the guiding priniples of the Red Cross. It comes to the aid of people in distress, without respect of their nationality, religious convections or social status. Swiss air-ambulance operates under the Air Operator Certificate CH-AOC-No.1015 issued by the Federal Office of Civil Aviation Switzerland (FOCA) and is compliant with EU-OPS. Please visit www.rega.ch

comment *314* comment by: *Aero-Club of Switzerland*

(30) (ii) Please define "drugs" more precisely!

(30) (ii) Transport of all kinds of medical supply should not be considered as "HEMS"

(41) Is "hostile" really the best word to describe what die Agency wants us to understand?

(41) (i) (B): Only helicopter occupants?

Please add (41) (ii) (C) Mountain areas

comment *322* comment by: *AgustaWestland*

In the List of definition should be added the definition of:

1. Pilot-in-Command (PIC)
2. Pilot Flying (PF)
3. Pilot non Flying (PNF)
4. Flight Crew
5. Crew Member

comment *368* comment by: *EHOC*

General

It is not clear why some definitions are contained in OPS.GEN.010 and others in GM OPS.GEN.010; is it because some definition contained in the GM are only used in the Guidance material? If so is that a good reason?

Specific

(xx) There is no definition of Child except by inference (used in subsequent text in Subpart C).

CP is used in GM1 OPS.SPA.005.SFL(b) but not defined.

(xx) Committal Point (CP). The committal point is defined as the point in the approach at which the pilot flying (PF) decides that, in the event of a power unit failure being recognised, the safest option is to continue to the deck.

(47) Low visibility procedures:

It is not clear the the new definition provides the same information as the original definition. The old definition might be preferred:

Low Visibility Procedures (LVP). Procedures applied at a aerodrome for the purpose of ensuring safe operations during Category II and III approaches and Low Visibility Takeoffs.

(48) Maximum passenger seating configuration:

The definition would be improved if 'excluding crew seats' was placed before

'operational purposes'.

The last sentence is information and might be better contained in AMC material; also required in guidance is how this configuration is achieved now that 'approved' has been removed from the definition.

For GA and without specific guidance it might be regarded as being as simple as the count of the passengers at the time (complex aircraft also have an OM). It is not even clear if GA have (or can be compelled) to consider or apply an AMC!

(56) Performance Class 1:

The definition would benefit from the insertion of the same text contained in the definition of PC2.

"... failure of the critical power unit, **performance is available to enable** the helicopter ~~is able~~ to land..."

This definition only works if, when used, it is prepended with "Operated in PCx".

(xx) Rotor Radius:

Rotor Radius used OPS.CAT.H.365 (obstacle clearance) but not defined.

R. Rotor radius.

(xx) Rotation Point:

Rotation Point is used in GM4 OPS.CAT.355.H and GM1 OPS.SPA.005.SFL(b) but not defined.

Rotation Point (RP). The rotation point is defined as the point at which a cyclic input is made to initiate a nose-down attitude change during the take-off flight path. It is the last point in the take-off path from which, in the event of an engine failure being recognised, a forced landing on the deck can be achieved.

(73) Take-off distance required:

Because this definition has been abbreviated from the original, the associated GM will also have to be amended:

See additional note in GM OPS.GEN.010(a)(73).

(xx) TLOF:

TLOF is used in AMC3 OPS.CAT.215.H but not defined.

Touchdown and lift-off area (TLOF). A load bearing area on which a helicopter may touch down or lift off

(xx) Vy:

Vy is used in GM3 OPS.CAT.355.H and GM2 OPS.SPA.005.SFL(d) but not defined.

Vy. Best rate of climb speed.

comment *429* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.010(a)(13): change as follows:

(13) 'Contaminated runway' means a runway of which more than 25% of the runway surface area (whether in isolated areas or not) within the required length and width being used is covered by the following:

(i) Surface water more than 3 mm (0.125 in) deep, or by slush, or loose snow, equivalent to more than 3 mm (0.125 in) of water;

(ii) Snow which has been compressed into a solid mass which resists further compression and will hold together or break into lumps if picked up (compacted snow); or

(iii) Ice, including wet ice~~.~~ **or those runaways which exhibit an equivalent aircraft braking action less than those assumed for a wet runway.**

Justification: Contaminants on runways may influence both aircraft acceleration (displacement/impingement drag) and aircraft deceleration (aircraft braking action). Non-dry runways which do not fulfil the requirements for a contaminated runway can be considered wet according to the proposed text. However there may be runways with contaminant depths below the values suggested in (i) or not qualifying as (ii) or (iii) which do not exhibit the same braking action as a wet runway. Clearly treating such runways as wet is unsafe. Such runways can be considered slippery runways and there is manufacturer guidance available for this situation.

comment *433* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.010 (a)(24): proposed new text: change as follows:

(24) 'Dry runway' means ~~**a runway which is neither wet nor contaminated, and includes those paved runways which have been specially prepared with grooves or porous pavement and maintained to retain 'effectively dry' braking action even when moisture is present.**~~ **a runway which is clear of contaminants and visible moisture within the required length and width being used.**

Justification:

With the development and harmonization of JAR/FAR/CS 25 it was recognized that grooved/PFC runways while improving aircraft braking action as compared to a regular wet runway do not provide an effectively dry braking action. To the knowledge of ECA there is no flight test data which indeed shows an effectively dry braking action on such runways.

The text is the same as the original JAR-OPS text which was interpreted by several operators not as a requirement to verify effectively dry braking action but was instead interpreted as a statement saying that such runways indeed produce an effectively dry braking action. ECA considers this an unsafe practice and feels supported by the requirements in JAR/FAR/CS-25, DNPA-OPS 47 as produced by the JAA Performance Subcommittee and the recent CAA-UK 2009/03 FODCOM.

As certification standards were already brought in line with scientific

knowledge more than 10 years ago and considering the fact that several draft JAA NPAs have been included in NPA 2009-02 ECA strongly urges adoption of the proposals contained in JAA DNPA-OPS 47.

comment *435* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.010 (a)(75):delete as follows:

~~**(75) 'Take-off flight path' means the vertical and horizontal path, with the critical power-unit inoperative, from a specified point in the take-off to 1000 ft above the surface.**~~

Justification:

The proposed definition for take-off flight path is not in agreement with either CS-25 or the original requirements in JAR-OPS. Limiting the take-off flight path definition to 1000 ft above the surface could result in certain obstacles not being part of the take-off analysis, thereby producing an unsafe situation.

Furthermore, the below definitions originally contained in JAR-OPS 1.480(b) are not included in OPS.GEN.010 and as such it is proposed to include a suitable reference to the Certification Specifications for the following definitions:
1. Accelerate-stop distance
2. Take-off distance
3. Take-off run
4. Net take-off flight path
5. One engine inoperative en-route net flight path
6. Two engines inoperative en-route flight path)

comment *436* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.010 (a)(79): change as follows REF.: JAA DNPA-OPS 47:

(79) 'Wet runway'**: a runway that is neither dry nor contamined is considered wet.** ~~**means a runway of which the surface is covered with water, or equivalent, less than specified by the 'contaminated runway' definition or when there is sufficient moisture on the runway surface to cause it to appear reflective, but without significant areas of standing water.**~~

Justification: Certain types of runways, such as e.g. grooved or PFC runways do not exhibit a tendency to become reflective when however the aircraft braking action is already reduced below that of a dry runway. The ambiguity in current or proposed runway state definitions result in erroneous or unsafe application of dry runway performance where application of wet runway performance would be appropriate. This situation was acknowledged more than 10 years ago and is reflected and harmonized in JAA/FAA/CS-25 certification standards. ECA strongly urges adoption of the proposals

contained in JAA DNPA-OPS 47.

comment *438* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.010: add the following definition:

(tbd) Accelerate-stop distance available (ASDA). The length of the take-off run available plus the length of stop way, if such stop way is declared available by the appropriate Authority and is capable of bearing the mass of the aeroplane under the prevailing operating conditions.

Justification:

The definition of Accelerate-stop distance available (ASDA) is missing. The reference is EU-OPS 1.480(a)(1).

comment *529* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.010(a)(13): change as follows:

(13) 'Contaminated runway' means a runway of which more than 25% of the runway surface area (whether in isolated areas or not) within the required length and width being used is covered by the following:

(i) Surface water ~~**more than**~~ 3 mm (0.125 in) deep, or by slush, or loose snow, equivalent to ~~**more than**~~ 3 mm (0.125 in) of water;

(ii) Snow which has been compressed into a solid mass which resists further compression and will hold together or break into lumps if picked up (compacted snow); or

(iii) Ice, including wet ice.

Justification:

ECA recommends to include the 3 mm in the definition. It is clearer for the pilots on when they should use "contaminated runway" data. To avoid pilots using "just" wet runway data on a runway covered with 3mm standing water. Also consistent with available data from manufacturer (eg. Boeing) regarding contamination depths which includes the 3 mm.

comment *581* comment by: *ECA - European Cockpit Association*

Request clarification why definitions of 'circling' and 'visual approach', 'CDFA', 'Lower than Standard Category I Operation', 'Other than Standard Category II Operation', "accepted/acceptable", "Approved (by the authority)", "MEL and MMEL" are not included in IR.

comment *582* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.010(46): changes as follows:

(46) 'Low Visibility Procedures (LVP)' ~~**shall mean**~~ **are** procedures applied at an aerodrome for the purpose of ensuring safe operations during ~~**low visibility conditions, for which a specific approval is required;**~~ **lower than Standard Category I, other than Standard Category II, Category II and III approaches and Low Visibility Take-offs.**

Justification:

The text needs to be more specific.

comment *676* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.010: Include definitions for "accepted/acceptable", "Approved(by the authority)", "MEL and MMEL"

Reference text from EUOPS 1.003 (a) and (b) not transferred.

comment *724* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.010(xx): missing definition for :

maximum ZF Mass, Landing Mass and Take off Mass definitions as per EU OPS 1.607 (b), (c) and (d) :

Add text as follows:

Maximum zero fuel mass. The maximum permissible mass of an aeroplane with no usable fuel. The mass of the fuel contained in particular tanks must be included in the zero fuel mass when it is explicitly mentioned in the Aeroplane Flight Manual limitations.

Maximum structural landing mass. The maximum permissible total aeroplane mass upon landing under normal circumstances.

Maximum structural take off mass. The maximum permissible total aeroplane mass at the start of the take-off run.

Justification:

Text not transferred from EU OPS 1

comment *725* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.010(tbd): add the following definition for passenger classification as per EU OPS 1.607 (e):

(tbd) Passenger classification.

1. Adults, male and female, are defined as persons of an age of 12

years and above.

2. Children are defined as persons who are of an age of two years and above but who are less than 12 years of age.

3. Infants are defined as persons who are les than two years of age.

Justification:

Text not transferred from EU OPS 1.

comment *726* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.010(65): change as follows: remove (ii):

(65) 'Series of flights' means consecutive flights, which begin and end:

(i) within a 24 hours period;

~~**(ii) at the same aerodrome/operating site;**~~ and

(iii) with the same pilot-in-command of the aircraft.

Justification:

This requirement is useless, and even renders provisions in OPS.COM.115, OPS.SPA.001.HEMS uselessly burdensome without safety benefit. Moreover, it conflicts with the FDP definition of OR.OPS.010.FTL (f).

comment *733* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(6), definition of 'aeroplane', change text as follows:

'Aeroplane' means **a power driven heavier than air aircraft, deriving its lift in flight chiefly from aerodynamic reactions on surfaces which remain fixed under given conditions of flight;**

~~**an engine-driven fixed-wing aircraft heavier than air capable of flight whose lift is generated not by wing motion relative to the aircraft, but by forward motion through the air that is supported in flight by the dynamic reaction of the air against its wings;**~~

Justification:

This is the Original text from ICAO Annex I, Annex 6.

comment *734* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(11), definition of 'cloud base':

clarify:

"Vicinity" in terms of ICAO regs means 8km ref. ICAO Annex 3 4.8.6 - is that the agencies intention ?

comment *736* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(15), definition of 'critical phases of flight':

Clarify :

Is the "final approach" per definition of PANS OPS sufficient measure for commercial and IFR flights ? (i.e. starting max 3-4000ft AAL?)

comment *737* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(21):

(21) 'Disruptive passenger' means a passenger who fails to respect the **rules of conduct** on board an aircraft or to comply with the instructions of crew members.

ECA requests clarification about the term 'Rules of conduct'. What is the legal effect of it? Where are those rules laid down?

comment *738* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(23), definition of 'dry operating mass':

Add text:

(iv) technical liquids (e.g. oil and hydraulic fluids)

~~**OK according JAR OPS subpart J 1.607 (a), but Missing supplies as well as the amounts of technical liquids eg. Oil and hydraulic fluids (commonly used in our operations manuals). Is this laid down somewhere else???**~~

comment *739* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(26), definition of 'enhanced vision system (EVS)', change text as follows:

'Enhanced Vision System (EVS)' ~~**shall**~~ mean**s** an electronic means of displaying a real-time image of the external scene through the use of imaging sensors;

comment *741* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(29), definition of 'ground emergency personnel', change text as follows:

'Ground emergency service personnel' **~~shall mean~~** **is** any ground emergency service personnel (such as policemen, firemen, etc.) involved with Helicopter Emergency Medical Service (HEMS) and whose tasks are to any extent pertinent to helicopter operations;

comment *742* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(30), definition of 'Helicopter emergency medical service (HEMS)', change text as follows:

'Helicopter Emergency Medical Service (HEMS) flight' **~~shall mean~~** **is** a flight by a helicopter operating under a HEMS approval, the purpose of which is to facilitate emergency medical assistance, where immediate and rapid transportation is essential, by carrying:

comment *743* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(31), definition of 'helicopter hoist operations (HHO)', change text as follows:

'Helicopter Hoist Operations (HHO) Flight' **~~shall mean~~** **is** a flight by a helicopter operating under an HHO approval, the purpose of which is to facilitate the transfer of persons and/or cargo by means of a helicopter hoist;

comment *744* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(33), definition of HEMS dispatch centre', change text as follows:

'HEMS dispatch centre' **~~shall mean~~** **is** a place where, if established, the coordination or control of the HEMS flight takes place. It may be located in a HEMS operating base;

comment *745* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(34), definition of 'HEMS operating base', change text as follows:

'HEMS operating base' **~~shall mean~~** **is** an aerodrome at which the HEMS crew members and the HEMS helicopter may be on stand-by for HEMS operations;

comment *746* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(35), definition of HEMS operating site', change text as follows:

'HEMS operating site' ~~**shall mean**~~ **is** a site selected by the pilot-in-command during a HEMS flight for Helicopter Hoist Operations, landing and take off;

comment *747* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(36), definition of 'HHO offshore', change text as follows:

'HHO Offshore' ~~**shall mean**~~ **is** a flight by a helicopter operating under a HHO approval, the purpose of which is to facilitate the transfer of persons and/or cargo by means of a helicopter hoist from or to a vessel or structure in a sea area or to the sea itself;

comment *748* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(37), definition of 'HHO passenger', change text as follows:

'HHO Passenger' ~~**shall mean**~~ **is** a person who is to be transferred by means of a helicopter hoist;

comment *749* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(38), definition of HHO site, change text as follows:

'HHO Site' ~~**shall mean**~~ **is** a specified area at which a helicopter performs a hoist transfer;

comment *750* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(39), definition of 'hold-over time (HoT):

We see the need to specify more types of precipitation (e.g. - FZRA and FZRA)?

comment *754* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(47), definition of 'low visibility take-off (LVTO)', change text as follows:

'Low Visibility Take-Off (LVTO)' ~~**shall mean**~~ **is** a take-off where the Runway Visual Range (RVR)**, measured for the respective runway, is less than 400m**

Jusitification:

RVR not applicable if not measured at the runway used for takeoff! Safety relevant

comment *755* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(50), definition of 'night vision goggles (NVG)', change text as follows:

'Night Vision Goggles (NVG)' ~~**shall mean**~~ **is** a head-mounted, binocular, light intensification appliance that enhances the ability to maintain visual surface references at night;

comment *756* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(51), definition of 'night vision imaging system (NVIS)', change text as follows:

'Night Vision Imaging System (NVIS)' ~~**shall mean**~~ **is** the integration of all elements required to successfully and safely use NVGs while operating a helicopter. The system includes as a minimum: NVGs, NVIS lighting, helicopter components (such as radio altimeter, visual warning system and audio warning system), training and continuing airworthiness;

comment *757* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(53), definition of 'NVIS flight', change text as follows:

'NVIS Flight' ~~**shall mean**~~ **is** a flight under night VMC with the flight crew using NVGs in a helicopter operating under an NVIS approval;

comment *758* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(59), definition of 'powered sailplane':

Clarify: given text applies to an Airbus 330 as well – so what are the *"characteristics of a sailplane"*? We suspect the definition is aiming at TMG licence holders only.

ECA recommends to use the term "touring motorglider " as in JAR FCL 3.001 (see below):

Touring Motor Glider (TMG)

A motor glider having a certificate of airworthiness issued or accepted by a JAA Member State having an integrally mounted, non-retractable engine and a non-retractable propeller plus those listed in Appendix 1 to JAR-FCL 1.215. It shall be capable of taking off and climbing under its own power according to its flight manual.

comment *759* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(62), definition of 'Runway visual range (RVR)':

ECA requests clarification: RVR is a meteorological measurement procedure and does not describe the range over which the pilot of an aircraft on the centreline of a runway can see the runway surface markings or the lights delineating the runway or identifying the centreline. This is a so-called 'pilot's assessment' of the actual visibility.

comment *760* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(66), definition of 'Sailplane', change text as follows:

'Sailplane' means a heavier-than-air **unpowered** aircraft **capable of flight whose lift is generated not by wing motion relative to the aircraft, but by forward motion through the air** ~~**that is supported in flight by the dynamic reaction of the air against its fixed lifting surfaces, the free flight of which does**~~ not depend**ent** on an engine;

Justification:

This wording is more understandable.

comment *761* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(67), definition of 'screen height':

ECA requests clarification:

Screen height is not variable for the operator - it is just dependent on dry/wet runway conditions in case of engine out. It needs to comply with performance requirements in first place, which is:

- Screen height for takeoff: 35 ft dry runway/ 15 ft wet runway

- Screen height for landing: 50 ft

comment *762* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(70), definition of 'take-off alternate':

ECA requests clarification:

The term "shortly" is ambiguous and needs to be specified in terms of flight time. On what rule is the requirement for an TO ALTN based upon? [1 hour of SAD?]. The reference text is EU OPS 1.295 (b) (1)-(3).

comment *763* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(75), definition of 'take-off flight path':

ECA requests clarification:

Where are "1000 ft" originating from? JAR OPS 1.480 does not offer a similar definition.

comment *765* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a)(69), definition of 'standard category I':

ECA requests clarification:

The definitions for higher approach categories are also needed, e.g. CAT II and CAT III.

comment *766* comment by: *ECA - European Cockpit Association*

Comment: add the following definition:

(tbd) 'Electronic Flight Bag (EFB)' <![endif]--> **is an electronic device intended for flight crew functions traditionally accomplished using paper references (e.g., operating manuals, aeronautical charts, performance calculations). In addition, the EFB may host other applications that have no paper equivalent e.g., a video surveillance system".**

comment *796* comment by: *French SAMU using helicopters for medical transport*

Whenever terms are used in the regulation with a specific meaning they should be defined: I.E TLOF, VY, Rotating Point, Approved Operating Site....

It is mine understanding that "Aerodrome" as defined in the NPA does only include heliports meeting the Annex XIV Volume 2 requirements and all the other sites are in the NPA under the generic term "Operating sites" which in Annex XIV and JAR-OPS 3 where covered by the generic word "heliport",

HEMS,HHO,EXTERNAL LOAD are specialized operating sites which may

request an Authority approval if performed in a congested hostile environment ,

I would like to have confirmation that such an interpretation is the proper one.

(38) add « **operating site** » after HHO

Consistency with the other specialized sites

(55) add "**External load operations"** at the end of the sentence

Questions:

External load operation : Term might be used in replacement of HHO operating site as being more generic ?

(56) use the same wording as for (57) insert in the sentence " **the performance is available to enable the helicopter to"**

consistency

The term "approved operating site" should appear in the definition chapter

In OPERATING PROCEDURES

OPS GEN 150, OPS GEN 155,OPS GEN 160 OPS GEN 200,

Insert "**operating sites"** after aerodrome

Helicopters may depart IFR or use operating sites as alternate

comment *815* comment by: *CAA-NL*

Attachments #2 #3

JAA NPA-OPS 41 was introduced in EU-OPS 1 amdt 2. Unfortunatley some explanatory material has not been added to this NPA.

As former chairman of the JAA AWOSG having produced this NPA-OPS 41 I would like you to consider it for EASA-OPS.

comment *907* comment by: *CAA-NL*

Suggestion CAA-NL:

Location of list of defintion is not used consistent in EASA OPS.

Suggestion, make a CS that contains all definitions.

Reason:

Consistency

comment *930* comment by: *REGA*

(12) "congested" has be defined more precisely. Otherwise every recreational area, e.g. a 100km2 park with 2 people on it will counts towards a congested area.

Proposal (12)

'Congested area' means in relation to a city, town or settlement, any area which is **actually** *and substantially used for residential, commercial or recreational purposes if* **persons or property is exposed to an unacceptable risk of injury or damage in respect to operation.**

(15)

For helicopter: air-taxiing instead of taxiing.

(30)

Def. 30 (HEMS-Operation). The definition excludes too much things.

Proposal

Delete the sub article i, ii, iii.

(41)

"Hostile" - This definition has an interpretative character as already seen in the JAA member states:

Only open see areas?

Mountainous area counts as hostile due to inadequate surfaces for safe forced landing?

Depending on the pilot's skill, areas could or could not count towards hostile?

It would be necessary to be more precise.

Proposal 1 (41)

(i) An environment in which:

(A) A safe forced landing cannot be accomplished <u>in any case</u> because the surface is inadequate; or

(…)

Proposal 2 (41)

(i) An environment in which:

(A) A safe forced landing cannot be accomplished ~~because the surface is inadequate; or~~

(…)

(45) What about HEMS missions beginning at 23:45h and ending after midnight?

Proposal (45)

(i) within a 24 hours period

(ii) 'Local operations' are conducted by day and night under VFR; and..

(50) *'Night Vision Goggles (NVG)' shall mean a ~~head~~-helmet mounted, (…)*

(53) Definition of "flight crew" is missing.

(60) In the case of multinational (within EU) operating company: What if the principal financial functions are in one country while the CAMO (CAM) is placed in another country? Different places for different activities: an usual European Business model.

Proposal (60)

'Principal place of business' means the head office or registered office of a Community operator in the Member State. ~~within which the principal financial functions operational control, including continued airworthiness management, of the Community operator are exercised.~~

comment *935* comment by: *EHOC*

General

This whole section contains examples of arcane use of language constructs. ICAO, in the definitions chapter, specifies the term to be defined, adds a 'period' and then provides the definition; this convention was followed by JAR-OPS.

Some States (and other Parts) specify the term to be defined and then, without adding a period, add "means" and provide the definition.

The ICAO method should be used because it has been used for JAR-OPS in the recent past and it therefore represents the *status quo ante*. Alternatively, 'means' can be added and the period removed. The use of 'shall' introduces a construct which should be used only for requirements and not statements.

Esoterically, the ICAO method does permit the complete definition to be picked up (in its entirety) and used in subsequent guidance material.

comment *965* comment by: *HCE Education*

The definition of Night (30 minutes after sunset until 30 minutes before sunrise) must be heavily objected. In the northern part of the Nordic countries, the civil twilight can be as long as several weeks in the autumn and in the spring. This is due to the fact that every autumn and spring, there is a period for approximately two weeks when the sun is constantly below the horizon but still above 6 degrees below the horizon (the definition of civil twilight). If the proposal for the definition would be implemented, it would e.g. make it illegal to fly VFR without a Night rating for about one month every year, although it is technically not night. Furthermore, one consequence with safety implications is that it would be possible during this time to train for a Night rating, although it is technically not night.

Furthermore, the definition of Night in the proposal for Part-FCL.010 is *'Night' means the period between the end of evening civil twilight and the*

beginning of morning civil twilight or such other period between sunset and sunrise as may be prescribed by the appropriate authority, as defined by the Member State. There should obviously not be different definitions in Part-FCL and Part-OPS.

The definition in Part-OPS should be changed to the proposed definition in Part-FCL but without *"or such other period between sunset and sunrise as may be prescribed by the appropriate authority, as defined by the Member State",* as has been proposed and explained in NPA 2008-17b comment #5630.

comment *1010* comment by: *Michael Kroell*

(31) "Helicopter Hoist Operations (HHO) Flight":

Integration of flights with human cargo on a fixed distance external load long line or a fixed distance external load long line which can be extended by the individual transported with the long line (variable long line).

(34) "HEMS operating base":

Not necessarily an aerodrome; ...mean an aerodrome or heliport ....

comment *1011* comment by: *Michael Kroell*

(45) "Local operations"

For Helicopters example:

HEMS - always from HEMS base to finally HEMS base;

External load ops: from working base to working base - exept ferry to change working base

Integration: (vi) Helicopters: Flights start and end at the same location

comment *1012* comment by: *Michael Kroell*

(45) (i) start and end on the same day

(ii) are conducted by day under vfr:

May be problematic for nordic coutries, where daylight is available on a 24h basis

comment *1013* comment by: *Michael Kroell*

(54) "Offshore operations":

partially right, but must not always be an offshore destination;

Definition should include: ".. more than 10 min. flighttime at normal cruise speed overwater from next shoreline."

comment *1019* comment by: *Michael Kroell*

(9) "Category A with respect to helicopters" ....specified in CS27/29 or equivalent and.....

equivalent is misleading;

should state: or equivalent certification standards

comment *1029* comment by: *arno liesch*

Def. 30 (HEMS-Operation) This article excludes too much things. Proposal: Delete the subarticle i, ii, iii.

comment *1033* comment by: *arno liesch*

(45) (ii) 'Local operations' are conducted by day **AND NIGHT** under VFR; and..

comment *1034* comment by: *AECA(SPAIN)*

To add

Paragraph 5:

... taking-off ans manoeuvering of aircraft **according his performances**

comment *1059* comment by: *AECA helicopteros.*

add a new definition because CP(Committal point) is used in GM1 OPS.SPA.005.SFL(b) but not defined.

Committal Point (CP). The committal point is defined as the point in the approach at which the pilot flying (PF) decides that, in the event of a power unit failure being recognised, the safest option is to continue to the deck.

comment *1060* comment by: *AECA helicopteros.*

add a new definition, because Rotation Point is used in GM4 OPS.CAT.355.H and GM1 OPS.SPA.005.SFL(b) but not defined.

Rotation Point (RP). The rotation point is defined as the point at which a cyclic input is made to initiate a nose-down attitude change during the take-off flight path. It is the last point in the take-off path from which, in the event of an engine failure being recognised, a forced landing on the deck can be achieved.

comment *1061* comment by: *AECA helicopteros.*

We suggest to take the definition from JAR OPS.

Touchdown and lift-off area (TLOF). A load bearing area on which a helicopter may touch down or lift off.

comment *1062* comment by: *AECA helicopteros.*

We suggest to take the definition content in JAR OPS

Vy. Best rate of climb speed.

comment *1107* comment by: *CAA-NL*

The CAA-NL proposes to EASA to include in OPS.GEN.010 DEFINITIONS, a generic reference to ICAO Part 1, chapter 3.1 of the ICAO TI for all dangerous goods definitions.

comment *1118* comment by: *Heli Gotthard*

Point 30 : Blood, organs or drugs which does not need any medical equipment shall not be considerated as HEMS.The final decision shall remain with the National Authority.

comment *1377* comment by: *International Air Transport Association*

OPS.GEN.010 Defintion of "Acceptance Check List". The wording of the defintion refers to the operator checking the "external appearance" of packages. This text should be more specific and refer to the marking and labelling on packages. In addition, the text then states that the check list is used to "determine that all appropriate requirements have been met". This should be qualified to state "determine, to the extent possible, that all appropriate requirements have been met." The operator can only validate what the shipper has provided.

comment *1392* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

General comment:

Among aviation regulations often different definitions can be found for one single term. EASA should elaborate a separate volume on definitions applicable for all its aviation regulations.

- **Concern Detail:**
  Definition(12): "Congested Area" has to be defined more precisely and tailored towards the practical use.
  Comment / Proposal:
  Modify text:
  Definition (12): 'Congested area' means in relation to a city, town or settlement, any area which
  is substantially used for residential, commercial or recreational purposes if persons or property is exposed to an unacceptable risk in respect to the operation.
- **Concern Detail:**
  Definition (30): Helicopter Emergency Medical Service
  Comment / Proposal:
  Modify text:
  Delete i, ii, iii
- **Concern Detail:**
  Definition (41): The definition of hostile environment is not applicable as proposed. A safe forced landing depends on the skill of the pilot and many more factors. It is not clear if the mountain area of Switzerland following the proposed definition would be considered as hostile environment.
  Comment / Proposal:
  Modify text:
  Definition (41:) A safe forced landing cannot be accomplished in any case because the surface is inadequate.

- **Concern Detail:**
  Definition (45): "Local Operations"
  Comment / Proposal:
  Modify text:
  Definition (45): "Local Operations" means flights operations conducted within a local and defined
  geographical area which:
  (i) start and end within a period of 24 hours (delete: on the same day);
  (ii) are conducted by day and night under VFR; and
  (iii) are navigated over routes by reference to visual landmarks.
  Remarks:
  Definition (45): The 24 hour period makes sense regarding HEMS operations which often take place at night.
- **Concern Detail:**

Definition (60)

Comment / Proposal:

Definition is not compliant with OR.GEN.001b, the definitions are not sufficient coordinated.

- **Concern Detail:**

Definition (77)

Comment / Proposal:

This definition is wrong, as V1 is already defined in CS.

comment *1421* comment by: *EUROCOPTER*

There is no definition of 'helicopter' while there is a definition of 'aeroplane' ((a)(6)).

Proposal: the ICAO definition of 'helicopter' should be added.

comment *1423* comment by: *EUROCOPTER*

The definition "heliport" used in JAR-OPS 3 is consistent with ICAO annex 6, and addresses a site used for take-off or landing by a helicopter, which is not necessarily an aerodrome, and which is not totally covered by the term 'operating site".

Proposal: to add the following definition in OPS.GEN.010:

"Heliport. An aerodrome or a defined area of land, water or a structure used or intended to be used wholly or in part for the arrival, departure and surface movement of helicopters."

comment *1483* comment by: *Airbus*

Add the following definition:

'Accelerate-stop distance available (ASDA)' means the length of the take-off run available plus the length of stop way, if such stop way is declared available by the appropriate Authority and is capable of bearing the mass of the aeroplane under the prevailing operating conditions.

Reason: This definition, which exists in OPS 1, is needed for understanding of the accelerate-stop performance requirements.

comment *1608* comment by: *Luftfahrt-Bundesamt*

Additional definitions are included in GM OPS.GEN.010. In our view, this is misleading. The material shuould be moved into OPS.GEN 010 in order to provide a single place where the reader can find all definitions used.

comment *1784* comment by: *Heli Gotthard AG Erstfeld*

Ops Gen 010 Definitions

Point 30 : Blood, organs or drugs which does not need any medical equipment shall not be considerated as HEMS.The final decision shall remain with the National Authority.

comment *1870* comment by: *Manchester Airport (EGCC)*

Comment re: OPS.GEN.010 (a) (24):-

The definition of "Dry Runway" is in appropriate. There are five main problems as follows.

1. If moisture is present on a runway pavement surface, it cannot exhibit the same friction coefficient as a truly dry runway. This therefore means that a runway with moisture is in fact "Damp", or if the surface is soaked, it is "Wet". A moist runway cannot be described as dry under any circumstances as it cannot exhibit the same friction qualities as a truly dry runway.
2. There is an underlying assumption that the surface friction characteristics are derived solely by the original material of the pavement surface. This assumption is severely flawed as a runway surface will wear over time, or may become contaminated with rubber build up, such that the maximum friction coefficient will reduce. Approaching the end of the life of a runway pavement surface, the friction level will be much lower than a new surface. Regardless of whether it is grooved or otherwise, the braking effect capability will be reduced and may not be sufficient to meet the

characteristics made in the assumption that a good runway surface may permit use of dry braking criteria. The only measure that can be relevant is the actual friction on the runway surface, however there is no specification for how this is "maintained" as suggested by the definition. Can EASA derive a means of comparing runway measured friction levels to an equivalent braking action capability that relates to aircraft braking performance?

3. The term "moisture" is not defined in ICAO as a means of describing the state of a runway surface. The only terms permitted are Dry, Damp, Wet, Water patches, or Flooded. This can lead operators of aircraft into making dangerously incorrect assumptions that a wet runway is moist and therefore "effectively dry". If moist means "Damp", then use the term Damp.
4. The definition has a vague reference to the method of preparation of a runway surface. It states that the dry runway criteria "includes" those specially prepared, leading to the assumption that other runway surface preparations are also "included" though not specifically mentioned.
5. The reference to some specific methods of runway surface preparation does not make the correct technical correlation between surface characteristics and friction (braking action). There are many ways of producing a pavement surface with high friction values in addition to grooving and porous materials. The significant factor is the Mean Texture Depth of the surface preparation. This is a scientifically measured and specified pavement characteristic. As an example, it is quite possible to groove a runway surface, but such that it will still have a lower friction level than a non-grooved runway that is made of a different material specification. A more correct technical requirement for the pavement surface should be specified that includes a value of mean texture depth. However, comments above must primarily be taken into account that propose that a "moist", or damp, runway cannot be described as dry.

Futher reference to this debate can be found in the UK CAA FODCOM No. 03/2009, titled "The importance of using performance data appropriate to the existng runway conditions".

comment *1907* comment by: *Ingmar Hedblom*

OPS.GEN.010(45)

Start and end on the same day means that a midnight local flight during summer in northern Sweden is not possible. Furthermore, the term “local operation” is not used in NPA 2009-02. This restriction is not acceptable and unreasonable.

Delete the whole definition of Local operation since it is not used.

The expression “Local area operations” is used in AMC OPS.CAT.235 with the definition “encompass usually an area within a distance of 20 - 25 nm”.

comment *1908* comment by: *Ingmar Hedblom*

OPS.GEN.010(59)

Powered sailplanes is defined here but which operating rules applies for TMG, Touring Motor Gliders?

Draft Opinion Part - Air Operations

OPS GEN 010. Definitions

(60) Page 26 - Principal place of BUsiness "means the head office of registered office of a community operator in the Member State ....."

COMMENT : This means that any operator may have its crew / aircraft based in Europe and the "Principal place of business" outside the EU. Crew Personnel will , in this case, not be suject to European legislation contained in the NPA 2009.

This may encourage AIrline operators to set up their principal place of business outside of the EU where regulations are less restrictive. In the past this has occured with American airlines based in the US and crew bases within the EU and elsewhere (ex:United AIrlines) and airline crew having little protection as to working conditions and hours.

OPS GEN 020 Crew Responsibilities

(b) Page 28 "Crew members shall be seated at their assigned stations and shall not perform any activities other than those required for the safe operation of the aircraft during critical phases of flight"

Comment: This is vague and does not enumerate "critical phases of flight". This should be detailed so as not to cause any confusion.

(g) Page 29 "Crew members should not undertake duties on an aircraft if they know that they are sufering from or are likely to suffer from fatigue or they feel unfit to the extent that the flight may be endangered. "

PROPOSED TEXT : "Crew members have a right to refuse to undertake duties or continue flight schedules if they do not feel that they are apt physically or mentally to ensure the safe

undertaking of their duties. As only the crew member in question is able to evaluate his/her capacity to safely undertake her/his duties the decision to refrain from flight duty may not be contested by the operator or the medical examiner unless this action becomes repetitive. In such a case the consultation of a medical practitioner is advised."

JUSTIFICATION : ICAO Annexe 6 2.2.3 " An important safeguard may be established if States and Operators recognise the right of a crew member to refuse further flight duty when suffering from fatique of such a nature as to affect adversely the safety of the flight."

See also French Decree 11 July 1991 referring to crew fatigue and the right to abstain from flight duties.

In order that crew may not be unduly punished for refusing it is imperative that it is left up to the crew member to evaluate his / her capacity to work in a safe manner.

OPS.GEN.010 Definitions

(22) 'DR'

DR means in aviation normally "Dead Reckoning" and is used in navigation.

Therefore it is suggested to clarify this definition by using another term or by

explanation of the distinction between " different DR".

comment *2285* comment by: *Austro Control GmbH*

(45) 'Local operations'

(i) start and end on the same day;

It is suggested to clarify "day" with the wording "*start and end within a period of consecutive 24 hours".*

Justification:

if "day" it is connected with sunrise, it might not be practicable for nordic countries where the day has 24 h.

comment *2309* comment by: *Austro Control GmbH*

(9)

"equivalent" is misleading and should be clarificated as "...*or equivalent certification standards*.."

comment *2310* comment by: *Austro Control GmbH*

(31)

Helicopter Hoist Operations:

There is a practical need to include human cargo with ropes or longe line, especially for HEMS, evacution or rescue work.

Therefore it is suggested to extend this definition or to add an seperate definiton for human external cargo operation.

"Human Exerternal Cargo operation" shall mean the transport of persons with a HHO approval or a longe line approval.

comment *2311* comment by: *Austro Control GmbH*

(35)

the listing is misleading, as the rule could be interpreted that only HHO is ment (see Definition 55, where this aspect is correct); also see Comment to Point 31 for human cargo.

Correction suggested:

".... a HEMS flight for landing, take off and Hoist or human long line operation".

comment *2315* comment by: *heliswiss ag, belp*

Point 30 : Blood, organs or drugs which does not need any medical equipment shall not be considerated as HEMS.The final decision shall remain with the National Authority.

comment *2347* comment by: *Dassault Aviation*

Technical comment:

Page 22 OPS.GEN.010 Definitions: With regards to MMEL and MEL, we propose to add a definition of "Inoperative Equipment" which is common to MMEL and MEL. The proposed definition could be introduced in the dedicated Definitions paragraph, as follows: "Inoperative Equipment: in connection with MMEL/MEL, an inoperative equipment is an equipment which can no longer function as intended, this include both loss of function and malfunction".

comment *2350* comment by: *Dassault Aviation*

Technical comment:

Page 22 OPS.GEN. Definitions:

proposed definition (new) of "separate runways": The concept "separate runways" is defined in EU-OPS1.192(f) but not in this NPA2009-02, although being mentioned in the paragraph OPS.CAT.155.A "Selection of alternate aerodromes" and GM1 OPS.CAT.205 "Fuel and oil supply". We suggest copying the EU-OPS1 definition here, in order to remind when overlapping or secant runways are considered as separate runways.

comment *2367* comment by: *Dassault Aviation*

Pages 27, 69 and 311 (resp. OPS.GEN.010 §67, OPS.CAT.345.A §(b) and AMC OPS.CAT.345.A(b)) (same comment as #1704) - Steep Approach and Screen Heights: these operational paragraphs consider that the landing distances data are based on a screen height of less than 50 feet but not less than 35 feet. It is to be noted that this 35-50 feet interval may be inadequate versus some airworthiness certification requirements. For example, NPA 25B-267 dealing with Steep Approach, allows screen heights from 35 feet up to 60 feet for the determination of landing distances data. Although it is a NPA, it is taken as it is through a Certification Review Item (CRI) therefore becoming an airworthiness certification bases on certain programs. The proposal is - if a maximum screen height needs to be mentioned - to increase the 50 feet proposed in the NPA 2009-02 to the value of 60 feet.

comment *2503* comment by: *Royal Aeronautical Society*

Page 22

Although the term 'ETOPS' is used in several places in this and other NPAs relating to operations, its meaning is not defined within Part-OPS. It is suggested that an appropriate meaning taken from EU-OPS 1.192 (amended only to reflect the NPA 2009-02b reference to OPS.CAT.156A in place of EU-OPS 1.245(a)) should be included in OPS.GEN.010 Definitions subparagraph (a) thus: '**(*sequence number*) ETOPS (Extended range operations for two engine aeroplanes). ETOPS operations are those with two engine aeroplanes approved by the Authority (ETOPS approval) to operate beyond the threshold distance determined in accordance with OPS.CAT.156A from an Adequate Aerodrome.'**

Pages 22, 23, 26, and 27

Both 'engine and 'power-unit' are used within the definitions, the former being associated mainly with aeroplanes and the latter with helicopters, however this is not consistent. **Unless some distinction is required either within texts covered by the Basic Regulation or for generic aircraft types, only one term – 'engine' or 'power-unit' - should be used (for all aircraft or for generic types) consistently.**

'Critical' with regard to engines/power-units is not defined. **It is suggested that a definition of 'critical' should be included in the list of Definitions in OPS.GEN.010.**

Page 26

Paragraph 65 (i): '24 hours' should be '24-hour' in this context.

comment *2542* comment by: *Walter Mayer, Heliswiss*

Point 30 : Blood, organs or drugs which does not need any medical equipment shall not be considerated as HEMS.The final decision shall remain with the National Authority.

Point 30 : Blood, organs or drugs which does not need any medical equipment shall not be considerated as HEMS.The final decision shall remain with the National Authority.

comment *2632* comment by: *AOPA-Sweden*

(22): The acronym DR normally means "Dead Reckoning" in terms of aviation. Therefore a change of acronym should be considered.

comment *2633* comment by: *AOPA-Sweden*

(23): The definition Dry operating mass' does not make any sense for small aircraft if it has to be used.

comment *2634* comment by: *AOPA-Sweden*

(45): The definition has no validity; it is not used in 02b or 22c. In the north of Europe there is no night-time in the middle of summer, so why the restriction of a local operation in the same day?

comment *2635* comment by: *AOPA-Sweden*

(25): In the northern Europe the twilight is much longer than 30 minutes during the summer.

The definition of "night" should be the same as NPA-2008-17: *'Night' means the period between the end of civil evening twilight and the beginning of morning civil twilight, or such other period between sunset and sunrise as may be prescribed by the appropriate authority, as defined by Member State.*

comment *2636* comment by: *AOPA-Sweden*

(59): Is a Touring Motor Glider (TMG), mentioned in the NPA 2008-17 to be considered a sailplane or an aeroplane?

comment *2637* comment by: *AOPA-Sweden*

(75): Is this a correct definition of a take-off flight path? AOPA-S sees that as a normal take-off, not a take-off with a non-operating engine. It is very difficult to decide that path, depending on where the failure occurs.

comment *2694* comment by: *Pietro Barbagallo ENAC*

Definition (48)

Comment: The definition should be rebuilt as in JAR-OPS 3. MAPSC, (maximum approved passenger seating configuration).

Justification: See JAR-OPS 3.005 (f)(g) and App.1 to JAR-OPS 3.005 (e). The helicopter configuration (MAPSC) must be "approved" by the Authority.

comment *2805* comment by: *Austro Control GmbH*

general comment:

for a uniforme understanding a definition of "Commercial Air transport" (see Subpart B, CAT) is necessary and should be added.

comment *2829* comment by: *Philipp Peterhans*

Point 30 : Blood, organs or drugs which does not need any medical equipment shall not be considerated as HEMS.The final decision shall remain with the National Authority.

comment *2888* comment by: *UK CAA*

Page No: 22

Paragraph No: OPS.GEN.010 (a)

Comment:

This paragraph details that "*For the purpose of this subpart, the following definitions shall apply*:"

It is not clear whether these definitions are to be used throughout Part-OPS or just Subpart A. If this is the case, then some may need to be repeated in other Subparts.

It is suggested that a consolidated 'Definition' section for the whole of the Implementing Rules would simplify the process and standardise terminology.

Justification:

To improve harmonisation and standardisation of definitions throughout the Implementing Rules with the aim of reducing the possibility of misinterpretation.

comment *2889* comment by: *UK CAA*

Page No: 22

Paragraph No: OPS.GEN.010(a)(5)

Comment: The definition of aerodrome differs from that now agreed by Council and Parliament with respect to the amendment of 216/2008 to extend its scope to the safety of aerodromes and ATM. Final text should await the formal adoption of the amendment.

Justification: Consistency is necessary for the efficient application of the total system approach for aviation safety.

Proposed Text (if applicable): (See Article 3 (m) as in formal adoption of amendment to 216/2008.)

comment *2890* comment by: *UK CAA*

Page No: 24

Paragraph No: OPS.GEN.010 (a)(32) Definitions

Comment: Some essential definitions are omitted, and some are in conflict with definitions elsewhere.

The term "Helideck" is at variance with the definition of an aerodrome;

Justification: Definitions must be consistent, and accurate.

Proposed Text (if applicable):

Define "**Cloud Ceiling"** as the height above the surface of the base of the

lowest layer of clouds that obscures more than half the sky; reported for only broken and overcast sky cover.

Define **"R"** as rotor radius.

comment *2891* comment by: *UK CAA*

Page No: 23

Paragraph No: OPS.GEN.010(a)(14)

Comment:

OPS.GEN 010 (14) gives a definition of "Controlled flight" as a flight subject to an ATC clearance. However, the words "controlled flight" are also used to describe an aircraft's motion as being under the positive control of the crew as in "controlled flight into terrain".

Justification: Clarification.

Proposed Text (if applicable):

(14) 'Controlled flight' means any flight which is subject to an air traffic control clearance. ***(The term may also be used to indicate a flight under the full control of its crew as in the expression "controlled flight into terrain").***

comment *2892* comment by: *UK CAA*

Page: 23

Paragraph No:

OPS.GEN.010 (a) (24) (79) and (13)

Comment: The definition of dry runway should not refer to 'specially prepared or grooved surface or 'effectively dry' braking action even when moisture is present'.

The definitions of dry, wet and contaminated runways should closer reflect the ICAO definitions.

Justification:

Dry runway:

There are many paved surfaces designed to improve braking characteristics in the presence of moisture. If it is not maintained the surface will not perform as the manufacturer intends and the performance of the surface will degrade with time. Also, it is now known that 'effectively dry' braking action can NEVER be achieved in the presence of moisture so it's not correct to offer it as a possibility in a definition. As a result of the current definition, many States/Operators assume that such prepared surfaces always allow the use of dry runway performance on wet runways; this is not the case.

Referrals to specially prepared runway surfaces should be included as AMC or GM material and the rule should be closer to the ICAO definition.

Contaminated Runway:

The depth for loose snow in the definition of a contaminated runway is no longer considered appropriate. This depth was derived assuming it meant loose dry snow and was based on an equivalency, in terms of its effect on airplane acceleration with 3 mm (0.125 in) of water. At the time this definition was formulated, the Joint Aviation Authorities (JAA) requirements did not have a separate definition for wet snow. Wet snow was considered to be indistinguishable from slush, and hence, not considered to be "loose snow." In addition, any depth of snow (either wet or dry) greater than 3 mm should be considered contaminated just like slush or water. While dry snow at this depth may not have a significant effect on acceleration, it will result in lower friction levels than a normal wet runway, which is what it would be considered under the Amendment 33 (at depths up to 20 mm). This is a significant safety concern.

Proposed Text (if applicable):

OPS.GEN.010 Definitions

(a)

(13) 'Contaminated runway' means, ***for the purpose of determining airplane performance*** a runway ~~of~~ which ~~more than 25% of the runway surface area (whether in isolated areas or not) within the required length and width being used is covered by the following:~~

~~(i) Surface water more than 3 mm (0.125 in) deep, or by slush, or loose snow, equivalent to more than 3 mm (0.125 in) of water;~~

~~(ii) Snow which has been compressed into a solid mass which resists further compression and will hold together or break into lumps if picked up (compacted snow); or~~

~~(iii) Ice, including wet ice.~~

is considered to be contaminated when more than 25 percent of the runway surface area (whether in isolated areas or not) within the required length and width being used is covered by:

(i) water, slush or snow more than 3 mm (0.125 in) deep; or

(ii) any depth of compacted snow or ice, including wet ice.

(24) 'Dry runway' means, ***for the purpose of determining***

aeroplane performance a runway which is neither wet nor contaminated, and includes those paved runways which have been specially prepared with grooves or porous pavement and maintained to retain 'effectively dry' braking action even when moisture is present.***clear of contaminants and visible moisture within the required length and width being used.***

(79) 'Wet runway' means, ***for the purpose of determining aircraft performance*** a runway of which ~~the surface is covered with water, or equivalent, less than specified by the 'contaminated runway' definition or when there is sufficient moisture on the runway surface to cause it to appear reflective, but without significant areas of standing water.~~

is neither dry nor contaminated.

comment *2893* comment by: *UK CAA*

Page No: 26

Paragraph No: OPS.GEN.010 (54)

Comment:

It is considered that 'Offshore Operations' should be associated with commercial operations only and covered by a Specific Approval (SPA) and therefore the definition should be amended to reflect this.

Justification:

Alignment of definition with intended requirement. Operations over water by 'private' operators could be affected disproportionately by requirements intended for commercial or commercial air transport type operations.

Proposed Text (if applicable):

(54) Offshore operations' means ***commercial helicopter*** operations which routinely have a substantial proportion of the flight conducted over sea areas to or from offshore locations. Such operations include, but are not limited to, support of offshore oil, gas and mineral exploitation and sea-pilot transfer ***and require a specific approval***.

comment *2894* comment by: *UK CAA*

Point 30 : Blood, organs or drugs which does not need any medical equipment shall not be considerated as HEMS.The final decision shall remain with the National Authority.

comment *2959* comment by: *Valair AG Switzerland*

Regarding helikopter performance

Art 77: From 1968 the Swiss AIB reports 58 occurrences related to technical or maintenance. 25 cases for SP, 28 cases for SE and 5 cases for ME. If we compare to the number of announced occurrences the figures shows : 25 occurrences for SP over a total of 121 representing 21%. 28 occurences for SE over a total of 240 representing 12%. 5 occurences for ME over a total of 29 representing 17%. Single Engine is according to this database the safest type. More, both IHST and EHEST in their respective analysis and research have not come to a result or any recommendations about the performance class type of helicopters. Therefore the choice of the performance class shall be left to the operator, provided he obtain the National Authority AOC required.

From 1968 the Swiss AIB reports 18 flame out occurrences (6 on SP and 12 on SE)(10 CAT - 5 AW - 3GA). Out of these 18, 3 were due to HFACS (ice ingestion and fuel contamination). Concerning the SE, on the remaining 9, five happends on Bell 204,205,206, three on SA315B and one on AS350. Considering 390 occurences and a total of 4 engine failure on the type in use for AW-HEMS-SAR, that represent only 1% of the total occurences.

From 1968 the Swiss AIB reports 22 occurrence for SAR and HEMS over a total of 390 which represents only the 5.6%. 22 occurrences for more than 325'000 missions accomplished represents 0,0068%. Seven happened on ME and fifthteen on SE and only 2 are related to Technical or maintenance (vibrations and hoist failure both on ME). Considering this, Helicopter Class choice shall be left to the operator, provided he obtain the National Authority AOC required.

There is no justification not allowing Performance Class 2 and 3 helicopter operating in SAR-HEMS-AW-CAT over hostile environement provided the operator obtain the National Authority AOC required.

(65) Series of flights means consecutive flights which begin and end: (i) within a 24 hour period (ii) at the same aerodrome/operating site and (iii) with the same pilot-in-command of the aircraft.

Comment:

It is our understanding that the definition 'series of flights' **only applies to helicopter operations**. For legal certainty reasons, we therefore believe this need to be clearly spelled out in this definition.

Proposal:

Add statement that 'series of flights' only applies to helicopter operations

comment *3007* comment by: *AEA*

Relevant Text:

(67) Screen Height means a hight selected by the (supplemental) type certificate holder at 50 ft, or another value from 25ft to 50ft.

Comment:

Screen height is not covered through the STC or TC

Proposal: .

Clarification needed

comment *3098* comment by: *M Wilson-NetJets*

Original text:

(15) 'Critical phases of flight' means the take-off run, the take-off flight path, the final approach, the landing including the landing roll, the go-around and any other phases of flight as determined by the pilot-in-command. For helicopters, 'critical phases of flight' includes in addition taxiing.

Suggested new text:

'Critical phases of flight' means the take-off run, **the path after the take-off run to such a point where landing gear and lift devices are retracted,** the final approach, the landing including the landing roll, the go-around and any other phases of flight as determined by the pilot-in-command. For helicopters, 'critical phases of flight' includes in addition taxiing.

Comment/suggestion:

The "critical phases of flight" definition contains the terminology of "take-off flight path" which, in itself, is defined with "one engine inoperative". This would mean that critical phases of flight are not applicable to an "all engines operating" take-off.

comment *3103* comment by: *M Wilson-NetJets*

Original text:

(65) 'Series of flights' means consecutive flights, which begin and end: (i) within a 24 hours period; (ii) at the same aerodrome/operating site; and (iii) with the same pilot-in-command of the aircraft.

Suggested new text:

No suggested text

Comment/suggestion:

The definition of "series of flights" in OPS.GEN does not appear to be compatible with its usage in OR.OPS.030.MLR and OR.OPS.010.FTL where it might be with a different pilot-in-command and may start and end at

different aerodromes.

comment *3105* comment by: *M Wilson-NetJets*

Original text:

(68) 'Special VFR flight' means a VFR flight cleared by air traffic control to operate within a control zone in meteorological conditions below VMC.

Suggested new text:

'Special VFR flight' means a VFR flight cleared by air traffic control to operate within a control zone in meteorological conditions below VMC **as required for the airspace class**.

Comment/suggestion:

VMC is dependant for the class of airspace the flight is conducted in. It might be that a flight in G airspace class operates in lower VMC conditions than a VFR flight that is operated in class B airspace. The flight operating in class G airspace is still flying under regular VFR and not special VFR although it flies in conditions "below VMC" for class B airspace.

comment *3107* comment by: *M Wilson-NetJets*

Original text:

(75) 'Take-off flight path' means the vertical and horizontal path, with the critical power-unit inoperative, from a specified point in the take-off to 1000 ft above the surface.

Suggested new text:

'Take-off flight path' means the vertical and horizontal path, with the critical power-unit inoperative, from a specified point in the take-off to **1500** ft above the surface.

Comment/suggestion:

The definition of "net take-off flight path" in CS 25 is defined up to 1500'. For ease of use and compatibility the two definitions should be aligned to the same altitude.

comment *3172* comment by: *Southern Cross International*

In numerous places reference is made to passenger, however there is no definition in this Part for a passenger. A definition is required for some commercial operations with technical crew members. Although OR-OPS.().TC describes the requirements for some technical crew members in HEMS, HHO and NVIS operations, in other types of operations other technical crew members may be present. Some examples are flight test engineers (see Part

21), flight test instrumentation engineers, loadmasters, radar operators, system and payload specialists, observers, et cetera. In addition, during acceptance and demonstration flights, customer technical representatives and authorities may be present during a flight.

These personnel shall not be considered as passengers but as crew members, assigned for a specific task by the operator.

The following definition is proposed for 'passenger':

A passenger shall mean any person who is present under a contract of carriage or any other person other than a crew member, an owner or operator's employee in an official capacity, an authorized representative of an appropriate national authority or person accompanying a consignment or other cargo.

comment *3206* comment by: *Eurocontrol CND*

A number of definitions differ from ICAO without any apparent reason. See e.g "aerodrome" where some details have been added (mand made structure or vessel) while the ICAO expression "surface movement" has been paraphrased into "manoeuvering" which has a completely different connotation. A cursory review of the definitions from page 22 onwards shows that at least the following definitions differ from ICAO: 5, 6, 19, 20, 26, 27, 32, 39, 43, 49, 56, 57, 58, 64, 65, 69, 71 and 73.

The potentially severe impact of such variations on ICAO definitions (and other ICAO provisions) must be taken into account and notably the conflicts that States may face concerning their obligations towards ICAO Standards versus the contents of EC regulatory material that may vary, rather than complement, those Standards. It should be noted that the approach that has been followed in relation to Single European Sky (SES) Implementing Rules (IR) has regognised that ICAO SARPs provide the baseline which SES IRs should complement and strengthen. To further enhance the process, tha Commission has recently required that Differences by States related to all SES IRs shall be identified and assessed during the development process of each of those IRs.

comment *3207* comment by: *Eurocontrol CND*

Stabilised approach. This definition misses the point. A stabilised approach according to most definitions includes wordings such as "a continuous descent with a rate of descent adjusted to achieve a constant descent gradient" (or words to that effect).

comment *3208* comment by: *Eurocontrol CND*

GLS missing in list (ILS, MLS, PAR) (Def 69, page 26)

comment *3422* comment by: *SNEH Organisation representing all french commercial helicopters operators*

HELICOPTER definition is missing

comment *3452* comment by: *IAOPA Europe*

The list of defitions is a typical example of reduced usability caused by combining all aircraft types into the same document.

For the pilot of a fixed wing aircraft many of the definitions are irrelevant since they refer to helicopters. However, this can only be realised after reading the whole definition plus others.

For instance definition 25 says: 'Elevated FATO' means a FATO which is at least 3 metres above the surrounding surface.

The fixed wing pilot most likely will not know the meaning of FATO and must therefore look up this term only then to realise that it is a term used for helicopter operations.

As a minimum the definitions should be grouped into sections according to aircraft type.

comment *3454* comment by: *IAOPA Europe*

Why should a 'local operation' be limited to start and end on the same day. In northern regions of Europe there is 24H daylight during the summer period. Therefore a local flight may well take place around midnight and still be 'a local operation'.

comment *3490* comment by: *Heliswiss International*

Point 30 : Blood, organs or drugs which does not need any medical equipment shall not be considerated as HEMS.The final decision shall remain with the National Authority.

comment *3555* comment by: *Walter Gessky*

3. OPS.GEN.010 Definitions

It is recommended that commonly used definitions are located in the Implementing Rule and not in the parts (Annexes) of the IR. I like to draw your intension to CS-Definition, which exists since 2003. In the interest of safety and legal certainty definitions shall, as far as possible, part of the

rules.

comment *3556* comment by: *Walter Gessky*

OPS.GEN.010 Definitions

(31) Helicopter Hoist Operation:

Add the following:

“human External Cargo operation: shall mean the transport of persons with a HHO approval or a long line approval.”

Justification:

It is suggested to add this definition for external human cargo operation, since there is a human transport with ropes or long line, especially for HEMS, evacuation or rescue work.

comment *3557* comment by: *Walter Gessky*

General comment, add a definition for

“Commercial operation”:

Justification:

For a uniform understanding a clear definition for commercial operation is required and should be added. This is especially essential for training organisations from when flight training is a commercial operation, and the training organisation is owned by a flying club.

comment *3601* comment by: *Austro Control GmbH*

(45) "local operations"

it is necessary to define local operations also for the use of helicoperts, especially HEMS:

Proposal:

delete "*on the same day*" in (i) and use the wording *"...start and end within a period" of 24 consecutive hours"*

Justification:

The 24 hours period is especially requested for HEMS operations which often are conducted during night.

comment *3612* comment by: *AUSTRIAN Airlines*

Relevant Text:

(*3) Adequate Aerodrome means any area on land, water or ma made structure or vessel, especially adapted for the landing, taking-off and manoeuvring of aircraft.*

Comment:

This definition is not line with EU-OPS. It does not take into account rescue and fire fighting services (RFFS). the need for aerodrome to be available at the expected time of use and the need for the aerodrome to be equipped with the necessary ancillary services such as ATS, sufficient lighting, communications, weather reporting, navaids and emergency services. Those essential elements of the definition of adequate aerodromes should not be in guidance material as suggested by EASA (see GM1 OPS.GEN.145 Use of Aerodromes/ Operating Sites, page 139). This definition of adequate aerodromes could potentially reduce flight safety.

Proposed Text

(if applicable):

'Performance Class 1' means ***operations with performance such*** that, in the event of failure of the critical power unit, the helicopter is able to land within the rejected take-off distance available or safely continue the flight to an appropriate landing area, depending on when the failure occurs.

comment *3813* comment by: *FOM ANWB MAA*

(15) 'critical phases of flight' .

Add:...and air taxiing

helicopters can be taxied both on the ground (wheeltype landinggear) or within ground effect (skidtype landinggear).

comment *3824* comment by: *AUSTRIAN Airlines*

Relevant Text:

(11) Cloud Base means the height of the base of the lowest observed or forecast cloud element in the vicinity of an aerodrome or operating site or within a specified area of operations, normally measured above aerodrome elevation or in the case of offshore operations above mean sea level.

Comment:

Ceiling has to be added as equal to an obstruction to the sky corresponding to the status broken as defined in ICAO Annex 3

Proposal:

Add definition of **ceiling**

comment *3825* comment by: *AUSTRIAN Airlines*

Comment:

The following definitions are missing and should be added for clarity:

Child;

Dangerous goods incident;

Proposal:

Add definition of child and dangerous good incident

Relevant Text:

(13) contaminated runway

comment *3827* comment by: *AUSTRIAN Airlines*

Comment:

In the definition of "contaminated runway", a category about **dry snow** is missing. This should be added.

Proposal:

Add a category of **dry snow** to the definition of contaminated runway

comment *3828* comment by: *AUSTRIAN Airlines*

Comment:

Some definitions seem to be written the hard-law (OPS.GEN.010 Definitions) whereas others are in guidance material (GM.OPS.GEN.010, page 103). This dvision in definitions does not seem to be based on clear criteria

Proposal:

Definitions should be in hard-law unless there is a clear justification

comment *3829* comment by: *AUSTRIAN Airlines*

Relevant Text:

(41) Hostile Environment

Comment:

It is our understanding that the definition ''hostile environment' only applies to helicopter operations. For legal certainty reasons, we therefore believe this need to be clearly spelled out in this definition

Proposal:

Add statement that 'hostile environment' only applies to helicopter operations

comment *3830* comment by: *AUSTRIAN Airlines*

Relevant Text:

(44) Landplane means a fixed wing aircraft that is designed for taking off and landing on land and includes amphibians operated as landplanes.

Comment:

The intent of this definition and its applicability to commercial operators is unclear.

Proposal:

Clarification needed.

Relevant Text:

(52) 'Non-hostile environment' means an environment in which:
(i) A safe forced landing can be accomplished;
(ii) The helicopter occupants can be protected from the elements;
(iii) Search and rescue response/capability is provided consistent with the anticipated exposure; and
(iv) those parts of a congested area with adequate safe forced landing areas shall be considered non-hostile.

comment *3831* comment by: *AUSTRIAN Airlines*

Comment:

It is our understanding that the definition 'non-hostile environment' **only applies to helicopter** operations. For legal certainty reasons, we therefore believe this need to be clearly spelled out in this definition

Proposal:

Add statement that 'non-hostile environment' only applies to helicopter operations

comment *3832* comment by: *AUSTRIAN Airlines*

Relevant Text:

(65) Series of flights means consecutive flights which begin and end: (i) within a 24 hour period (ii) at the same aerodrome/operating site and (iii) with the same pilot-in-command of the aircraft.

Comment:

It is our understanding that the definition 'series of flights' **only applies to helicopter operations**. For legal certainty reasons, we therefore believe this need to be clearly spelled out in this definition.

Proposal:

Add statement that 'series of flights' only applies to helicopter operations

comment *3833* comment by: *AUSTRIAN Airlines*

Relevant Text:

(67) Screen Height means a hight selected by the (supplemental) type certificate holder at 50 ft, or another value from 25ft to 50ft.

Comment:

Screen height is not covered through the STC or TC

Proposal: .

Clarification needed

comment *3839* comment by: *FOM ANWB MAA*

(26) Enhanced Vision System (EVS)

EVS is not the same as NVIS, nor is NVIS commonly reffered to as EVS.

The definition would fit NVIS as well though. EVS is based on Infrared technology and this should be mentioned to impove the definition:

26) 'Enhanced Vision System (EVS)' shall mean an electronic means of displaying a real-time image of the external scene through the use of infrared imaging sensors;

comment *3858* comment by: *FOM ANWB MAA*

(29) 'Ground Emergency Services Personel'

There is no justification to define all police and firemen and other persons alike that may only once in their life be involved in helicopter operations as "Ground emergency services personel".

Suggested:

(29) 'Ground emergency service personnel' shall mean any ground emergency service personnel (such as policemen, firemen, etc.) involved with Helicopter Emergency Medical Service (HEMS) who have a dedicated task in helicopter operation as described in the operations manual;

comment *3871* comment by: *FOM ANWB MAA*

(50) 'Night Vision Goggles (NVG)' shall mean a ~~head~~-helmet-mounted, binocular, light intensification appliance that enhances the ability to maintain visual ~~surface~~ references at night;

NVGs are usually helmet mounted as most aviators heads have no provisions to attach NVGs.

NVGs do not only enhance the ability to maintain visual surface references at night but enhance all visual references at night.

comment *3873* comment by: *FOM ANWB MAA*

(51) 'Night Vision Imaging System (NVIS)' shall mean the integration of all

elements required to successfully and safely use NVGs while operating a helicopter. ~~The system includes as a minimum: NVGs, NVIS lighting, helicopter components (such as radio altimeter, visual warning system and audio warning system), training and continuing airworthiness~~;

The system requirements are described in:

Section VII – Helicopter operations with night vision imaging systems

comment *3876* comment by: *FOM ANWB MAA*

(60) 'Principal place of business' means the ~~head office or~~ registered office of a Community operator in the Member State ~~within which the principal financial functions and operational control, including continued airworthiness management, of the Community operator are exercised.~~

Operations, finance and CAMO functions should be possible in different member states, as they are today.

comment *3907* comment by: *DRF Stiftung Luftrettung gemeinnützige AG*

add: air taxiing.

comment *3923* comment by: *DRF Stiftung Luftrettung gemeinnützige AG*

(26) EVS is not NVIS, both fit the definition though. Definition needs improvement for clarity

comment *3924* comment by: *DRF Stiftung Luftrettung gemeinnützige AG*

(29) change to read: "… and who have a dedicated task in Helicopter Operations". There is no justification to define all police and firemen and other persons that may only once in their life be involved in helicopter operations as " Ground emergency services personel".

comment *3929* comment by: *DRF Stiftung Luftrettung gemeinnützige AG*

(50) Change to read: " helmet mounted....visual references. " NVGs are usually mounted to helmets, most aviators heads have no special provisions to attach NVGs. NVGs also enhance other references than ground references.

comment *3930* comment by: *DRF Stiftung Luftrettung gemeinnützige AG*

(51) Delete all after:..while operating a helicopter. These are described in Section VII OPS.SPA.NVIS

comment *3931* comment by: *DRF Stiftung Luftrettung gemeinnützige AG*

(60) change to read: …the registred office in the Member state. Operations, finance and CAMO functions may be in different member states, as they are today..

comment *3996* comment by: *Virgin Atlantic Airways*

Relevant Text:

(*3) Adequate Aerodrome means an aerodrome on which the aircraft can be operated, taking account of the applicable performance requirements and runway characteristics.*

Comment:

This definition is not in-line with EU-OPS. It does not take into account rescue and fire fighting services (RFFS), the need for an aerodrome to be available at the expected time of use and the need for the aerodrome to be equipped with the necessary ancillary services such as ATS, sufficient lighting, communications, weather reporting, navaids and emergency services. Those essential elements of the definition of adequate aerodrome should not be in guidance material as suggested by EASA (see GM1 OPS.GEN.145 Use of Aerodromes/ Operating Sites, page 139). This definition of adequate aerodrome could potentially reduce flight safety.

Proposal:

Realign the definition of adequate aerodrome with the definition used in EU-OPS.

comment *3997* comment by: *Virgin Atlantic Airways*

Comment:

The following definitions are missing and should be added for clarity:

Child;

Dangerous goods incident;

Proposal:

Add definition of child and dangerous goods incident

comment *4000* comment by: *Virgin Atlantic Airways*

Comment:

Some definitions seem to be written in hard-law (OPS.GEN.010 Definitions) whereas others are contained within the guidance material (GM.OPS.GEN.010, page 103). This division in definitions does not seem to be based on clear criteria.

Proposal:

Definitions should be in hard-law unless there is a clear justification

comment *4002* comment by: *Virgin Atlantic Airways*

Relevant Text:

(41) Hostile Environment

Comment:

It is our understanding that the definition ''hostile environment' only applies to helicopter operations. For legal certainty reasons, we therefore believe this needs to be clearly spelled out in this definition

Proposal:

Add statement that 'hostile environment' only applies to helicopter operations

Add statement that 'non-hostile environment' only applies to helicopter operations

comment *4009* comment by: *Virgin Atlantic Airways*

Relevant Text:

(65) Series of flights means consecutive flights which begin and end: (i) within a 24 hour period (ii) at the same aerodrome/operating site and (iii) with the same pilot-in-command of the aircraft.

Comment:

It is our understanding that the definition 'series of flights' only applies to helicopter operations. For legal certainty reasons, we therefore believe this need to be clearly spelled out in this definition.

Proposal:

Add statement that 'series of flights' only applies to helicopter operations

comment *4102* comment by: *Benedikt SCHLEGEL*

Point 30 : Blood, organs or drugs which does not need any medical equipment shall not be considerated as HEMS.The final decision shall remain with the National Authority.

comment *4136* comment by: *DGAC*

General comment

It is not very convenient to have definitions spread in so many places throughout the text of the NPA (OPS.GEN.010, GM OPS.GEN.010 Definitions, AMC 1 OPS.GEN.320A(a), …). Moreover, some terms are used early in an AMC and defined later on in another AMC (ex.: Class A&C used in AMC 1 OPS.GEN.320A(a) and only defined in AMC.OPS.CAT.316A(a)(1)).

Besides, is an AMC or a GM really the proper place for a definition, especially when the term is used in the IR ? The fact that a definition could be subject to interpretation and alternative means of compliance (as AMC or GM) is questionable actually. How can a standard be applied if there is no assurance on the meaning of the terms it is built upon ?

comment *4137* comment by: *DGAC*

(a): Amend the text of the first sentence as follows :

"~~(a) For the purpose of this subpart, t~~**T**he following definitions shall apply: "

Justification : OPS.GEN.010 does not contain any (b) and these definitions seem also applicable to the other subparts.

comment *4138* comment by: *DGAC*

(a)(1): '3% En-Route Alternate (ERA) aerodrome' :

Proposal: Amend the definition as follows:

"'3% En-Route Alternate (ERA) aerodrome' means an ERA aerodrome selected for the purpose of reducing contingency fuel to 3% **and/or replacing one destination alternate aerodrome when two are required**."

Justification: OPS.CAT.155.A(b) allows for operators to select one destination alternate and one 3% en-route alternate (ERA) aerodrome. This choice doesn't mean that the reduced contingency fuel (RCF) procedure will be applied. Therefore, it is necessary to amend the definition of "3% ERA" to reflect the use of these terms in the present OPS.CAT.155.A(b).

comment *4139* comment by: *DGAC*

(a)(3) 'Adequate aerodrome': This definition is incomplete compared to the definition of EU-OPS 1.192(a). The following is missing :

"at the expected time of use, the aerodrome will be available and equipped with necessary ancillary services such as ATS, sufficient lighting, communications, weather reporting, navaids and emergency services."

There seems to be some equivalent material in GM 1 OPS.GEN.145 but this is not the proper place: an old version of JAR-OPS 1 was drafted this way (IEM JAR-OPS 1.220) but it was considered recently that this provision should be added in the definition for safety imperatives (NPA-OPS 58). This is the reason why it had been introduced in the definition of 'adequate aerodrome' in change 2 of EU-OPS.

comment *4140* comment by: *DGAC*

(a)(8) 'Anti-icing'

Proposal: Amend the definition as follows :

'Anti-icing' means the procedure **applied to an aeroplane on the ground** that provides protection against the formation of frost or ice and accumulation of snow on treated surfaces of the **aeroplane** ~~aircraft~~ for a limited period of time (hold-over time).

Justification :

Up to now and for coming years anti-icing fluids and procedure are designed and used only on the ground and are restricted to aeroplanes (e.g. Hold Over Time makes sense for aeroplanes only)

comment *4141* comment by: *DGAC*

(a)(15) 'critical phase of flight"

The term "taxiing" is not adapted for helicopter operations

Proposed Text:

Add the term "translation" for helicopters.

comment *4142* comment by: *DGAC*

(a)(20) 'De-icing'

Proposal: Amend the definition as follows :

'De-icing' **with respect to ground procedures** means the procedure by which frost, ice, snow or slush is removed from an aircraft in order to provide uncontaminated surfaces.

Justification : This definition has been designed in JAR-OPS to be applied only as a ground procedure. Using this definition for in-flight de-icing could be misleading if not dangerous.

comment *4143* comment by: *DGAC*

(a)(38)'HHO site'

Terminology should be "HHO operating site" (used in OPS.SPA.XXX.HHO) and not "HHO site".

Proposed Text:

Amend text as follows "(38) HHO Operating Site" shall means a site…""

comment *4144* comment by: *DGAC*

(a)(39) 'Hold-over Time (HoT)'

Proposal: Amend the definition as follows :

'Hold-over Time (HoT)' means the estimated period of time for which an anti-icing fluid is expected to prevent the formation of frost or ice and the accumulation of snow on the treated surfaces of an **aeroplane** ~~aircraft~~ on the ground in the prevailing ambient conditions.

Justification :

Up to now and for coming years anti-icing fluids and procedures are designed and used only for aeroplanes. Hold Over Time makes sence for aeroplanes only.

comment *4145* comment by: *DGAC*

(a)(48) Maximum passenger seating configuration:

The last sentence ("this may be lower than the maximum certificated passenger seating configuration of the aircraft") is not a definition. It should be in an AMC.

comment *4146* comment by: *DGAC*

(a)(49) 'Night' :

Proposal :

Amend definition (49) as follows :

"(49) 'Night' means the period ~~between 30 minutes after sunset until 30 minutes before sunrise, determined at surface level~~ **the end of evening civil twilight and the beginning of morning civil twilight, or such other period between sunset and sunrise as may be prescribed by the appropriate authority, as defined by the Member State.**"

and add a new AMC and a new GM as follows :

"**GM OPS.GEN.010(a)(49) Definitions**

NIGHT

Civil twilight ends in the evening when the centre of the sun's disc is 6 degrees below the horizon and begins in the morning when the centre of the sun's disc is 6 degrees below the horizon.

AMC OPS.GEN.010(a)(49) Definitions

NIGHT

Under moderate latitudes, night may be considered as the period between 30 minutes after sunset until 30 minutes before sunrise, determined at

surface level"

Justification :

The definition of night as proposed in NPA 2009-02b is a simplified definition which will not be accurate under all latitudes. A more generic definition is needed, which would have the double advantage of being usable everywhere, and being consistent both with the definition of « night » as per NPA 2008-17b Part FCL :

'Night' means the period between the end of evening civil twilight and the beginning of morning civil twilight, or such other period between sunset and sunrise as may be prescribed by the appropriate authority, as defined by the Member State.

and with the definition of night as per ICAO annex 6 :

Night. The hours between the end of evening civil twilight and the beginning of morning civil twilight or such other period between sunset and sunrise, as may be prescribed by the appropriate authority.

Note.— Civil twilight ends in the evening when the centre of the sun's disc is 6 degrees below the horizon and begins in the morning when the centre of the sun's disc is 6 degrees below the horizon.

The '30minutes' value is only applicable under moderate latitudes.

comment *4147* comment by: *DGAC*

(a)(56) Performance class 1

Proposal: Amend the text as follows

"(56) 'Performance Class 1' means that, in the event of failure of the critical power unit, ~~the helicopter is able~~ **performance is available to enable the helicopter** to land within the rejected take-off distance available or safely continue the flight to an appropriate landing area, depending on when the failure occurs."

Justification:

The proposed amendment improves consistency of the wording of (a)(56) performance class 1 with the wording both of (a)(57) performance class 2 and of the definitions of ICAO annex 6-3.

comment *4148* comment by: *DGAC*

(a)(65) 'Series of flight' :

Proposal: Amend the definition as follows:

"(65) 'Series of flights' means consecutive flights, which begin and end:

(i) within a 24 hours period; **and**

(ii) ~~at the same aerodrome/operating site; and~~

~~(iii)~~ with the same pilot-in-command of the aircraft.

Justification: Except in one GM, **'**Series of flights' in NPA 2009-02 is only used in the expression "flight or series of flight" as it was used in EU/JAR OPS 1/3. It is an extension of the term 'flight' to which it is attached, used in various cases such as document filling, briefings, definition of Flight Duty Period. It has therefore to be consistent with the term 'flight' to which it is attached: if there is no notion of circular flight ('A to A' flight), then there is no reason to add that notion to the series of flights. If (ii) is not deleted, then the definition of Flight Duty Period will not make any sense (how is the FDP counted for two consecutive flights from A to B, when do the rests occur, etc?) and the use of series of flights in other paragraphs of Part OPS and Part OR will not make any sense either :

PART OPS :

OPS.GEN.610 Journey log book

Particulars of the aircraft, its crew and each journey shall be retained for each flight or series of flights in the form of a journey log book.

OPS.COM.115 Briefing of operational personnel

Operational personnel involved in specialised tasks shall be briefed on operational procedures associated with the specific task before each flight or series of flights.

OPS.SPA.001.HEMS Helicopter emergency medical service operations (HEMS)

(b)(4)(x) briefing of medical staff prior to any HEMS flight, or series of flights.

AMC1 OPS.GEN.020(a) Crew responsibilities

FATIGUE RISK MANAGEMENT

1.d. Number or series of flights (sectors) planned or accomplished;

GM OPS.GEN.610 Journey log book

SERIES OF FLIGHTS

The term 'series of flights' is used to facilitate a single set of documentation.

AMC OPS.SPA.001.HHO(b)(4) Helicopter hoist operations (HHO)

OPERATING PROCEDURES

4. Passenger briefing. Prior to any HHO flight, or series of flights, HHO passengers should be briefed and made aware of the dangers of static electricity discharge and other HHO considerations.

AMC OPS.SPA.001.HEMS(b)(4) Helicopter emergency medical service operations (HEMS)

OPERATING PROCEDURES

2. Medical passenger

Prior to any HEMS flight, or series of flights, the medical passenger should

be briefed on the following:

PART OR :

OR.OPS.030.MLR Information retained on the ground commercial air transport

Information relevant to the flight and appropriate for the type of operation shall be preserved on the ground for the duration of each flight or series of flights, except for operations with:

OR.OPS.010.FTL Definitions

(f) 'Flight Duty Period (FDP)' means a period which commences when a crew member is required to report for duty that includes a flight or a series of flights and which finishes when the aircraft finally comes to rest and the engines are shut down or the rotor blades are stopped, at the end of the last flight on which they are a crew member;

CS FTL.1.135 Maximum daily Flight Duty Period (FDP)

(c) FDP with different reporting time for flight crew and cabin crew

In cases where cabin crew require more time than the flight crew for their preflight briefing for the same flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 60 minutes.

GM OR.OPS.250.CC Operations on more than one type or variant

SAFETY BRIEFING FOR CABIN CREW

When changing aeroplane type or variant during a series of flights, the cabin crew safety briefing should include a representative sample of type specific normal and emergency procedures and safety equipment applicable to the actual aircraft type to be operated.

GM OR.OPS.025.FTL Fatigue Risk Management System (FRMS) and GM OR.OPS.325.FTL Fatigue Risk Management System (FRMS)

1.4.b. the necessity to manage the duty period in which additional tasks are performed immediately prior to a flight or at intermediate points during a series of flights in such a way as to prevent transient fatigue;

comment *4149* comment by: *DGAC*

(a)(67) 'Screen height' :

Clarify the definition as follows to avoid misunderstanding:

"(67) 'Screen height' means**, in the context of steep approaches,** a height selected by the (Supplemental) Type certificate holder at 50 ft, or another value from 35 to 50 ft."

comment *4150* comment by: *DGAC*

(a)(71) 'Take-off distance available (TODA)'

The definition of TODA is incorrect for helicopter operations.

Proposed Text:

Amend text as follows :

"(71) 'Take-off distance available (TODA)' means the length of the take-off run available**/FATO** plus the length of the clearway available."

comment *4151* comment by: *DGAC*

THERE ARE SEVERAL MISSING DEFINITIONS:

There is no definition of "**helicopter**", "**balloon**", "**airship**". Add the relevant ICAO definitions

Adequate ETOPS en-route alternate aerodrome's definition is missing

Child/Children : Adults and infants are defined OPS.GEN.010(a)(4) and (a)(42), but not children.

Proposed Text:

Add the following definition in OPS.GEN.010:

" **'Child/Children' mean(s) person(s) of an age of two years and above but who are less than 12 years of age.**"

Heliport: The term "heliport" has been deleted and replaced by FATO or aerodrome (e.g. "elevated FATO"); this terminology should be reintroduced

Justification:

The definition "heliport" used in JAR-OPS 3 is consistent with ICAO annex 6, and addresses a site used for take-off or landing by a helicopter, which is not necessarily an aerodrome, and which is not totally covered by the term 'operating site'.

ICAO Annex 6 : "Heliport. An aerodrome or a defined area on a structure intended to be used wholly or in part for the arrival, departure and surface movement of helicopters.

Note 1.— Throughout this Part, when the term "heliport" is used, it is intended that the term also applies to aerodromes primarily meant for the use of aeroplanes."

Proposed Text:

Add the following definition in OPS.GEN.010:

"Heliport. An aerodrome or a defined area of land, water or a structure used or intended to be used wholly or in part for the arrival, departure and surface movement of helicopters. »

HHO (technical) crew member (OPS.SPA.030)

Medical passenger (GM OPS.SPA.001.HEMS)

DPBL (GM3/GM4 OPS.CAT.355.H) is defined page 319 while DPATO is

defined page 23. These two definitions are linked and having them separated by 300 pages makes it difficult to read.

R : rotor radius

Rotation Point (RP) :

Proposed text:

"The rotation point is defined as the point at which a cyclic input is made to initiate a nose-down attitude change during the take-off flight path. It is the last point in the take-off path from which, in the event of an engine failure being recognised, a forced landing on the deck can be achieved."

Touchdown and lift-off area (TLOF).

Proposed text :

A load bearing area on which a helicopter may touch down or lift off.

Vy: (used in GM OPS.CAT.355.H): best rate of climb

comment *4232* comment by: *KLM*

elevant Text:

(*3) Adequate Aerodrome means any area on land, water or ma made structure or vessel, especially adapted for the landing, taking-off and manoeuvring of aircraft.*

Comment:

This definition is not line with EU-OPS. It does not take into account rescue and fire fighting services (RFFS). the need for aerodrome to be available at the expected time of use and the need for the aerodrome to be equipped with the necessary ancillary services such as ATS, sufficient lighting, communications, weather reporting, navaids and emergency services. Those essential elements of the definition of adequate aerodromes should not be in guidance material as suggested by EASA (see GM1 OPS.GEN.145 Use of Aerodromes/ Operating Sites, page 139). This definition of adequate aerodromes could potentially reduce flight safety.

Proposal:

Realign the definition of **adequate aerodromes** with the definition used in EU-OPS.

comment *5085* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment: Definition of 'Commercial Air Transport" should be included.

Proposal: Define 'Commercial Air Transport'

comment *5088* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment:

Aerobatic is not defined, which is confusing. Will aerobatic be regulated by NAA?

Proposal:

Develop a definition of aerobatic flight and implementing rules for aerobatic flights.

comment *5090* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

(45) Local operations means flight operations within a local and defined geographical area which:

(i) start and end on the same day;

(ii) are conducted by day and VFR; and

(iii) are navigated over routes by reference to visual landmarks.

Comment:

1. This is not applicable in the northern part of Europe, due to the midnight sun with long dawns and twilights.

2. The definition should include an area around the airport of origin

Proposal (including ***new text***):

(45) Local operations means flight operations within a local and defined geographical area which:

~~(i) start and end on the same day;~~

(i) are conducted by day and VFR; and

(ii) are navigated over routes by reference to visual landmarks;

(iii) ***encompass an area within a distance 25 nm.***

comment *5091* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

(49) Night means a period between 30 minutes after sunset until 30 minutes before sunrise, determined at surface level.

Comment:

This definition is not appropriate and applicable to VFR operations in northern Europe with long dawns and twilights during summertime.

Furthermore, it is not the same definition as used in the FCL NPA 2008-17.

There must be the same definition for OPS and FCL use

Proposal (including ***new text***):

Introduce the definition from NPA 2008-17:

"Night" means the period between the end of evening civil twilight and the beginning of morning civil twilight, or such other period between sunset and sunrise as may be prescribed by the appropriate authority, as defined by the Member State.

comment *5093* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

(59) 'Powered sailplane' means an aircraft, equipped with one or more engines having, with engine(s) inoperative, the characteristics of a sailplane.

Comment:

The definition is confusing. Which operating rules applies for TMG, Touring Motor Gliders?

Proposal:

Touring Motor Glider should be defined and be included in the operating

rules.

comment *5117* comment by: *Ryanair*

(21) - Disruptive Passenger

The term "potentially disruptive passenger" in the context of Regulation (EC) 300/2008 means a "passenger who is either a deportee, a person deemed to be inadmissible for immigration purposes, or a person in lawful custody".

It is clear that the term "disruptive passenger" is used in a much wider context. This anomaly must be addressed and any potential for confusion removed.

(65) - Series of flights

There is no reason why a series of flights must begin and end at the same aerodrome/operating site

Proposal

Remove para (ii)

comment *5280* comment by: *Department for Transport UK*

OPS.GEN.010 Definition of commercial air transport

The Basic Regulation defines 'commercial operation'. That definition covers all commercial activities including commercial air transport (CAT). While the implementing rules place additional requirements on CAT operations they do not define what constitutes CAT. Under the SES common requirements CAT is defined "any aircraft operation involving the transport of passengers, cargo or mail for remuneration or hire." For the avoidance of doubt this definition should be repeated in the OPs IRs.

comment *5298* comment by: *Light Aircraft Association UK*

Item 68.

The LAA supports the proposed wording with the following amendment:

"'Special VFR flight' means a VFR flight cleared by air traffic control to operate within a control zone in meteorological conditions below VMC *or in circumstances where VFR flight is not normally permitted*."

comment *5311* comment by: *CAA CZ*

The definition No (69) "Standard Category I" should be supplemented by GLS (to be final wording as ILS, MLS, GLS or PAR).

comment *5338* comment by: *Peter Moeller*

010(a)(11) How many octas define a cloud base'

010(a)(12) Should the definition not refer to the availibility of emergency landing sites

010(a)(15) include air-taxi for helicopters without wheel type landing gears

010(a)(18) are medication and medical O2 defined as dangerous goods which have to be included in the Dangerous Good transport Doc

010(a) (45) ii are conducted by day and night under VFR

010(a)(50) .....shall mean a helmet mounted

comment *5344* comment by: *Danish Balloon Organisation*

Airships and Balloons should be included in OPS.GEN.010 Definitions as follows:

Airship means a power driven lighterthanair aircraft, with the exception of hot air airships, which, for the purposes of this Part, are included in the definition of balloon.

Balloon means a lighter than air aircraft that is not engine driven and sustains flight through the use of either gas or an airborne heater. For the purposes of this part, a hot air airship, although engine driven, is also considered a balloon.

comment *5443* comment by: *Esko RUOHTULA*

Definition (49) Night may be resonable at Central European latitudes, but it is unacceptably restrictive for operations at higher latitudes.

For example aiports Kittilä in Finland, Kiruna in Sweden and Bodö in Norway have approximately same latitude about 67,5 degrees N. At these airports in December sun never rises for about two weeks but there is more than 5 hours civil twilight even on the shortest day. According to ICAO definition of night VFR-day operations are possible every day, but the proposed definition of night would prevent such operations for over two weeks.

Higher north the proposed definition of night is even more absurd. At e.g. Kirkenes, Alta and Tromsö airports when sun sets in late November it rises next in mid January, but even at these latitudes there is civil twilight more than four hours even on the shortest day.

The proposed definition is not valid even at much lower latitudes. During

summer as far south as e.g. Tampere and Pori airports (latitude approximately 61 deg 25 min N) sun is below horizon more than four hours even on the shortest day, but still there is no gap between dusk and dawn (continuous civil twilight) for over one month.

Length of daylight at different locations around the globe can be easily checked at www.gaisma.com.

I propose that ICAO definition of night is used.

comment *5582* comment by: *HSD Hubschrauber Sonder Dienst*

What is equivalent here: BO105 and AS355? Recommandation:time limit, what is the relation to PC2Enhanced?

The FAR 27 certificated AC which meet the FAR 29 engine isolation requirements are not certificated under cat A and can therefore not meet the requirement of OPS.CAT.355.H(d)(1). The AMC is not in line with the implementing rule and should therefore be revised.

comment *5640* comment by: *ERA*

European Regions Airline Association Comment

- It has been noted that there is an apparent inconsistency in where definitions are placed, and whether material of the same nature and status enters at Implementation Rule [Hard Law] level or at AMC/GM

level.

- OPS.GEN.010 is overloaded with definitions related to helicopter operations, while definitions of the same nature for aeroplane operations are contained at AMC level, or not given at all. It is evident in other areas that helicopter material is treated at IR level, whereas similar material for aeroplanes is at AMC level.

Examples:

1. Performance classes for helicopters are given in OPS.GEN.010. Performance classes for aeroplanes are not stated in a definitions section at all, but are to be found in AMC OPS.CAT.316.A(A)(1). Likewise, definitions in GM OPS.GEN.010 are given at GM level, whereas in AMC1 OPS.CAT.010 definitions are given at AMC level. Such inconsistencies seem ill-founded and confusing.
2. Material on obstacle clearance during climb-out, stemming from Annex 6, for helicopters is presented in OPS.CAT.365.H, while for aeroplanes it is, much more appropriately, presented in AMC2 OPS.CAT.327.A. These inconsistencies seem to be ill-founded, as all similar material should in principle be in the AMC/GM level.

ERA members would urge EASA to re-edit the IR to achieve consistency of material at AMC level.

comment *5698* comment by: *Irish Aviation Authority*

Comment:

Numerous JAR-OPS 3 & ICAO Annex 6 definitions are missing.

Justification:

Definitions are required where they are referenced in the Rule.

Suggested text:

'Commercial air transport operation' means an aircraft operation involving the transport of passengers, cargo or mail for remuneration or hire.

Approach and landing phase — helicopters. That part of the flight from 300 m (1 000 ft) above the elevation of the FATO, if the flight is planned to exceed this height, or from the commencement of the descent in the other cases, to landing or to the balked landing point.

Area navigation (RNAV). A method of navigation which permits aircraft operation on any desired flight path within the coverage of ground- or space-based navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

Note.— Area navigation includes performance-based navigation as well as other operations that do not meet the definition of performance-based navigation.

Cabin crew member. A crew member who performs, in the interest of

safety of passengers, duties assigned by the operator or the pilot-in-command of the aircraft, but who shall not act as a flight crew member.

Cargo Aircraft. Any aircraft which is carrying goods or property but not passengers. In this context the following are not considered to be passengers:

(i) A crew member;

(ii) An operator's employee permitted by, and carried in accordance with, the instructions contained in the Operations Manual;

(iii) An authorised representative of an Authority; or

(iv) A person with duties in respect of a particular shipment on board.

Children are defined as persons of an age of two years and above but who are less than 12 years of age.

Committal Point (CP). The committal point is defined as the point in the approach at which the pilot flying (PF) decides that, in the event of a power unit failure being recognised, the safest option is to continue to the deck.

Dangerous Goods Accident. An occurrence associated with and related to the transport of dangerous goods which results in fatal or serious injury to a person or major property damage.

Dangerous Goods Incident. An occurrence, other than a dangerous goods accident, associated with and related to the transport of dangerous goods, not necessarily occurring on board an aircraft, which results in injury to a person, property damage, fire, breakage, spillage, leakage of fluid or radiation

or other evidence that the integrity of the packaging has not been maintained. Any occurrence relating to the transport of dangerous goods which seriously jeopardises the aircraft or its occupants is also deemed to constitute a dangerous goods incident.

Decision altitude (DA) *or* ***decision height (DH).*** A specified altitude or height in the precision approach or approach with vertical guidance at which a missed approach must be initiated if the required visual reference to continue the approach has not been established.

Note 1.— Decision altitude (DA) is referenced to mean sea level and decision height (DH) is referenced to the threshold elevation.

Note 2.— The required visual reference means that section of the visual aids or of the approach area which should have been in view for sufficient time for the pilot to have made an assessment of the aircraft position and rate of change of position, in relation to the desired flight path. In Category III operations with a decision height the required visual reference is that specified for the particular procedure and operation.

Note 3.— For convenience where both expressions are used they may be written in the form "decision altitude/height" and abbreviated "DA/H".

Emergency locator transmitter (ELT). A generic term describing equipment which broadcast distinctive signals on designated frequencies and, depending on application, may be automatically activated by impact or

be manually activated. An ELT may be any of the following:

Automatic fixed ELT (ELT(AF)). An automatically activated ELT which is permanently attached to an aircraft.

Automatic portable ELT (ELT(AP)). An automatically activated ELT which is rigidly attached to an aircraft but readily removable from the aircraft.

Automatic deployable ELT (ELT(AD)). An ELT which is rigidly attached to an aircraft and which is automatically deployed and activated by impact, and, in some cases, also by hydrostatic sensors. Manual deployment is also provided.

Survival ELT (ELT(S)). An ELT which is removable from an aircraft, stowed so as to facilitate its ready use in an emergency, and manually activated by survivors.

Elevated heliport. A heliport which is at least 3 m above the surrounding surface.

Exposure time. The actual period during which the performance of the helicopter with the critical power unit inoperative in still air does not guarantee a safe forced landing or the safe continuation of the flight. (See also definition of maximum permitted exposure time).

Flight plan. Specified information provided to air traffic services units, relative to an intended flight or portion of a flight of an aircraft.

Freight Container. A freight container is an article of transport equipment for radioactive materials, designed to facilitate the transport of such materials, either packaged or unpackaged, by one or more modes of transport.

Handling Agent. An agency which performs on behalf of the operator some or all of the latter's functions including receiving, loading, unloading, transferring or other processing of passengers or cargo.

Heliport operating minima. The limits of usability of a heliport for:

a) take-off, expressed in terms of runway visual range and/or visibility and, if necessary, cloud conditions;

b) landing in precision approach and landing operations, expressed in terms of visibility and/or runway visual range and decision altitude/height (DA/H) as appropriate to the category of the operation;

c) landing in approach and landing operations with vertical guidance, expressed in terms of visibility and/or runway visual range and decision altitude/height (DA/H); and

d) landing in non-precision approach and landing operations, expressed in terms of visibility and/or runway visual range, minimum descent altitude/height (MDA/H) and, if necessary, cloud conditions.

HEMS crew member. A person who is assigned to a HEMS flight for the purpose of attending to any person in need of medical assistance carried in the helicopter and assisting the pilot during the mission. This person is subject to specific training.

HHO Crew Member. A crew member who performs assigned duties relating to the operation of a hoist.

Human Factors principles. Principles which apply to aeronautical design, certification, training, operations and maintenance and which seek safe interface between the human and other system components by proper consideration to human performance.

***Human performance*.** Human capabilities and limitations which have an impact on the safety and efficiency of aeronautical operations.

ID number. A temporary identification number for an item of dangerous goods which has not been assigned a UN number.**]**

Instrument meteorological conditions (IMC). Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling*, less than the minima specified for visual meteorological conditions.

Integrated survival suit. A survival suit which meets the combined requirements of the survival suit and life jacket.

Maximum approved passenger seating configuration [(MAPSC)]. The maximum passenger seating capacity of an individual helicopter, excluding crew seats, used by the operator, approved by the Authority and included in the Operations Manual.

Maximum permitted exposure time. A period, determined on the basis of the power unit failure rate recorded for the helicopter's engine type, during which the probability of a power unit failure can be discounted. (See also definition of exposure time).

Medical passenger. A medical person carried in a helicopter during a HEMS flight, including but not limited to doctors, nurses and paramedics.

Minimum descent altitude (MDA) or ***minimum descent height (MDH).*** A specified altitude or height in a non-precision approach or circling approach below which descent must not be made without the required visual reference.

Note 1.— Minimum descent altitude (MDA) is referenced to mean sea level and minimum descent height (MDH) is referenced to the aerodrome elevation or to the threshold elevation if that is more than 2 m (7 ft) below the aerodrome elevation. A minimum descent height for a circling approach is referenced to the aerodrome elevation.

Note 2.— The required visual reference means that section of the visual aids or of the approach area which should have been in view for sufficient time for the pilot to have made an assessment of the aircraft position and rate of change of position, in relation to the desired flight path. In the case of a circling approach the required visual reference is the runway environment.

Note 3.— For convenience when both expressions are used they may be written in the form "minimum descent altitude/height" and abbreviated "MDA/H".

Obstacle. Obstacles include the surface of the earth, whether land or sea.

Obstacle clearance altitude (OCA) or ***obstacle clearance height (OCH).*** The lowest altitude or the lowest height above the elevation of the relevant runway threshold or the aerodrome elevation as applicable, used in establishing compliance with appropriate obstacle clearance criteria.

Note 1.— Obstacle clearance altitude is referenced to mean sea level and obstacle clearance height is referenced to the threshold elevation or in the case of non-precision approaches to the aerodrome elevation or the threshold elevation if that is more than 2 m (7 ft) below the aerodrome elevation. An obstacle clearance height for a circling approach is referenced to the aerodrome elevation.

Note 2.— For convenience when both expressions are used they may be written in the form "obstacle clearance altitude/height" and abbreviated "OCA/H".

Operations specifications. The authorizations, conditions and limitations associated with the air operator certificate and subject to the conditions in the operations manual.

Performance-based navigation (PBN). Area navigation based on performance requirements for aircraft operating along an ATS route, on an instrument approach procedure or in a designated airspace.

Note.— Performance requirements are expressed in navigation specifications (RNAV specification, RNP specification) in terms of accuracy, integrity, continuity, availability and functionality needed for the proposed operation in the context of a particular airspace concept.

Pilot-in-command. The pilot designated by the operator, or in the case of general aviation, the owner, as being in command and charged with the safe conduct of a flight.

Proper Shipping Name. The name to be used to describe a particular article or substance in all shipping documents and notifications and, where appropriate, on packagings.

Psychoactive substances. Alcohol, opioids, cannabinoids, sedatives and hypnotics, cocaine, other psychostimulants, hallucinogens, and volatile solvents, whereas coffee and tobacco are excluded.

Reported headwind component. Reported headwind component is interpreted as being that reported at the time of flight planning and may be used provided there is no significant change of unfactored wind prior to take-off.

Required communication performance (RCP). A statement of the performance requirements for operational communication in support of specific ATM functions.

Required communication performance type (RCP type). A label (e.g. RCP 240) that represents the values assigned to RCP parameters for communication transaction time, continuity, availability and integrity.

Rotation Point (RP). The rotation point is defined as the point at which a cyclic input is made to initiate a nose-down attitude change during the take-off flight path. It is the last point in the take-off path from which, in the event of an engine failure being recognised, a forced landing on the deck can be achieved.

Safety management system. A systematic approach to managing safety, including the necessary organizational structures, accountabilities, policies and procedures.

Safety programme. An integrated set of regulations and activities aimed at improving safety.

Serious Injury. An injury which is sustained by a person in an accident and

which:

(i) Requires hospitalisation for more than 48 hours, commencing within seven days from the date the injury was received; or

(ii) Results in a fracture of any bone (except simple fractures of fingers, toes or nose); or

(iii) Involves lacerations which cause severe haemorrhage, nerve, muscle or tendon damage; or

(iv) Involves injury to any internal organ; or

(v) Involves second or third degree burns, or any burns affecting more than 5% of the body surface; or

(vi) Involves verified exposure to infectious substances or injurious radiation.

State of Origin. The Authority in whose territory the dangerous goods were first loaded on an aircraft.

Take-off and initial climb phase. That part of the flight from the start of take-off to 300 m (1 000 ft) above the elevation of the FATO, if the flight is planned to exceed this height, or to the end of the climb in the other cases.

Technical Instructions. The latest effective edition of the Technical Instructions for the Safe Transport of Dangerous Goods by Air (Doc 9284AN/905), including the Supplement and any Addendum, approved and published by decision of the Council of the International Civil Aviation Organisation.

Touchdown and lift-off area (TLOF). A load bearing area on which a helicopter may touch down or lift off.

UN Number. The four-digit number assigned by the United Nations Committee of Experts on the Transport of Dangerous Goods to identify a substance or a particular group of substances.

comment *5723* comment by: *Norsk Luftambulanse*

(15) add: and air taxiing.

(26) EVS is not NVIS, both fit the definition though. Definition needs improvement for clarity.

(29) change to read: "… and who have a dedicated task in Helicopter Operations". There is no justification to define all police and firemen and other persons that may only once in their life be involved in helicopter operations as " Ground emergency services personel".

(50) Change to read: " helmet mounted....visual references. " NVGs are usually mounted to helmets, most aviators heads have no special provisions

to attach NVGs. NVGs also enhance other references than ground references.

(51) Delete all after:..while operating a helicopter. These are described in Section VII OPS.SPA.NVIS

(60) change to read: …the registred office in the Member state. Operations, finance and CAMO functions may be in different member states, as they are today.

comment *5792* comment by: *Ph.Walker*

Point 30 : Blood, organs or drugs which does not need any medical equipment shall not be considerated as HEMS.The final decision shall remain with the National Authority.

comment *5835* comment by: *Mikael Markow*

(45)

(i) In the north of europe, where there during summer is sufficent light, a fligt starting before midnight and ending after midnight next day should also be concidered a 'local operation'.

Such a flight might be very local and have a short duration. This could, for example, be a local flying in the pattern during midnight.

The present writing should be changed to include such flights as 'local operation'.

(49)

This definition is not suitable for countries in the north where there, in the summer, may be light for several hours after sunset / before sunrise.

Under some periods of the year there will in fact be no dark period, night, at all between sunset and sunrise.

This writing would restrict VFR flying more than necessary and should be changed.

comment *5870* comment by: *Maths Holmberg*

Definition 49.

The suggested time of 30 min after and before the sunset can be suitable for aviation in the south of Europe.

In the northern part we have more time before it will be night so the suggested time is grounded our airplane before it should.

The definition must be change so we can use so much of the daylight as

possible.

Best Regards

Maths Holmberg

comment *5960* comment by: *Irish Aviation Authority*

Comment:

The definition of Series of flights is more restrictive than the ICAO definition. Replace existing with ICAO definition below.

Proposed text:

Series of flights. Series of flights are consecutive flights that:

a) begin and end within a period of 24 hours; and

b) are all conducted by the same pilot-in-command.

comment *6010* comment by: *ECA - European Cockpit Association*

Comment:

A definition of 'Approach ban point' needs to be added.

comment *6120* comment by: *Hans MESSERLI*

Point 30 : Blood, organs or drugs which does not need any medical equipment shall not be considerated as HEMS.The final decision shall remain with the National Authority.

comment *6277* comment by: *Royal Danish Aeroclub*

In the nordic countries, the twilight period is longer than in the southern part of Europe.

There is no reason to fix the twilight period to 30 minutes and avoid pilots to fly in flyable conditions.

We suggest the text to read:

'Night' mean the period from the sun is 6 degrees below the horizon until the sun is less than 6 degress under the horizon.

comment *6312* comment by: *SHA (AS)*

Point 30 : Blood, organs or drugs which does not need any medical equipment shall not be considerated as HEMS.The final decision shall remain with the National Authority.

Draft Opinion Part - Air Operations

OPS GEN 010. Definitions

(60) Page 26 - Principal place of BUsiness "means the head office of registered office of a community operator in the Member State ....."

COMMENT : This means that any operator may have its crew / aircraft based in Europe and the "Principal place of business" outside the EU. Crew Personnel will , in this case, not be suject to European legislation contained in the NPA 2009.

This may encourage AIrline operators to set up their principal place of business outside of the EU where regulations are less restrictive. In the past this has occured with American airlines based in the US and crew bases within the EU and elsewhere (ex:United AIrlines) and airline crew having little protection as to working conditions and hours.

comment *6541* comment by: *SFR Sweden*

Section: NPA 2009-02, Draft Opinion Part – Air Operations, Subpart A, Section 1, General.

'Night' means the period between 30 minutes after sunset until 30 minutes before sunrise, determined at surface level.

Comment: In the northern countries this definition does not constitute a relevant way of defining visibility, due to solar effects around and above the arctic circle, where in fact during summer, even though the sun sets for a period of time, daylight visibility are present at all times. On the other hand, during winter the sun does not rise at all above the horizon but daylight visibility is still present for a certain period. For the use of nav lights this is not crucial, but if applied as a definition for night operations and qualifications it will impose a greater limitation than what might be reasonable for flight safety.

Proposal: The definition Sweden use today is: time between sunset and

sunrise when, due to reduced lighting conditions, a prominent unlit object cannot be clearly distinguished at a range of more than 8000 meters

comment *6564* comment by: *Danish Powerflying Union*

(45) (i):

In some parts of the Nordic countries there are daylight 24 hours during Summer, eg. for 1-3 month. We see no reason to define a local flight to start and end on the same day.

comment *6579* comment by: *Danish Powerflying Union*

(49):

"Night" to be defined as 30 minutes after sunset and 30 minutes before sunrise is not acceptable in the Nordic countries. Today the degree of latitude is taken into consideration. In the Nordic countries the sun sets slower, which means our twilight period is longer compared to southern part of Europe. Forexample July 2 2009 (West of 11 degree East) "night" starts 1 hour and 2 minutes after sunset and ends 1 hour and 2 minutes before sunrise. This gives a considerably longer VFR day period compared to the definition in this NPA.

We strongly recommend EASA to take the degree of latitude into consideration.

comment *6583* comment by: *European HEMS & Air Ambulance Committee (EHAC)*

(15) 'critical phases of flight'

Add:...and air taxiing

helicopters can be taxied both on the ground (wheeltype landinggear) or within ground effect (skidtype landinggear).

comment *6586* comment by: *European HEMS & Air Ambulance Committee (EHAC)*

(26) Enhanced Vision System (EVS)

EVS is not the same as NVIS, nor is NVIS commonly reffered to as EVS.

The definition would fit NVIS as well though. EVS is based on Infrared technology and this should be mentioned to impove the definition:

26) 'Enhanced Vision System (EVS)' shall mean an electronic means of displaying a real-time image of the external scene through the use of

infrared imaging sensors;

comment *6589* comment by: *European HEMS & Air Ambulance Committee (EHAC)*

(29) 'Ground Emergency Services Personel'

There is no justification to define all police and firemen and other persons alike that may only once in their life be involved in helicopter operations as "Ground emergency services personel".

Suggested:

(29) 'Ground emergency service personnel' shall mean any ground emergency service personnel (such as policemen, firemen, etc.) involved with Helicopter Emergency Medical Service (HEMS) who have a dedicated task in helicopter operation as described in the operations manual;

comment *6591* comment by: *European HEMS & Air Ambulance Committee (EHAC)*

(50) 'Night Vision Goggles (NVG)' shall mean a ~~head~~-helmet-mounted, binocular, light intensification appliance that enhances the ability to maintain visual ~~surface~~ references at night;

NVGs are usually helmet mounted as most aviators heads have no provisions to attach NVGs.

NVGs do not only enhance the ability to maintain visual surface references at night but enhance all visual references at night.

comment *6592* comment by: *European HEMS & Air Ambulance Committee (EHAC)*

(51) 'Night Vision Imaging System (NVIS)' shall mean the integration of all elements required to successfully and safely use NVGs while operating a helicopter. ~~The system includes as a minimum: NVGs, NVIS lighting, helicopter components (such as radio altimeter, visual warning system and audio warning system), training and continuing airworthiness~~;

The system requirements are described in:

Section VII Helicopter operations with night vision imaging systems

comment *6593* comment by: *European HEMS & Air Ambulance Committee (EHAC)*

(60) 'Principal place of business' means the ~~head office or~~ registered office of a Community operator in the Member State ~~within which the principal financial functions and operational control, including continued airworthiness~~

~~management, of the Community operator are exercised.~~

Operations, finance and CAMO functions should be possible in different member states, as they are today.

comment *6646* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Comment

There is a need for a global part dedicated to definitions. Moreover, the "principle place of business" definition was already a term of matters in NPA 2008-22, as a result we are still sceptical with the practical application of this concept.

Proposal

We suggest a specific part or the EASA regulation framework may contain a comprehensive and exhaustive list of definitions, applicable to the whole EASA regulation, which is the best way to provide consistent definitions.

Justification

This might be a legal issue regarding the scope of understanding and cause problems of reading.

comment *6667* comment by: *HeliFlite Oy*

Regulation or GM (**GM OPS.GEN.010(a)(41) Definitions**) should open this little bit more. Regulation should provide examples of situation where conditions mentioned in OPS.GEN.010 (a) Definitions point (41)(i), A to D are fulfilled.

For example point (C); after -25°C degrees at night time when SAR response is more than…..hours.

For example point (B); examples of minimum i.e. protective gear in certain weather conditions.

For example point (A); examples of what kinds of surfaces are inadequate for safe forced landing.

Definition of whole hostile environment concept has to be more clarified. It is small part of whole regulation but so many things are depending on it. Example: Operator defines some area as non-hostile in its operations manual. Competent Authority won't accept the operations manual and insist that whole country has to be handled as Hostile environment at least in the mission planning phase. Now company has more restricted and expensive operation due the wrong interpretation of regulation.

Regulation should state more clearly that who has final responsibility of defining hostile/non-hostile areas.

comment *6701* comment by: *Greger Ahlbeck*

Paragraph text: Night means the period between 30 minutes after sunset until 30 minutes before sunrise, determined at surface level.

Comment: This definition is not appropriate and detrimental to VFR operation in northern Sweden with long morning and evening twilights during the summertime.

Furthermore, it is not the same definition as used in the FCL NPA 2008-17.

To avoid misunderstanding definitions must be same for OPS and FCL use.

Proposal (including ***new text***):

Introduce the definition from NPA 2008-17:

Night' means the period between the end of evening civil twilight and the beginning of morning civil twilight, or such other period between sunset and sunrise as may be prescribed by the appropriate authority, as defined by the Member State.

comment *6705* comment by: *Icelandair*

Relevant Text:

(*3) Adequate Aerodrome means any area on land, water or ma made structure or vessel, especially adapted for the landing, taking-off and manoeuvring of aircraft.*

Comment:

This definition is not line with EU-OPS. It does not take into account rescue and fire fighting services (RFFS). the need for aerodrome to be available at the expected time of use and the need for the aerodrome to be equipped with the necessary ancillary services such as ATS, sufficient lighting, communications, weather reporting, navaids and emergency services. Those essential elements of the definition of adequate aerodromes should not be in guidance material as suggested by EASA (see GM1 OPS.GEN.145 Use of Aerodromes/ Operating Sites, page 139). This definition of adequate aerodromes could potentially reduce flight safety.

Proposal:

Realign the definition of **adequate aerodromes** with the definition used in EU-OPS.

comment *6706* comment by: *Greger Ahlbeck*

Paragraph text: "Local operations" means flights operations conducted within a local and defined geographical area which:

(i) start and end on the same day;

(ii) (ii) are conducted by day under VFR; and

(iii) (iii) are navigated over routes by reference to visual landmarks

Comment: Start and end on the same day means that a local flight during summer in northern Sweden is not possible when the flight start one day and continues next day under the bright midnight sun. Furthermore, the term "local operation" is not used in NPA 2009-02.

The expression "Local area operations" is used in AMC OPS.CAT.235 with the definition "encompass usually an area within a distance of 20 - 25 nm".

Proposal (including ***new text***): Delete the whole definition of Local operation since it is not used.

comment *6708* comment by: *Icelandair*

Relevant Text:

(*11) Cloud Base means the height of the base of the lowest observed or forecast cloud element in the vicinity of an aerodrome or operating site or within a specified area of operations, normally measured above aerodrome elevation or in the case of offshore operations above mean sea level.*

Comment:

Ceiling has to be added as equal to an obstruction to the sky corresponding to the status broken as defined in ICAO Annex 3

(67) Screen Height means a hight selected by the (supplemental) type certificate holder at 50 ft, or another value from 25ft to 50ft.

Comment:

Screen height is not covered through the STC or TC

Proposal: .

Clarification needed

comment *6729* comment by: *Icelandair*

Comment:

There's no definition for commander and PIC is used in all NPA 2009-02. There's a **conflict** with NPA FCL 17 as there can be a nominated commander by a company but also an other Pilot in Command e.g when under supervision (LFUS) or when relieving the commander.

Commander is a role, responsibility. Pilot in command is a function, it could be a pilot other than the commander.

The term commander is used in several conventions. (Tokyo, Chicago)

Proposal:

Reinstate the function "**Commander**" Use definition from EU-OPS 1.940 (a) 5;

"*One pilot amongst the flight crew, qualified as a pilot-in-command in accordance with the requirements governing Flight Crew Licenses, is designated as the commander who may delegate the conduct of the flight to another suitably qualified pilot*."

comment *6797* comment by: *EFLEVA*

Comment on OPS.GEN 010

Item 45

Page 25

The EFLEVA notes that this definition excludes over midnight local operations in northern latitudes where midnight twilight would allow day/VFR local flights to start and end on subsequent days.

comment *6798* comment by: *EFLEVA*

Comment on OPS.GEN 010

Item 49

Page 25

The EFLEVA notes that the definition of Night in this paragraph is not appropriate for northern latitudes where there are long periods of twilight. The definition of night must consider regions where there are long twilight periods.

Proposal:

Add a category of **dry snow** to the definition of contaminated runway

comment *7132* comment by: *AIR FRANCE*

General comment about the Definitions in the IRs: all definitions should be gathered in one only place and this place should be an IR. Definitions scattered through AMCs are not easy to trace and may be interpreted.

comment *7143* comment by: *AIR FRANCE*

Relevant Text:

(67) Screen Height means a hight selected by the (supplemental) type certificate holder at 50 ft, or another value from 25ft to 50ft.

Comment:

Screen height is not covered through the STC or TC

Proposal: .

Clarification needed, 99% of the readers don't know this concept.

comment *7156* comment by: *Virgin Atlantic Airways*

Relevant Text:

OPS.GEN.010 Definitions

Comment:

No definition of "Ceiling" has been included.

Proposed Text:

Add definition of "Ceiling" as per ICAO Annex III

comment *7159* comment by: *Virgin Atlantic Airways*

Relevant Text:

(13) 'Contaminated runway' means a runway of which more than 25% of the runway surface area (whether in isolated areas or not) within the required length and width being used is covered by the following:

(i) Surface water more than 3 mm (0.125 in) deep, or by slush, or loose

snow, equivalent to more than 3 mm (0.125 in) of water;

(ii) Snow which has been compressed into a solid mass which resists further compression and will hold together or break into lumps if picked up (compacted snow); or

(iii) Ice, including wet ice.

Comment:

Change term from loose snow to dry snow. Loose snow is not a commonly used term.

Proposed Text:

(13) 'Contaminated runway' means a runway of which more than 25% of the runway surface area (whether in isolated areas or not) within the required length and width being used is covered by the following:

(i) Surface water more than 3 mm (0.125 in) deep, or by slush, or ~~loose~~ **dry** snow, equivalent to more than 3 mm (0.125 in) of water;

(ii) Snow which has been compressed into a solid mass which resists further compression and will hold together or break into lumps if picked up (compacted snow); or

(iii) Ice, including wet ice

comment *7164* comment by: *Virgin Atlantic Airways*

Relevant Text:

(67) 'Screen height' means a height selected by the (Supplemental) Type certificate holder at 50 ft, or another value from 35 to 50 ft.

Comment:

Definition of 'Screen Height' as stated is neither clear nor commonly used.

Proposal:

Please check ICAO definition for Screen Height

comment *7183* comment by: *Uppvinden AB*

Local operations:

The restriction that it starts and ends on the same day is irrelevant. As "day" is not defined I think you mean "date" but operations can start on one date and end the next date without any "night" in between.

Night:

Night is when it is dark. It is NOT dark outside the proposed times. Sometimes it is dark 2-3 hours after sunset. Either use the definition that

you cannot see an unlighted figure or - if you need a numerical defintion - between the times the sun is 6 degrees under the horizon. These times are easy to obtain for each location.

Brgds

Anders

comment *7230* comment by: *ANE (Air Nostrum) OPS QM*

- It has been noted that there is an apparent inconsistency in where definitions are placed, and whether material of the same nature and status enters at Implementation Rule [Hard Law] level or at AMC/GM level.
- OPS.GEN.010 is overloaded with definitions related to helicopter operations, while definitions of the same nature for aeroplane operations are contained at AMC level, or not given at all. It is evident in other areas that helicopter material is treated at IR level, whereas similar material for aeroplanes is at AMC level
- Examples:

  1. Performance classes for helicopters are given in OPS.GEN.010. Performance classes for aeroplanes are not stated in a definitions section at all, but are to be found in AMC OPS.CAT.316.A(A)(1). Likewise, definitions in GM OPS.GEN.010 are given at GM level, whereas in AMC1 OPS.CAT.010 definitions are given at AMC level. Such inconsistencies seem ill-founded and confusing.

  2. Material on obstacle clearance during climb-out, stemming from Annex 6, for helicopters is presented in OPS.CAT.365.H, while for aeroplanes it is, much more appropriately, presented in AMC2 OPS.CAT.327.A. These inconsistencies seem to be illfounded, as all similar material should in principle be in the AMC/GM level.

We would urge EASA to re-edit the IR to achieve consistency of material at AMC level.

comment *7290* comment by: *FAA*

OPS.GEN.10 Definition 13. 'Contaminated runway'

Comment:

The proposed definition indicates that a 'Contaminated runway' means a runway of which more than 25% of the runway surface area (whether in isolated areas or not) within the required length and width being used is covered by the following:

(i) Surface water more than 3 mm (0.125 in) deep, or by slush, or loose snow, equivalent to more than 3 mm (0.125 in) of water;

(ii) Snow which has been compressed into a solid mass which resists

further compression and will hold together or break into lumps if picked up (compacted snow); or

(iii) Ice, including wet ice.

Although 25% coverage may be the threshold for the use of contaminated runway performance information when computing takeoff and landing distance performance, a runway with any amount of standing water or other form of contamination should be termed contaminated

Recommendation:

Review FAA Takeoff and Landing Performance Assessment Aviation Rulemaking Committee (TALPA ARC) recommendations. Consider harmonization with the rulemaking activity and associated guidance material development underway by the FAA to address contaminated runway takeoff and landing performance. International harmonization of runway surface condition information and terminology would enhance safety by providing more usable information for flight operations.

comment *7291* comment by: *FAA*

OPS.GEN.10 Definition 79 'Wet runway'

Comment:

The proposed regulation indicates that a 'Wet runway' means a runway of which the surface is covered with water, or equivalent, less than specified by the 'contaminated runway' definition ***or when there is sufficient moisture on the runway surface to cause it to appear reflective***, but without significant areas of standing water.

Industry has recommended, through the FAA's Takeoff and Landing Performance Assessment Aviation Rulemaking Committee (TALPA ARC), to delete the phrase "or when there is sufficient moisture on the runway surface to cause it to appear reflective," from the definition because there could be degraded braking performance at water levels less than that which would cause reflectivity. As worded, operators could use dry runway takeoff and landing performance data under degraded runway friction levels if the wet surfaces do not meeting the reflective criteria.

Recommendation:

Delete the phrase "or when there is sufficient moisture on the runway surface to cause it to appear reflective," from the definition.

comment *7328* comment by: *FAA*

OPS.GEN.010 Definition Number (51) "Night Vision Imaging System (NVIS)

Comment:

The definition of 'NVIS' is applied only to helicopters.

The definition is limiting. 'NVIS' technology may provide a safety benefit at night in certain fixed-wing operations as well as helicopters, so the definition should be broadened to address all potential applications.

Recommendation:

Revise the definition to address 'NVIS' for all aircraft, not just helicopters.

comment *7331* comment by: *FAA*

OPS.GEN.010 Definition Number (69)

Comment:

Definition does not address GPS/GNSS operations.

The definition is limiting. Newer GPS/GNSS approaches utilizing WAAS technology may provide the capability to meet 'Standard Category I' minimums. As written, the definition may limit safe operation using a GPS approach.

Recommendation:

Revise the definition to include GPS/GNSS approaches that have the same height and visibility minimums as defined.

comment *7332* comment by: *FAA*

OPS.GEN.010 Definition Number (77)

Comment:

The term 'critical engine' is not defined. Without defining all the technical terms within a definition, it remains open to interpretation.

Recommendation:

Revise the Definitions section to include 'critical engine' definition.

comment *7333* comment by: *FAA*

OPS.GEN.010 Definition Number (77)

Comment:

The term 'accelerate-stop distance' is not defined. Without defining all the technical terms within a definition, it remains open to interpretation.

Recommendation:

Revise the Definitions section to include 'accelerate-stop distance' definition.

comment *7339* comment by: *K Franzen*

This definition for Night is not suitable for us in the EU nordic countries. Please, use the Swedish definition (8 km visibility).

comment *7341* comment by: *Europe Air Sports, VP*

4

The definition of "adult" in aviation law is not appropriate because there are much more implications and consequences if this definition is becoming law. This definition should be withdrawn and rephrased to include the reason for it.

42

The same arguments are true for the definition of "infant."

68

VFR flight conditions depend on ICAO airspace classification, visibility and cloud base differ depending on airspace classification. "VMC conditions" needs clarification.

comment *7342* comment by: *K Franzen*

(45) This definition for "Local operations" is not suitable for us in EU nordic countries as we have enough light to fly VFR day all the day around in the summer.

comment *7372* comment by: *new European Helicopter Association*

<![endif]-->

comment *7376* comment by: *Comercial Operators in Sweden*

(49)

In Sweden it can be light several hours or all night in the north during the summer. We often fly 1 or several hours after the sunset. This roule will make ballon flight impossible in most parts of Sweden during the summer and that is of course not good.

SUGGESTION

Today the rules regarding flight between sunset and night is defined as this. It is night when a big object example as a house can't be seen in a distence of 8 km. The building shall not be lighted up.

comment *7381* comment by: *Axel Schwarz*

Definition (49) "night": Often night is defined as the period between ECET and BCMT, i.e. the time when the sun is more than 6° below the horizon.

The proposed definition does not take account of the different duration of dusk and dawn with varying latitude (e.g. in the summer in northerly regions there is still sufficient daylight long after sunset, while in southerly regions the dawn may be as short as 24 minutes).

The definition should therefore be changed to include the time between ECET and BCMT.

comment *7457* comment by: *Baden-Württembergischer Luftfahrtverband*

OPS.GEN.010(a)(11)

Wording in the NPA

(11) 'Cloud base' means the height of the base of the lowest observed or forecast cloud element in the vicinity of an aerodrome or operating site or within a specified area of operations, normally measured above aerodrome elevation or, in the case of offshore operations, above mean sea level.

Our proposal

(11) Cloud base means the height of base of the lowest observed or forecasted clouds (except of cb-clouds) with more than 2/8 coverage in vicinity of an aerodrome or operating site or within a specified area of operations, measured or estimated above aerodrome elevation (ft gnd) or, in case of offshore operations, above mean sea level (ft msl)

Issue with current wording

The definition is too restrictive.

Rationale

A few scattered clouds should not define the cloud base since they can easily be avoided.

comment *7548* comment by: *AOPA UK*

The acronym DR normally means "Dead Reckoning" in terms of aviation. Therefore a change of acronym should be considered.

comment *7549* comment by: *AOPA UK*

The definition Dry operating mass' does not make any sense for small

aircraft if it has to be used.

comment *7550* comment by: *AOPA UK*

The definition has no validity; it is not used in 02b or 22c.

In the north of Europe there is no night-time in the middle of summer, so why the restriction of a local operation in the same day?

comment *7551* comment by: *AOPA UK*

In the northern Europe the twilight is much longer than 30 minutes during the summer.

The definition of "night" should be the same as NPA-2008-17: *'Night' means the period between the end of civil evening twilight and the beginning of morning civil twilight, or such other period between sunset and sunrise as may be prescribed by the appropriate authority, as defined by Member State.*

comment *7552* comment by: *AOPA UK*

Is a Touring Motor Glider (TMG), mentioned in the NPA 2008-17 to be considered a sailplane or an aeroplane?

comment *7553* comment by: *AOPA UK*

Is this a correct definition of a take-off flight path? AOPA UK sees that as a normal take-off, not a take-off with a non-operating engine. It is very difficult to decide that path, depending on where the failure occurs.

comment *60* comment by: *Air Southwest*

See comment 59

comment *369* comment by: *EHOC*

General Comment:

1. There is a problem with the text as it is written because, whilst it correctly addresses a single-pilot, single crew environment, it does not reflect the original rule for multi-person crews. The text needs to be rewritten to reflect both the single-pilot case (as in GA) and the multi-crew environment (as in Corporate and CAT).

2. Text in the original rule required the commander to "ensure that the pre-flight inspection has been carried out". Although this is covered in ERs, it should still be addressed in an IR because it is not clear that there is an obligation on the PIC to ensure it has been done (as well as the case where it will be the responsibility of the PIC to do it).

comment *699* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.015: add the following text:

The pilot-in-command shall, in an emergency situation that requires immediate decision and action, take any action he/she considers necessary under the circumstances. In such cases he/she may deviate from rules, operational procedures and methods in the interest of safety.

Justification:

Missing requirements from EU OPS 1.085 (g).

comment *700* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.015: add the following text:

Authority of the pilot-in-command:

An operator shall take all reasonable measures to ensure that all persons carried in the aeroplane obey all lawful commands given by the pilot-in-command for the purpose of securing the safety of the aeroplane and of persons or property carried therein.

Justification:

This text has to appear explicitly, not implicitly.

comment *899* comment by: *AECA(SPAIN)*

Include in this paragraph the content of EU-OPS 1 085, (f) paragraph 10

comment *1042* comment by: *AECA helicopteros.*

New redaction

"ensuring that all operational procedures and check lists are complied with."

comment *2639* comment by: *AOPA-Sweden*

(a) (1)

What about the PiC's responsibility in all other aircraft, are they not the same?

comment *2640* comment by: *AOPA-Sweden*

(a) (4):

The text should be elucidated to '*to perform emergency functions*'. To be able not to serve a drink to the passenger does not always restrict a person to react in a urgent situation.

comment *2641* comment by: *AOPA-Sweden*

(d):

If OPS-GEN-015 (a) (4) is changed as proposed above, this paragraph Is not needed as extra procedures.

comment *2756* comment by: *Pietro Barbagallo ENAC*

Comment: The requirement concerning the mandatory occurrences reporting (MOR) scheme for the pilot in command and the others crew members, is missing.

Justiifcation: This requirement already exists in EU-OPS1. Its purpose is to extend to the pilot in command and to the crew members as individuals, the obligation to report to the competent Authority any accident or incident occurrences.

comment *3010* comment by: *AEA*

Comment:

There's no definition for commander and PIC is used in all NPA 2009-02. There's a **conflict** with NPA FCL 17 as there can be a nominated commander by a company but also an other Pilot in Command e.g when under supervision (LFUS) or when relieving the commander.

Commander is a role, responsibility. Pilot in command is a function, it could be a pilot other than the commander.

The term commander is used in several conventions. (Tokyo, Chicago)

Proposal:

Reinstate the function "**Commander**" Use definition from EU-OPS 1.940 (a) 5;

"*One pilot amongst the flight crew, qualified as a pilot-in-command in accordance with the requirements governing Flight Crew Licenses, is designated as the commander who may delegate the conduct of the flight to another suitably qualified pilot*."

European Regions Airline Association Comment

Paragraph (a)

In the interest of achieving consistency with the wording of OPS.GEN.020

(f)) there is a need to amend Para (a) as follows:

(a) The pilot-in-command shall be responsible for:.... (4) not commencing nor continuing a flight beyond the nearest suitable aerodrome or landing site when flight crew members' capacity to perform functions is significantly reduced **to the extent that the flight may be endangered** from causes such as fatigue, sickness or lack of oxygen;

Paragraph (d)

Both JAR OPS and EU OPS use(d) the title Commander rather than Pilot-in-Command. Within the Commercial Air Transport scenario Commander is a more relevant title for the person (pilot) on board the aeroplane with regulatory responsibility, rather than the title Pilot-in-Command which is a Rules of the Air title. Granted in the overall scenario (balloons, gliders, single pilot ops etc...) PIC is applicable because he is probably the only pilot on board. However, in multi-pilot CAT operations the Pilot-in-Command (the pilot who for the time being is responsible for complying with the rules of the air) may not be the 'commander'. This is not only an example of the drawback of having one large all encompassing rule for different scenario but also of not taking into consideration the use of simplified English that cannot cause confusion when translated into other languages.

comment *6269* comment by: *DAeC LV NRW e.V.*

OPS.GEN.015

Wording in the NPA

Pilot-in-command responsibilities and authority

Our proposal

Add:

(f) In case of flights with instructor where pilot and instructor could be pilot in command the holder of the aircraft can appoint the pilot in command or pilot and instructor can agree who fly's as pilot in command. In case the instructor is pilot in command but the pilot is at the controls most of the time both can count the time as flight time.

Issue with current wording

A definition is missing who the pilot in command is.

Rationale

By default the pilot in command is the pilot occupying the seat specified as the seat of the pilot in command in the flight manual. But there are many exceptions to this rule but not in all cases the situation is apparent. This is especially in the case of flights with instructors where the instructed pilot has the license and rating to conduct the flight. In these cases there must be a provision in the regulation that the pilot in command can be appointed by the aircraft holder or agreed upon between pilot and instructor. Situations are check flights required by the aircraft holder, training flights requested by a pilot e.g. if he does not feel safe, familiarization with aircraft for which

instruction is not required. For these flights it must also be stated that the pilot in command and the instructed or checked pilot can count the time as flight time.

comment

6412 comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Comment

Wording "Pilot-in-command" needs a more precise definition as we can find other terms as : "commander" in GM OPS.GEN.180.H, "pilot flying/pilot non flying" in GM 2 OPS.GEN.460, "non-operating/non-handling pilot" in GM2 OPS.GEN.150.A which can be really confusing. Those terms are also in other parts of NPA 2009-02 B.

Proposal

We suggest specific definitions for those wordings so the text may be more clear and understandable for operators.

Justification

This might be a legal issue regarding the scope of understanding and cause problems of reading. All those wordings can lead to specific responsabilities that can be widely diffrerent.

6548 comment by: *European Gliding Union (EGU)*

OPS.GEN.015 Pilot in Command

The present NPA gives detailed information on the duties of the pilot in

command but does not verify the crew composition in multi seat aircraft in regards to who the PIC is. This issue is rather important to the GA as in many cases instructors and Type rating instructors are asked to perform duties not relating their instructor task but assist and supervise fully qualified pilots due to their actual and/or subjective lack of skill. These training flights, mainly performed for enhancement of flying skills and safety, are common use in airsport clubs. Fully certified pilots are flying accompanied by an instructor for supervision. In these flights, it has to be clarified, that the instructor can act as pilot in command.

For those flights it must also be stated that the pilot in command and the instructed or checked pilot can log the time as flight time and the instructor may log it as instruction time.

comment *18* comment by: *George Knight*

-(a) (6) Sailplanes and light aircraft do not have MELs and CDLs.

comment *19* comment by: *George Knight*

-(a) (7) this is an attempt to impose inappropriate commercial standards onto sailplanes and light aircraft. Glider training flights in particular are frequently less than ten minutes, and often only one minute when conducting training in launch failures using cable launches. Having to update the aircraft logbook at the termination of each flight is just not sensible.

It is not normal practice to keep a glider's aircraft log book at the potentially wet and windy launch point and most gliders do not have anywhere in the cockpit to stow such documents. Typically the launch-site launch log maintains a list of launch times, landing times and crew for each glider flight. Aircraft logbooks are made-up from those data on a regular basis – I believe that other regulations allow up to 30 days after a flight for such logbooks to be made up. Furthermore aircraft logbooks for gliders are usually completed not for each flight but to show e.g. a monthly total of hours, launches and (for powered sailplanes) engine hours.

Regarding technical issues most gliders (in the UK) have a Daily Inspection (DI) book that is completed after the daily inspection and lists any known defects. If a pilot detects a new defect it is written in the DI book at the end of then flight. DI books are much smaller than aircraft log books and are kept in gliders.

The imposition of Journey Logs onto gliders and light aircraft is the imposition of commercial standards where they are not appropriate. There is nothing of value to be gained. There is nowhere to keep such paperwork in most gliders and leaving them lying around at the launch point of an airfield is silly.

Powered aircraft used as glider tugs may conduct up to 7/8 flights per hour over a period of up to two hours without stopping the engine. The aircraft type may be a Pawnee where the only stowage for logbooks is under the seat and virtually impossible to access whilst seated. It is a totally unacceptable requirement that an aircraft log book be made after every launch. Current practice is for a kneepad to be used to record the take-off time, the details of the glider being towed and the release altitude. These data are transcribed to formal documents by administrative staff at a later time – not by the pilot. The proposed regulations make what is normal, efficient operation today cumbersome and difficult for no perceivable benefit.

Propose:

1. For sailplanes, powered sailplanes, microlights, SLMGs, TMGs and other light aircraft that the need for Journey Log be waived.
2. That the aircraft log book can be made up at a later date, not necessarily by the pilot, from other data such as the sites launch/landing time log or pilot's kneepad.

comment *370* comment by: *EHOC*

Paragraph (a)(2)

There is a responsibility on the PIC for the whole of the crew; text might better be:

"ensuring that all operational procedures and check lists are complied with."

Paragraph (a)(3)

This is less than transparent and requires, not just the access to the paragraph concerned but also to several others in the Essential Requirement.

All Parts of Annex 6 have a section dealing with flight preparation that are very similar:

Part 1: 4.3.1 A flight shall not be commenced until flight preparation has been completed certifying that the pilot-in-command is satisfied that:

Part II: Section 2.2.3.1 A flight shall not be commenced until the pilot in command is satisfied that:

Part II: Section 3.4.3.1 The operator shall develop procedures to ensure that a flight is not commenced unless:

Part III: Section 2.3.1 A flight or series of flights shall not be commenced until flight preparation forms have been completed certifying that the pilot-in-command is satisfied that:

Clearly, the rule covering 'flight preparation' needs to be included which specifies the elements without having to refer to the Essential Requirements.

Paragraph (a)(6)

This is one of the elements contained in point (4) above (article 2.a.3 iii and article 5) - why is this listed as a requirement when the others (in (a)(3)) are just referred to?

comment *632* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.015(a): add the proposed following text and renumber the following paragraphs accordingly:

(a) The pilot-in-command shall be responsible for:

(1) the safety of all crew members, passengers and cargo on board. The commander, or if not present, the crew member or person assuming responsibility for the aircraft and its contents until the commander is present shall be responsible for the aircraft and contents as defined in their areas of responsibility by the operator. They shall assume responsibility from the time of boarding the aircraft. When all crew members are on-board the responsibility shall be in accordance with the chain of command. On leaving the aircraft in normal situations the responsibility of that person or crew member shall cease.

Justification:

It is needed to define in a uniform way (not as a GM) when the responsibility of pilot-in-command starts and ends. This is also required to comply with ICAO Annex 6 provisions.

comment *633* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.015(a)(1): change text as follows:

(a) The pilot-in-command shall be responsible for:

(1) the initiation, continuation, termination or diversion of a flight, when involved in non-commercial operations ~~**with other than complex motor-powered aircraft**~~;

Justification:

The provision as written suggests that there's any difference between the pilot-in-command involved in a commercial operation and the PIC involved in a non-commercial operation with a complex motor-powered aircraft. The last part of the paragraph should be deleted.

comment *698* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.015: add the following paragraphs 8 - 13 under a):

ALL AIRCRAFT

(a) The pilot-in-command shall be responsible for:

[...]

(8) not permitting any crew member to perform any activity during take-off, initial climb, final approach and landing except those duties required for the safe operation of the aeroplane;

(9) not permitting:

(i) a flight data recorder to be disabled, switched off or erased during flight nor permit recorded data to be erased after flight in the event of an accident or an incident subject to mandatory reporting;

(ii) a cockpit voice recorder to be disabled or switched off during flight unless he/she believes that the recorded data, which otherwise would be erased automatically, should be preserved for incident or accident investigation nor permit recorded data to be manually erased during or after flight in the event of an accident or an incident subject to mandatory reporting;

(10) deciding whether or not to accept an aeroplane with unserviceabilities allowed by the CDL or MEL; and

(11) ensuring that the pre-flight inspection has been carried out.

(12) the operation and safety of the aeroplane from the moment the aeroplane is first ready to move for the purpose of taxiing prior to take-off until the moment it finally comes to rest at the end of the flight and the engine(s) used as primary propulsion units are shut down;

(13) giving all commands he/she deems necessary for the purpose of securing the safety of the aeroplane and of persons or property carried therein;

Justification:

Requirements from EU OPS 1.085 (f) 2-3 and 9-12 are missing.

comment *785* comment by: *Association of Dutch Aviation Technicians NVLT*

Please clarify the definition of the 'pilot-in-command' in case of flying the A/C, this could be the captain or the copilot . In case of responsibilities and authority this should be the captain.

Please clearify and improve the following item.

and (7) recording utilisation data, and all known or suspected defects in the aircraft at the termination of the flight, in the aircraft log book or journey log book for the aircraft.

It must be strictly clear for the sake of continuing airworthiness that all known defects found during flight or on the ground or during any inspection (Pre-flight or maintenance inspection) should be reported mandatory at its least after the flight in the aircraft log book or journey log book for the aircraft

comment *801* comment by: *Ingmar Hedblom*

OPS.GEN.015(a)(1) does not apply for commercial operation or for non-commercial operation with complex motor-powered aircraft. Why not for all operation?

A definition of Pilot-in-command responsibility is difficult to find in other parts of the NPA.

OR-OPS.020.FC (02c page 13) requires that a PiC is designated

OR.OPS.120.FC requires PiC training

AMC5 OR.OPS.015MLR point 1.4 (page 52 in 02c) asks for a statement defining the authority, duties and responsibilities of the pilot-in-command in the operations manual but is an AMC, not binding.

Proposal:

Delete "when involved in non-commercial operations with other than complex motor powered aircraft" in OPS.GEN.015(a)(1)

comment *897* comment by: *Ryanair*

comment *1030* comment by: *arno liesch*

Paragraph c: As we operate often in bad weather conditions, this article should be formulatet in a commendation manner, so a possible juridical trap can be avoidet.

comment *1035* comment by: *AECA helicopteros.*

Question.

Paragraph (a)(1) is not necessary or convenient to refer in this paragraph to commercial operations

comment *1393* comment by: *British Parachute Association*

At the end of (a) (2) we suggest that the following words be added..

.."except in the case of parachute operations those operational procedures which are the responsibility of the jumpmaster (or similarly designated person).

This is in order to ensure that the pilot is not deemed responsible for operational procedures over which he may have no control. (An example would be a procedure which requires the jumpmaster to ensure that the airspace beneath the aircraft is clear of other airborne hazards prior to parachutists exiting - this is a task which the pilot cannot be responsible for as he is unable to perform it.)

comment *1396* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

(d) formulation far too open.

Comment / Proposal:

Such global descriptions do not add any value. Shall be deleted without replacement.

comment *1682* comment by: *Dassault Aviation*

Technical comment.

Page 28 OPS.GEN.015(a)(1): this subparagraph says that the PIC shall be responsible for "the initiation, continuation, termination or diversion of a flight, when involved in non-commercial operations with other than complex motor-powered aircraft". We do not know the reason why it is limited to non-commercial operations with other than complex motor-powered aircraft. We thought these responsibilities were mentioned in the Basic Regulation (EC) 216/2008 Annex IV §1.c, 2.a.3, 7.c, 7.d for the others type of operations / aircraft (i.e. non-commercial operations with complex motor-powered aircraft, and commercial operations with other than complex motor-powered aircraft), but they don't. Therefore, it will be logical to extend as well these PIC's responsibilities to non-commercial operations with complex motor-powered aircraft, and commercial operations with other than complex motor-powered aircraft.

comment *2898* comment by: *UK CAA*

Page No: 28

Paragraph No:

OPS.GEN.015 (a) (4) and (d)

Comment:

OPS.GEN 015 (a) (4) requires that a flight should not be continued beyond a suitable aerodrome when crew members' operating capacity has been reduced from causes such as "fatigue, sickness or lack of oxygen", with (d) then permitting the flight to be continued with "adequate mitigating measures" in place. The only mitigating measures described later in AMC / GM are "additional crew members" and "controlled rest". The use of additional crew members (provided they are qualified to the same standard as the replaced crew members) and "controlled rest" can be accepted to mitigate the effects of fatigue but it is most unlikely that such measures will combat the effects of lack of oxygen or sickness. It is suggested that "mitigating measures" should only apply to fatigue and then only in exceptional circumstances which themselves should be reported to the competent authority.

Justification:

Clarification.

Proposed Text (if applicable):

(d) Notwithstanding the provision of OPS.GEN.015(a)(4), in a multi-crew operation the pilot-in-command may continue a flight beyond the nearest suitable aerodrome ***when the reduction in capacity is as a consequence of fatigue only and*** when adequate mitigating procedures are in place. ***All such instances of continuation shall be fully reported to the competent authority*.**

comment *2899* comment by: *UK CAA*

Page No: 28

Paragraph No: OPS.GEN.015 (a) (2)

Comment:

Text of Pilot in Command duty in this subparagraph confers the task to the pilot and not to the crew as a whole.

Justification:

Amending the text will make it clear where the PiC's responsibility lies in ensuring that the tasks are completed by himself or his crew as appropriate.

Proposed Text (if applicable):

~~compliance with all operational procedures and checklists;~~

(2) ***ensuring that all operational procedures and check lists are complied with;***

comment *3209* comment by: *Eurocontrol CND*

OPS.GEN.015 Pilot-in-command responsibilities and authority

ALL AIRCRAFT

It is stated that: "(a) The pilot-in-command shall be responsible for: (1) the initiation, continuation, termination or diversion of a flight, when involved in non-commercial operations with other than complex motor-powered aircraft;"

Why not include commercial operations and ops with complex motor-powered aircraft? Also, in items 2 – 7 it is implied that all pilots-in-command are responsible for these items which basically involves also item (1).

comment *3318* comment by: *AEA*

Relevant text:

a.2. Compliance with all operational procedures and checklists.

Comment:

The commander cannot be responsible for all operational procedures and checklists. The requirement should be as mentioned in EU-OPS 1.080(f)(8) by mentioning the Operations Manual.

Proposed text:

ensuring that all operational procedures and checklists are complied with in accordance with the Operations Manual.

comment *3353* comment by: *M Wilson-NetJets*

Original text:

(a)(4) not commencing nor continuing a flight beyond the nearest suitable aerodrome or landing site when flight crew members' capacity to perform functions is significantly reduced from causes such as fatigue, sickness or lack of oxygen;

Suggested new text:

not commencing nor continuing a flight beyond the nearest, **in flight time**, suitable aerodrome or landing site when a flight crew members' capacity to perform functions is significantly reduced from causes such as fatigue, sickness, **injury** or lack of oxygen, **unless, based on all information available to the PIC and the condition of the flight crewmember does not pose any danger to the safety of the other passengers and crewmembers, proceeding to another suitable aerodrome improves either the survival chances or long term effects related to the condition of the flight crewmember ;**

Comment / suggestion:

The suitability of the aerodrome takes only aviation aspects into consideration, like weather, approach facilities and runway length. The overall survivability of the flight crew member may be increased if he/she would be subjected to the most appropriate medical attention. Some aerodromes do not have appropriate medical facilities/attention or no medical facilities/attention at all for certain medical conditions. It should be the allowed for the PIC to elect to proceed to another suitable aerodrome, not being the closest in flight time, if it is believed to increase the survival or recuperation chances of the flight crew member. For completeness purposes include injury.

comment *4159* comment by: *DGAC*

OPS.GEN.015(a)(4), OPS.GEN.020(f), AMC1 to OPS.GEN.020(a)

It is accepted, as mentioned in OPS.GEN.020 (f), that the flight crew has a responsibility in managing his own fatigue.

However the elements highlighted in AMC1 OPS.GEN.020(a), if the crew member works for an operator is much too detailed. The interpretation of those items will lead to a simplified vision of fatigue without taking into account operational environment, support and resources, nor individual or

collective countermeasures.

It is unreasonable to assume that an individual can assess all those factors on the spot. The wording in the IR is considered sufficient to evaluate its own fatigue, notwithstanding tools and countermeasures (i.e. fatigue checklist) that an individual may use as an industry best practice. It should not be the role of a regulation body to provide an exhaustive list for a topic that also include personal life, operational issues, etc. that may impact on the non linear link between physiological fatigue and safety.

comment *5122* comment by: *Egon Schmaus*

General comment:

Pilot in Command (PIC) is generally viewed as the commercial pilot operating in a two.man cockpit. Here the private pilots situation is totally missing.

Often, in aeroclubs, pilots are to fly with an instructor more frequently than demanded by law. Most aeroclubs demand the "90-day rule" for passenger transport as mandatory flying with a club instructoe prior to hiring a club aircraft for solo.flight.

Pilots (PIC) responsibilities in this para are not questionable!

proposed text: Add:

(f) In case of flights with an instructor, when both pilot and IP could be PIC, the aircraft operator can appoint the PIC. If not regulated, pilot and instructor may agree who is PIC. For booking of flight time refer to corresponding paras. The purpose of the flight should be documented in the log books.

OPS.GEN.015 (a)(4)

….suitable aerodrome or landing site when …

In OPS.GEN.010 there is no "landing site" defined.

Either "landing site" should be defined in this paragraph or the expression amended to operating site, which is already defined in OPS.GEN.010.

comment

6205 comment by: *Lufthansa CityLine GmbH*

In the interest of achieving consistency with the wording of OPS.GEN.020 (f)) there is a need to amend Para (a) as follows:

The pilot-in-command shall be responsible for:....

(a)

.....

(4) not commencing nor continuing a flight beyond the nearest suitable aerodrome or landing site when flight crew members' capacity to perform functions is significantly reduced to the extent that the flight may be endangered from causes such as fatigue, sickness or lack of oxygen;

(d)

Both JAR OPS and EU OPS use(d) the title Commander rather than Pilot-in-Command. Within the Commercial Air Transport scenario Commander is a more relevant title for the person (pilot) on board the aeroplane with regulatory responsibility, rather than the title Pilot-in-Command which is a Rules of the Air title. Granted in the overall scenario (balloons, gliders, single pilot ops etc...) PIC is applicable because he is probably the only pilot on board. However, in multi-pilot CAT operations the Pilot-in-Command (the pilot who for the time being is responsible for complying with the rules of the air) may not be the 'commander'. This is not only an example of the drawback of having one large all encompassing rule for different scenario but also of not taking into consideration the use of simplified English that cannot cause confusion when translated into other languages

OPS.GEN.015

Wording in the NPA

Pilot-in-command responsibilities and authority

Our proposal

Add:

(f) In case of flights with instructor where pilot and instructor could both act as pilot in command the holder of the aircraft can appoint the pilot in command or pilot and instructor can agree who acts as pilot in command. In case the instructor is pilot in command but the pilot is at the controls most of the time both can count the time as flight time and the instructor can count the time as instruction time. The purpose of the flight should be documented in the log books.

Issue with current wording

A definition is missing who the pilot in command is for certain flight with instructors.

Rationale

By default the pilot in command is the pilot occupying the seat specified as the seat of the pilot in command in the flight manual. But there are many exceptions to this rule but not in all cases the situation is apparent. This is especially in the case of flights with instructors where the instructed pilot has the license and rating to conduct the flight. In these cases there must be a provision in the regulation that the pilot in command can be appointed by the aircraft holder or agreed upon between pilot and instructor. Such situations are check flights required by the aircraft holder, training flights requested by a pilot e.g. if he does not feel safe, familiarization with aircraft for which instruction is not required. For these flights it must also be stated that the instructor as pilot in command and the instructed or checked pilot can count the time as flight time and the instructor may count it as instruction time.

Page No: 28

Paragraph No: OPS.GEN.015 (e) (2)

Comment:

Text of the sub-paragraph uses the phrase "within the direct vicinity" is vague and open to subjective interpretation. "Direct vicinity" should either be defined or replaced by a distance.

Justification:

Clarification is required.

comment *3113* comment by: *Axel Ockelmann + Manfred Poggensee Commercial Balloon Operators Germany*

The term "appropriate protective clothing" is a loose concept.

Really neccessary are only gloves which we supply to them.

Mostly passengers are involved in the inflation and deflation and there are wearing, what they like.

comment *3721* comment by: *Civil Aviation Authority of Norway*

Comment:

Text of Pilot in Command duty in this subparagraph confers the task to the

pilot and not to the crew as a whole.

Justification:

Amending the text will make it clear where the PiC's responsibility lies in ensuring that the tasks are completed by himself or his crew as appropriate.

Proposed Text

(if applicable):

~~compliance with all operational procedures and checklists;~~

ensuring that all operational procedures and check lists are complied with;

comment *7232* comment by: *ANE (Air Nostrum) OPS QM*

Paragraph (a)

In the interest of achieving consistency with the wording of OPS.GEN.020 (f)) there is a need to amend Para (a) as follows:

(a) The pilot-in-command shall be responsible for:....

(4) not commencing nor continuing a flight beyond the nearest suitable aerodrome or landing site when flight crew members' capacity to perform functions is significantly reduced to the extent that the flight may be endangered from causes such as fatigue, sickness or lack of oxygen;

Paragraph (d)

Both JAR OPS and EU OPS use(d) the title Commander rather than Pilot-in-Command. Within the Commercial Air Transport scenario Commander is a more relevant title for the person (pilot) on board the aeroplane with regulatory responsibility, rather than the title Pilot-in-Command which is a Rules of the Air title. In multi-pilot CAT operations the Pilot-in-Command (the pilot who for the time being is responsible for complying with the rules of the air) may not be the 'commander'. This is not only an example of the drawback of having one large all encompassing rule for different scenario but also of not taking into consideration the use of simplified English that cannot cause confusion when translated into other languages.

comment *7527* comment by: *Pascal JOUBERT*

It is preferable to say 'management' instead of 'pre-flight briefing'.

Justification: At the place of the landing, some people, which have not flew in the balloon, may help for the deflating of it. They didn't assist to the pre-flight briefing.

comment *7638* comment by: *European Balloon Corporation*

The paragraph (a) is referring to aerodrome which is non sense in case of ballooning

The prefilght briefing is many times given by the crew chief and not the pilot, it should be changed : given by the pilot or a crew member…

It is preferable to say 'management' instead of 'pre-flight briefing'.

Justification: At the place of the landing, some people, which have not flew in the balloon, may help for the deflating of it. They didn't assist to the pre-flight briefing.

(e) 3. wear appropriate protecting clothing, what does it means : nothing , remove. It is not describe in flight manual, only gloves are describe for people holding mouth of balloons.

B. I. Draft Opinion - Part-OPS - Subpart A - Section I - OPS.GEN.020 Crew responsibilities p. 28-29

comment *371* comment by: *EHOC*

Paragraph (b)

Now crew member responsibility in GEN.020(b) when formerly the Commander's.

"Not permit any crew member to perform any activity during a critical phase of flight except those duties required for the safe operation of the aircraft."

Whilst this works in a GA context, it does not capture the intent of the original rule with respect to multi-crew environments. As has been pointed out in comments to OPS.GEN.015 above, perhaps PIC responsibilities need to be stated in both environments.

comment *635* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.020(b): change as follows:

(b) Crew members shall be seated at their assigned stations and shall not perform any activities other than those required for the safe operation of the aircraft during critical phases of flight **and when deemed necessary by the pilot-in-command in the interest of safety**.

Justification:

self-explanatory

comment *636* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.020(d): change as follows:

(d) At least one **suitably** qualified ~~**flight crew member**~~ **pilot** shall remain at the controls of the aircraft at all times.

Justification:

Compliance with EU OPS 1.310 (a) (2).

comment *690* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.020(a): NIL

The change from EU OPS has been noted, but it is accepted.

comment *691* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.020(g): change as follows:

(g) A crew member shall ~~**report to the pilot-in-command**~~:

(1) **report to the pilot-in-command** any fault, failure, malfunction or defect, which he/she believes may affect the airworthiness or safe operation of the aircraft, including emergency systems; and

(2) **report to the pilot-in-command** any incident that was endangering, or could endanger, the safety of the operation.

(3) make use of the operator's occurrence reporting schemes. A copy of the report(s) shall be communicated to the pilot-in-command concerned.

Justification:

Reference to occurrence reporting system needs to be established in the rule.

Downgrading of existing rules from EU OPS 1.085 (b) (3) is not acceptable.

comment *786* comment by: *Association of Dutch Aviation Technicians NVLT*

Please clearify and improve the following item:

A crew member shall report to the pilot-in-command:

any fault, failure, malfunction or defect, which he/she believes may affect the airworthiness or safe operation of the aircraft, including emergency systems; and

Not all crew members f.i. cabin crew are able to determine if any fault, failure, malfunction or defect will affect the airworthiness or safe operation of the aircraft.

Proposed text:

A crew member shall report to the pilot-in-command: if any fault, failure, malfunction or defect is noticed on or in the A/C by themselves or by others.

comment *900* comment by: *AECA(SPAIN)*

Include in this paragraph the content of OPS 1 085 (e) 1, 2 and 3

comment *1398* comment by: *British Parachute Association*

At the end of (c) we suggest adding the words..

..."except in the case of parachute operations where jumpmasters are exempt provided that they are wearing a serviceable parachute."

This is to ensure that the rule does not prohibit jumpmasters from the correct performance of their duties.

comment *2332* comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

Comment:

Missing is that there is no requirement for the PIC to report onwards.

Add: The PIC is required to report to the Operator

comment *2757* comment by: *Pietro Barbagallo ENAC*

Comment: The requirement concerning the mandatory occurrences reporting (MOR) scheme for the pilot in command and the others crew members, is missing.

Justiifcation: This requirement already exists in EU-OPS1. Its purpose is to avoid misunderstanding and inproper interpretations of the procedures contained in the operations manual by all the involved operator personnel, in order to assure a safe and consistent application of such procedures.

OPS.GEN.015(a)(4), OPS.GEN.020(f), AMC1 to OPS.GEN.020(a)

It is accepted, as mentioned in OPS.GEN.020 (f), that the flight crew has a responsibility in managing his own fatigue.

However the elements highlighted in AMC1 OPS.GEN.020(a), if the crew member works for an operator is much too detailed. The interpretation of those items will lead to a simplified vision of fatigue without taking into account operational environment, support and resources, nor individual or collective countermeasures.

It is unreasonable to assume that an individual can assess all those factors on the spot. The wording in the IR is considered sufficient to evaluate its own fatigue, notwithstanding tools and countermeasures (i.e. fatigue checklist) that an individual may use as an industry best practice. It should not be the role of a regulation body to provide an exhaustive list for a topic that also include personal life, operational issues, etc. that may impact on the non linear link between physiological fatigue and safety.

OPS GEN 020 Crew Responsibilities

(b) Page 28 "Crew members shall be seated at their assigned stations and shall not perform any activities other than those required for the safe operation of the aircraft during critical phases of flight"

Comment: This is vague and does not enumerate "critical phases of flight". This should be detailed so as not to cause any confusion.

(g) Page 29 "Crew members should not undertake duties on an aircraft if they know that they are sufering from or are likely to suffer from fatigue or they feel unfit to the extent that the flight may be endangered. "

PROPOSED TEXT : "**Crew members have a right to refuse to undertake duties or continue flight schedules if they do not feel that they are apt physically or mentally to ensure the safe undertaking of their duties. As only the crew member in question is able to evaluate his / her capacity to safely undertake her / his duties the decision to refrain from flight duty may not be contested by the operator or the medical examiner unless this action becomes repetitive. In such a case the consultation of a medical practitioner is advised."**

JUSTIFICATION : ICAO Annexe 6 2.2.3 " An important safeguard may be established if States and Operators recognise the right of a crew member to refuse further flight duty when suffering from fatique of such a nature as to affect adversely the safety of the flight."

See also French Decree 11 July 1991 referring to crew fatigue and the right to abstain from flight duties.

In order that crew may not be unduly punished for refusing it is imperative that it is left up to the crew member to evaluate his / her capacity to work in a safe manner.

comment *6497* comment by: *FSC - CCOO*

(f) ~~Crew members shall not undertake duties on an aircraft if they know that they are suffering from or are likely to suffer from fatigue or they feel unfit, to the extent that the flight may be endangered.~~

Replace:

(f) Crew members shall have the right to refuse to undertake or continue duties on an aircraft if they know that they are suffering from or are likely to suffer from fatigue or they feel mentally or physically unfit, to safely perform their duties.

Reason: An individual crew member might not be able to assess whether his/her feeling unfit might endanger the flight, but an individual is able to evaluate if he/she is fit enough to perform his/her duties safely.

Moreover, ICAO Annexe 6- 2.3.2. reads: "an important safeguard may be established if states and operators recognise the right of a crew member to refuse further flight duty when suffering from fatigue of such a nature as to

adversely affect the safety of flight". This ICAO recommendation is reflected in Annex IV 7.f. of Regulation 216/2008 and should therefore be reflected in the thereof emanating IR. **The difference between adversely affecting the safety of flight and *endagering the flight* should be observed. The proposed text is far weaker than the ICAO recommendation.** Furthermore French and Spanish CAA have this principle enshrined in their FTL Rules:

French Decree of 11 July 1991 relative to fatigue of crew members:

"A crew member must abstain from duty if she/he feels any type of deficiency that leads Him/her to believe that she/he may not have the necessary aptitude to exercise his/her duties".

The Spanish CIRCULAR OPERATIVA 16 B SOBRE LIMITACIONES DE TIEMPO DE VUELO, MÁXIMOS DE ACTIVIDAD AÉREA Y PERIODOS MÍNIMOS DE DESCANSO PARA LAS TRIPULACIONES reads in its paragraph 2.: No obstante lo que se establece en estas normas, un Tripulante no volará, ni su Empresa le exigirá que lo haga, si aquel o ésta tienen razones bien fundadas para creer que el Tripulante está padeciendo fatiga excesiva o, teniendo en cuenta las circunstancias del vuelo particular que debe llevarse a cabo, es probable que llegue a acumular fatiga excesiva durante el mismo.

(c) Flight crew members shall keep their safety belt fastened while at their stations. Shoulder harness must only be fastened during take-off, landing and all other critical phases of flight.

comment *7379* comment by: *ETF*

Add: (c) Prior to and during taxiing, take-off and landing, and whenever deemed necessary in the interest of safety by the pilot-in-command, each person **and crew member** on board shall occupy a seat or berth and, except in the case of parachute operations, have his/her safety belt or harness properly secured.

Reason: The conflicting roles of cabin crew will often contain more service duties than safety, for example to hand out coats during taxiing or checking the seat-belts of passengers during turbulence. Cabin crew should know that they have an obligation to sit down when it is deemed necessary.

comment *7438* comment by: *David ROBERTS*

Sub para (e). The question arises here of, where for example, an ATPL is also a PPL holder: does the FTL relevant to that pilot's commercial (ATPL) activities combine with any PPL flying?

If that is what is intended it could lead to some difficult situations for the pilot, who may be flying for leisure one day (maybe up to 6 hours in a sailplane), then the following day be flying professionally. In my experience there are many private pilots who are professional airline pilots.

Further, sub para (e) (2) could be a bureacratic nightmare of information transfer.

This section requires some careful thinking if pilots who take part in multiple aviation activities are not to be unreasonably restricted.

Proposal: To be discussed in the review stage with selected experts (if in fact there is a 'problem' with the draft wording in this respec

B. I. Draft Opinion - Part-OPS - Subpart A - Section I - OPS.GEN.025 Common language p. 29

comment *20* comment by: *George Knight*

Communicating with whom? Between themselves, with ATC or with passengers? Without further qualification this regulation could have some unexpected consequences such as preventing cabin crew talking to a passenger in a language not shared by all crew members! It appears to make it mandatory for all crew, including cabin crew, to speak English since ATC will normally use that.

comment *372* comment by: *EHOC*

The original text in this rule had two parts:

(a) that all crew members should communicate in a common language; and

(b) that the operator had to ensure that all operations personnel able to understand the language in which the parts of the Operations Manual are written. We are aware of some States where the OM is written in a language which cannot be understood by some Operations Personnel.

A suggest text is:

(b) The operator shall ensure that all operations personnel are able to understand the language in which those parts of the Operations Manual which pertain to their duties and responsibilities are written.

comment *548* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.025: change as follows:

OPS.GEN.025 Common language

~~**All crew members shall communicate in a common language.**~~

1. An operator must ensure that all crewmembers can communicate in a common language.

2. An operator must ensure that crewmembers are able to understand the language in which the relevant operations manuals are written.

Justification:

This is more in line with JAR-OPS 1.025. It shifts the responsibility for a common language to the operator i.nstead of the individual crewmember. Another option is to leave OPS.GEN.025 as it is and add the proposed text as AMC OPS.GEN.025.

comment *679* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.025: Insert text from EU OPS 1.025:

(a) An operator must ensure that all crew members can communicate in a common language.

(b) An operator must ensure that all operations personnel are able to understand the language in which those parts of the operations manual which pertain to their duties and responsibilities are written.

Justification:

The regulation is not sufficient, is should be ensured that communication is performed in ONE common language.

Note: in NPA 2009-02f, the cross-reference in the table is wrong for this provision. EU OPS 1.025 (b) is inappropriately cross-referenced to OR.OPS.015.MLR (d).

comment *901* comment by: *AECA(SPAIN)*

Question:

Who is responsible for designation of common language?

comment *902* comment by: *AECA(SPAIN)*

According to FCL rules, all flight crew members need to demostrate a proficiency language in english at a minimum level 4. We think this is sufficient to cover this rule.

comment *908* comment by: *CAA-NL*

Comment regarding:

All crew members shall communicate in a common language.

Include: All manuals shall be in a commom language

comment *1038* comment by: *AECA helicopteros.*

Add a new paragraph

b) The operator shall ensure that all operations personnel are able to understand the language in which those parts of the Operations Manual which pertain to their duties and responsibilities are written.

comment *1374* comment by: *Royal Danish Aeroclub*

We support the proposal of a common language for crew members.

comment *2286* comment by: *Austro Control GmbH*

OPS.GEN.025 Common language

All crew members shall communicate in a common language.

extend sentence for practical reasons *"...used in the AFM/Operations Manual".*

comment *2758* comment by: *Pietro Barbagallo ENAC*

Comment: The requirement concerning the comprehension of the language in which the Operations Manual is written, by all the concerned personnel of the operator as applicable, is missing.

Justification: This requirement already exists in EU-OPS1. Its purpose is to avoid misunderstanding and inproper interpretations of the procedures contained in the operations manual by all the involved operator personnel, in order to assure a safe and consistent application of such procedures.

comment *2903* comment by: *UK CAA*

Page No: 29

Paragraph No: OPS.GEN.025

Comment:

Common Language.

This requirement should also apply to operations staff and publications

Justification:

All operationally critical staff and publications, such as the flight crew, operations controllers and the operations manual, should use common language to prevent misunderstanding.

Proposed Text (if applicable):

(a) All crew members shall communicate in a common language.

(b) All operations staff shall be able to understand the language in which the Operations Manual is written.

comment *2962* comment by: *REGA*

Are there any requirements for commom language regarding documentation?

Proposal

The Manuals shall be written and available in the mother language of the crew member.

comment *3015* comment by: *AEA*

Relevant Text:

All crew members shall communicate in a common language

Comment:

This requirement should only apply to those crew member who have safety duties in the aircraft. In addition, crew member should not always communicate in a common language but should be able to do so. We therefore suggest amending this paragraph for clarity reasons.

Proposal:

All crew members **assigned to safety duties in the aircraft** shall **be able to** communicate in a common language **for safety related duties and procedures**

comment *3215* comment by: *Eurocontrol CND*

OPS.GEN.025 Common language

It is stated that: "All crew members shall communicate in a common

language.”

There is no statement as to the level of knowledge of the common language that is required.

There is no reference to ICAO language requirements for RT communications as prescribed in ICAO Annex 1.

comment *3365* comment by: *M Wilson-NetJets*

Original text:

All crew members shall communicate in a common language.

Suggested new text:

All crew members shall communicate in **one** common language.

Comment/suggestion:

The way the current text is written it might be that crewmembers swap between languages. For some crewmembers swapping between languages might be additionally stressful and reduces their spare capacity. Secondly, languages have "false friends" between them and switching between languages more quickly introduce these "false friends" which might lead to misunderstandings and subsequent reduction of flight safety. Therefore, it is advisable to communicate in one common language.

comment *3726* comment by: *Civil Aviation Authority of Norway*

Comment:

Common Language.

This requirement should also apply to operations staff and publications

Justification:

All operationally critical staff and publications, such as the flt crew, operations controllers and the operations manual, should use common language to prevent misunderstanding.

Proposed Text

(if applicable):

(a) All crew members shall communicate in a common language.

(b) All operations staff shall be able to understand the language in which the Operations Manual is written.

comment *4021* comment by: *Virgin Atlantic Airways*

Relevant Text:

All crew members shall communicate in a common language

Comment:

Crew members must not always communicate in a common language but should be able to do so. We therefore suggest amending this paragraph to reflect EU-OPS.

Proposal:

An operator must that all crew members can communicate in a common language

comment *4162* comment by: *DGAC*

The material of EU-OPS/JAR-OPS 3, § 1/3.025(b) must be transferred somehow here.

[1/3.025(b) An operator must ensure that all operations personnel are able to understand the language in which those parts of the Operations Manual which pertain to their duties and responsibilities are written.]

This material is said [X-ref table] to have been transferred to (d) of OR.OPS.015.MLR, but (d) only deals with access by the personnel to the portions of the Ops Manual they need to carry out there tasks.

Besides, for non commercial operator, a provision should be added to make sure that the crew understands the language in which placards and Flight Manual are written.

comment *4163* comment by: *DGAC*

Proposal :

All **operational** communications shall be made in a common language

Justification :

There is no safety justification to regulate other communication than operational communications

comment *4253* comment by: *KLM*

Relevant Text:

All crew members shall communicate in a common language

Comment:

This requirement should only apply to those crew member who have safety duties in the aircraft. In addition, crew member should not always

communicate in a common language but should be able to do so. We therefore suggest amending this paragraph for clarity reasons.

Proposal:

All crew members **assigned to safety duties in the aircraft** shall **be able to** communicate in a common language **for safety related duties and procedures**

comment *4468* comment by: *TAP Portugal*

Relevant Text:

All crew members shall communicate in a common language

Comment:

This requirement should only apply to those crew member who have safety duties in the aircraft. In addition, crew member should not always communicate in a common language but should be able to do so. We therefore suggest amending this paragraph for clarity reasons.

Proposal:

All crew members **assigned to safety duties in the aircraft** shall **be able to** communicate in a common language **for safety related duties and procedures**

comment *4861* comment by: *Deutsche Lufthansa AG*

Relevant Text:

All crew members shall communicate in a common language

Comment:

This requirement should only apply to those crew member who have safety duties in the aircraft. In addition, crew member should not always communicate in a common language but should be able to do so. We therefore suggest amending this paragraph for clarity reasons.

Proposal:

All crew members **assigned to safety duties in the aircraft** shall **be able to** communicate in a common language **for safety related duties and procedures**

comment *5316* comment by: *Norwegian Air Sports Federation*

We do support the paragraph.

comment *5432* comment by: *Swiss International Airlines / Bruno Pfister*

Relevant Text:

All crew members shall communicate in a common language

Comment:

This requirement should only apply to those crew member who have safety duties in the aircraft. In addition, crew member should not always communicate in a common language but should be able to do so. We therefore suggest amending this paragraph for clarity reasons.

Proposal:

All crew members **assigned to safety duties in the aircraft** shall **be able to** communicate in a common language **for safety related duties and procedures**

comment *5873* comment by: *Danish Powerflying Union*

We agree on the suggestion that crew members use a common language.

comment *6742* comment by: *Icelandair*

Relevant Text:

All crew members shall communicate in a common language

Comment:

This requirement should only apply to those crew member who have safety duties in the aircraft. In addition, crew member should not always communicate in a common language but should be able to do so. We therefore suggest amending this paragraph for clarity reasons.

Proposal:

All crew members **assigned to safety duties in the aircraft** shall **be able to** communicate in a common language **for safety related duties and procedures**

comment *7126* comment by: *ECA - European Cockpit Association*

Comment: This requirement should be treated in a new paragraph OPS.CAT.025 as well, as follows (see also comment 548):

OPS.CAT.025 Common language

1. An operator must ensure that all crewmembers can communicate in a common language.

2. An operator must ensure that crewmembers are able to

understand the language in which the relevant operations manuals are written.

Justification:

This is more in line with JAR-OPS 1.025. It shifts the responsibility for a common language to the operator instead of the individual crew member.

comment *7178* comment by: *AIR FRANCE*

Relevant Text:

All crew members shall communicate in a common language

Comment:

This requirement should only apply to those crew member who have safety duties in the aircraft. In addition, crew member should not always communicate in a common language but should be able to do so. We therefore suggest amending this paragraph for clarity reasons.

Proposal:

All crew members **assigned to safety duties in the aircraft** shall **be able to** communicate in a common language **for safety related duties and procedures**

comment *7334* comment by: *FAA*

1. OPS.GEN.025

Comment:

The 'common language' requirement is not specific; more detail is requires. Under the proposed text, it is possibil that crewmembers agree to communicate in a 'common language' that NOT ALL crewmembers are fluent in, creating a communication hazard.

Recommendation:

Modify the regulation of the guidance material to indicate that each crewmember must be able to speak and understand the 'common language' being used.

comment *7440* comment by: *David ROBERTS*

I agree with this proposal.

comment *7451* comment by: *British Airways*

Relevant Text:

All crew members shall communicate in a common language

Comment:

This requirement should only apply to those crew members who have safety duties in the aircraft. In addition, crew members should not always have to communicate in a common language but should be able to do so. We therefore suggest amending this paragraph for clarity reasons.

Proposal:

All crew members **assigned to safety duties in the aircraft** shall **be able to** communicate in a common language **for safety related duties and procedures**

B. I. Draft Opinion - Part-OPS - Subpart A - Section I - OPS.GEN.030 Transport of dangerous goods p. 29-30

comment *619* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.030(b)(5): add text as follows:

(b) Dangerous goods shall only be transported by an operator approved in accordance with OPS.SPA.DG, except when:

(3) required on board the aircraft for specialised purposes;

(4) carried by passengers or crew members in accordance with the Technical Instructions; or

(5) in baggage which has been separated from its owner **during transit (e.g. lost baggage or improperly routed baggage) but which is carried by the operator.**

comment *903* comment by: *AECA(SPAIN)*

New wording:

The transport of dangerous goods by air shal be conducted in accordance with the **Edition in force** of the Technical...

Reasons:

Refer a specific edition of the Technical Instructions limit the validity of this rule to 2007 and 2008 only.

comment *954* comment by: *Quality Assurance, Denim Air*

The inability to allow dynamic references to other standards – in particular the ICAO TIs for DG – is of concern. If EASA does not keep up with international developments operators face double jeopardy – the NAA won't let us use a new ICAO rule, but a foreign NAA (during a ramp check, for example) will fine us for not having applied it. It is not credible that EASA cannot address this matter and avoid slipping behind on international rulemaking developments.

comment *1159* comment by: *CAA-NL*

Paragraph No: OPS.GEN.030 (a)

Comment1. : The text refers to an out of date edition of the International Civil Aviation Organization's Technical Instructions for the Safe Transport of Dangerous Goods by Air

Justification: A new edition of the Technical Instructions are produced by ICAO every two years; the current edition is the 2009-2010 edition.

Proposed Text:

"The transport of dangerous goods by air shall be conducted in accordance with the ~~2007-2008~~ current ~~E~~edition of the Technical Instructions for the Safe Transport of Dangerous Goods by Air published by decision of the Council of the International Civil Aviation Organization. (ICAO Doc 9284-AN/905.). "

Paragraph No: OPS.GEN.030 (b)

Comment 2: sub paragraphs (2) and (3) are redundant as they are addressed by sub paragraph (1).

Justification: Part 1 of the Technical Instructions, detailing those dangerous goods which are not subject to the Technical Instructions, includes dangerous goods required on board the aircraft in accordance with airworthiness and operational requirements (2) and those required on board for specialised purposes.

Proposed Text:

Delete OPS.GEN.030 (b) (2) and (3) and consequentially renumber (4) and (5)

Paragraph No: OPS.GEN.030 (d)

Comment 3: Editorial

Justification: The grammatical construction of this sub para could be improved because the preamble refers to "the accident or incident" without referring to an incident or accident previously.

Proposed Text :

"The operator shall, in accordance with the Technical Instructions, report

without delay ~~to the competent authority and the authority of the State where the accident or incident occurred~~:

(1) any incidents or accidents involving dangerous goods; and

(2) the finding of undeclared or misdeclared dangerous goods discovered in cargo or passengers' baggage

to the competent authority and the authority of the State where the accident or incident occurred."

Paragraph No: OPS.GEN.030

Comment 4: The text of EU-OPS 1.1220 relating to training programmes should be included.

Justification: NPA 2009-02f states that the above text has been addressed by AMC OPS.SPA.001.DG(b)(1) but this is not the case as it relates to the content of a training programme, not the requirement for training to be provided, a test to verify understanding etc. and more importantly this relates to all operators and so should be in OPS.GEN not OPS.SPA. Furthermore, the requirement for all training to be approved by the Authority, which appears to have been omitted, would be adopted. Also, if recurrent training is completed within the final three months of validity of previous training, the Technical Instructions provides for the period of validity of the recurrent training to extend until 24 months from the expiry date of that previous training.

Proposed Text:

1. Add a new sub paragraph (e) to OPS.GEN.030 as follows:

"The operator shall establish and maintain staff training programmes, as required by the Technical Instructions, which shall be approved by the Authority, and shall ensure that

(1) staff receive training in the requirements commensurate with their responsibilities;

(2) training is provided or verified upon the employment of a person in a position involving the transport of dangerous goods by air;

(3) all staff who receive training undertake a test to verify understanding of their responsibilities;

(4) all staff who require dangerous goods training receive recurrent training at intervals prescribed by the Technical Instructions;

(5) records of dangerous goods training are maintained for all staff as required by the Technical Instructions; and

(6) his handling agent's staff are trained as required by the Technical Instructions."

2. Move AMC OPS.SPA.001.DG(b)(1) to become AMC OPS.GEN.030 (e) (because this applies to all operators irrespective of whether an approval is held) but with the following amendments to paragraphs 5 and 6:

"5. Training in emergency procedures should include as a minimum:

a. For personnel other than crew members:

i. ~~Dealing with damaged or leaking packages; and~~

~~ii. Other~~ actions in the event of ground emergencies arising from dangerous goods;

b. For flight crew members:

i. Actions in the event of emergencies in flight arising from dangerous goods carried by passengers ~~occurring in the passenger cabin or in the cargo compartments; and~~

~~ii. The notification to Air Traffic Services should an in-flight emergency occur.~~

c. For crew members other than flight crew members:

i. Dealing with incidents arising from dangerous goods carried by passengers~~; or~~

~~ii. Dealing with damaged or leaking packages in flight.~~

6. Training should be conducted at intervals of not longer than 2 years. However, if recurrent training is completed within the final three months of validity of previous training, the period of validity extends from the date on which the recurrent training was completed until 2 years from the expiry date of that previous training."

3. Create a new AMC OPS.SPA.001.DG(b)(1) (which details those areas relevant if an approval is held) as follows:

"In addition to the training detailed in AMC OPS.GEN.030(e), training in emergency procedures should additionally include, as a minimum:

a. For personnel other than crew members:

i. Dealing with damaged or leaking packages; and

b. For flight crew members:

i. Actions in the event of emergencies in flight arising from dangerous goods carried in the cargo compartments; and

ii. The notification to Air Traffic Services of any dangerous goods carried as cargo should an in-flight emergency occur.

c. For crew members other than flight crew members:

i. Dealing with damaged or leaking packages in flight. "

Comment 5 regarding:

OPS.GEN.030(d)(2)

Comment 5: OPS.GEN.030(d)(2) should be amended in respect of "undeclared or misdeclared dangerous goods" in passenger baggage.

Justification: The terms "undeclared" and "misdeclared" are not appropriate to passenger baggage because they relate to cargo i.e.

undeclared dangerous goods are those which have not been declared to the operator because of the absence of a Dangerous Goods Transport Document whereas misdeclared dangerous goods are those which are accompanied by a Dangerous Goods Transport Document which has been erroneously completed. With the exception of a small number of items which may only be carried in baggage with the approval of the operator there is no provision for declaration of dangerous goods by a passenger.

Proposed Text:

"(1) any incidents or accidents involving dangerous goods; ~~and~~

(2) the finding of undeclared or misdeclared dangerous goods ~~discovered~~ in cargo ~~or passengers' baggage~~; and

(3) the finding of dangerous goods in passenger baggage when not In accordance with the Technical Instructions."

comment *1378* comment by: *International Air Transport Association*

OPS.GEN.030 (a). The text refers to a specific, out-of-date edition of the ICAO Technical Instructions.

This text should be revised to read:

"The transport of dangerous goods by air shall be conducted in accordance with the current Edition of the Technical Instructions for the Safe Transport of Dangerous Goods by Air (ICAO Doc 9284-AN/905), including any addendum to the Technical Instructions issued by ICAO, published by decision of the Council of the International Civil Aviation Organization."

comment *1379* comment by: *International Air Transport Association*

OPS.GEN.030 (b). The text contained in sub paragraphs (2) & (3) is redundant as the provisions for dangerous goods required on board an aircraft in accordance with airworthiness requirements and operational requirements and those required on board for specialised purposes are addressed in Part 1 of the Technical instructions as set out in sub paragraph (1).

comment *1397* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

Regulations are already contained in ICAO Technical Instructions. **Comment / Proposal:**

(b) to (d) can be deleted.

Note:

AMC to be adapted accordingly by EASA.

comment *1399* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

- **OPS.GEN.030(a), page 29**
  The text refers to an out of date edition of the International Civil Aviation Organization's Technical Instructions for the Safe Transport of Dangerous Goods by Air.

A new edition of the Technical Instructions are produced by ICAO every two years; the current edition is the 2009-2010 edition.

Proposed Text (if applicable):

"The transport of dangerous goods by air shall be conducted in accordance with the ~~2007-2008~~ current Edition of the Technical Instructions for the Safe Transport of Dangerous Goods by Air published by decision of the Council of the International Civil Aviation Organization. (ICAO Doc 9284-AN/905.). "

- **OPS.GEN.030(b), page 29**

Sub paragraphs (2) and (3) are redundant as they are addressed by sub paragraph (1). Part 1 of the Technical Instructions, detailing those dangerous goods which are not subject to the Technical Instructions, includes dangerous goods required on board the aircraft in accordance with airworthiness and operational requirements (2) and those required on board for specialised purposes.

Proposed Text (if applicable):

Delete OPS.GEN.030 (b) (2) and (3) and consequentially renumber (4) and (5).

- **OPS.GEN.030(d), page 29 Editorial**

The grammatical construction of this sub para could be improved because the preamble refers to "the accident or incident" without referring to an incident or accident previously.

Proposed Text (if applicable):

"The operator shall, in accordance with the Technical Instructions, report without delay ~~to the competent authority and the authority of the State where the accident or incident occurred~~:

(1) any incidents or accidents involving dangerous goods; and

(2) the finding of undeclared or misdeclared dangerous goods discovered in cargo or passengers' baggage to the competent authority and the authority of the State where the accident or incident occurred."

- **OPS.GEN.030, page 29**

The text of EU-OPS 1.1220 relating to training programmes should be included. NPA 2009-02f states that the above text has been addressed by

AMC OPS.SPA.001.DG(b)(1) but this is not the case as it relates to the content of a training programme, not the requirement for training to be provided, a test to verify understanding etc. and more importantly this relates to all operators and so should be in OPS.GEN not OPS.SPA. Furthermore, the requirement for all training to be approved by the Authority, which appears to have been omitted, would be adopted. Also, if recurrent training is completed within the final three months of validity of previous training, the Technical Instructions provides for the period of validity of the recurrent training to extend until 24 months from the expiry date of that previous training.

Proposed Text (if applicable):

1 Add a new sub paragraph (e) to OPS.GEN.030 as follows:

"The operator shall establish and maintain staff training programmes, as required by the Technical Instructions, which shall be approved by the Authority, and shall ensure that

1. staff receive training in the requirements commensurate with their responsibilities;

2. training is provided or verified upon the employment of a person in a position involving the transport of dangerous goods by air;

3. all staff who receive training undertake a test to verify understanding of their responsibilities;

4. all staff who require dangerous goods training receive recurrent training at intervals prescribed by the Technical Instructions;

5. records of dangerous goods training are maintained for all staff as required by the Technical Instructions; and

6. his handling agent's staff are trained as required by the Technical Instructions."

2 Move AMC OPS.SPA.001.DG(b)(1) to become AMC OPS.GEN.03

"5. Training in emergency procedures should include as a minimum:

a. For personnel other than crew members:

i. ~~Dealing with damaged or leaking packages; and~~

~~ii. Other a~~ Actions in the event of ground emergencies arising from dangerous goods;

b. For flight crew members:

i. Actions in the event of emergencies in flight arising from dangerous goods carried by passengers; ~~occurring in the passenger cabin or in the cargo compartments; and~~

~~ii. The notification to Air Traffic Services should an in-flight emergency occur.~~

c. For crew members other than flight crew members:

i. Dealing with incidents arising from dangerous goods carried by passengers; ~~or~~

~~ii. Dealing with damaged or leaking packages in flight.~~

6. Training should be conducted at intervals of not longer than 2 years. However, if recurrent training is completed within the final three months of validity of previous training, the period of validity extends from the date on which the recurrent training was completed until 2 years from the expiry date of that previous training."

3 Create a new AMC OPS.SPA.001.DG(b)(1) (which details those areas relevant if an approval is held) as follows:

"In addition to the training detailed in AMC OPS.GEN.030(e), training in emergency procedures should additionally include, as a minimum:
a. For personnel other than crew members:

i. Dealing with damaged or leaking packages; and

b. For flight crew members:

i. Actions in the event of emergencies in flight arising from dangerous goods carried in the cargo compartments; and

ii. The notification to Air Traffic Services of any dangerous goods carried as cargo should an in-flight emergency occur.

c. For crew members other than flight crew members:

i. Dealing with damaged or leaking packages in flight.

- **OPS.GEN.030(d)(2), page 30**

OPS.GEN.030(d)(2) should be amended in respect of "undeclared or misdeclared dangerous goods" in passenger baggage. The terms "undeclared" and "misdeclared" are not appropriate to passenger baggage because they relate to cargo i.e. undeclared dangerous goods are those which have not been declared to the operator because of the absence of a Dangerous Goods Transport Document whereas misdeclared dangerous goods are those which are accompanied by a Dangerous Goods Transport Document which has been erroneously completed. With the exception of a small number of items which may only be carried in baggage with the approval of the operator there is no provision for declaration of dangerous goods by a passenger.

Proposed Text (if applicable):

"(1) any incidents or accidents involving dangerous goods; and

(2) the finding of undeclared or misdeclared dangerous goods discovered in cargo or passengers' baggage; and

(3) the finding of dangerous goods in passenger baggage when not in accordance with the Technical Instructions."

comment *1412* comment by: *British Parachute Association*

We suggest that an additional item (6) is added at the end of (b) to read as follows..

(6) Required to be used by parachutists who intend to exit the aircraft.

This is in order to enable the use of smoke trail devices by parachutists engaged on parachute displays. It will also ensure consistency with our comments 1604, 1632 and 1657.

comment *1432* comment by: *International Air Transport Association*

OPS.GEN.030

Missing from this part is the requirement that an operator must establish and maintain dangerous goods training programs for all categories of employees as set in Table 1-4 and Table 1-5 in the ICAO Technical Instructions. While OPS.SPA.001.DG(b)(1) requires that operators establish and maintain dangerous goods training programs this part only applies to operators holding an approval to transport dangerous goods. Many operators may elect not to transport dangerous goods as cargo, but with never the less still be handling dangerous goods that are permitted in passenger baggage. The ICAO TI requires that all flight crew, cabin crew, check-in personnel and baggage/ramp staff must receive initial and recurrent dangerous goods training, even where the operator does not carry dangerous goods in cargo.

Proposed amendment:

Add additional text into OPS.GEN.030 as a new (c) the provisions from the ICAO Technical Instructions as set out in Part 1;4.2.1, 4.2.2, 4.2.3, 4.2.4, 4.2.5.

Also missing from this part is:

1. a requirement that the operator shall provide information to passengers by way of notices at check-in areas, places where tickets are issued and aircraft boarding areas alerting passengers as to the types of dangerous goods they are forbidden from transporting in baggage; and

2. a requirement that the operator should have notices at cargo acceptance areas about the transport of dangerous goods.

This requirement applies regardless of whether the operator holds an approval to transport dangerous goods. The provisions are set out in ICAO TI Part 7;.5.1.1 and 7.4.7 respectively.

comment *1735* comment by: *Luftfahrt-Bundesamt*

- Character (a) refers to a specific version of the Technical instructions (edition 2007-2008) which is furthermore obsolete. Refering to a specific edition means that the Implementing Rule would have to be changed approximately every 2 years in order to be in compliance with the corresponding valid version of the Technical Instructions. Therefore „in accordance with the 2007 – 2008 Edition" should be changed into **„in accordance with the current edition"**

- With respect to character (b), the bullets (2) and (3) are already included in bullet (1). Therefore (2) and (3) should be deleted and (4) and (5) renamed accordingly.

- Because of recent changes in the regulations concerning Dangerous goods, paragraph (d)(2) has to be concretized as follows:

(2) the finding of undeclared or misdeclared dangerous goods discovered in cargo or **mail**

(3) the finding of dangerous goods in passengers' baggage **when not in accordance with the Technical Instructions.**

- Refererring to Section I „ – General Requirements" in general, the training requirements in the range of Dangerous Goods should also be mentioned. Therefore a new sub-paragraph should be added:

(e) The operator must establish and maintain staff training programmes as stipulated in the Technical Instructions.

comment *2259* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern detail:

Transport of dangerous goods

Comment / Proposal:

Additional issue on (b): (6) If transported as an helicopter external load.

Remarks:

DG as external load on helicopters need to be treated differently. The ICAO requirements (TL) has been developed for CAT operations. An operator transporting DG as external load should only have to follow simple procedures. All crew members shall be be able to identify the DG and their hazards to take appropriate action.

Proposed Text (if applicable):

Delete OPS.GEN.030 (b) (2) and (3) and consequentially renumber (4) and (5)

comment *2906* comment by: *UK CAA*

Page No: 29/30

Paragraph No: OPS.GEN.030 (d)

Comment:

1. The grammatical construction of this sub para could be improved because the preamble refers to "the accident or incident" without referring to an incident or accident previously. Also, rather than refer to "incidents or accidents involving dangerous goods" it is suggested preferable to use the terms "dangerous goods incidents" and "dangerous goods accidents" since these are defined terms in the Technical Instructions

2. OPS.GEN.030(d)(2) should be amended in respect of "undeclared or misdeclared dangerous goods" in passenger baggage.

Justification:

1. Clarity.

2. The terms "undeclared" and "misdeclared" are not appropriate to

passenger baggage because they relate to cargo i.e. undeclared dangerous goods are those which have not been declared to the operator because of the absence of a Dangerous Goods Transport Document whereas misdeclared dangerous goods are those which are accompanied by a Dangerous Goods Transport Document which has been erroneously completed. With the exception of a small number of items which may only be carried in baggage with the approval of the operator, there is no provision for declaration of dangerous goods by a passenger.

Furthermore, dangerous goods incidents/accidents and discoveries of undeclared/ misdeclared dangerous goods are required by the Technical Instructions to be reported to both the Competent Authority (of the State of the operator) and the State in which the incident, accident or discovery occurred; discoveries of forbidden dangerous goods need only be reported to the State in which the discovery occurred. It is suggested this is covered by the text "in accordance with the Technical Instructions" and no further qualification is required in the IRs.

Proposed Text (if applicable):

"The operator shall, in accordance with the Technical Instructions, report without delay to the competent authority and the authority of the State where the accident or incident occurred:

(1) ~~any~~ dangerous goods incidents ~~or accidents involving dangerous goods~~; ~~and~~

(2) dangerous goods accidents;

~~(2)~~(3) the finding of undeclared or misdeclared dangerous goods discovered in cargo ~~or passengers' baggage~~; and

~~(3)~~(4) the finding of dangerous goods in passenger baggage when not in accordance with the Technical Instructions."

Sub paragraphs (2) and (3) are not applicable as they are covered in sub paragraph (1). Details in (2) and (3) are covered in the Technical Instructions.

Proposed Text:

Delete sub paragraphs (2) and (3) and renumber (4) and (5).

comment *4694* comment by: *Virgin Atlantic Airways*

Relevant Text:

(1) any incidents or accidents involving dangerous goods; and

(2) the finding of undeclared or misdeclared dangerous goods discovered in cargo or passengers' baggage.

Comment:

Terms "undeclared" and "misdeclared" are not appropriate to passenger baggage because they relate to cargo i.e. undeclared dangerous goods are those which have not been declared to the operator in the correct way i.e. on a shippers declaration. whereas misdeclared dangerous goods are those, which are accompanied by a shipper's declaration, but it has been completed incorrectly. With the exception of a small number of items which may only be carried in baggage with the approval of the operator there is no provision for declaration of dangerous goods by a passenger.

Proposed Text:

(1) any incidents or accidents involving dangerous goods; ~~and~~

(2) the finding of undeclared or misdeclared dangerous goods ~~discovered~~ in cargo ~~or passengers' baggage~~; and

(3) the finding of dangerous goods in passenger baggage when not In accordance with the Technical Instructions.

European Regions Airline Association Comment

Here and throughout the IR, document references [versions, publication dates, revision, etc] are made to outdated documents, All these references should be made as generic as possible, ICAO document reference numbers normally do not change but their version and dates do. Any subsequent change to these referenced documents means that the IR will have to be amended. ERA members therefore request that EASA use "latest effective edition" or a similar statement.

The following modification to paragraph (a) is suggested for clarity:

(a) The transport of dangerous goods by air shall be conducted in accordance with the latest Edition of the Technical Instructions for the Safe

Transport of Dangerous Goods by Air published by decision of the Council of the International Civil Aviation Organization. (ICAO Doc 9284-AN/905 and successive revisions).

comment *5884* comment by: *Civil Aviation Authority Finland*

Proposal:

(a) Delete the years 2007-2008 from the sentance:

... in accordance with ~~the 2007-2008 Edition of~~ the Technical Instructions for ...

Justification:

The ICAO TI Doc 9284-AN/905 itself defines the document clearly and it is amended every two years (an new edition) without changing the Doc number (Doc 9284-AN/905). Using the years of the edition is causing amendment of OPS.GEN every two years.

comment *6026* comment by: *Finnish CAA*

Paragraph No: OPS.GEN.030 (a)

Comment: The text refers to an outdated edition of ICAO Doc 9284.

Justification: ICAO Publishes a new revised edition of Doc 9284 every two years. Currently the 2009-2010 edition is valid.

Proposed text (if applicable):

"The transport of dangerous goods by air shall be conducted in accordance with the ~~2007-2008~~ current ~~E~~edition of the Technical Instructions for the Safe Transport of Dangerous Goods by Air published by decision of the Council of the International Civil Aviation Organization (ICAO Doc 9284-AN/905)."

comment *6036* comment by: *Finnish CAA*

Paragraph No: OPS.GEN.030 (b)

Comment: Sub paragraphs (2) and (3) are are redundant as they are addressed by (1).

Justification: Part 1 of the Technical Instructions, detailing those dangerous goods which are not subject to the Technical Instructions, includes dangerous goods required on board the aircraft in accordance with airworthiness and operational requirements (2) and those required on board for specialised purposes (3).

Proposed text (if applicable):

Delete OPS.GEN.030 (b) (2) and (3) and consequentially renumber (4) and (5).

comment *6070* comment by: *Finnish CAA*

Paragraph No: OPS.GEN.030

Comment: The text of EU-OPS 1.1220 relating to training programmes should be included.

Justification: NPA 2009-02f states that the above mentioned text has been addressed by AMC OPS.SPA.001.DG(b)(1) but this is not the case as it relates to the content of a training programme, not the requirement for training to be provided, a test to verify understanding etc. and more importantly this relates to all operators and so should be in OPS.GEN not OPS.SPA. Furthermore, the requirement for all training to be approved by the Authority, which appears to have been omitted, would be adopted. Also, if recurrent training is completed within the final three months of validity of previous training, the Technical Instructions provides for the period of validity of the recurrent training to extend until 24 months from the expiry date of that previous training.

Proposed text (if applicable):

1. Add a new sub paragraph (e) to OPS.GEN.030 as follows:

"The operator shall establish and maintain staff training programmes, as required by the Technical Instructions, which shall be approved by the Authority, and shall ensure that

(1) staff receive training in the requirements commensurate with their responsibilities;

(2) training is provided or verified upon the employment of a person in a position involving the transport of dangerous goods by air;

(3) all staff who receive training undertake a test to verify understanding of their responsibilities;

(4) all staff who require dangerous goods training receive recurrent training at intervals prescribed by the Technical Instructions;

(5) records of dangerous goods training are maintained for all staff as required by the Technical Instructions; and

(6) his handling agent's staff are trained as required by the Technical Instructions."

2. Move AMC OPS.SPA.001.DG(b)(1) to become AMC OPS.GEN.030 (e) (because this applies to all operators irrespective of whether an approval is held) but with the following amendments to paragraphs 5 and 6:

"5. Training in emergency procedures should include as a minimum:

a. For personnel other than crew members:

i. ~~Dealing with damaged or leaking packages; and~~

~~ii. Other~~ actions in the event of ground emergencies arising from dangerous goods;

b. For flight crew members:

i. Actions in the event of emergencies in flight arising from dangerous goods carried by passengers ~~occurring in the passenger cabin or in the cargo compartments; and~~

~~ii. The notification to Air Traffic Services should an in-flight emergency occur.~~

c. For crew members other than flight crew members:

i. Dealing with incidents arising from dangerous goods carried by passengers~~; or~~

~~ii. Dealing with damaged or leaking packages in flight.~~

6. Training should be conducted at intervals of not longer than 2 years. However, if recurrent training is completed within the final three months of validity of previous training, the period of validity extends from the date on which the recurrent training was completed until 2 years from the expiry date of that previous training."

3. Create a new AMC OPS.SPA.001.DG(b)(1) (which details those areas relevant if an approval is held) as follows:

"In addition to the training detailed in AMC OPS.GEN.030(e), training in emergency procedures should additionally include, as a minimum:

a. For personnel other than crew members:

i. Dealing with damaged or leaking packages; and

b. For flight crew members:

i. Actions in the event of emergencies in flight arising from dangerous goods carried in the cargo compartments; and

ii. The notification to Air Traffic Services of any dangerous goods carried as cargo should an in-flight emergency occur.

c. For crew members other than flight crew members:

i. Dealing with damaged or leaking packages in flight. "

comment *6132* comment by: *Finnish CAA*

Paragraph No: OPS.GEN.030(d)(2)

Comment: The expression "undeclared or misdeclared dangerous goods" is

appropriate in respect of cargo but inappropriate in respect of passengers' baggage. Therefore, the text should be amended.

Justification: The terms "undeclared" and "misdeclared" are not appropriate to passenger baggage because they relate to cargo i.e. undeclared dangerous goods are those which have not been declared to the operator because of the absence of a Dangerous Goods Transport Document whereas misdeclared dangerous goods are those which are accompanied by a Dangerous Goods Transport Document which has been erroneously completed. With the exception of a small number of items which may only be carried in baggage with the approval of the operator there is no provision for declaration of dangerous goods by a passenger.

Proposed text (if applicable):

"(1) any incidents or accidents involving dangerous goods; ~~and~~

(2) the finding of undeclared or misdeclared dangerous goods ~~discovered~~ in cargo ~~or passengers' baggage~~; and

(3) the finding of dangerous goods in passenger baggage when not in accordance with the Technical Instructions."

comment *6230* comment by: *Lufthansa CityLine GmbH*

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.100 Ice and other contaminants p. 31

comment *374* comment by: *EHOC*

There is no objective requirement for flight in icing conditions. An objective requirement for Flight in Expected of Known Icing Conditions should be appended to this rule.

"(c) The pilot-in-command shall not commence a flight in known or expected icing conditions unless the aircraft is certificated and equipped to cope with such conditions."

This goes beyond the ERs and places the responsibility with the PIC for entering icing conditions. This will also be seen by Private Pilots who will then know to avoid such conditions.

There might also be a need to provide an objective requirement on which to the requirement for procedures is hung - such as:

"(d) An operator shall establish procedures for flights in expected or actual icing conditions."

This might have to be limited to complex aircraft and commercial operations.

comment *1053* comment by: *AECA helicopteros.*

There is no objective requirement for flight in icing conditions. At least an objective requirement for Flight in Expected of Known Icing Conditions should be appended to this rule.

"(c) The pilot-in-command shall not commence a flight in known or expected icing conditions unless the aircraft is certificated and equipped to cope with such conditions."

This goes beyond the ERs and places the responsibility with the PIC for entering icing conditions. This will also be seen by Private Pilots who will then know to avoid such conditions.

There might also be a need to provide an objective requirement on which to the requirement for procedures is hung - such as:

"(d) An operator shall establish procedures for flights in expected or actual icing conditions."

Comment: add paragraph (c) as follows:

(c) Such process shall comply with the procedures promulgated by or be acceptable to the type design certificate holder

Justification:

Although the AMC is comprehensive the Rule is very open and vague. It should be a requirement that the process is compliant with the aircraft certification. The wording is as suggested

comment *2908* comment by: *UK CAA*

Page No: 31

Paragraph No: OPS.GEN.100

Comment:

There is no objective rule for flight in icing conditions to amplify the requirement at ER 2.a.5.

AMC1 OPS.GEN.100 supports ER 2.a.5 directly but there should be a rule and the AMC should be linked to it.

Justification:

There is a need to provide an objective rule on which the requirement for procedures is based. This rule amplifies ER 2.a.5 and places the responsibility with the P-I-C for entering icing conditions. In addition, the rule will provide Private Pilots with information on how to avoid such conditions.

Proposed Text (if applicable):

(c) The pilot-in-command shall not commence a flight in known or expected icing conditions unless the aircraft is certificated and equipped to cope with such conditions.

(d) An operator shall establish procedures for flights in expected or actual icing conditions.

comment *3366* comment by: *M Wilson-NetJets*

Original text:

The operator shall apply ground de-icing/anti-icing processes whenever determined necessary, on the basis of inspections and weather conditions.

Suggested new text:

The **Pilot-In-Command** shall **ensure that** ground de-icing/anti-icing

processes **are applied** whenever determined necessary, on the basis of inspections and **current and expected** weather conditions.

Comment/suggestion:

Many non-scheduled/on-demand operators outsource their de/anti-icing activities and do not have any representation, directly affiliated with the operator, present at all aerodromes they fly to. Therefore, it is not the operator that can apply at those airports but it is the third party provider. The ultimate responsibility lies with the PIC and if he ensures that the processes are correctly applied as prescribed by the operator the safety is covered.

comment *3523* comment by: *IAOPA Europe*

The proper wording must be "the aircraft shall be clear of any deposit which may SIGNIFICANTLY affect its performance".

Any deposit will affect the performance of the aircraft so the current wording will in principle require any deposit to be removed. The intention must be that any deposit which has significance for the operation must be removed.

comment *3531* comment by: *Boeing*

NPA 2009-02b, Part Ops

OPS.GEN.100, Ice and other contaminants

Para (a) and (b)

Page 31 of 464

BOEING COMMENT:

(a) Paragraph (a) states: *"… the external surfaces of the aircraft shall be clear of any deposit …"* We suggest that this be either eliminated or clarified.

(b) We suggest revising paragraph (b) as follows:

*"The operator shall apply ground de-icing/anti-icing processes whenever determined necessary, on the basis of inspections, **if necessary,** and weather conditions."*

JUSTIFICATION:

(a) Ice on the fuselage, outside critical areas, and on lower wing surfaces, is acceptable according to the approved Boeing Flight Crew Operating Manual (FCOM). This should be taken into consideration.

(b) Our suggestion to add "if necessary" in the statement would eliminate the need to always inspect an aircraft.

comment *3725* comment by: *Civil Aviation Authority of Norway*

Comment:

There is no objective requirement here for flight in icing conditions to amplify the rule at ER 2.a.5. AMC1 OPS.GEN.100 supports ER 2.a.5 directly but it is felt that there should be a rule here and that the AMC should be linked to it. A requirement for Flight in expected or known Icing Conditions should be applied to this rule.

There might also be a need to provide an objective requirement on which to the requirement for procedures is hung. This might have to be limited to complex aircraft and commercial operations.

Justification:

This requirement will go beyond ER 2.a.5 and places the responsibility with the P-I-C for entering icing conditions. This will also be seen by Private Pilots who will then know to avoid such conditions.

Proposed Text

(if applicable):

(c) The pilot-in-command shall not commence a flight in known or expected icing conditions unless the aircraft is certificated and equipped to cope with such conditions.

(d) An operator shall establish procedures for flights in expected or actual icing conditions.

comment *4164* comment by: *DGAC*

Proposal : Amend the text as follows :

"**OPS.GEN.100 Ice and other contaminants**"

GROUND PROCEDURES

(a) At the commencement of a flight the external surfaces of the aircraft shall be clear of any deposit which might adversely affect its performance or controllability.

(b) The operator shall apply ground de-icing/anti-icing processes whenever determined necessary, on the basis of inspections and weather conditions.

IN-FLIGHT PROCEDURES - AEROPLANE AND HELICOPTER

(c)

(1) an operator shall (when appropriate in the case of helicopters), establish procedures for flights in expected or actual icing conditions.

(2) A commander shall not commence a flight nor intentionally fly into expected or actual icing conditions unless the helicopter is

certificated and equipped to cope with such conditions."

Justification :

As proposed, OPS GEN 100 is based on JAR OPS 1/3.345 which is restricted to ground procedures. This should appear in the title or in a subtitle.

Besides, some AMC & GM to this OPS.GEN.100 deal with in-flight procedures that the operator is supposed to develop. There must be a legal hook in the IR giving this obligation to the operator. §2.a.5 of the BR 216 is not precise enough to cover this aspect. Therefore it is proposed to reintroduce the material contained in (a) of EU/JAR-OPS 1/3.346.

JAR-OPS ACJ 1/3.346 is designed for aeroplane and helicopter only. No other category of aircraft is certified to fly in icing conditions.

Generally speaking, the nuances that have been achieved in the JAR-OPS texts were introduced on purpose after long discussions on the matters with experts of all domains.

This comment applies to other matters of the NPA as well…

comment *5645* comment by: *ERA*

European Regions Airline Association Comment

OPS.GEN.100 (b) Ice and other contaminants

ERA members have been in the forefront of applying pressure on EASA to develop without delay rulemaking action on aircraft ground de-icing / anti-icing operations. EASA consider this and other areas of this NPA provide provisions that may meet the concerns related to any lack of current individual rulemaking activity in this area. The ERA Directorate would disagree and stress that EASA as a matter of urgency should be looking at rulemaking action.

Here in sub-paragraph (b) the IR states that 'the operator shall apply ground de-icing/anti-icing processes…' , while the AMC2 OPS.GEN.100 1 states that 'De-icing and/or anti-icing procedures should…'. The latter implies the existence of 'procedures', but there is no explicitly stated requirement for the operator to establish procedures.

There is a need for explicit statements on the establishment of procedures and methods to be considered for incorporation.

comment *5648* comment by: *Irish Aviation Authority*

Paragraph (a) & (b)

Comment:

Paragraph (a) refers to "commencement of flight", aircraft may not be de-iced at commencement of flight (push-back from gate). Therefore it should read "should not commence take-off", as per OPS 1.345.

Justification:

To ensure aircraft is clear of ice at commencement of take-off.

comment *5892* comment by: *Civil Aviation Authority Finland*

Comment:

(a) The text "which might adversely affect its performance or controllability." will cause accidents, when the PIC has too open rights to deem, if the contamination or deposit can affect adversely.

Justification:

We have during the years had many of accidents, also some fatal in commercial operations, where the PIC has decided to take off with frost, snow, slash or ice on the surfaces of the aircraft trusting that the airflow will blow it away during the take-off run. Very often this does not happen and the controllability or performance of the aircraft is lost and the aircraft has crashed.

Therefore it should be written more exactly and required that the PIC shall not commence the flight if there is frost, snow, slash or ice on the surfaces of the aircraft.

comment *6972* comment by: *IACA International Air Carrier Association*

Contrary to the AMC, the rule is only dealing with pre-departure icing. Hence, the AMC should be restricted or the rule extended.

comment *7176* comment by: *ECA - European Cockpit Association*

Comment: change paragraph (b) as follows:

(b) The operator shall apply ground de-icing/anti-icing processes whenever determined necessary **by the operator or pilot in command**, on the basis of inspections and weather conditions.

Justification:

As it is currently worded, it could imply that the operator has sole discretion as to whether the aircraft requires deicing. However, it can happen that the PIC may need to take that decision. Proposed wording clarifies it.

comment *7292* comment by: *FAA*

1. OPS.GEN.100 (a) Ice and other contaminants

Comment:

The proposed text indicates: (a) At the commencement of a flight ***the external surfaces*** of the aircraft shall be clear of any deposit which might adversely affect its performance or controllability

Use of the phrase ***external surface*** could be misinterpreted to exclude contamination inside of engine inlets in front of the fan blades. The engine inlet must be free of frozen contaminates that could cause damage and failure of the engine during takeoff and initial climb.

Recommendation:

Proposed definition revision: (a) At the commencement of a flight the aircraft shall be clear of any deposit which might adversely affect its performance or controllability.

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.105 Simulated abnormal situations in flight p. 31

comment *637* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.105: add the following proposed text:

An operator shall ensure that when passengers or cargo are being carried, no emergency or abnormal situations shall be simulated.

Justification:

Simulation of abnormal situations during commercial operations.

Comment / Proposal:

(a) during commercial air transport operations no abnormal situation or emergency shall be trained (not even in instruction).

comment *1531* comment by: *Christer Ullvetter*

Test flights should also be exempted.

comment *2723* comment by: *Southern Cross International*

Simulation of abnormal or emergency situations which require the application of abnormal or emergency procedures should not be carried out when carrying (paying) passengers or cargo.

Also, OPS.GEN.105 should make an exemption for test flights and demonstration flights.

It is proposed to change OPS.GEN.105 as follows:

When carrying passengers or cargo or when conducting commercial operations the following shall not be simulated:

(a) abnormal or emergency situations which require the application of abnormal or emergency procedures; or

(b) Instrument Meteorological Conditions (IMC) by artificial means,

except in the case of

(i) flight instruction provided by a training organisation approved in accordance with Part-OR or

(ii) test flights and demonstration flights in accordance with Part-21,

provided all persons on board have received a briefing on the type of training or tests that will be carried out.

comment *4525* comment by: *ADAC Luftrettung GmbH*

Unclear definition, how about medical passengers, how about a passenger to assist in lookout duty when simulating IMC. This can mean standdown for training purposes of a HEMS helicopter

Unclear definition: If the intent of the rule is to prohibit abnormal, emergency and simulated IMC during commercial operations than this must be clearly stated. "Simulated abnormal and emergency situations are only allowed during training flights under an approved training organisation."

comment *5230* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

(a) abnormal or emergency situations which require the application of abnormal or emergency procedures;

Comment:

Should exclude test flights.

comment *5420* comment by: *ALFA-HELICOPTER*

Unclear definition: If the intent of the rule is to prohibit abnormal, emergency and simulated IMC during commercial operations than this must be clearly stated. Simulated abnormal and emergency situations are only allowed during training flights under an approved training organisation.

comment *5631* comment by: *HSD Hubschrauber Sonder Dienst*

Easier to understand and to interprete would be:

" Abnormal or emergency situations or IMC-conditions shall not be simulated in an aircraft when there are commercial passengers on board."

This would leave the possibility for useful and required operational training and checking with the standard crew, at least in the helicopter regime.

comment *5766* comment by: *Norsk Luftambulanse*

Unclear definition: If the intent of the rule is to prohibit abnormal, emergency and simulated IMC during commercial operations than this must be clearly stated. Simulated abnormal and emergency situations are only allowed during training flights under an approved training organisation.

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.110 Carriage of persons p. 31

comment *375* comment by: *EHOC*

Paragraph (a)

There appears to be a disparity between the intent of the original rule and the contents of this one; the original intent was to make entry into cargo holds a matter for the pilot-in-command.

No person shall be in any part of an aircraft in flight which is not a part designed for the accommodation of persons, **unless temporary access has been granted by the pilot-in-command** for the purpose of taking action necessary for the safety of the aircraft or of any animal or goods therein.

comment *689* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.110(a): change as follows:

(a) No person shall be in any part of an aircraft in flight which is not a part designed for the accommodation of persons, unless for the purpose of taking action necessary for the safety of the aircraft or of any animal or goods therein **and unless temporary access has been granted by the pilot-in-command**.

Justification:

PIC needs to be informed about presence of persons in these areas

comment *1028* comment by: *P.Becker ACG*

The aeroplanes used in Cargo operation do not have a cockpit door (OR.OPS.035.SEC).

Normally the AOC has an approval for cargo but not for passengers. The airlines have the need to transport cargo attendants. The definition in OPS.GEN.110 does not reflect this

propsal:

Carriage of persons without compliance with the passenger - carrying requirements
When authorized by the certificate holder, the following persons, but no others, may be carried aboard an airplane without complying with the passenger-carrying airplane requirements.

(1) A crewmember.

(2) A company employee.

(3) operational staff like loadmasters, mechanics, auditors

(4) An air carrier inspector of the Competent Authority or Regualtor who is performing official duties.(5) A person necessary for

a. The safety of the flight;

b. The safe handling of animals;

c. The safe handling of hazardous materials whose carriage is governed by regulations

d. The security of valuable or confidential cargo;

e. The preservation of fragile or perishable cargo;

f. Experiments on, or testing of, cargo containers or cargo handling devices;

g. The operation of special equipment for loading or unloading cargo; and

h. The loading or unloading of outsize cargo.

(6) A person described in paragraph (1-5) of this section, when traveling to or from his assignment.

(7) No certificate holder may operate an airplane carrying a person covered by this paragraph of this section unless

a. Each person has unobstructed access from his seat to the pilot compartment or to a regular or emergency exit;

b. The pilot in command has a means of notifying each person when smoking is prohibited and when safety belts must be fastened; and

c. The airplane has an approved seat with an approved safety belt for each person. The seat must be located so that the occupant is not in any position to interfere with the flight crewmembers performing their duties.

(8) Before each takeoff, each certificate holder operating an airplane carrying persons covered by paragraph of this section shall ensure that all such persons have been orally briefed by the appropriate crewmember on

a. Smoking;

b. The use of seat belts;

c. The location and operation of emergency exits;

d. The use of oxygen and emergency oxygen equipment; and

e. For extended overwater operations, the location of life rafts, and the location and operation of life preservers including a demonstration of the method of donning and inflating a life preserver.

(9) Each certificate holder operating an airplane carrying persons covered by paragraph(1-5) of this section shall incorporate procedures for the safe carriage of such persons into the certificate holder's operations manual.

(10) The pilot in command may authorize a person covered by paragraph (1-5) of this section to be admitted to the Flight Deck compartment of the airplane.

comment *1040* comment by: *AECA helicopteros.*

Modified to read

No person shall be in any part of an aircraft in flight which is not a part designed for the accommodation of persons, **unless temporary access has been granted by the pilot-in-command** for the purpose of taking action necessary for the safety of the aircraft or of any animal or goods therein **or due to duties tobe performed in aircraft.**

Reason. To cover technical activities must to be performed in aircraft, as e.g. HHO operations

Attachment #6

(c) "Prior to and during taxiing, take-off and landing, ..., each person on board shall occupy a seat or berth"

For some heliborne operations, and especially for Human External Cargo operations, workers don't necessary have a seat or a berth.

The image attached shows linemen in a cradle without any seats. The cradle is approved by an STC, thus it must be considered as a a part of the helicopter.

Proposal : "**Except for specific aerial works approved by the authority**, prior to ... each person on board shall occupy a seat or berth..."

or "**Except for Human External Cargo operations**, prior to ... each person on board shall occupy a seat or berth ..."

comment *1375* comment by: *Royal Danish Aeroclub*

OPS.GEN.110

Parachutists do use parts of airplanes for accomodation which are not designed for persons - i.e. standing on a wing bar before jumping from the plane. That an area not is constructed a passanger area does not neccessary

make the part or area of the airplane unusable for parachutists or persons.

We do not support this suggestion, unless the text is changed to this or similar:

No person skal be in any part of an aircraft in flight which is not a part designed for the accomodation of persons, unless for the purpose of taking action neccessary for the safety of the aircraft or of any animal or goods therein, unless the pilot in command do agree and a proper safety for the passangeres are keep i.e. by using parachutes for the passangers or crew placed outside passanger areas.

comment *1427* comment by: *British Parachute Association*

We suggest in (c) after the words "except in the case of parachute operations" there should be added the following...

..."(where parachutists may also be seated on the cabin floor)"...

There is otherwise the suggestion that although parachutists may not be required to use safety belts or harnesses they are nevertheless required to use a seat. Many aircraft flight manuals require seats to be removed for parachute operations.

This change will also ensure that this rule is consistent with the existing rule in OPS.GEN 405 (f) CARRIAGE OF PARACHUTISTS - which permits parachutists to be floor seated if necessary.

Carriage of persons : No person shall be in any part of an aircraft in flight which is not a part designed for the accommodation of persons, unless temporary access has been granted by the pilot in command for the purpose of taking action necessary for the safety of the aircraft or of any animal or goods therein.

comment *2067* comment by: *Airbus S.A.S.*

EU-OPS, at paragraph OPS1.075 (2), addresses the possibility for a pilot in command to grant temporary access to part of the aircraft in which cargo or stores are carried, being a part which is designed to enable a person to have access thereto while the aeroplane is in flight.

The proposed paragraph OPS.GEN.105 (a) discards this possibility.

Rationales for this change would be appreciated. This possibility should be kept and addressed in IR-OPS, at least in OPS.CAT.110

Page: 31

Paragraph No: OPS.GEN.110 (a)

Comment: There appears to be a disparity between the intent of the rule as seen in EU-OPS and JAR-OPS and the contents of this one; the original intent was to make entry into cargo holds a matter for the pilot-in-command.

Furthermore, this paragraph must be modified to ensure that persons cannot be carried outside of the normal crew and passenger compartments in an approved harness designed for the carriage of persons unless additional safety measures are in place. This should at least consist of appropriate training for the crew and passenger(s). An AMC is needed to clarify the requirements.

Justification: Improvement to text and standardisation.

Wing walking and other similar activities that involve the carriage of persons on the wings, fuselage etc. is hazardous and therefore should be subject to additional regulatory measures.

Proposed Text (if applicable):

OPS.GEN.110 Carriage of persons

(a) No person shall be in ***or on*** any part of the aircraft which is not a part designed for the accommodation of persons ***unless temporary access has been granted by the pilot-in-command*** for the purpose of taking action necessary for the safety of the aircraft or of any animal or goods therein.

(***b) A person shall not be carried outside of the crew or passenger compartments unless appropriate safety measures have been taken to ensure the safety of the aircraft and its occupants during the flight.***

Renumber subsequent paragraphs.

AMC1 OPS.GEN.110 Carriage of persons

If a person is to be carried outside of the crew or passenger compartments the operator must be satisfied that the pilot in command and the person being carried are fit and competent and have received adequate training.

Amend existing AMC:

AMC ***2*** OPS.GEN.110 Carriage of persons

comment *2913* comment by: *UK CAA*

Page No: 31 & 126

Paragraph No: OPS.GEN.110 and GM1 OPS.GEN.110

Comment:

The rule contains no reference to how the carriage of persons relates to the classification of a flight (whether as private or commercial air transport etc). Neither does it contain any reference to the maximum number of persons who may be carried. But GM1 OPS.GEN.110 declares that the carriage of operational personnel indispensable to the performance of a task is not considered commercial air transport. It goes on to declare that "except for parachute operations, the number of persons carried should not exceed six, excluding crew members". These statements are not guidance as to how to comply with the rule. They are independent, unrelated declarations, which can have little or no weight. The subject matter of the two declarations in this GM are of sufficient importance that they should form part of a rule, or at the very least, a properly constructed AMC to an appropriate rule.

comment *2921* comment by: *Pascal DREER*

Carriage of persons : No person shall be in any part of an aircraft in flight which is not a part designed for the accommodation of persons, unless temporary access has been granted by the pilot in command for the purpose of taking action necessary for the safety of the aircraft or of any animal or goods therein.

Carriage of persons : No person shall be in any part of an aircraft in flight which is not a part designed for the accommodation of persons, unless temporary access has been granted by the pilot in command for the purpose of taking action necessary for the safety of the aircraft or of any animal or goods therein.

comment *4575* comment by: *British Airways Flight Operations*

Relevant Text:

c) Prior to and during taxiing, take-off and landing, and whenever deemed necessary in the interest of safety by the pilot-in-command, each person on board shall occupy a seat or berth and, except in the case of parachute operations, have his/her seat belt or harness properly secured.

Comment:

With regard to cabin crew members, this **requirement goes beyond** the requirements of EU-OPS.1320 (a) which does not refer to taxing. In commercial air transport (aeroplanes) it is commonplace for the cabin crew to give the safety demonstration while the aeroplane is taxiing. If the cabin crew were required to be seated during taxxing that would not be possible.

NB, in EU Ops, taxiing is not a critical stage of flight, nor should it be.

Proposal:

Use the text from EU-OPS 1.320 (a) for the purpose of crew members.

Distinguish between crew members and passengers through a simple transposition of EU-OPS 1.320.

General Comment:

NPA 2009-2 in its entirety is unfit for the purpose for which it is intended and must be withdrawn and reconsidered.

European Regions Airline Association Comment

With regard to cabin crew members, this requirements goes beyond the

requirements of EU-OPS.1320 (a) which does not refer to taxing

The ERA Directorate ptopose EASA stick to EU-OPS 1.320 (a) for the purpose of crew members. Distinguish between crew members and passenger through a simply 'copy and paste' of EU-OPS 1.320.

comment *5793* comment by: *Ph.Walker*

Carriage of persons : No person shall be in any part of an aircraft in flight which is not a part designed for the accommodation of persons, unless temporary access has been granted by the pilot in command for the purpose of taking action necessary for the safety of the aircraft or of any animal or goods therein.

comment *6037* comment by: *ECA - European Cockpit Association*

Comment on paragraph (a): add text as follows and renumber the following paragraphs accordingly:

ALL AIRCRAFT

(a) No person shall be in any part of an aircraft in flight which is not a part designed for the accommodation of persons, unless for the purpose of taking action necessary for the safety of the aircraft or of any animal or goods therein.

(b) An operator shall not permit any person to enter or be in, and take all reasonable measures to ensure that no person enters or is in, an aeroplane when under the influence of alcohol or drugs to the extent that the safety of the aeroplane or its occupants is likely to be endangered.

Justification:

Original text from EU OPS did not allow any person under influence of Alcohol/drugs on board the aircraft. According to EASA, these persons are now allowed, there is not operator responsibility, nor support of PIC.

comment *6121* comment by: *Hans MESSERLI*

Carriage of persons : No person shall be in any part of an aircraft in flight which is not a part designed for the accommodation of persons, unless temporary access has been granted by the pilot in command for the purpose of taking action necessary for the safety of the aircraft or of any animal or goods therein.

comment *6223* comment by: *Irish Aviation Authority*

Comment:

(a) - No ref in text to access been granted by Commander. (EU-OPS 1.075 adn JAR-OPS 3.075 refers)

Justification:

Commanders responsibility to issue access

Proposed text:

Insert "unless temporary access has been granted by the Commander to any part of the A/C

comment *6351* comment by: *Trans Héli (pf)*

Carriage of persons : No person shall be in any part of an aircraft in flight which is not a part designed for the accommodation of persons, unless temporary access has been granted by the pilot in command for the purpose of taking action necessary for the safety of the aircraft or of any animal or goods therein.

comment *6355* comment by: *DGAC*

Proposal:

Rewrite (c)

"**Except for specific aerial works approved by the authority**, prior to and during taxiing, take-off and landing ..."

Justification:

For some heliborne operations (eg Human External Cargo Operations), workers don't necessarily have a seat or berth.

comment *6746* comment by: *Icelandair*

Relevant Text:

c) Prior to and during taxiing, take-off and landing, and whenever deemed necessary in the interest of safety by the pilot-in-command, each person on board shall occupy a seat or berth and, except in the case of parachute operations, have his/her seat belt or harness properly secured.

Comment:

With regard to cabin crew members, this **requirement goes beyond** the requirements of EU-OPS.1320 (a) which does not refer to taxing

Page No: 31

Paragraph No: OPS.GEN.115

Comment:

The text of this section does not indicate any responsibility for the completion of passenger briefing and only describes the act of briefing. It is recommended that the responsibility is placed on the pilot in command to

ensure that the briefing has been conducted.

Justification:

Improvement to text and indication of responsibility.

Proposed Text (if applicable):

Passengers shall be briefed on the location and use of emergency exits and relevant safety and emergency equipment.

The pilot in command shall ensure that passengers are briefed on the location and use of emergency exits and relevant safety and emergency equipment.

comment *3320* comment by: *AEA*

Relevant text:

Passengers shall be briefed on the locations and use of emergency exits and relevant safety and emergency equipment.

Comment:

This requirement can be interpreted in 2 different ways:

1. Passengers shall be briefed on the locations and use of emergency exits and shall be briefed on relevant safety and emergency equipment.

2. Passengers shall be briefed on the locations and use of emergency exits and the locations and use of safety and emergency equipment.

In case of number 2 the briefing will become rather long because also the use of emergency equipment should be briefed.

Proposal:

Change text to read:

Passengers shall be briefed on relevant safety and emergency equipment and the locations and use of emergency exits.

comment *3588* comment by: *Aero-Club of Switzerland*

Please add by whom such a briefing has to be given!

Justificaton: We think it is the duty of the PiC to care for his passengers, therefore a passenger briefing falls under his responsibility. The presentation of a passenger briefing may be delegated by him to an adequately trained and properly informed crew member.

comment *3619* comment by: *AUSTRIAN Airlines*

Relevant text:

Passengers shall be briefed on the locations and use of emergency exits and relevant safety and emergency equipment.

Comment:

This requirement can be interpreted in 2 different ways:

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.120 Securing of passenger cabin and galleys p. 31

comment *4167* comment by: *DGAC*

(a) :

Add "or translation" after "taxiing" to take helicopters into account.

comment *4765* comment by: *Virgin Atlantic Airways*

Relevant Text:

(b) "Prior to and during take-off and landing, and whenever deemed

necessary in the interest of safety by the pilot-in-command, all equipment and baggage shall be properly secured."

Comment:

Some equipment may be needed by the crew for use during taxiing, e.g. safety demonstration equipment, however all baggage should be secured before start of taxiing.

Proposed Text:

(b) "Prior to and during take-off and landing, and whenever deemed necessary in the interest of safety by the pilot-in-command, all equipment ~~and baggage~~ shall be properly secured."

(c) "Immediately prior to and during taxi, take-off and landing, and whenever deemed necessary in the interest of safety by the pilot-in-command, all baggage shall be properly secured."

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.125 Portable electronic devices p. 32

comment *315* comment by: *Aero-Club of Switzerland*

We ask the Agency to publish details about portable electronic devices that can adversely affect the systems of an aircraft.

Justification: To have an appropriate listing of such devices could represent a real safety gain, especially for the pilots flying well equipped light aircraft.

comment *988* comment by: *REGA*

Medical equipmeny cannot be approved by part 21 organisations, change text to read that all fixtures and fittings for medical equipment must be part 21 approved.

Proposal (OPS.GEN.125)

Medical equipment: Portable electronic devices that have been proven to adversely affect the performance of the aircraft's systems and equipment shall not be used on board the aircraft.

comment *2260* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern detail:

Portable electronic devices

Comment / Proposal:

Modify text:

Portable electronic devices that have been proven to adversely affect the performance of the aircraft's systems and equipment shall not be used on board the aircraft.

Remarks:

This modification is necessary especially for HEMS operations carrying electronic devices to support the health care.

comment *3018* comment by: *AEA*

Relevant Text:

Portable Electronic Devices that can adversely affect the performance of the aircraft systems and equipment shall not be used on board the aircraft.

Comment:

This definition is different from EU-OPS. The responsibility of the operator is to have procedures and a PED policy to ensure that no passenger uses PEDs that can adversely affect flight safety but operators cannot be responsible for intentional and unintentional unauthorized use by some passengers. Moreover, this regulation does not apply to airline passengers but should specify the responsibilities of the aircraft operator.

Proposal:

Revert to OPS 1.110 (PED) "*An operator shall not permit any person to use, and take all reasonable measures to ensure that no person does use, on board an aircraft a portable electronic device that can adversely affect the performance of the aircraft systems and equipment*."

comment *3608* comment by: *Austro Control GmbH*

"can" is not the right wording and to unclear:

Practical experience, especially in HEMS shows, that for health care electronic devices have to be used on board.

It should be proved that the electric device does not affect the aircraft systems.

Therefore suggestion to change the text:

"*Portable electronic devices* ***that adversely affect****....."*

Portable Electronic Devices that can adversely affect the performance of the aircraft systems and equipment shall not be used on board the aircraft.

Comment:

This definition is different from EU-OPS. The responsibility of the operator is to have procedures and a PED policy to ensure that no passenger uses PEDs that can adversely affect flight safety but operators cannot be responsible for intentional and unintentional unauthorized use by some passengers. Moreover, this regulation does not apply to airline passengers but should specify the responsibilities of the aircraft operator.

Proposal:

Revert to OPS 1.110 (PED) "*An operator shall not permit any person to use, and take all reasonable measures to ensure that no person does use, on board an aircraft a portable electronic device that can adversely affect the performance of the aircraft systems and equipment*."

comment *4531* comment by: *ADAC Luftrettung GmbH*

comment *5900* comment by: *HSD Hubschrauber Sonder Dienst*

Actually it is the AMC OPS.GEN.125 in regard to Medical Equipment. It can not be approved by part 21 organisations. Clarification should be given, that only the fittings and fixtures for medical equipment need to be certfied by Part 21 organisations

comment *6233* comment by: *Lufthansa CityLine GmbH*

The phrase 'should consider' when it comes to operators installing detectors to detect unauthorised PED transmissions raises concerns. The first concern is as to what kind of detectors are we talking about and the second concerns that does EASA realise that all these "should consider", depends on the authority, and usually ends up as "must install", Recent examples of where a single authority has read the cabin surveillance 'should consider' requirement as meaning the installation of cabin surveillance cameras. Therefore Lufthansa CityLine requests the removal of such text.

comment *6598* comment by: *European HEMS & Air Ambulance Committee (EHAC)*

comment *6874* comment by: *PPL/IR Europe*

We recommend deleting 'can', the 5th word in this sentence. Otherwise, this sentence is unclear; whilst the AMC gives appropriate guidance for commercial ops there is no clarification for non-commercial ops.

For non-commercial operations of non-complex aircraft, the crew usually has much more direct and immediate control over the use of PEDs. All that is required is an awareness of PED issues, and action when required. The current wording could cause much unnecessary debated and confusion.

comment *6876* comment by: *Ryanair*

This text could be expanded for clarity

"PED's approved for use on board aircraft are permitted. Operators may define when PED's may be used through the relevant manuals"

comment *7202* comment by: *AIR FRANCE*

Somebody is needed to clarify whether an electronic device has an adverse effect.

We suggest to add this to the responsibility of the pilot in command.

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.130 Smoking on board p. 32

comment *377* comment by: *EHOC*

In the text there is a section entitled "COMPLEX MOTOR-POWERED AIRCRAFT".

It is not clear what a COMPLEX MOTOR-POWERED AIRCRAFT is! Should it have been COMPLEX AND MOTOR-POWERED AIRCRAFT or what?

comment *910* comment by: *CAA-NL*

Comment regarding:

ALL AIRCRAFT

(a) No person shall be allowed to smoke on board: (1) while the aircraft is on the ground, unless specifically permitted by the operator in accordance with specified procedures; (2) while the aircraft is being refuelled; or (3) whenever the pilot-in-command deems necessary in the interest of safety.

COMPLEX MOTOR-POWERED AIRCRAFT

(b) No person shall be allowed to smoke on board a complex motor-powered aircraft: (1) in cargo compartments or other areas where cargo is carried; (2) in those areas of the cabin where oxygen is being supplied; (3) if the operator has declared a flight to be operated as a non-smoking flight; or (4) outside those areas that the operator has designated smoking areas

Suggestion CAA-NL:

ALL AIRCRAFT

(a) No person shall be allowed to smoke on board: (1) while the aircraft is on the ground, unless specifically permitted by the operator in accordance with specified procedures; (2) while the aircraft is being refuelled; or (3) whenever the pilot-in-command deems necessary in the interest of safety.

(4) in cargo compartments or other areas where cargo is carried; (5) in those areas of the cabin where oxygen is being supplied; (6) if the operator has declared a flight to be operated as a non-smoking flight; or (7) outside those areas that the operator has designated smoking areas

comment *1004* comment by: *KLM*

This should be :

Smoking on board including artificial smoking.

comment *1609* comment by: *Luftfahrt-Bundesamt*

The LBA recommends to introduce the text of (b)(2) also in (a).

Reason: Smoking should also be not allowed in any other aircraft when oxygen is supplied. One can even question why the rule distinguishes between all and complex motor powered aircraft.

comment *1721* comment by: *claire.amos*

(b) (3)

This is a much improved statement and one that should be included.

comment *2061* comment by: *Airbus S.A.S.*

Procedures defined by operator, to allow smoking on board while the aircraft is on the ground, should be clearly addressed in the Operations Manual.

Paragraph OPS.GEN.130 (a)(1) should read:

"while the aircraft is on the ground, unless specifically permitted by the operator in accordance with procedures defined in the Operations Manual".

comment *2352* comment by: *Dassault Aviation*

Technical comment:

Page 32 OPS.GEN.130 §(b)(2) Smoking on board: since oxygen is supplied in basically all areas of the cabin for a complex motor powered aircraft, compliance with this subparagraph (b)(2) will prohibit smoking everywhere in the cabin. To keep the intent of this subparagraph, we rather suggest the following: "in those areas of the cabin where oxygen flow is continuous".

comment *3020* comment by: *AEA*

Relevant Text:

(a) No person shall be allowed to smoke on board…

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.135.A Taxiing of aeroplanes p. 32

comment *378* comment by: *EHOC*

As a matter of interest, this text repeats the requirement contained in ER 3.a.8; this is not a criticism but indicates that completeness dictates that IRs should be complete and not just contain references to ERs/BRs.

comment *701* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.135.A: change as follows:

Aeroplanes shall only be taxied on the movement area of an aerodrome when the person at the controls is properly qualified ~~**to taxi an aeroplane**~~

Justification:

Safety reasons, best practice.

comment *1909* comment by: *Ingmar Hedblom*

The text means that no qualification is required for taxing a powered sailplane (or a TMG?) since sailplanes are not aeroplanes. Furthermore, helicopters are not covered.This is probably not intended.

comment *3533* comment by: *Boeing*

NPA 2009-02b, Part Ops

OPS.GEN.135.A, Taxiing of aeroplanes

Page 32 of 464

BOEING COMMENT:

This paragraph states: *"Aeroplanes shall only be taxied on the movement area of an aerodrome when the person at the controls is properly qualified to taxi an aeroplane."*

We request clarification on how "properly qualified" is demonstrated to authorities. What are the requirements to become properly qualified?

JUSTIFICATION: This issue needs clarification in order for those regulated by it to comply appropriately.

comment *5299* comment by: *Light Aircraft Association UK*

The word 'aeroplane' should be substituted with 'aircraft' to cover aircraft not defined as aeroplanes, such as powered sailplanes, gyroplanes, etc.

comment *6715* comment by: *Greger Ahlbeck*

Paragraph text: Aeroplanes shall only be taxied on the movement area of an aerodrome when the person at the controls is properly qualified to taxi an aeroplane

Comment: The text means that no qualification is required for taxing a powered sailplane (or a TMG?) since sailplanes are not aeroplanes. This is probably not intended.

Proposal (including ***new text***):

Change the lead in to "Aeroplanes, powered sailplanes and TMG shall only be taxied…"

comment *6718* comment by: *Greger Ahlbeck*

Comment: The text means that no qualification is required for taxing a powered sailplane (or a TMG?) since sailplanes are not aeroplanes. Furthermore, helicopters are not covered. This is probably not intended.

Proposal (including ***new text***):

Change to "Aircraft shall only be taxied on the movement area of an aerodrome when the person at the controls is properly qualified to taxi an aircraft"

comment *6801* comment by: *EFLEVA*

The EFLEVA suggests that the term 'aeroplane' should be replaced by 'aircraft' to allow for those types not defined as aeroplanes, such as powered sailplanes, gyroplanes, etc.

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.140.H Rotor engagement p. 32

comment *379* comment by: *EHOC*

As a matter of interest, this text repeats the requirement contained in ER 3.a.8; this is not a criticism but indicates that completeness dictates that IRs should be complete and not just contain references to ERs/BRs.

comment *960* comment by: *Fjallflygarna AB*

There are situations when a pilot has to leave the controls with the rotor spinning for safety reasons or for practical reasons. With this cognizance we believe it is better to allow pilots to leave the aircrafts while the rotor is spinning provided that the operator in the Operations Manual has stated the special conditions that should be met and provided that it is not inappropriate because of the construction of the helicopter. It is better that this is done legally and under stated conditions than illegal and out of control.

comment *968* comment by: *Jämtlands Flyg AB*

To whom this concerns

We must stress that actual situations do arise when a pilot has to leave the controls with the rotor turning under power for safety reasons or for practical reasons. With this acknowledgment as basis we believe the writing should allow for pilots to leave the helicopter whilst the rotor is turning under power provided that the operator in the Operations Manual has stated those special conditions that should be met, and provided that it is not inappropriate due to the construction of the helicopter or the specific type of job carried out. With the wide variety of work and environments operators and pilots face,

we forcefully conclude it is in line with the EASA statues that this is controlled and carried out in line with stated conditions rather than out of control – speedy and concealed due to risk of detection. This would enhance the risk of accidents which in turn would be detrimental to the public's view and trust of the aviation business.

Best regards

Jon Håkansson, LLM

Jämtlands Flyg AB

Operating five single engine helicopters in the remote and montanious regions of northern Sweden.

comment *1401* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

For the purpose of flight.

Comment / Proposal:

When the rotor is engaged under power the person at the controls must be qualified in any case to do so. Replace "pilot" by "qualified person". Delete "for the purpose of flight".

comment *3110* comment by: *UK CAA*

Page No: 32

Paragraph No:

OPS.GEN.140.H Rotor Engagement

Comment:

The intent of this paragraph is to ensure that only qualified persons are at the controls of a helicopter when its rotors are turned under power. In this configuration, unlike an aeroplane, the helicopter is able to become airborne easily.

However as presented, the focus of the text is on when the rotors are turned for the purpose of 'flight' which might allow someone other than a pilot but who is qualified to conduct ground runs to interpret that ground taxiing as acceptable. Ground taxiing is essentially the helicopter flying in contact with the ground due the nature of the propulsion force being applied. This is an unacceptable interpretation.

A small change to the text overcomes this misinterpretation.

Justification:

The change to the text will ensure that a person other than a qualified pilot does not try move a helicopter by use of its rotors under power.

Proposed Text (if applicable):

"A helicopter rotor shall only be turned under power for the purpose of ***ground movement or*** flight with a qualified pilot at the controls."

comment *3228* comment by: *Eurocontrol CND*

OPS.GEN.140.H Rotor engagement

In accordance with this rule, a mechanic may turn the main rotor under power as long as it is not for the purpose of flight. This paraphrasing of the ICAO provisions introduces a significant difference from ICAO Annex 6 where it is said: ´2.2.3.2 A helicopter rotor shall not be turned under power without a qualified pilot at the controls." In this context it is noted that through this change it is assumed that aeroplanes and helicopters can be dealt with in the same way, which is a dangerous assumption. It should also be noted that "flight time" for helicopters is "The total time from the moment a helicopter's rotor blades start turning." [Emphasis added] Consequently, the EASA rule allows for a non qualified person to be at the controls during flight time.

comment *3777* comment by: *Civil Aviation Authority of Norway*

Comment:

The intent of this paragraph is to ensure that only qualified persons are at the controls of a helicopter when its rotors are turned under power. In this configuration, unlike an aeroplane, the helicopter is able to become airborne easily.

However as presented, the focus of the text is on when the rotors are turned for the purpose of 'flight' which might allow someone other than a pilot but who is qualified to conduct ground runs to interpret that ground taxiing as acceptable. comment *7447* comment by: *David ROBERTS*

The question here is 'what is the interpretation of operating sites'?

Aeroplanes, helicopters, and gliders sometimes have to put down (land) at other than a recognised aerodrome or 'operating site' This is usually in an emergency. Gliders also have to land in fields when the pilot is unable to find rising air to stay airborne in order to reach the planned destination. Balloons nearly always 'land out' in a field.

Proposal: Add 'except in an emergency when a landing elsewhere is necesary or, in the case of sailplanes and balloons when the pilot has to land elsewhere of necessity'.

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.147 Visual Flight Rules (VFR) Operating minima p. 32-33

comment *62* comment by: *Air Southwest*

ICAO Doc 4444 Chapter 7.14 (7.14.1.3) states that SVFR may only be authorised when the GROUND visibility is not less than 1500m. The activities permitted are also defined in the paragraph. OPS.GEN.147 implies GROUND or FLIGHT visibility. This is incorrect.

comment *114* comment by: *Martin Gregorie*

The requirement for 1000 ft vertical and 1.5 km horizontal is unrealistic for sailplanes. In many cross country days in thre UK that would restrict operation to below 2500 ft, which means almost continuous searching for a land-out sight and severely restricts the ability for older 35:1 gliders to cross unlandable regions.

HELICOPTERS

Paragraph (c)

Missing is the limit on cloud ceiling for VFR flight over-water and out of sight of land of 600ft by day and 1,200ft by night. Text might be:

"(d) Except as provided in (e) below, overwater flights out of sight of land are only to be conducted under VFR when the cloud ceiling is greater than 600ft by day and 1 200ft by night."

renumber old (d) to (e).

Justification

This text was put into JAR-OPS 3.465 as a safety net rule to prevent en-route descent (mostly by night) when the cloud base had not been established by report and/or forecast to be above 1 200ft. It was expected that, when cloud ceiling was lower than 1 200ft, an ARA would be performed. In States where there is no VFR 500ft level flight rule (the UK for example), the absence of this limitation would permit the pilot to descend below 500ft with the concomitant risk of inadvertent entry into cloud. That this is a dangerous procedure, has been demonstrated recently when an EC225 descended into an area where cloud was forecast (and reported) to be below 1 200ft lost visual reference and flew into the sea.

Paragraph (c)(1)

Editorial: amend 'for short period' either: to 'short periods'; or 'a short period'.

comment *819* comment by: *Reto Ruesch*

Night VFR 5 km vis.

There is no possibility to determine in flight the distance and therefore that shall be at pilot's discretion for SAR or HEMS to assess the risk of flying temporarily into reduced visibility against the need to provide emergency medical service see GM OPS.SPA.020.HEMS page 464.Visibility may be reduced to 800 m for short periods when in sight of land if the helicopter is manoeuvred at a speed that will give adequate opportunity to observe any obstacle and avoid a collision.

comment *999* comment by: *British Gliding Association*

Many European sailplane pilots currently have the privilege of flying close to and in, cloud. In many parts of Europe, and in particular North Western Europe where maritime air masses are prevalent, European glider pilots can only fly in thermals and mountain wave by flying close to cloud. This aspect of gliding is the basis of participating in sport gliding and achieving international sporting awards.

There is no known safety case that should prevent sailplane pilots from flying within 300m (1000') vertically and 1500m horizontally of cloud

Cloud base within many European countries is invariably between 3,000ft and 4,500ft AMSL during summer cross-country flying days. The proposed VFR limits would effectively present an operational ceiling for sailplanes of between 2,000ft and 3,500ft AMSL.

The direct negative impact on safety that the IR proposal will have on gliding will be to;

- Increase the amount of sailplane traffic in a smaller vertical layer – that which is predominantly flown in by the largest proportion of the GA community – thus increasing the risk of collisions
- Increase already high cockpit workloads
- Increase the risk of out-landing
- Force pilots to focus primarily on selecting suitable out-landing fields to the detriment of flying the sailplane

In addition, the ongoing social and economic impact would include;

- Limit the enjoyment and value of the sport
- Negative financial impact on the gliding industry in Europe
- Negative impact on sporting participation
- Negative impact on the value of sailplanes which are generally owned and operated by tax paying private citizens

A blanket application of ICAO VFR above 3000' to sailplane flying rather than ensuring European gliding as a major aviation stakeholder has an appropriate and proportional VFR requirement will unwittingly reduce overall levels of safety. Indeed, there is compelling evidence to demonstrate that such a restriction would actually decrease safety. This is clearly not the intention of the proposed IR.

It is the qualified view of the BGA that the retained ability of sailplane pilots to fly close to cloud actually supports an improved safety case for future European aviation.

Therefore, the BGA propose that the wording of OPS.GEN.147 Visual Flight Rules (VFR) Operating minima is modified as follows;

(a) Visual flight rules (VFR) flights by aeroplanes and helicopters shall be conducted in accordance with the Visual Flight Rules and table 1.

And…

Sailplanes

(e) Visual flight rules (VFR) flights by sailplanes in airspace classes A, B, C,

D and E shall be conducted in accordance with the Visual Flight Rules and table 1. Visual flight rules (VFR) flights by sailplanes in airspace classes F and G shall be conducted clear of cloud and in sight of the surface

comment *1230* comment by: *Royal Swedish Aeroclub*

Airspace G below 3000 ft AMSL or 1000 above terrain.

Visibility 5 km is in generally good but can be a big hindrance to many flights that could be done safe. The Swedish rules today are in generally good. We suggest the following exemptions from visibility 5 km based on the Swedish rules:

1. In general momentary visibility 3 km should be accepted, for instance for passing a rain shower. That will make it possible to go thru a shower instead of making a longer distance. You don't have to turn back when it is obvious that in short time the visibility will be better again.

2. Local flight near the airfield of take off, a visibility of 3 km should be accepted. In Sweden this distance is today 25 NM and that is what we suggest for a local flight. You normally know the terrain so close to the airport. You can train take-offs and landings and you can train pilots flying in low visibility.

I airspace class G the flight visibility should be 3 km for airplanes in the landing patterns and 1.5 km for balloons.

The current regulation with these suggested values work fine, and should be keept.

comment *1747* comment by: *Danish Powerflying Union*

Tabel 1, OPS.GEN.147 Visual Flight Rules (VFR) Operation Minima is not identical to ICAO Annex 2 Rules of the air. We assume it is an editorial mistake and encourage EASA to set regulations for Visual Flight

Rules according to ICAO standards.

The current Danish regulation permit aircrafts established in the aerodrome traffic circuit, to fly with a flight visibility of at least 1.5 KM clear of cloud and with the aerodrome in sight. This works without problems and should also be possible in the future regulations.

comment *2005* comment by: *Klaus HARTMANN*

Für flight visibility gibt es im Luftraum G nur eine Ausnahme für Hubschrauber zum Unterschreiten der 5 km. In diesem Falle soll die Geschwindigkeit, zur Möglichkeit des Ausweichens bei Hindernissen, entsprechend angepasst sein. Dazu wird in AMC OPS.GEN.147(c) (1)

ausgeführt :

Bei einer Sicht < 5km soll die Sicht nicht kleiner sein als der Hubschrauber in 30 Sekunden zurücklegt. Die entsprechenden Werte sind in einer Tabelle zusammengefasst. Dabei sollen für die minimal angegebene Mindestsichtweite von 800 m eine Geschwindigkeit von 50 kts nicht überschritten werden.

Ein Freiballon wird keine 50 kts im Luftraum G erreichen können. Normale Geschwindigkeiten von Freiballonen im Luftraum G liegen, bei Einhaltung der in den Flughandbüchern angegebenen maximalen Windgeschwindigkeiten am Startplatz, in der Regel zwischen 0 und 10 kts, sehr selten bis 20 kts. Selbst bei dieser Geschwindigkeit würden Hindernisse 1,5 Minuten vor dem Erreichen erkannt werden.

Bei der deutschen Bundesstelle für Flugunfalluntersuchung gibt es in der Statistik keine Unfälle die auf Grund mangelnder Sicht, bei Sichtweiten zwischen 800m und 5 km, ihre Ursache haben. Die Regelung der Mindestsichtweite von 800m für Freiballone im Luftraum G hat sich in Deutschland bewährt.

Daher sollte für Freiballone eine Mindestsichtweite von 800 m statt 5 km gefordert werden.

comment *2011* comment by: *Ulrich Baum*

From Table 1, it does not become clear whether class F airspace may exist below 900m AMSL (as it does in Germany today) or class G airspace may exist above 900m AMSL, and what VFR minima would be applicable in such cases. Please clarify.

comment *2012* comment by: *Ulrich Baum*

In class G airspace, Table 1 prescribes a minimum flight visibility of 5km. The only exception given is for helicppters. ICAO Annex 2 allows down to 1,5km in certain circumstances. Currently, Germany requires only 1,5km visibility in Class G airspace. Because of the geographic and meteorological conditions, low-altitude flight visibility between 1,5km and 5km due to haze is a frequent condition in many parts of Germany, but experience shows that VFR flights in small and relatively slow airplanes can be conducted safely in such conditions.The 1,5km minimum also allows flights to take off under VFR at an uncontrolled airfield (which allows neither an IFR nor a special VFR departure) and then switching to IFR when entering controlled airspace.

Compared to the status quo, prescribing a 5km minimum visibility in Class G airspace would severely restrict operations for small aircraft in Germany; in fact, this would mean that many uncontrolled (VFR-only) airfields would have to be frequently closed due to near-ground visibility below 5km while much better conditions prevail at somewhat higher altitudes. On the other hand, I am not aware of any evidence showing that such a higher VFR

minimum would significantly increase safety.

I suggest to set a 1,5km visibility minimum in Class G airspace. This would also correspond to FAA regulations which set a 1 statute mile (1,6km) minimum in low-altitude Class G airspace.

Concern detail:

Visual Flight Rules (VFR) Operating minima

Comment / Proposal:

Modify text:

(c)(1) 1500m [...]the visibility may reduced.

Remarks:

Cancel the requirement of the 800m for short period in order to allow some flexibility for daily operations especially in the mountains.

comment *2339* comment by: *IDRF e.V. (association of regional airports)*

The VFR-minima shown in table 1 are almost indentical with EU-OPS 1.465 Appendix 1. But the EU-OPS shows a note, allowing speed category A and B aeroplanes to operate at flight visibilities less than 5 km but not less than 3 km (IAS = 140 kts or less), which is consistent with ICAO Annex 2, table 3-1.

The draft opinion doesn´t refer to this lower limit (other than for helicopters). Otherwise special VFR flights may however not be commenced when the VSBY is less than 3 km (and not otherwise conducted if the visibility is less than 1,5 km).

A "special VFR flight" is - as per ICAO-definition - a flight within a control zone (but not in airspace G). The existing NPA-text must therefore at least be corrected for consistency.

Apart from this, some memberstates allowing VFR-flights with a VSBY down to 1,5 km in airspace G without specifying any speed, as far as non-CAT flights are concerned. The legal basis to overregulate national law, which is conform to ICAO-regulations, is missing.

comment *2643* comment by: *AOPA-Sweden*

AOPA-S suggest the current Swedish rules: In Sweden there is a possibility to fly according the following conditions in airspace class G: At or below 3000ft MSL or 1000ft GND, whichever is highest:

Airspeed max 140 KTS: Flight visibility 3km, Clear of clouds and ground visible from aircraft.

In addition, with airport/aerodrome in sight: Lowest visibility 1,5km.

The rules should permit a return flight out of Airspace class G into airspace class C also if the visibility at the airport is below 3km. Example: The airport has visibility 2500m. An approaching VFR flight from outside the control zone has 4km visibility but may with the proposed regulation be prohibited from entering the control zone.

The 3 km possibility to take off with special VFR should also be possible from non-towered airports, as well as for aircraft taking off with 3km visibility and who wishes to continue outside the CTR. Therefore the VMC-minima of 3km (see above) that are used in Sweden should also in the future continue to be used. Change airspace class G requirements accordingly: (140knots and 3km flight visibility).

comment *2794* comment by: *REGA*

Proposal (c)

Helicopters shall be operated in a flight visibility of not less than: (1) 1 500 m during daylight, except when in sight of land, if the helicopter is maneuvered at a speed that will give adequate opportunity to observe other traffic and any obstacles in time to avoid a collision, the visibility may be reduced ~~***to 800 m***~~ *for short period.*

Page No: 32/33

Paragraph No:

OPS.GEN.147 Visual Flight Rules (VFR) Operating minima paragraphs (a), (b) and (c) and Table 1

Comment:

These sections should not be included in the IRs.

ICAO Annex 2 (The Rules of the Air) lays down the criteria for VFR and IFR flight, amongst other factors, and includes the minima for VMC flight in various airspaces. Currently, States lay down their own interpretation of the Rules of the Air for use in their airspace through their own aviation legislation and Aeronautical Information Services. This section may be at variance from those rules of individual States. The minima indicated by sub-paragraph (c) for helicopters is below the current legal limit for VFR in the UK where also all night flight is IFR.

Table 1 as presented, and it appears to have been taken from JAR-OPS 3, is incorrect in its construction with the Class F and G boxes separated. These two boxes should be joined up and would have been corrected in JAR-OPS 3 but for the change in the regulatory environment.

Justification:

Amending OPS.GEN.147 will reduce confusion and confliction with the requirements of individual States Rules of the Air regulations thus enhancing the safe operation of aircraft within the Community.

Proposed Text (if applicable):

OPS.GEN.147 Visual Flight Rules (VFR) Operating minima

(a) Visual Flight Rules (VFR) flights shall be conducted in accordance with the ~~Visual Flight Rules~~ ~~and table 1~~ ***Rules of the Air Regulations specified by the State whose territory is overflown***.

(*Delete sub-paragraphs (b) and (c) and Table 1 plus notes*)

comment *3112* comment by: *UK CAA*

Page No: 33

Paragraph No:

OPS.GEN.147 Visual Flight Rules (VFR) Operating minima paragraph (d) and Table 2 plus notes.

Comment:

This section should be restricted to Commercial Operators.

The text derives from JAR-OPS 3 and is specific to Offshore Commercial Operations with attendant control through an operations manual. As presented, the text might lead any operator to consider applying the limitations and this would not be a safe situation without the appropriate controls in place.

It is recommended that this section be annotated for Helicopter Commercial Operations only and be assigned a different paragraph number and heading.

Justification:

The text of OPS.GEN.147 (d) was intended for commercial air transport operations and controlled through an Operations Manual. As presented, it could be misused with attendant negative effect on flight safety.

Proposed Text (if applicable):

OPS.GEN.148 Minima for flying between helidecks located in Class G airspace

HELICOPTERS – COMMERCIAL OPERATIONS

(***a***) In Class G airspace, when flying between helidecks where the overwater sector is less than 10 nm, VFR flights are conducted in accordance with table ***1***.

(*Amend Table 2 to Table 1 and retain the table and notes*)

comment *3230* comment by: *Eurocontrol CND*

OPS.GEN.147 Visual Flight Rules (VFR) Operating minima

Table 1

First, the VMC visibility and distance from cloud minima are contained in ICAO Annex 2 – Rules of the Air, Chapter 3, Table 3-1. VFR operating minima are primarily an Air Traffic Management/Air Traffic Services matter. As such, it would be more appropriate to include these minima in an Implementing Rule on **Rules of the Air** instead of in these Implementing Rules for **Air Operations**. Accordingly, VFR operating minima should be removed from these Implementing Rules.

Second, this is an attempt to paraphrase ICAO Annex 2, Table 3-1, which have resulted in mistakes/omissions.

Table 1 in the NPA concerns "minimum visibilities for VFR operations" while there is no statement in the document as regards the minima for IFR flights to be operating in visual meteorological conditions (VMC). There should be a distinct differentiation between the expression "VFR operations" and "operations in VMC"

Class F airspace:

There is no requirement shown for distance from cloud below 900 m (3000 ft).

Class G airspace:

The distance from cloud requirement is only shown as "clear of cloud and in sight of the surface". There are no stated requirements for distance from cloud above 900 m (3 000 ft);

The requirement as regards visibility is 5 km at all levels whilst ICAO requirements are 8 km at or above 3050 m (10 000 ft) and 5 km below 3050 m (10 000 ft).

Other comments

The ICAO requirements: ** When so prescribed by the appropriate ATS authority:

Flight visibilities reduced to not less than 1 500 m may be permitted for

flights operating:

1) at speeds that, in the prevailing visibility, will give adequate opportunity to observe other traffic or any obstacles in time to avoid collision; or

2) in circumstances in which the probability of encounters with other traffic would normally be low, e.g. in areas of low volume traffic and for aerial work at low levels."

These provisions are not covered except as mentioned in the paragraph below.

In paragraph (b) it is stated that "special VFR flights shall not be commenced when the visibility is less than 3 km and not otherwise conducted when the visibility is less than 1 500 m". That begs the question as to what a VFR flight should do when operating at a visibility of 1 500 m outside controlled airspace and then wishes to approach and land at a controlled aerodrome, i.e. commence a SVFR flight at that flight visibility? In this context it should be noted that over the high seas, ICAO Annex 2 applies without exception.

Regarding paragraph (c), to restrict flight by helicopters to 1 500 m during day and in particular, 5 km during night, would severely restrict the use of civil helicopters during search and rescue operations in adverse weather. This could have far-reaching consequences for States' SAR operations.

It should be noted that all of the requirements listed in this section also impacts e.g. ICAO Annex 11, paragraph 2.6, Chapter 3 and Appendix 4.

comment *3257* comment by: *Aero-Club of Switzerland*

Table 1, Flight visibility, column 3: Please add the following part of the text of (c) (1);

"1500 m during daylight when the crew will have adequate opportunity to observe other traffic and any obstacles in time to avoid collission."

Justifications: For local patterns a visbility of 1500 m are sufficient. even for training flights, as the area is known to the FI and to the student.

Especially for gliders, the proposal of the Agency would have a very negative impact. So please add:

(e) VFR flights by sailplanes in airspace classes A, B, C, D, E shall be conducted according to VFR and table 1. VFR flights in airspaces F and G shall be conducted clear of clouds and in permanent sight of the surface.

comment *3378* comment by: *guy Corbett*

Gliders in the UK can currently fly in VFR in class F when clear of cloud. The proposed 1 500 m horizontally 300 m (1 000 ft) vertically would reduce safety by concentrating gliders into a narrow space and forcing them to fly

lower than present therby increasing the risk of landing out and distracting the pilots from other activities such as keeping a good lookout. There is no evidence of any safety gain by this change.

comment *3406* comment by: *George Knight*

There is no safety case for preventing gliders from flying within 1300 metres vertically and 1500 metres horizontally from cloud. This removes the existing privilege most European glider pilots have of exploiting the best soaring conditions in wave and thermal lift.

It is attacking the fundamental principles of soaring for no known safety reason.

It will negatively impact safety in several ways including:

- Forcing more traffic into a narrower vertical band.
- Increase the number of field landings.
- Detract pilots from looking out because they will be looking for fields to land in.

I propose that VFR flight by sailplanes outside controlled airspace shall be conducted clear of cloud.

comment *3424* comment by: *SNEH Organisation representing all french commercial helicopters operators*

(c) why does the flight visibilité cannot be reduce less that 1500m ?

Proposal : "Helicopters shall be operated in a flight visibility of not less than : 800 m ir 30s flight time during day light"

comment *3527* comment by: *IAOPA Europe*

The table with VFR minimas seems to be incomplete. Apparently there are no defined minimas for class G airspace above 3000 ft and for class F airspace below 3000ft.These minimas should be defined in accordance with ICAO.

comment *3528* comment by: *IAOPA Europe*

Most EU countries in accordance with ICAO allow for lower than 5 km visibility in class F and G airspace. For instance 3 km visibility if the aircraft is operated at less than 140 knots and thereby allows enough time to see

and avoid other traffic. This fundamental option for VFR flights should be preserved.

comment *3734* comment by: *Civil Aviation Authority of Norway*

Comment:

It is considered that this section should not be included in Part OPS.GEN or that it should be restricted to Commercial Operators.

The text derives from JAR-OPS 3 and is specific to Offshore Commercial Operations with attendant control through an operations manual. As presented, the text might lead any operator to consider applying the limitations and this would not be a safe situation without the appropriate controls in place.

Proposed Text

(if applicable):

OPS.GEN.148 Minima for flying between helidecks located in Class G airspace

HELICOPTERS – COMMERCIAL OPERATIONS

(***a***) In Class G airspace, when flying between helidecks where the overwater sector is less than 10 nm, VFR flights are conducted in accordance with table ***1***.

(*Amend Table 2 to Table 1 and retain the table and notes*)

comment *3775* comment by: *Civil Aviation Authority of Norway*

Comment:

It is considered that these sections should not be included in the IRs.

ICAO Annex 2 (The Rules of the Air) lays down the criteria for VFR and IFR flight, amongst other factors, and includes the minima for VMC flight in various airspaces. Currently, States lay down their own interpretation of the Rules of the Air for use in their airspace through their own aviation legislation and Aeronautical Information Services. This section may be at variance from those rules of individual States. The minima indicated by sub-paragraph (c) for helicopters is below the current legal limit for VFR in the UK where also all night flight is IFR.

Table 1 as presented, and it appears to have been taken from JAR-OPS 3, is incorrect in its construction with the Class F and G boxes separated. These two boxes should be joined up and would have been corrected in JAR-OPS 3 but for the change in the regulatory environment.

It is recommended that this text be replaced as indicated and addressed through States AIS . In the longer term, it might be that a new Rules of the Air part be introduced to provide common European criteria for all operations under Annex IV to the Basic Regulation.

Justification:

Amending OPS.GEN.147 will reduce confusion and confliction with the requirements of individual States Rules of the Air regulations thus enhancing the safe operation of aircraft within the Community.

Proposed Text

(if applicable):

OPS.GEN.147 Visual Flight Rules (VFR) Operating minima

(a) Visual Flight Rules (VFR) flights shall be conducted in accordance with the ~~Visual Flight Rules and table 1~~ ***Rules of the Air Regulations specified by the State whose territory is overflown***.

(Delete sub-paragraphs (b) and (c) and Table 1 plus notes)

comment *3942* comment by: *HDM Luftrettung gGmbH*

Ops Gen 147: Operating minima : There is no possibility to determine in flight the distance and therefore that shall be at pilot's discretion for SAR or HEMS to assess the risk of flying temporarily into reduced visibility against the need to provide emergency medical service see GM OPS.SPA.020.HEMS page 464.

Visibility may be reduced to 800 m for short periods when in sight of land if the helicopter is manoeuvred at a speed that will give adequate opportunity to observe any obstacle and avoid a collision during daylight.

There is no possibility to determine in flight the distance and therefore that shall be at pilot's discretion for SAR or HEMS to assess the risk of flying temporarily into reduced visibility against the need to provide emergency medical service see GM OPS.SPA.020.HEMS page 464.Visibility may be reduced to 800 m for short periods when navigation is conducted by reference to visual landmarks and if the helicopter is manoeuvred at a speed that will give adequate opportunity to observe any obstacle and avoid a collision.

comment

4509 comment by: *IAOPA Europe*

It seems the regulation contains no provisions for VFR on top operations where the aircraft is operated VFR but does not have the surface in sight. This is possible in several EU countries and this possibility should definitely be preserved since it will help to improve the safety of flights where the takeoff and landing area have a limited cloud cover but parts of the route has low level clouds or poor visibility.

comment

4513 comment by: *Christophe Baumann*

Operating minima : There is no possibility to determine in flight the distance and therefore that shall be at pilot's discretion for SAR or HEMS to assess the risk of flying temporarily into reduced visibility against the need to provide emergency medical service see GM OPS.SPA.020.HEMS page 464. 5060 comment by: *Trevor Wilcock*

It is difficult to comment on this paragraph in isolation; one needs fully to understand the airspace classifications that are proposed (the definitions here of Class F & G do not accord with UK practice) and the privileges that will apply in respect of VFR and IFR with the various categories of licence. However the proposed 300m/1500m separation from cloud in Class F airspace is restrictive compared with present UK limits (and those for some other European countries?) and would be particularly onerous for sailplanes, having an impact on the conduct, success and financial viability of the sport

and probably also detrimentally on overall safety. EASA regulations should not seek to be some sort of average or common factor of existing national regulations but should aim to provide the greatest freedoms consistent with safety. Unless there is an existing safety case which justifies the proposed limit, it is proposed that for sailplanes the VFR definition should be clear of cloud and in sight of the surface. The flight visibility limit for Class G is also more restrictive (not just for sailplanes) and a limit of 3km coupled to an appropriate speed limit (eg 140kn) should be considered. As an example a visibility of 3km would seem acceptable for winch-launched circuit training at a gliding site.

comment *5125* comment by: *Egon Schmaus*

OPS.GEN.147 VFR in Airspace "G":

Minimum visibility is lifted from presently 1500m to 5 km

OPS.GEN.147 VFR in Airspace "D":

Minimum visibility for special VFR is lifted from 1500m to 3 km for take-offs

In both cases should read: minimum visibility: 1500meters for aircraft

comment *5264* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment:

The table is a simplification of a more complicated rule. The row with "Airspace above 900 m . . ." and "At or below 900 m . . " shall be connected to both class F and class G. But for the next row below about "Distance from cloud" the two classes shall not be put together. And the same is valid for "Flight visibility".

Proposal:

In the headline "Airspace class", change class "F" to "FG" and class "G" to "FG'

comment *5268* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

HELICOPTERS

(c) Helicopters shall be operated in a flight visibility of not less than: (1) 1 500 m during daylight, except when in sight of land, if the helicopter is manoeuvred at a speed that will give adequate opportunity to observe other traffic and any obstacles in time to avoid a collision, the visibility may be

reduced to 800 m for short period.

Comment: The exception for helicopters to reduce the visibility minima to 800 meters for short periods should only be possible for commercial operations. Not for general aviation, including CPL-pilots performing private flights.

Proposal: State in the section that general aviation is not included and that the exception is only allowed for commercial operations.

comment *5320* comment by: *Norwegian Air Sports Federation*

We du support the BGA comments to this paragraph:

Our proposal:

(a) Visual flight rules (VFR) flights by aeroplanes classes shall be conducted in accordance with the Visual Flight Rules and table 1.

And…

Sailplanes

(e) Visual flight rules (VFR) flights by sailplanes in airspace classes A, B, C, D and E shall be conducted in accordance with the Visual Flight Rules and table 1. Visual flight rules (VFR) flights by sailplanes in airspace classes F and G shall be conducted clear of cloud and in sight of the surface

comment *5345* comment by: *Danish Balloon Organisation*

Typing Error ?

Table 1 is not in accordance with ICAO Annex 2 Rules of the Air.

We understand that the Commission has expressed its preference for maintaining an ICAO-based airspace classification in Europe.

Please change the table to reflect ICAO rules.

comment *5347* comment by: *Danish Balloon Organisation*

Flight visibility below 5 km is acceptable in Airspace class F and G at low level in accordance with ICAO rules as follows:

When so prescribed by the appropriate authority:

Flight visibilities reduced to not less than 1500 m may be permitted for flights operating:

1) at speeds that, in the prevailing visibility, will give adequate opportunity to observe other traffic or any obstacles in time to avoid collision; or

2) in circumstances in which the probability of encounters with other traffic

would normally be low, e.g. in areas of low volume traffic and for aerial work at low levels.

We suggest that flight with manned balloons in Airspace class F and G at or below 450 M (1500 FT) MSL or 300 M (1000 FT) above terrain whichever is the higher is permitted with a flight visibility of at least 1,5 KM.

Justification: Balloons operate at very low speeds and 1,5 KM flight visibility has been used for many years without problems in Denmark.

comment *5651* comment by: *ERA*

European Regions Airline Association Comment

There is no reference here to reduced minima in class F/G airspace for reduced airspeeds and low traffic density (cf App1 to JAR-OPS 1.465). The table is therefore not consistent with Annex 2 Table 3-1.

The ERA Directorate would suggest some amendment was required

comment *5795* comment by: *Ph.Walker*

Operating minima : There is no possibility to determine in flight the distance and therefore that shall be at pilot's discretion for SAR or HEMS to assess the risk of flying temporarily into reduced visibility against the need to provide emergency medical service see GM OPS.SPA.020.HEMS page 464.Visibility may be reduced to 800 m for short periods when in sight of land if the helicopter is manoeuvred at a speed that will give adequate opportunity to observe any obstacle and avoid a collision during daylight.

comment *5871* comment by: *Esko RUOHTULA*

1. The last two columns in table 1 should both be applicable for airspace classes F and G.

2.The logic in AMC1 OPS.GEN.147(c)(1) should be applicable also for airplane operations. Consequently the minimum flight visibility for airplanes in airspace classes F and G at and below 900 m AMSL or 300 m AGL should be:

5 km, IAS more than 140 kt

3 km, maximum IAS 140 kt

2 km, maximum IAS 120 kt

1.5 km, maximum IAS 100 kt

comment *5886* comment by: *SWISS AERODROMES ASSOCIATION*

The VFR minimum visibility should be 1500 m (and not 5 km) in Airspace G in order to allow local trafic, training and tuition for instance. National deviations should be possible.

comment *6015* comment by: *Konrad Polreich*

OPS.GEN.147 (c)(2)

Minimum flight visibility at night for onshore helicopter ops

This rule doesn't differentiate according crew composition (single or multi pilot), their qualifications (IR-qualified or just VFR-night) and the equipment (fully IFR versus basic VFR-night equipped). This limits operational possibilities of operators utilizing higher qualified crews as well as better equipped helicopters and doesn't encourage to invest in training/qualification and better equipment.
Own experience shows, that following limits seem adequate and reflect the great differences in equipment and training status

Suggestion:

Onshore operations

Conditions: Visibility/Ceiling

Single Pilot (VFR only): 8 km/1500ft AGL

Single Pilot (with IR): 5 km/1200ft AGL

Two Pilots (VFR only): 5 km/1200ft AGL

Two Pilots (with IR): 3 km/800ft AGL

Proposal:

Replace (c)(1) by:

"*1500 m during daylight, except when in sight of land, the visibility can be reduced to 30s flight time, but not less than 800m*."

Justification:

Already applied in french rules of the air.

comment *6529* comment by: *TG WHITING*

This proposal strikes at the heart of gliding as a sport in Europe. In many parts of Europe, particularly in Northern Europe in which maritime airmasses are frequent, it is necessary to fly close to cloud in order to climb in thermals and mountain wave. Restricting sailplanes from flying within (300m) 1000' vertically and 1500m horizontally of cloud will severely damage the options for sport gliding and for achieving international sporting awards, and does not appear to offer any safety or operational advantages to the GA community. In a Northern European summer it is quite normal to have cloud bases varying from 3,000 to 4,000ft on a typical cross country flying day. Restricting sailplanes as described in Class F airspace is likely to decrease the safety of the sailplane & GA community for the following reasons :

- Sailplanes will effectively be given an operational ceiling of 2,000 - 3,500 feet amsl, which will increase the traffic in a small vertical layer thus vasty increasing the risk of collisions. Non commercial GA

tends to use this height range heavily.

- The risk of outlandings will be greater, and the cross country workload will increase
- Sailplane pilots will be forced to spend a greater part of thier flying time selecting suitable fields rather than flying the sailplane.
- There will inevitably be more outlandings, and more possiblity of damage to crops, sailplanes and pilots.

In addition, it is likely that there will be an overall negative impact on sailplane flying within northern eurpoe, with pilots chosing not fly on the poorer days due to the additional risks of going cross country with a low operating ceiling.

It is not clear what benefit would be accrued from preventing sailplanes operating in this band of air in VFR conditions. I would ask that the VFR rules are amended to permit sailplanes to operate in VFR in airspace classes F and G clear of cloud and in sight of the surface.

comment *6539* comment by: *European Gliding Union (EGU)*

OPS.GEN.147 Visual Flight Rules (VFR) Operating minima

The European Air Navigation Service Providers (ANSP) are at present in the process to harmonize the Air space regulations, but not necessarily implementing the ICAO Regulation out of Annex II. Different approaches have led to safe and meaningful deviations from ICAO. Full information is available through the Air Navigation Team (ANT) at Eurocontrol.

German Air Space regulation differ in the application of Air Space Class G below 10.000 feet in that respect that the vertical limit is always 2500 AGL. This general setup makes adherence to the regulation far easier than the ICAO regulation. The band of air space parallel to the surface allows safe flying to much of the GA and air sports community in weather conditions less than the required 5k and 1500m horizontally and 1000 feet vertically from clouds.

ANSP and Eurocontrol are evaluating the use of Air Space D used for Control zones as applicable in Germany were no distance from cloud i.e. clear of cloud is required up to a minimum cloud base of 1500 feet. As all traffic is known to the ATC unit separation and information is maintained.

Recommendation: Introduce the Air space classification agreed upon by the European ANSP.

comment *6543* comment by: *SFR Sweden*

Section: OPS.GEN.147 Visual Flight Rules (VFR) Operating minima

Relevant Text:

HELICOPTERS

(c) Helicopters shall be operated in a flight visibility of not less than: (1) 1 500 m during daylight, except when in sight of land, if the helicopter is manoeuvred at a speed that will give adequate opportunity to observe other traffic and any obstacles in time to avoid a collision, the visibility may be reduced to 800 m for short period.

Comment:

As this is a general requirement, it allows for non-commercial operation (i.e pilots holding PPL) to operate in low visibility conditions for which they might not be fully qualified.

Proposal: Possibility to operate in visibility below 1500 m should be applicable to CAT & COM operations only.

comment *6545* comment by: *SFR Sweden*

Section: OPS.GEN.147 Visual Flight Rules (VFR) Operating minima

Relevant Text:

HELICOPTERS

(c) Helicopters shall be operated in a flight visibility of not less than: (1) 1 500 m during daylight, except when in sight of land, if the helicopter is manoeuvred at a speed that will give adequate opportunity to observe other traffic and any obstacles in time to avoid a collision, the visibility may be reduced to 800 m for short period.

Comment:

It should be possible for short periods to reduce the visibility to below 800 m during COM operations, to facilitate for various applications, for example where safe operations are possible at a work site but surrounding weather does not allow 800 m visibility.

Proposal: Possibility to operate in visibility below 800 m should be allowed for COM.

(Allowed today i.a.w Swedish national regulations)

comment *6563* comment by: *Baden-Württembergischer Luftfahrtverband*

OPS.GEN.147

Wording in the NPA

Airspace G

At and below 900 m (3 000 ft) AMSL or 300 m (1 000 ft) above terrain, whichever is the higher

Distance from cloud:

Clear of cloud and in sight of the surface

Flight visibility:

5 km

Our proposal

Be compliant with the air space classification agreed upon by the European ANSP**.**

Or

Add:

Airfields can be given a special airspace G extended to 600m (2000ft) AGL with a minimum flight visibility of 1.5 km in a radius of 2.5 NM around the airfield. Other dimensions can be specified if local conditions require it.

Issue with current wording

Airspace G regulation is too restrictive for operations in the vicinity of uncontrolled airfields

Rationale

On glider airfields with an elevation above about 500m gliders would be launched above airspace G during winch tows. In this case the required cloud distance for the adjacent airspace may not be maintainable if clouds are low but otherwise perfect conditions for flying in the pattern exist.

For training flights in the airport pattern especially with slow flying aircraft as typically used in non commercial flying flight visibility of 5 km is a too limiting requirement since conditions with less than 5 km visibility exist quite often in European airspaces. This limits the time for training flights unnecessarily which often already is limited to weekends in private flying.

Under marginal conditions flying in the airport pattern is still safe as the terrain is known to the pilots, coordination between the aircraft is easy to maintain and last not least there also is a training effect.

comment *6695* comment by: *Finnish Aeronautical Association - Kai Mönkkönen*

There are many of European sailplane pilots that are current valid privilege of flying in a cloud and therefore also close to a cloud. For example in Finland and Sweden "sailplane cloud flying right or cloud flying rating", based on applicable sailplane cloud flying training has long history as a specific part of gliding sports activity, for example to reach certain F.A.I defined altitude badges. In case of sailplane cloud flying operations, application of OPS.GEN.147 should therefore be referred to take-off, release, approach and landing phases of the flight, in order not to block the possibility of a qualified sailplane pilot from the sailplane cloud flying activity if applicable in a Member State in the area the flight is to be made. For example in Finland, basic intention of a sailplane cloud flying activity, where, as described above, take-off and landing is made under VFR conditions, is

gaining altitude inside a(n individual) cloud under which part of a flight VFR minimas as mentioned in this IR can not be applied. It is essential that "sailplane cloud flying activity" is not mixed with IFR-operations of powered aircraft having different purpose than what cloud flying by sailplanes is.

Should it be considered if there is a need for definition for "sailplane cloudflying" in between pure VFR and full IFR ?

comment

6794 comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

(a) Visual flight rules (VFR) flights shall be conducted in accordance with the Visual Flight Rules and table 1.

Comment:

Table 1 lacks requirements as regards VFR operations during night. As VFR flights during darkness puts additional burden upon the pilot it is motivated that a reference to visibility during night is made in the paragraph.

Proposal:

Add a requirement concerning VFR flights during night

1. OPS.GEN.147, (c)(1)

Comment:

The term "Short period" is not defined. The term 'short period' is impossible to interpret. A specified amount of time should be defined or this reference removed as different parties may take advantage of the lack of definition, possibly decreasing safety.

Recommendation:

Remove reference to "short period."

comment *7364* comment by: *Europe Air Sports, VP*

The VFR operating Minima are part of the ICAO letter classification system and not ICAO Annex 6 They need to be deleted from Ops.

comment *7367* comment by: *A. Mertz*

Die Reduzierung der Sichtminima für Hubschrauber auf 1,5 km Flugsicht wird damit begründet, dass Hubschrauber langsamer fliegen können als Flächenflugzeuge. Als Maximalgeschwindigkeit bei 1,5 km Flugsicht werden in diesem Dokument 100 kts genannt. Auch nicht komplexe Motorflugzeuge ,Segelflugzeuge und Luftsportgeräte können sicher mit Geschwindigkeiten unterhalb 100 kt betrieben werden.

Aufgrund der Gleichbehandlung mit Helikoptern sollten die Minima auch für die oben genannten "langsamen" Luftfahrzeuge gelten.Dies würde keinen Widerspruch zu den ICAO Forderungen darstellen:

"....it may be reduced to 1500m for slower aircraft, or in low intensity airspace"

Eine Formulierung könnte lauten:

Helicopters, airships, non-complex aeroplanes, micro lights and sailplanes shall be operated in a flight visibility of not less than:

(1) 1500 m during daylight, if the aircraft is operated at a speed ..... to

avoid a collision. For helicopters and airships, the visibility may be reduced to 800 m for a short period.

comment *7389* comment by: *Axel Schwarz*

Operations in airspace "G" below 1000ft AGL / 3000ft MSL may be conducted at visibilities as low as 1,5 km. This should be included in the table.

comment *7452* comment by: *David ROBERTS*

This subject is currently under debate within FCL.008.

For glider / sailplane pilots it is of the utmost importance that they can continue, where national rules allow, to fly in cloud or in less than VFR conditions as specified in this clause 147. This is necessary not only for cross country flying in thermal conditions but also essential often for accessing and descending from wave conditions.

Rather than repeating the argument here, please refer to the submission on this point by the British Gliding Association, which I fully endorse.

comment *7460* comment by: *European Sailplane Manufacturers*

Many European sailplane pilots currently have the privilege of flying close to and in, cloud. In many parts of Europe, and in particular North Western Europe where maritime air masses are prevalent, European glider pilots can only fly in thermals and mountain wave by flying close to cloud. This aspect of gliding is the basis of participating in sport gliding and achieving international sporting awards. There is no known safety case that should prevent sailplane pilots from flying within 300m (1000') vertically and 1500m horizontally of cloud Cloud base within many European countries is invariably between 3,000ft and 4,500ft AMSL during summer cross-country flying days. The proposed VFR limits would effectively present an operational ceiling for sailplanes of between 2,000ft and 3,500ft AMSL.

The direct negative impact on safety that the IR proposal will have on gliding will be to;

- Increase the amount of sailplane traffic in a smaller vertical layer – that which is predominantly flown in by the largest proportion of the GA community – thus increasing the risk of collisions
- Increase already high cockpit workloads
- Increase the risk of out-landing
- Force pilots to focus primarily on selecting suitable out-landing fields to the

detriment of flying the sailplane In addition, the ongoing social and economic impact would include;

• Limit the enjoyment and value of the sport

• Negative financial impact on the gliding industry in Europe

• Negative impact on sporting participation

• Negative impact on the value of sailplanes which are generally owned and operated by tax paying private citizens A blanket application of ICAO VFR above 3000' to sailplane flying rather than ensuring European gliding as a major aviation stakeholder has an appropriate and proportional VFR requirement will unwittingly reduce overall levels of safety. Indeed, there is compelling evidence to demonstrate that such a restriction would actually decrease safety. This is clearly not the intention of the proposed IR.

It is the qualified view of the BGA and the manufacturers that the retained ability of sailplane pilots to fly close to cloud actually supports an improved safety case for future European aviation. Therefore, we propose that the wording of OPS.GEN.147 Visual Flight Rules (VFR) Operating minima is modified as follows;

(a) Visual flight rules (VFR) flights by aeroplanes classes shall be conducted in accordance with the Visual Flight Rules and table 1.

And…

Sailplanes

(e) Visual flight rules (VFR) flights by sailplanes in airspace classes A, B, C, D and E shall be conducted in accordance with the Visual Flight Rules and table 1. Visual flight rules (VFR) flights by sailplanes in airspace classes F and G shall be conducted clear of cloud and in sight of the surface

comment *7513* comment by: *John Castle*

British glider pilots can only safely fly in thermals and wave by flying close to cloud. This is the basis of sport gliding.

Cloud base in Great Britain and many European countries is invariably between 3,000ft and 4,500ft

AMSL during our summer cross-country flying days. The proposed VFR limits would effectively present an operational ceiling for sailplanes of between 2,000ft and 3,500ft AMSL. The direct negative impact on safety that the IR proposal will have on gliding will be to;

Increase the amount of sailplane traffic in a smaller vertical layer –

that which is predominantly flown in by the largest proportion of the GA

community – thus increasing the risk of collisions

Increase already high cockpit workloads

Increase the risk of out-landing

Force pilots to focus primarily on selecting suitable out-landing fields to the

detriment of flying the sailplane

Additionally the impact of the proposal would;

Limit the enjoyment and value of the sport

Negative financial impact on the gliding industry in Europe as a whole

Negative impact on sporting participation

Negative impact on the value of sailplanes which are generally owned and operated by tax paying private citizens

A blanket application of ICAO VFR above 3000' to sailplane flying will actually reduce overall levels of safety.

comment *7558* comment by: *AOPA UK*

AOPA UK adherence to ICAO rules i.e. Class G: at or below 3000ft MSL or 1000ft GND, whichever is highest. ICAO SARPs meet the requirements as well as providing flexibility as the geography of States do vary considerably.

Airspeed max 140 KTS: Flight visibility 3km, Clear of clouds and ground visible from aircraft (lCAO).

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.150 Instrument Flight Rules (IFR) Operating minima p. 33-34

comment *21* comment by: *George Knight*

-(a) Whilst large commercial operators, conducting scheduled services to a known set of airfields, may have the resources to conduct formal investigations into each and every airfield into which they operate this is a disproportionate cost to small operators especially those conducting non-commercial IFR flights and to air-taxi operators who fly to a multitude of different airfields often at short notice. For smaller aircraft (say less than 19 seats) the operator should be allowed to use existing published data approved by the authority in the country where the airfield is situated.

comment *381* comment by: *EHOC*

General

This rule does not provide an 'Instrument Flight Rules (IFR) Operating Minima' but 'Aerodrome Operating Minina'; operating minima for IFR would have to encompass elements that are currently contained in other rules.

Paragraph (a)(2)

Clause 2 is not clear because it appears to require approval in accordance with OPS.SPA.LVO under all circumstances - it might better state:

(2) **When Low Visibility Operations are being undertaken**, require the prior approval...OPS.SPA.001.LVO"

Paragraph (b)

It is not clear that sections 2 and 3 of AMC2 OPS.GEN.150 can stand without a requirement. It might be better if there was an additional element in OPS.GEN.150 which would provide the objective on which this method of compliance is hung:

"(b) The minima referred to in (a) shall take account of any increment:

(1) imposed by the competent authority; and/or

(2) applied to non-precision minima when a stabilised approach is not flown."

The text from items 2 and 3 of the AMC could then be put into a separate AMC which is attached to OPS.GEN.150(b)(2).

Paragraph (d)

In the original text, there is the word 'full' – i.e. "shall take 'full' account of..."; it is only a small point but one which takes account of the understanding of the operator psyche.

To 'take account of' might imply that is should be considered but 'take full account of' implies much more. That is why the text was as it was; there is no justification for the change.

The correct wording can be seen in 'AMC1 OPS.SPA.020.LVO paragraph 4.':

"In establishing the aerodrome operating minima which will apply to any particular operation, an operator should take full account of:"

Paragraph (d)(3)

Use of just of the acronym 'FATO' would make this text much more readable than use of the acromym with the expansion. It is not clear why this language convention has not been used throughout the proposed regulation.

Comment on OPS.GEN.150(d): change as follows:

(d) In establishing the aerodrome operating minima which will apply to any particular operation, an operator ~~**shall**~~ **must** take account of:

comment

873 comment by: *Condor Flugdienst GmbH - FRA HO/R*

I am referring to OPS.GEN.150 (a):It should be clarified that not every

individual aerodrome minimum requires authority approval, but only the method of establishing such minima.

With regards to OPS.GEN.150(a)(2) the reference must be changed to "AMC 1 OPS.SPA.020 LVO"!

comment

1046 comment by: *AECA helicopteros.*

The text in (a)(1) should be amended as in (proposed) OPS.GEN.160(c) below:

(1) except as provided in OPS.GEN.160(a) not be lower than those specified by the State in which the aerodrome is located;

andClause 2 is not clear because it appears to exclude include Cat 1 and non-precision minima; it might better say:

(2) When Low Visibility Operations are being undertaken, require the prior approval...OPS.SPA.001.LVO"

comment

1047 comment by: *AECA helicopteros.*

To split the paragraph b.

It is not clear that sections 2 and 3 of AMC2 OPS.GEN.150 can stand without a requirement. It might be better if there was an additional element in OPS.GEN.150 which would provide the objective on which this method of compliance is hung:

"(b) The minima referred to in (a) shall take account of any increment:

(1) imposed by the competent authority; and/or

(2) applied to non-precision minima when a stabilised approach is not flown."

The text from items 2 and 3 of the AMC could then be put into a separate AMC which is attached to OPS.GEN.150(b)(2).

comment

2013 comment by: *Ulrich Baum*

In case of non-commercial IFR operations, adhering to published procedural and aerodrome minima (as found on approach plates) should be sufficient. Requiring non-commercial operators to fomally define their own operating minima seems to be overly burdensome and will, in most cases, not be practicable. The corresponding AMC (which allows use of commercially available information) is rather vague. Please clarify requirements for non-commercial IFR operations.

I suggest to make OPS.GEN.150 applicable to commercial operations only.

comment *2319* comment by: *heliswiss ag, belp*

Operating minima : There is no possibility to determine in flight the distance and therefore that shall be at pilot's discretion for SAR or HEMS to assess the risk of flying temporarily into reduced visibility against the need to provide emergency medical service see GM OPS.SPA.020.HEMS page 464.

Visibility may be reduced to 800 m for short periods when in sight of land if the helicopter is manoeuvred at a speed that will give adequate opportunity to observe any obstacle and avoid a collision during daylight.

comment *2338* comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

Comment:

The authority approval of every individual aerodrome minimum was introduced with EU-OPS and was not required before.

Proposal:

Instead of the approval of every individual minimum, EASA should require authority approval of the method used by the operator for establishing such minima. This would avoid the duplication of repetitive approvals of previously approved minima for the same airport and aircraft types. Safety will be better served if an operator could focus on what has not yet been assessed/approved, than having to duplicate what has already been done many times before.

comment *2644* comment by: *AOPA-Sweden*

The item does not make any sense. What does it mean with '*except when specially approved by the State*' when it is already in the first part of the paragraph already stated '*specified by the State*'?

comment *3022* comment by: *AEA*

Relevant Text:

(a) The operator shall specify aerodrome operating minima for each departure, destination and alternate aerodrome to be used. Such minima shall

(2) require prior approval of the competent Authority in accordance with OPS.SPA.001.LVO

Comment:

Editorial. **Only LVO <u>operating minima</u>** should be subject to prior approval by the Competent Authority.

Proposal:

Add reference to LVO operating minima (editorial).

comment *3082* comment by: *Michael Hoeck*

Line 2 states that approval of the competent authority is required. AMC 1 states that an acceptable method of specifying aerodrome operating minima may be through commercially available information. Does that mean if I use e.g. a Jeppesen I do not need approval? If so, good, if not I venture the guess that the competent authorities are totally understaffed.

In light of line b) of OPS GEN 150 one could think every minima requires an approval for the individual operator.

PLEASE clarify language used and make it as simple as possible - that is true for a lot of the draft, not only 150...

comment *3115* comment by: *UK CAA*

Page No: 33

Paragraph No: OPS.GEN.150 (a)(2)

Comment:

The text is not clear because it appears to exclude Cat 1 and non-precision minima.

Justification:

Clarification of text.

Proposed Text (if applicable):

"**when Low Visibility Operations are being undertaken**, require the prior approval of the competent authority in accordance with OPS.SPA.001.LVO"

comment *3409* comment by: *Peter SCHMAUTZER*

If the state has specified the minimas, why should the competent authority give a special approval.

comment *3580* comment by: *PPL/IR Europe*

The phrasing in para (a) "the operator shall specify" is not appropriate for private flight. A private operator determines minima pre-flight (or in-flight under certain circumstances) and should be able to do so simply by reading

the available IAP plates without the more elaborate methods suited to a commercial operation.

comment *3623* comment by: *AUSTRIAN Airlines*

Relevant Text:

(a)

The authority approval with regards to Runway proving of every individual aerodrome minimum was introduced with EU-OPS and was not required before. Instead of the approval of every individual minimum through Runway proving, EASA should require authority approval of the method used by the operator for establishing such minima. This would avoid the duplication of repetitive approvals of previously approved minima for the same airport and aircraft types. Safety will be better served if an operator could focus on what has not yet been assessed/approved, than having to duplicate what has already been done many times before.

comment *6984* comment by: *IACA International Air Carrier Association*

(b)

With regards to OPS.GEN.150(a)(2) the reference must be changed to "AMC 1 OPS.SPA.020 LVO"!

comment *7246* comment by: *ANE (Air Nostrum) OPS QM*

There is no reference here to reduced minima in class F/G airspace for reduced airspeeds and low traffic density (cf App1 to JAR-OPS 1.465). The table is therefore not consistent with Annex 2 Table 3-1.

We would suggest some amendment was required

comment *7559* comment by: *AOPA UK*

The item does not make any sense. What does it mean with *'except when specially approved by the State'* when it is already in the first part of the paragraph already stated *'specified by the State'?*

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.155 Selection of alternate aerodromes p. 34-35

comment *22* comment by: *George Knight*

-(b) What about single engined aircraft?

comment *63* comment by: *Air Southwest*

OPS.GEN.155 contains an implied definition of a take-off alternate aerodrome that is in most respects a duplication of definition 70 (page 27). Suggest rewording of 155(a) to read "A take-off alternate shall be selected and specified in the FPL when required."

comment *64* comment by: *Air Southwest*

OPS.GEN.155(e)(3) states the criteria for dispensing with an alternate aerodrome under IFR where the destination aerodrome is isolated. OPS.CAT.155.A (a) repeats this requirement without the additional criteria. OPS.CAT.155.A (a) states 'Notwithstanding OPS.GEN.155'.

This implies that OPS.GEN.155 is to be ignored for CAT operations. OPS.CAT.155.A (c) exempts the requirements of OPS.GEN.150 for an isolated destination aerodrome, and finally for an isolated destination aerodrome OPS.CAT.155.A (d) directs the operator to Table 1A.

Under JAR-OPS this was neatly covered in JAR-OPS 1.295 and 1.297. As it is written here, the process is laborious with the possibility of confusion. I suggest that OPS.GEN.155 should contain a pre-amble directing commercial operators directly to OPS.CAT.155.A if it is intended that the section is not applicable to CAT.

comment *382* comment by: *EHOC*

Paragraph (d)

It is not clear what is intended here; the text of (d) appears to require compliance for CAT helicopters; however, the requirements is already contained in OPS.CAT.156.H (see also the note contained in OPS.CAT.H.155).

comment *549* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.155(a): change as follows: choose one of the options below:

(a) A take-off alternate aerodrome shall be selected and specified in the **operational** flight plan if the weather conditions at the aerodrome of departure are ~~**at or**~~ below the applicable aerodrome operating minima or it would not be possible to return to the aerodrome of departure for other reasons.

OR

(a) A take-off alternate aerodrome shall be selected and specified in the **operational** flight plan if ~~**the weather conditions at the aerodrome of departure are at or below the applicable aerodrome operating minima or**~~ it would not be possible to return to the aerodrome of departure for **meteorological or** other reasons.

Justification:

Changed from '…AT or below..' (a departure aerodrome with weather conditions AT the applicable minima is still suitable for landing).

This is a more general definition and in line with JAR.OPS 1.295 (b)

comment *550* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.155(b)(1):change as follows:

(b) The take-off alternate aerodrome shall be located within the following

distance from the aerodrome of departure:

(1) aeroplanes having two power-units. ~~**Not more than a distance equivalent to a flight time of one hour at the single-engine cruise speed; and**~~**:**

(i) Not more than a distance equivalent to a flight time of one hour at the single-engine cruise speed;

(ii) Not more than a distance equivalent to the operator's approved ETOPS diversion time, up to a maximum of two hours, subject to any MEL restriction, at the single-engine cruise speed based. and;

Justification:

Compliance with former EU OPS requirement. (b) (1) does not cater for a two-hour ETOPS take-off alternate. This is specified in OPS.CAT.156.A, so OPS.GEN.155 (b) should allow this as well. Another option is to add 'Notwithstanding OPS.GEN.155 to OPS.CAT.156.A (b)'.

comment *551* comment by: *KLM*

OPS gen 155 (b)(1) Aeroplanes having two power-units etc...

Except with an ETOPS approval then the maximum flying time to a take-off alternate may be two hours/120 minutes in still air and standard conditions.

comment *620* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.155(e)(1): The concept of Reasonable Time should be better specified. Change text as follows:

(e) For a flight to be conducted in accordance with instrument flight rules (IFR), at least one destination alternate shall be selected and specified in any flight plan, unless:

(1) for aeroplanes, the duration of the flight and the available current meteorological information indicates that, at the estimated time of arrival at the place of intended landing, and for a **reasonable period** before and after such time, the approach and landing may be made under visual meteorological conditions; or

comment *874* comment by: *Condor Flugdienst GmbH - FRA HO/R*

I am refering to OPS.GEN.155(e)(3): Isolated Aerodrome Minima are specified as "Minimum Ceiling plus

1.000 ft/Minimum visibility plus 4km (resp. 5.5 km). This is contradictory to OPS.CAT.155(d) which

specifies normal alternate aerodrome minima.

comment *1476* comment by: *ECA - European Cockpit Association*

Comment: change as follows:

a. A take-off alternate aerodrome shall be **available** ~~**selected**~~ and ~~**specified**~~ **nominated by the pilot in command to the other flight deck crew member** ~~**in the flight plan if the**~~ **if** weather conditions at the aerodrome of departure are at or below the applicable aerodrome operating minima or it would not be possible to return to the aerodrome of departure for other reasons.

Justification:

This wording is copied from EU OPS.

comment *1840* comment by: *claire.amos*

(e)(1)Definition of "reasonable", requires clarification. easyjet currently operates +/- 1 hour

comment *1915* comment by: *Ingmar Hedblom*

OPS.GEN.155(b)(1)

Power units is not defined. Could be mis-interpreted as electrical power units….

Include a definition of power unit in the definitions

comment *2320* comment by: *heliswiss ag, belp*

Meteo conditions : There is no possibility to determine in flight the distance and therefore that shall be at pilot's discretion for SAR or HEMS to assess the risk of flying temporarily into reduced visibility against the need to provide emergency medical service see GM OPS.SPA.020.HEMS page 464.

Visibility may be reduced to 800 m for short periods when in sight of land if the helicopter is manoeuvred at a speed that will give adequate opportunity to observe any obstacle and avoid a collision.

comment *2341* comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

Destination Alternate Aerodromes

(e)

(3)

Isolated Aerodrome minima are specified as "Minimum Ceiling plus 1000ft/minimum visibility plus 4 km [resp. 5.5]. This is contradictory to OPS.CAT.155(d) which specifies normal alternate aerodrome minima and is consistent with EU-OPS 1.297 minima.

Amend:

OPS.GEN.155 i.a.w. OPS.CAT.155, or alternatively, specify that restrctions in GEN.155 are not applicable for CAT operators.

comment *2646* comment by: *AOPA-Sweden*

The sections (b) and (c) should shift, because the current section (b) only refers to multi-engine aircraft. Just for the logic.

comment *2647* comment by: *AOPA-Sweden*

(e) (1):

There is no AMC or GM defining reasonable time, AOPA-S proposes plus minus one hour of ETA.

comment *2648* comment by: *AOPA-Sweden*

(e) (3):

A definition of isolated aerodrome (referring to planning etc) should be given in the beginning of the Part OPS.

comment *3023* comment by: *AEA*

Relevant Text:

(a) A take-off alternate aerodrome shall be selected and specified in the flight plan if the weather conditions at the aerodrome of departure ***are at or below the applicable aerodrome operating minima*** *or it would not be possible to return to the aerodrome of departure for other reasons.*

Comment:

This definition is not consistent with EU-OPS. It should refer to the applicable aerodrome **landing minima.**

Proposal:

Realign with EU-OPS

comment *3024* comment by: *AEA*

Relevant Text:

(c) For an aerodrome to be selected as a take-off alternate the available information shall indicate that, at the estimated time of use, the conditions will ***be at or above the aerodrome operating minima for that operation.***

Comment:

This definition is not consistent with EU-OPS. It should refer to the applicable aerodrome **landing minima.**

Proposal:

Realign with EU-OPS

comment *3025* comment by: *AEA*

Relevant Text:

(b) The take off alternate aerodrome shall be located within the following distance from the aerodrome of departure

(1) Aeroplanes having two power units. Not more than a distance equivalent to a flight time of one hour at the single-engine cruise speed

(2) Aeroplanes having three or more power-units. Not more than a distance equivalent to a flight time of two hours at the one-engine inoperative cruise speed.

Comment:

This definition is not consistent with EU-OPS due to the lack of reference to the '**in still air standard conditions**' (EU OPS 1.295). This would have a tremendous impact on flight operations which cannot be justified on safety grounds.

Proposal:

Realign with EU-OPS 1.295 to add '**in still air standard conditions**'

comment *3026* comment by: *AEA*

Relevant text:

OPS GEN.155 Selection of Aerodromes

Comment:

The applicability of this paragraph to commercial operators is confusing when reading the paragraph in conjunction with OPS.CAT.155. It outlines that the new rule structure proposed by EASA is not user-friendly and leads to many misunderstandings which could potentially decrease flight safety. There is no added value for EASA to alter the well known and well proven

structure of EU-OPS and JARs.

Proposal:

Realign with EU-OPS.

Paragraph No: OPS.GEN.155

Comment:

The requirement to specify a Take-off Alternate for non-complex motor powered aeroplanes is in excess of ICAO standards specified in Annex 6 Part II Section 2. The title of the section should be amended to reflect the relevant aircraft.

Justification:

Alignment with ICAO SARP's and current practice

Proposed Text (if applicable):

OPS.GEN.155 Selection of alternate aerodromes

TAKE-OFF ALTERNATE AERODROMES

~~ALL AEROPLANES~~ ***COMPLEX MOTOR-POWERED AEROPLANES USED IN NON-COMMERCIAL OPERATIONS AND AEROPLANES USED IN COMMERCIAL OPERATIONS***

comment *3129* comment by: *UK CAA*

Page No: 34

Paragraph No: OPS.GEN.155 Para (b)

Comment:

Selection of take off alternate.

There is no mention of all distances being calculated in still air, standard conditions.

Justification:

EU-OPS 1.295 (b) includes the words 'in still air standard conditions'. This is essential for planning purposes.

Proposed Text (if applicable):

ALL AEROPLANES

(a) A take-off alternate aerodrome shall be selected and specified in the flight plan if the weather conditions at the aerodrome of departure are at or below the applicable aerodrome operating minima or it would not be possible to return to the aerodrome of departure for other reasons.

(b) The take-off alternate aerodrome shall be located within the following distance from the aerodrome of departure:

(1) aeroplanes having two power-units. Not more than a distance equivalent to a flight time of one hour, ***in still air standard conditions***, at the single-engine cruise speed; and

(2) aeroplanes having three or more power-units. Not more than a distance equivalent to a flight time of two hours, ***in still air standard conditions***, at the one-engine inoperative cruise speed.

(c) For an aerodrome to be selected as a take-off alternate the available information shall indicate that, at the estimated time of use, the conditions will be at or above the aerodrome operating minima for that operation.

comment *3131* comment by: *UK CAA*

Paragraph No: OPS.GEN.155.(e)

Comment:

Sub-paragraph (20 defines additional requirements for helicopters in regards to the need for an Destination Alternate. This text is derived from ICAO Annex 6 Part III section III. The UK does not mandate this requirement and has filed a difference. The weather requirements are excessive when compared with those for aeroplanes at sub-paragraph (1), which is drawn from ICAO Annex 6 Part II, and therefore should be removed. In addition, flight at night in the UK is conducted under IFR even when flown in VMC, where there is no requirement to file a flight plan or have an destination alternate.

A small adjustment to sub-paragraph (1) as indicated below will provide a better requirement and adequate safety.

Justification:

Clarification and alignment of text with current regulations.

Proposed Text (if applicable):

(e) For a flight to be conducted in accordance with instrument flight rules (IFR), at least one destination alternate shall be selected and specified in any flight plan, unless:

(1) ~~for aeroplanes,~~ the duration of the flight and the …..

(2) Delete in toto

(~~3~~***2***) the place ……

comment *3469* comment by: *M Wilson-NetJets*

Original text:

(c) For an aerodrome to be selected as a take-off alternate the available information shall indicate that, at the estimated time of use, the conditions will be at or above the aerodrome operating minima for that operation.

Suggested new text:

For an aerodrome to be selected as a take-off alternate the available information shall indicate that, at **a reasonable time before and after** the estimated time of use, the conditions will be at or above the aerodrome operating minima for that operation.

Comment/suggestion:

Under OPS.GEN the selection of a take-off alternate does not have a clause for the weather to be within limits before and after the time of estimated use. Analogue to selection of take-off alternate aerodromes in OPS.CAT and the selection of destination alternate aerodromes in OPS.CAT and OPS.GEN there should be a provision to have suitable forecasted/expected weather conditions before and after the estimated time of use of the take-off alternate.

comment *3529* comment by: *IAOPA Europe*

For OPS.GEN.155 a, b and c it is not stated that the requirements are for IFR operations only. This is assumed to be the case but should be specified clearly.

comment *3530* comment by: *IAOPA Europe*

OPS.GEN.155 d) The inclusion of special requirements for commercial air transport does not seem to belong in this general section. It should be included in the section specifically dealing with CAT.

comment *3535* comment by: *Boeing*

NPA 2009-02b, Part Ops

OPS.GEN.155, Selection of alternate aerodromes

Page 34 of 464

BOEING COMMENT:

This entire section is not in accordance with the new proposed amendment to ICAO Annex 6, Part I, Operation of Aircraft. We suggest updating this rulemaking to reflect the standards set forth in new ICAO Document AN-WP/8387.

JUSTIFICATION: Consistent international criteria for safe operating practices will ensure the safety of air navigation worldwide and maintain a level playing field.

comment *3579* comment by: *PPL/IR Europe*

Paras (a),(b)&(c) ahould only apply to Commercial Operations

Otherwise, the application (a), (b) and (c) on selection of take-off alternates to non-commercial operations exceeds ICAO Annex 6 Part II requirements and therefore in the absence of an explicit safety case, violates the provisions of Art 8(6) of the Basic Regulation. See our General remarks.

comment *4171* comment by: *DGAC*

The requirement in OPS.GEN.155(a) applies to all aircraft, whatever the number of engines is.

However OPS.GEN.155(b) does not define the maximum distance of the take-off alternate for single-engined aircraft.

comment *4172* comment by: *DGAC*

The purpose of this paragraph, in order to select a take-off alternate, is to determine a distance threshold equivalent to flying during 60 minutes (or 120 minutes) in still air standard conditions (see EU-OPS 1.295 for CAT). We should find in this paragraph or the conditions for calculation of the distance threshold because the way it is written, it seems to be dependant on the actual conditions (temperature, wind, etc...) which is not feasible.

comment *7224* comment by: *AIR FRANCE*

(e) (1) This is an example where the new structure is clearly misleading when OPS.CAT.155 states something else for the commercial transport.

comment *7336* comment by: *FAA*

1. OPS.GEN.155, (e)(1)

Comment:

The term 'Reasonable period' is not defined. The term 'reasonable period' is impossible to interpret. A specified amount of time should be defined or this reference removed as different parties may take advantage of the lack of definition, possibly decreasing safety.

Recommendation:

Remove reference to 'reasonable period.'

comment *7337* comment by: *FAA*

1. OPS.GEN.155, (e)(3)(iv)

Comment:

The term 'PNR' is not defined. Without defining all the technical terms within the regulation, it remains open to interpretation.

Recommendation:

Revise the Definitions section to include 'PNR' definition.

comment *7560* comment by: *AOPA UK*

The sections (b) and (c) should move, because the current section (b) only refers to multi-engine aircraft.

comment *7561* comment by: *AOPA UK*

There is no AMC or GM defining reasonable time,AOPA UK proposes plus minus one hour of ETA.

comment *7562* comment by: *AOPA UK*

A definition of isolated aerodrome (referring to planning etc) should be given in the beginning of the Part OPS.

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.160 Departure and approach procedures p. 35

comment *317* comment by: *Aero-Club of Switzerland*

Is "State responsible" to be understood to mean "member state" or "any state"?

comment *383* comment by: *EHOC*

This text does not adequately capture the intent of the original and also uses a non-ICAO term for the State; the intent could be restored such:

"(a) Except as provided in (c) below, an operator shall use the departure and approach procedures established by the State of Operation.

(b) ...

(c) Alternative procedures to those required to be used in accordance with sub-paragraph (a) above may only be implemented by an operator provided they have been approved by the State of Operation."

This would permit discrete company procedures to be developed – e.g. for offshore approaches.

comment *1048* comment by: *AECA helicopteros.*

This text does not adequately capture the intent of the original and also uses a non-ICAO term for the State; the intent could be restored such:

comment *3133* comment by: *UK CAA*

Page No: 35

Paragraph No: OPS.GEN.160 Departure and approach procedures

Comment:

The text of this section has been reduced from the original EU-OPS and JAR-OPS text and has lost some of the meaning and intent.

The previous text should be reinstated.

Justification:

Clarity and accuracy of text.

Proposed Text (if applicable):

~~(a) Unless otherwise approved by the State responsible for an aerodrome, an operator shall use the departure and approach procedures established by that State.~~

(a) An operator shall ensure that instrument departure and approach procedures established by the State in which the aerodrome is located are used.

(b) ***Notwithstanding sub-paragraph (a),*** the pilot-in-command shall only accept an Air Traffic Control (ATC) clearance to deviate from a published departure or arrival route, provided obstacle clearance criteria can be observed and full account is taken of the operating conditions. In any case, the final approach shall be flown visually or in accordance with the published ***instrument*** approach procedures.

(c) Different procedures to those required to be used in accordance with sub-paragraph (a) may only be implemented by an operator provided that they have been approved by the State in which the aerodrome is located, if required, and accepted by the Competent Authority.

comment *3534* comment by: *IAOPA Europe*

It seems that OPS.GEN.160 b places the responsibility for obstacle clearance on the pilot when he follows an ATC clearance.

It is a well established principle that if the controller provide radar vectors to an aircraft then the controller has the responsibility for obstacle clearence. The pilot in practice has no way of determining if a an ATC radar vector provides sufficient obstacle clearance.

comment *3733* comment by: *Civil Aviation Authority of Norway*

Comment:

There is conflict between para (a) and (b). Para (a) states that an operator shall use the procedure published by the state and para (b) discusses deviation from the published procedure. Text of para (a) needs to be

clarified.

Justification:

Correction of error in syntax

Proposed Text

(if applicable):

(a) Unless otherwise approved by the State responsible for an aerodrome ***or under and in accordance with a clearance from ATC*** an operator shall use the departure and approach procedures established by that State.

comment *3772* comment by: *Civil Aviation Authority of Norway*

Comment:

The text of this section does not adequately capture the intent of the original text used in JAR-OPS 3 and also uses a non-ICAO term for the State.

The intent could be restored by the proposed change.

Justification:

This change will permit discrete company procedures to be developed – e.g. for offshore helicopter approaches.

Proposed Text

(if applicable):

"(a) Except as provided in (c) below, an operator shall use the departure and approach procedures established by the State of Operation.

(b) ...

(c) Alternative procedures to those required to be used in accordance with sub-paragraph (a) above may only be implemented by an operator provided they have been approved by the State of Operation."

comment *4173* comment by: *DGAC*

OPS.GEN.160 is only relevant for IFR operations

comment *6886* comment by: *PPL/IR Europe*

Para (a) and (b) should apply only to Commercial operations. Otherwise, the requirement to use only published procedures or a visual approach for non-commercial operations exceeds ICAO Annex 6 Part II requirements and therefore in the absence of an explicit safety case, violates the provisions of Art 8(6) of the Basic Regulation. See General remarks.

Note that Annex 6 Part II 4.16.1 is open to interpretation. One

interpretation would require, for example, the UK to design an IAP and DP for every aerodrome used at night, as such flights must be under IFR. For the reasons described in the general comments, mandatory use of approved procedures for all non-commercial operations under IFR would be clearly disproportionate.

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.165 Noise abatement p. 35

comment *541* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.165: change as follows:

~~**Operating procedures shall take into account the need to minimise the effect of aircraft noise.**~~ **Aeroplane operating procedures for noise abatement should comply with the provisions of PANS-OPS (Doc 8168), Volume I, Chapter 7.**

Justification:

ECA strongly opposes to the obligatory nature of this text and proposes deletion of this paragraph. The objections were already raised in the ECA response to NPA 2008-15 on Essential Requirements for Civil Aviation Environmental Protection.

1) It's ICAO policy to address noise only if noise is a problem , i.e. health hazards or annoyance. Flexibility should be incorporated in the requirements so as to allow implementing rules to be adapted to the size and nature of the problem.

2) To minimize means to reduce to the smallest possible amount, but ECA strongly stresses that safety considerations must prevail over environmental issues in the operational field. To minimize noise can mean at the cost of flight safety. A thorough safety-environmental interdependency assessment should be made, in which all safety implications should be considered. A degradation of the flight safety level can not be tolerated. Flight safety must not be affected by environmental considerations.

This can not be assured by the sole compliance to the safety related essential requirements.

3) ECA endorses the usage of ICAO standards and a uniform approach to environmental issues.

ECA endorses the balanced approach in order to alleviate the environmental burden of air traffic. It consists of a balanced combination of effective measures in the field of technology, operations, restrictions, market-based measures and land-use management. This proposal merely focusses on measures in the field of operations.

4) The need to minimize noise may increase the level of LAQ and GHG emissions and is therefore not in line with the objective to mitigate health

hazards, annoyance and climate effects related to noise and emissions.

5) The effect of aircraft noise is difficult to quantify. In contrast with flight safety, noise impact research is not mature, quantitative health impacts for noise (and emissions) are uncertain and management tools lack.

comment *638* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.165:

Reference to ICAO PANS OPS Volume 1 should be added for harmonising reasons (rationale: noise is more related to aircraft certification than operator procedures – aircraft noise certification must comply with ICAO).

comment *1025* comment by: *EUROCOPTER*

AMC & GM show that the requirement is only applicable to aeroplanes – Proposal is to add 'aeroplanes' in OPS.GEN.165 title.

comment *3035* comment by: *AEA*

Relevant Text:

Operating Procedures shall take into account the need to mimise the effect of aircraft noise

Comment:

The possibility for the pilot in command not to follow the noise abatement procedures whenever there is a detrimental effect on aircraft safety should not be in the AMC (see page 170, AMC.OPS.GEN.165A) but should be in the hard-law. As currently written, EASA seems to give priority on environmental issue above safety. The unclear spread of noise abatement requirements between hard-law, AMC and guidance material does not provide legal certainty. This proposal is therefore unacceptable to AEA since it could result in some airport authorities forcing airlines to fly unsafe procedures.

Proposal:

Realign with EU-OPS 1.235 at the level of hard law

Proposal:

Transfer complete EU-OPS 1.235 into IR, especially to re-incorporate the basic principle of EU-OPS 1.235 (a):

"The operator shall ensure that safety has priority over noise abatement" at prominent first place.

comment *4174* comment by: *DGAC*

When first introduced in JAR-OPS 1.165 this provision was meant to give a legal tool to the pilot in command to refuse unsafe procedures in case such procedures was designed by an airport. The priority should be safety.

Therefore it is necessary to upgrade to IR the rest of the JAR provision left in the AMC

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.170 Minimum terrain clearance altitudes – IFR flights p. 35

comment *65* comment by: *Air Southwest*

Given that this paragraph is a generality, it should however, include the requirement for minimum flight level for flight above the transition altitude. For IFR flight the minimum safe FL is more 'user friendly' for the en route phase and such information is generally included in the operational flight plan rather than 'safety altitude'. For the terminal phase of the flight, minimum sector altitude (MSA) will be specified on the instrument plate.

comment *2649* comment by: *AOPA-Sweden*

An item together with an AMC without any use. No pilot will plan a CFIT.

comment *3135* comment by: *UK CAA*

Page No: 35

Paragraph No: OPS.GEN.170 & 175

Comment:

These two paragraphs would have appeared to confuse the ICAO Rules of the Air requirements for VFR and IFR flight 'Minimum Heights' and 'Minimum Levels' respectively.

OPS.GEN.170 introduces the term 'Minimum terrain clearance altitudes – IFR' which is not a recognised term and one which appears to have been drawn from the requirements of EU-OPS 1.250 or JAR-OPS 3.250 'Establishment of minimum flight altitudes'. This confuses the requirements and conflicts with the current OPS.GEN.175 'Minimum flight altitudes' which is not contextualised by either VFR or IFR.

The requirement for minimum heights over certain areas is partially captured in OPS.GEN.315(b) (Performance general) when it should perhaps be covered more appropriately at this section. The actual minimum heights are set by individual States within their Rules of the Air regulations.

It is recommended that the subject paragraphs are reorganised into two topics: 'Minimum Heights' and 'Minimum Levels' to reflect the ICAO requirements at the general aviation level. These can be supplemented for Complex and Commercial operations.

Associated AMCs and GM may need to be adjusted to compensate for the change.

Justification:

The text of the subject paragraphs does not reflect ICAO minimum standards for all flights and has introduced non-standard phraseology and confused the meaning of height and altitude.

Proposed Text (if applicable):

~~**OPS.GEN.170 Minimum terrain clearance altitudes – IFR flights**~~

~~For each flight to be conducted in accordance with instrument flight rules (IFR), terrain clearance altitudes for the route to be flown shall be specified.~~

~~**OPS.GEN.175 Minimum flight altitudes**~~

~~An aircraft shall not be flown below minimum altitudes established by the State overflown, except when: (a) necessary for take-off or landing; or (b) descending in accordance with procedures established by that State subject to demonstration by the operator that the operation does not create a hazard to persons or property on the surface.~~

OPS.GEN.170 Minimum Heights

(a) In order not to hazard persons or property on the surface, aircraft shall not be flown:

(1) except when necessary for take-off or landing, or except by permission from the appropriate authority, over the congested areas of cities, towns or settlements or over an open-air assembly of persons; or

(2) elsewhere,

below the minimum heights specified by the State whose territory is being overflown.

OPS.GEN.175 Minimum Levels

AEROPLANES AND HELICOPTERS - IFR

(a) Except when necessary for take-off or landing, or except as specifically authorised by the appropriate authority, an IFR flight shall be flown at a level which is not below the minimum flight altitude established by the State whose territory is overflown, or, where no such minimum flight altitude has been established:

(1) over high terrain or in mountainous areas, at a level which is at least 600 m (2000 ft) above the highest obstacle located within 8 km of the estimated position of the aircraft; or

(2) Elsewhere than as specified in (1), at a level which is at least 300 m (1000 ft) above the highest obstacle located within 8 km of the estimated position of the aircraft.

COMPLEX MOTOR POWERED AIRCRAFT USED IN NON-COMMERCIAL OPERATIONS, AEROPLANES AND HELICOPTERS USED IN COMMERCIAL OPERATIONS

***(b) An operator of a complex motor powered aircraft or an aeroplane or helicopter used in commercial operations shall establish minimum flight altitudes for all route segments to be flown which provide the required terrain clearance taking into account the performance of the aircraft Where minimum flight altitudes established by the State overflown are higher than those established* by the operator, the higher values shall apply.**

comment *3581* comment by: *PPL/IR Europe*

For a private operator flying ad-hoc IFR, possibly not on an IFPS flight plan and outside controlled airspace, the pilot should plan and be aware of terrain clearance altitudes at all times, but the wording "shall be specified" is not appropriate.

comment *3770* comment by: *Civil Aviation Authority of Norway*

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.175 Minimum flight altitudes p. 35

comment *384* comment by: *EHOC*

Whilst it is understood that this is in GEN and therefore is available to anyone, it was provided in the original to permit en-route let down whilst offshore - i.e. a cloud break procedure over water to VFR below (used to: avoid complex RADAR let downs at the oil field; or as part of the coastal airport procedure etc.). Attempting to generalize the rule has now made it completely obscure and probably not practical. Perhaps the best that can be done it to return the use to the application for which it was provided -

offshore operations.

"An aircraft shall not be flown below specified minimum altitudes, except when:

(a)...

(b) descending in accordance with with procedures approved by the State of the Operator."

This was never intended to be used for VFR operations as is now evident in by GM OPS.GEN.175; perhaps that element 2. of that GM should be removed.

It is also not clear how an approval could be obtained from the 'State Overflown'.

comment *1055* comment by: *AECA helicopteros.*

comment *3231* comment by: *Eurocontrol CND*

OPS.GEN. 175 Minimum flight altitudes

Is this applicable to IFR and VFR? As regards IFR, there is no mentioning of the fact that there are areas outside of controlled airspace where no minimum altitude has been established by the State, in which case the minima stated in ICAO Annex 2 should apply (i.e. 300 m (in high/mountainous terrain, 600 m) above the highest obstacle within 8 km of the estimated position of the aircraft.

comment *3538* comment by: *IAOPA Europe*

It seems that to descend according to procedures established by the State, each individual operator must first demonstrate that the operation does not create a hazard to persons or property on the ground. This does not make

any sense.

comment *3771* comment by: *Civil Aviation Authority of Norway*

Proposed Text

(if applicable):

OPS.GEN.170 Minimum Heights

(a) In order not to hazard persons or property on the surface, aircraft shall not be flown:

(1) except when necessary for take-off or landing, or except by permission from the appropriate authority, over the congested areas of cities, towns or settlements or over an open-air assembly of persons; or

(2) elsewhere,

below the minimum heights specified by the State whose territory is being overflown.

OPS.GEN.175 Minimum Levels

AEROPLANES AND HELICOPTERS - IFR

(a) Except when necessary for take-off or landing, or except as specifically authorised by the appropriate authority, an IFR flight shall be flown at a level which is not below the minimum flight altitude established by the State whose territory is overflown, or, where no such minimum flight altitude has been established:

(1) over high terrain or in mountainous areas, at a level which is at least 600 m (2000 ft) above the highest obstacle located within 8 km of the estimated position of the aircraft; or

(2) Elsewhere than as specified in (1), at a level which is at least 300 m (1000 ft) above the highest obstacle located within 8 km of the estimated position of the aircraft.

COMPLEX MOTOR POWERED AIRCRAFT USED IN NON-COMMERCIAL OPERATIONS, AEROPLANES AND HELICOPTERS USED IN COMMERCIAL OPERATIONS

(b) An operator of a complex motor powered aircraft or an aeroplane or helicopter used in commercial operations shall establish minimum flight altitudes for all route segments to be flown which provide the required terrain clearance taking into account the performance of the aircraft Where minimum flight altitudes established by the State overflown are higher than those established by the operator, the higher values shall apply.

comment *6009* comment by: *Civil Aviation Authority Finland*

Comment:

The minimum flight altitudes for Aerial Work operations should be defined.

Special Aerial Work operations (dusting and crop spraying, fire fighting and inspection of electrical wires, photographing etc.) are flown at very low altitudes and paragraphs OPS.GEN.175 (a) or (b) do not fit for this, because it is not question of descending, landing or take-off, but the whole operation is done at very low altitude.

The paragraph OPS.COM.270 does not solve the problen either.

Also some Aerial Work operations are flown as private operations (ie. spraying the own crop fields or forests of the farmer).

Comment:

(b) - The Statement in (b) is very vague

Justification:

Needs further clarification

Proposed text:

(b) in accordance with procedures approved by the State of operation and subject to compliance with minimum heights established by the State overflown.

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.180 Routes and areas of operation p. 36

comment *1049* comment by: *AECA helicopteros.*

It has been suggested that ERs 2.a.1, 2.a.4, 2.a.6 and 3.a.5 contain the original intent of this rule.

However, the original intent (in accordance with Annex 6 Part I Chapter 4.1 - Annerx 6 Part I Chapter 2.1) was to ensure that, over-and-above general considerations for flight, specific elements that address the Area and Route of Operation are considered. This could include additional equipment - e.g. offshore, the met coverage for the area (offshore operations), performance in the case of mountains etc.

ER is only general and requirement should be put into an IR expanded out into its respective parts.

comment *6922* comment by: *Christian Hölzle*

Meteo conditions : There is no possibility to determine in flight the distance and therefore that shall be at pilot's discretion for SAR or HEMS to assess the risk of flying temporarily into reduced visibility against the need to provide emergency medical service see GM OPS.SPA.020.HEMS page 464. Visibility may be reduced to 800 m for short periods when in sight of land if the helicopter is manoeuvred at a speed that will give adequate opportunity

to observe any obstacle and avoid a collision.

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.185 Meteorological conditions p. 36

comment *302* comment by: *Rega / Swiss Air-Ambulance*

OPS.GEN.185 Meteorological conditions

Scope:

A flight in accordance with instrument flight rules shall always have (pre-flight planning or in-flight replanning) two landing possibilities.

Text to be added:

(b) A flight in accordance with instrument flight rules (IFR) shall only be initiated or continued towards the planned destination aerodrome when the latest available meteorological information indicates that, at the estimated time of arrival, the weather conditions at the destination, **and** at least one destination alternate aerodrome are at or above the applicable aerodrome operating minima.

Proof:

A flight in accordance with instrument flight rules shall always have (pre-flight planning or in-flight replanning) two landing possibilities. Nevertheless it shall be possible to plan without destination alternate aerodrome when the requirements according OPS.CAT.155.A are fulfilled.

Background:

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. Its services range from providing medical advice to repatriating patients to/from Switzerland or any other point of the world. Swiss air-ambulance is a private, non-profit organisation, which operates in accordance with the guiding priniples of the Red Cross. It comes to the aid of people in distress, without respect of their nationality, religious convections or social status. Swiss air-ambulance operates under the Air Operator Certificate CH-AOC-No.1015 issued by the Federal Office of Civil Aviation Switzerland (FOCA) and is compliant with EU-OPS. Please visit www.rega.ch

comment *391* comment by: *EHOC*

Paragraph (b)

The text of paragraph (b) contains a concatenation of ICAO Annex 6, Part II, Chapters 2.2.3.4.2 and 2.2.4.1.1 by combining the respective 'commenced' and 'continued' of ICAO into the single 'initiated or continued'; notwithstanding this, the intent of ICAO Annex 6 Part II for General Aviation (GA) appears to have been satisfied. However, in the previous requirements for Commercial Air Transport (CAT) the two clauses were kept separate because of the distinction between: those conditions that obtain before take-off; and those which apply once the flight has commenced.

Apart from the restriction on wind speed for helidecks and elevated heliports for helicopters, there are no additional requirements for CAT in the proposal. It is therefore suggested that additional text for CAT should be provided meeting the principles stated above. It is not clear how this can be done by modifying the text of OPS.GEN.185(b); perhaps, therefore, it is necessary to provide a new OPS.CAT.185.

The text in the new IR could separate the two clauses: one for commencement of take-off; and the other for continuation to destination. A skeleton of the rule might be:

OPS.CAT.185 Meteorological conditions

Notwithstanding OPS.GEN.185(b), a flight to be conducted in accordance with the instrument flight rules shall not be:

(a) commenced unless information is available which indicates that conditions will, at the estimated time of arrival:

(1) when one alternate is required; at the aerodrome of intended landing and the destination alternate aerodrome; or

(2) when two alternates are required; at the two destination alternate aerodromes,

be at or above the planning minima

(b) continued towards the aerodrome of intended landing unless the latest available meteorological information indicates that conditions at that aerodrome, or at least one destination alternate aerodrome, will, at the estimated time of arrival, be at or above the specified aerodrome operating minima.

Note: The text of (a) has to be slightly modified from the ICAO because of the provision, in OPS.CAT.155.X(b), for two destination alternates.

OPS.GEN.185

The paragraph could be understood in a way that will demand the pilot to check the weather every minute until the last minute before the flight. And for all flights, independent upon the weather and the length of the flight.

The text in paragraph (a) should be added.

"If the weather conditions are of such kind that the latest avalaible meteorological information will be similar to the previous issued information the pilot can fly based upon that information."

For example in high pressure, sunshine a short local flight do not need the latest weather information along the route and at the intended destination. The pilot can see the weather and easily judge that it is possible to fly and should be able to fly without more information or unneccessary demand for weather ananlysis.

If the pilot do not have information about the weather along the route and the destination weather information should be collected.

comment *3542* comment by: *IAOPA Europe*

So long as the pilot has an alternative plan there should be no reason why a flight cannot commence and continue towards a destination where the weather is below VFR operating minima. The concept of an alternative airport is allowed for IFR operations so why not for VFR?

comment *3582* comment by: *PPL/IR Europe*

OPS.GEN.185 is completely unsuitable for private operations, which are often of a much more ad-hoc nature than commercial operations and subject to both higher weather limits (in VFR) and available forecasts which are much less deterministic (eg. to aerodromes without a TAF, or low-level enroute forecasts which are not very specific or accurate).

A private operator should not be bound this kind of determinism in "intended destination", and "destination alternate" in the IFR case. A commercial flight will rarely depart except for the express purpose of reaching a specified destination. A private flight may depart with many contingencies intended, subject to the weather that prevails enroute and towards the potential destination(s). Therefore, the obligations of a PIC in private flight, under IFR or VFR, should be to ensure that the he has "latest available meteoroligcal information relevant to the intended flight". Beyond that, VFR flight is covered by the Visual Flight Rules - there is no justification to overlay an additional Rule that says VFR flight may not be initiated or continued unless a forecast to an intended destination is favourable. IFR flight is similarly covered by the Instrument Flight Rules (including the Alternate requirements).

In addition, by requiring the positive evidence that "information indicates....weather conditions...at or above the applicable VFR minima", this wording could, in effect, ground VFR operations in all but perfect weather conditions. GA weather forecasts are rarely able to clearly "indicate" enroute conditions and much of the discipline of VFR flight is about managing the likelihood of encountering weather which is below VFR limits.

The required phrasing could not be simpler - every conceivable situation is dealt with by the intersect of the following

1. the requirement for the PIC to get appropriate weather information pre-flight

2. the requirement to observe VFR or IFR, as appropriate

3. the other requirements of the PIC for safe operation of the flight (eg. fuel reserves, and Aerodrome Operating Minima)

If the intent of OPS.GEN.185 really is to introduce a new restriction on VFR pilots decision-making and ability to initiate a flight into uncertian conditions, then this is an unprecedented step of very major importance which we reject, and we certainly do not believe it can be "slipped in" to a 464 page NPA produced under tight time conditions. It must be left for a time when EASA can make a proper study and safety case, etc.

comment *3589* comment by: *Aero-Club of Switzerland*

Looking at (a), we think, that the word "initiate" has to be deleted.

Justification: Especially in mountain aereas and during helicopter operations weather conditions may change rapidly. An "initiated" flight must then be discontinued. PiC are trained to take such decisions in time.

comment *6697* comment by: *Finnish Aeronautical Association - Kai Mönkkönen*

There are many of European sailplane pilots that are current valid privilege of flying in a cloud and therefore also close to a cloud. For example in Finland and Sweden “sailplane cloud flying right or cloud flying rating”,

based on applicable sailplane cloud flying training has long history as a specific part of gliding sports activity, for example to reach certain F.A.I defined altitude badges. In case of current sailplane cloud flying operations, take-off, release from launch to free flight, approach and landing shall be able to be made under VFR, but cloud flying part in a thermal inside a convection cloud is made under VFR-minima (inside a cloud). The proposed OPS.GEN.185 however, seems to be ignoring completely sailplane cloud flying activity currently and historically allowed in several Member States.

comment

6795 comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

(a) The pilot-in-command shall not initiate or continue a Visual Flight Rules (VFR) flight unless the latest available meteorological information indicates that the weather conditions along the route and at the intended destination at the appropriate time will be at or above the applicable VFR operating minima.

Comment:

For safety reasons the SCAA suggests that EASA act in order to look over the requirements concerning operation limitations for non local VFR flights conducted during night over water or terrain with limited visual references. The rationale for the suggestion is that when flying over such areas during darkness, visual references might be reduced very fast even with small weather changes. During e.g. level changes a pilot might unintentionally fly in to clouds and be in IMC conditions. A pilot without applicable IFR-training might not be able to handle such a case with loss of control as a consequence. In order to reduce the possibility for such occurrences limitations to fly VFR on top during darkness is suggested.

Proposal:

It is suggested that EASA act in order to look over the requirements in line with comments above. E.g. add a new paragraph/requirement which limits the possibility to fly on top of clouds during night over water or terrain with limited visual references and specify meteorological conditions for the planning phase.

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.190 Take-off conditions p. 36

comment *394* comment by: *EHOC*

This is one of three rules that were provided so that a final check against gross error could be completed when approaching the take-off so that the pilot would be satisfied that he had checked the 'take-of conditions', the 'application of take-off minima' and 'fuel and oil supply'; to replace 'be satisfied' with 'ensure' would imply a calculation rather than this check-against-gross-error. This rule would be improved if the wording were changed from 'ensure' to 'be satisfied'.

Paragraph (a)

This too wordy; once FATO has been defined, the acromym should be used.

comment *552* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.190(b): change text as follows:

OPS.GEN.190 Take-off conditions

Before commencing take-off, the pilot-in-command shall ensure that:

(a) according to the information available, the weather at the aerodrome or operating site and, for motor-powered aircraft, the condition of the runway/Final Approach and Take-off Area (FATO) intended to be used, will not prevent a safe take-off and departure; and

(b) the visibility/Runway Visual Range (RVR) ~~**and the ceiling**~~ in the take-off direction are equal to or better than the applicable aerodrome operating minima.

Justification:

For take-off a ceiling limit is usually not required. This would limit LVTO operations.

comment *789* comment by: *KLM*

(b) the applicable aerodrome operating minima should be:

the applicable minima for take off.

It now says here that the minima have to be the landing minima, which is not required when a take off alternate is specified. Ceiling to be deleted as only VIS/RVR is required for take-off

comment *2447* comment by: *Catherine Nussbaumer*

Meteo conditions : There is no possibility to determine in flight the distance and therefore that shall be at pilot's discretion for SAR or HEMS to assess the risk of flying temporarily into reduced visibility against the need to provide emergency medical service see GM OPS.SPA.020.HEMS page 464.

Visibility may be reduced to 800 m for short periods when in sight of land if the helicopter is manoeuvred at a speed that will give adequate opportunity to observe any obstacle and avoid a collision

Paragraph No:

OPS.GEN.195 Approach and landing conditions

Comment:

Although this requirement has been copied from JAR/EU-OPS 1, it continues to be deficient, particularly for commercial operations, because it does not specify what landing distance margin should be applied by the pilot-in-command that would result in a safe landing being achieved.

Justification:

In order to ensure an harmonised standard across all operators, it is necessary to quantify the 'in-flight' landing distance factor that should be applied, in the same way that the landing distance factor at despatch is also quantified (albeit in AMC material in these proposals). The value of such a factor needs to be developed by appropriate specialists.

comment *4175* comment by: *DGAC*

This paragraph is similar to actual EU-OPS 1.400 in subpart D.

It should be detailed with indications about how a pilot must calculate in flight the landing performances. Particularly when the actual conditions for landing are different from the expected ones at time of dispatching the aircraft (contaminated runway for example).

Besides, the case of an in-flight failure affecting landing performance is not taken into account.

For CAT operations in performance class A : it should be clear whether in-flight checks must be performed by applying a factor to the AFM landing distances (as the dispatch requirements) or other method in order to keep some safe margins from certified landing distances.

This important issue hasn't been considered by JAR- OPS1 and EU-OPS1 but IR-OPS could improve the safety level and comply with the amendment 33 of ICAO annex 6 Part 1 supplement C below by defining an acceptable safety margin :

"7.4 Performance considerations before landing

The operator should provide the flight crew with a method to ensure that a full stop landing, with a safety margin acceptable to the State of the Operator, that is at least the minimum specified in the Type Certificate holder's aircraft flight manual (AFM), or equivalent, can be made on the runway to be used in the conditions existing at the time of landing, and with the deceleration means that will be used."

Moreover in the AMC2 OPS.CAT.A(a)(1) Landing requirements-Aeroplanes, the paragraph (8) requires that "before commencing an approach to land at the destination aerodrome, the pilot in command should ensure that a safe landing can be made".

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.200 Commencement and continuation of approach p. 36-37

comment *397* comment by: *EHOC*

General

It is stated in the explanatory text that "The provisions on commencement and continuation of approach (OPS.GEN.200) transpose Subpart E Appendix 1 to EUOPS 1.430 and JAROPS 3.430." This is not correct and there has

been substantial amendment to the wording (and principles) that were contained in those texts.

Paragraph (a) and (b)

When the Approach Ban was introduced to ICAO Annex 6 in 1999 (AN 11/1.1.26-99/19) - as a result of the accident record, the ICAO Standard was based primarily on the text of in JAR-OPS 1.405 (and the principles of FAR 121.651); this included reference to reported visibility as well as RVR (the JAR text also providing a clause dealing with a convertion of visibility to RVR). Whilst it is understood why JAR-OPS 1.405(b) has been replaced into AMC OPS.GEN.200, the removal of the reference to 'reported visibility' in OPS.GEN.200(a) breaks the link between the objective contained in the IR and the method of compliance. This could introduce the following misunderstandings: (1) the approach ban applies only to landing sites where RVR is reported; (2) the approach ban applies only to precision approaches (i.e. not for non-precision approaches which are not normally dependent upon the reporting of RVR); and (3) there is no ability to utilise a conversion of visibility to runway visual range (Converted Meteorological Visibility (CMV)).

The revision of the previous text from "...if the reported RVR/visibility is less than the applicable minima" to "...is at or above the applicable minima specified for the runway." is incorrect in the following examples: (1) the applicable minima is not for the runway but is a function of a number of elements of which the type of procedure being used is the most significant - i.e. there will be a number of applicable minima for any runway; and (2) the use of 'runway' appears to preclude the approach ban in those cases where there no runway is present (e.g most helicopter procedures).

The wording and intent of the original should be restored; alternatively, the text in (a) could be slightly amended to include 'Converted Meteorological Visibility (CMV)' if it is felt that use of CMV (and the associated definition) would provide more clarity:

(a) ...when the RVR/CMV is at or above the applicable minima.

Paragraph (c)

The text of paragraph (c) is a concatenation of: the original rule for the continuation of the approach - which was primarily concerned with the application of the 'approach ban'; and, the requirement for appropriate 'visual reference' that was contained in the prescriptive requirement for each type of approach (in Appendix 1 to JAR-OPS x.430 one each for ARA, non-precision, Cat I, Cat II and Cat III). It would appear to have been assumed that by including elements (in GEN.200) that were formerly contained in the *'Visual reference'* paragraph of each type of approach procedure, it is not necessary to provide them in the description of each type of approach.

By doing this the clarity, which was previously achieved by providing a general text in 'commencement and continuation of approach', and a precise requirement for the *'visual reference'* in each type of approach, is now missing. This has implication for the approach ban in those procedures for which the 'list' does not represent those precise elements which are required as *visual reference*.

It is recommended: (1) that the elements that are contained in paragraph (c) are removed and the principle reverted to that which formerly existed; and (2) the description for those approaches (non-precision and Cat I) which have been revised to remove the reference to *'visual reference'* are revisited and the original text restored.

The original text should be reinstated - i.e. "The approach may be continued below DA/H or MDA/H and the landing may be completed provided that the visual reference is established at the DA/H or MDA/H and is maintained.".

comment *553* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.200(c): change as follows:

(c) The approach may be continued below DA/H or MDA/H and the landing may be completed provided that ~~**at least one of the following visual references for the intended runway**~~ **the required visual reference** is established at the DA/H or MDA/H and maintained:

Justification:

The current text is too specific regarding required visual references and does not allow for CAT IIIB (no DH) operations. Proposed text is according JAR-OPS 1.405 (e). Specific requirements as in the current text can be added in a (new) OPS.CAT.200 or added to AMC OPS.GEN.200

comment *767* comment by: *Swiss Air Ambulance*

(this comment applies especially for helicopter operations):

a) According to OPS.GEN.195 an approach may not be commenced without the RVR being at or above the minimum. This is to restrictive for IFR operations. In my opinion an IFR approach may be commenced and continued below 1000ft regardless of the reported RVR. The decision to land or go-around is taken at the DA/H or MDH/A by the PIC

Pure GPS Approaches:

c) Approach may be continued below MDA when VMC prevail.

comment *773* comment by: *ECA - European Cockpit Association*

Comment , add text as follows:

(a) An instrument approach may be commenced regardless of the reported visibility/RVR.

~~**(a)**~~ **(b)** An instrument approach shall only be continued below 1 000 ft above the aerodrome on the final approach segment when the reported

Runway Visual Range (RVR) is at or above the applicable minima specified for the runway.

~~**(b)**~~ **(c)** If, after passing 1 000 ft above the aerodrome on the final approach segment, the RVR falls below the applicable minimum, the approach may be continued to Decision Altitude/Height (DA/H) or Minimum Descent Altitude/Height (MDA/H).

~~**(c)**~~ **(d)** The approach may be continued below DA/H or MDA/H and the landing may be completed provided that at least one of the following visual references for the intended runway is established at the DA/H or MDA/H and maintained: [...]

Justification:

<![endif]-->This is according JAR-OPS 1.405 (a). The header of OPS.GEN.200 reads 'Commencement and continuation of approach' but commencement is not mentioned in the current text.

comment *923* comment by: *REGA*

This comment applies especially for helicopter operations:

a) According to OPS.GEN.195 an approach may not be commenced without the RVR being at or above the minimum. This is too restrictive for IFR helicopter operations. An IFR approach may be commenced and continued below 1000 ft regardless of the reported RVR. The decision to land or go-around is taken at the DA/H or MDH/A by the PIC. Additonally heliports (e.g. operating bases or landings sites at hospitals) do not provide RVR informations.

Proposal (a)

An instrument approach shall only be continued below 1000 ft above the aerodrome on the final approach segment when the reported Runway Visual Range (RVR) is at or above the applicable minima specified for the runway or alternatively the decision can be taken Decision Altitude/Height (DA/H) or Minimum Descent Altitude/Height (MDA/H).

Proposal (c)

Approach may be continued below MDA when VMC prevail.

comment *934* comment by: *French SAMU using helicopters for medical transport*

OPS .GEN .200

This chapter is too much aerodrome oriented, helicopters are conducting Point In Space approaches or departures from operating sites (hospitals) where the equipment does not provide RVR information but visibility and cloud base information; In addition the important fact is that after bkeaking clouds the pilots does identify visual cues which will permit him indentify his landing site and the flight path he must follow to land.

(c) should be modified in order to give such a possibility by introducing

(x) Other visual cues accepted by the Authority(such as FATO identifying flash light)

comment *1058* comment by: *AECA helicopteros.*

Referred to paragraph (c)

This probably needs to be modified to:

"(c) Except as provided in Part SPA.LVO, the approach may be continued..."

There are different visual references specified for CAT II and CAT III.

comment *3037* comment by: *AEA*

Relevant Text:

The approach may be continued below DA/H or MDA/H and the landing may be completed provided that at least one of the following visual references for the intended runway is established at the DA/H or MDA/H and maintained:

(1) Elements of the approach light system; (2) The threshold; (3) The threshold markings; (4) The threshold lights; (5) The threshold identification lights; (6) The visual glide slope indicator; (7) The touchdown zone or touchdown zone markings; (8) The touchdown zone lights; or (9) Runway/Final Approach and Take-off Area (FATO) edge lights.

Comment:

The lack of reference to '**other visual references'** is not in line with EU-OPS.

Proposal:

Realign with EU-OPS indicating "other visual references"

comment *3234* comment by: *Eurocontrol CND*

OPS.GEN.200 Commencement and continuation of approach

Regarding (a) it is noted that this provision would mean that operators from outside the EU could continue their approaches down to DA/H whilst community operators can not continue below 1 000 ft.

Regarding (c), it is noted that, according to the NPA it is sufficient that e.g. visual reference is established at the DA/H and maintained whilst ICAO Annex 6, definition of DA/H, Note 2, indicates that "… that section of the visual aids or of the approach area which should have been in view for sufficient time for the pilot to have made an assessment of the aircraft position and rate of change of position, in relation to the desired flight path."

comment *3474* comment by: *M Wilson-NetJets*

Original text:

(a) An instrument approach shall only be continued below 1 000 ft above the aerodrome on the final approach segment when the reported Runway Visual Range (RVR) is at or above the applicable minima specified for the runway.

Suggested new text:

(a) An instrument approach shall only be continued below 1 000 ft above the aerodrome on the final approach segment when the Runway Visual Range (RVR) is at or above the applicable minima specified for the runway.

Comment/suggestion:

The RVR can also be vissually assessed by the pilot(s) on final to be above the required minimums or CMV can be used. Therefore, the use of the word reported will not allow the pilot(s) to use all the inputs available to assertain the actual RVR.

comment *3537* comment by: *Boeing*

NPA 2009-02b, Part Ops

OPS.GEN.200, Commencement and continuation of approach

Page 36 of 464

BOEING COMMENT:

By referring to "1000 feet above the aerodrome" (i.e., *"An instrument approach shall only be continued below 1 000 ft above the aerodrome on the final approach segment …"*), an essential change of current procedures would be required.

For this requirement, we request that EASA revert to the original wording (regarding "outer marker") that is currently in EU-OPS 1.405.

JUSTIFICATION: By specifying the "approach gate" at *1000 feet above the aerodrome*, additional new crew procedures would be required, which will necessitate additional training and updating of FCOM publications -- all at a significant cost to operators. (The cost would need to be reflected in the RIA.) In light of this, we request that the proposed language in the NPA be deleted and replaced with the current EU-OPS 1 language for this same item. This will ensure consistency of requirements.

New Text

Comment:

Text relating to commencement of an approach has not been included as per EU-OPS 1.405

Proposal:

Insert the following text from EU-OPS 1.405 as a new paragraph (a):

(a) The commander or the pilot to whom conduct of the flight has been delegated may commence an instrument approach

regardless of the reported RVR/Visibility but the approach shall not be continued beyond the outer marker, or equivalent

position, if the reported RVR/visibility is less than the applicable minima (see OPS 1.192).

comment *7257* comment by: *ANE (Air Nostrum) OPS QM*

OPS.GEN.200 (a) and (b)

Reference to altitude above ground in place of an "outer marker" is considered positive; however, shouldn't this reference also be made to an altitude addition to minima? There are approaches with higher minima values and this could be interpreted that the pilot may go below. The suggestion is maybe: "1000 ft or approach minima, whichever is higher".

OPS.GEN.200 (c)

Paragraph "(x) other visual references accepted by the Authority" of Appendix 1 to EU-OPS1.430 appears to have been removed. But this is of

paramount important in approaches with very high MDA/H where it is not possible to see any of the references (1) to (9) simply because when reaching the MDA/H, the runway is far beyond minimum visibility.

We are therefore seeking the reinstatement of paragraph :

"(10) other visual references accepted by the Authority"

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.205 Fuel and oil supply p. 37-38

comment *23* comment by: *George Knight*

This regulation is may be too restrictive for self-sustaining and self-launching sailplanes (powered sailplanes), and TMGs if they are considered to be aeroplanes, rather than gliders. Rules are not clear into which category they fall.

Self-sustaining and self-launching sailplanes may only have 30 minutes endurance, or less, when the batteries are fully charged or the fuel tanks full. They should be excluded from the scope of the regulation.

comment *399* comment by: *EHOC*

General

The two elements of the original rule which dealt with 'Fuel policy' and 'Fuel and oil supply' have been condensed into a single rule. Although this follows the ICAO scheme, the number of AMCs concerned with fuel planning probably indicate that the two elements should remain split: one concerned with the planning; and the other that meets the operational take-off requirement.

The operational aspect might be covered by:

"Before commencing a take-off the pilot in command shall be satisfied that aircraft carries at least the planned amount of fuel and oil to complete the flight safely, taking into account the expected operating conditions."

The planning aspect (at least for CAT) could contain the following text:

"The operator shall establish a fuel policy for the purpose of flight planning and in-flight replanning to ensure that every flight carries sufficient fuel for the planned operation and reserves to cover deviations from the planned operation."

Pargraphs (e)

The alleviation from the fuel carriage rule was previously permitted for non-complex helicopters under specific operating conditions; this has not been carried across to OPS.GEN:

"on completion of the flight, or series of flights, the fuel remaining is not less than an amount of fuel sufficient for 30 minutes flying time at normal cruising (this may be reduced to 20 minutes when operating within an area providing continuous and suitable precautionary landing sites). Final reserve fuel must be specified in the operations manual."

comment *639* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.205(c): Reference to "normal cruising altitude" is not adequate.

(c) Except for non-commercial flights with other than complex motor-powered aircraft taking off and landing at the same aerodrome/operating site and remaining within 50 nautical miles (nm) of that aerodrome/operating site, flights conducted in accordance with VFR shall carry reserve fuel not less than:

(1) 30 minutes fuel at **normal cruising altitude** by day; or

(2) 45 minutes fuel at normal cruising speed by night.

Justification:

Cruising altitude varies enormously and also the fuel required for performing this operation. For consistency purposes, the reference should be made to the altitude specified in the ATS flight plan.

comment *640* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.205(d)(1):

This paragraph reinforces the comment made above (ref.: OPS GEN 155 (e)) This fuel requirement precludes that in 45 minutes after ETA, the required meteorological visual conditions shall be met.

comment *790* comment by: *KLM*

(d) (2)

There is 2x to fly stated in (i) and (ii).

This last one should be :

(ii) and land with 30 minutes holding fuel, to cover for a low fuel emergency, calculated at holding speed at 1500 ft above aerodrome elevation in standard conditions and with the estimated weight on arrival.

comment | *821* | comment by: *Reto Ruesch*

Before commencing a take-off the pilot in command shall be satisfied that aircraft carries at least the planned amount of fuel and oil to complete the flight safely, taking into account the expected operating conditions. The planning aspect (at least for CAT) could contain the following text:The operator shall establish a fuel policy for the purpose of flight planning and inflight replanning to ensure that every flight carries sufficient fuel for the planned operation and reserves to cover deviations from the planned operation.

comment | *876* | comment by: *Condor Flugdienst GmbH - FRA HO/R*

Refering to OPS.GEN.205(d)(2)(ii):Change fuel for flight at normal cruising altitude to 30 minutes, instead of 45 minutes.

comment *1910* comment by: *Ingmar Hedblom*

Why is this specific reference to the basic regulation stated here? It is not so for other paragraphs.

comment *1911* comment by: *Ingmar Hedblom*

OPS.GEN.205(c)

There is no requirement for a fuel reserve stated for a local flight.

Corresponding U.S.FAR.91 requirement is:

(a) No person may begin a flight in an airplane under VFR conditions unless (considering wind and forecast weather conditions) there is enough fuel to fly to the first point of intended landing and, assuming normal cruising speed—

(1) During the day, to fly after that for at least 30 minutes; or

(2) At night, to fly after that for at least 45 minutes.

This U.S. definition means that a fuel reserve is also required for a local flight where the (first point of intended) landing is at the same place as the take-off.

Proposal: Introduce a requirement for a fuel reserve also for a local flight

comment *1912* comment by: *Ingmar Hedblom*

OPS.GEN.205(c)

Why 30 minutes at ...cruising **altitude** by day... and 45 minutes at cruising **speed** by night?

Change (1) to 30 minutes fuel at normal cruising **speed** by day

comment *1933* comment by: *Berner Oberländer Helikopter AG BOHAG*

Fuel and oil supply : Before commencing a take-off, the pilot in command shall be satisfied that aircraft carries at least the planned amount of fuel and oil to complete the flight safely, taking into account the expected operating conditions. The planning aspect (at least for CAT) could contain the following text:The operator shall establish a fuel policy for the purpose of flight planning and inflight replanning to ensure that every flight carries sufficient fuel for the planned operation and reserves to cover deviations from the planned operation.

comment *2015* comment by: *Ulrich Baum*

OPS.GEN.205 (c) refers to (1) normal cruising altitude by day and (2) normal cruising speed by night.

This appears to be inconsistent. I think it should say "cruising speed" for both day and night. Please verify.

comment *2019* comment by: *Heliswiss AG, Belp*

Fuel and oil supply : Before commencing a take-off, the pilot in command shall be satisfied that aircraft carries at least the planned amount of fuel and oil to complete the flight safely, taking into account the expected operating conditions. comment *6501* comment by: *Thomas Cook Airlines Ltd*

AEROPLANES

(c) Except for non-commercial flights with other than complex motor-powered aircraft taking off and landing at the same aerodrome/operating site and remaining within 50 nautical miles (nm) of that aerodrome/operating site, flights conducted in accordance with VFR shall carry reserve fuel not less than:

(1) 30 minutes fuel at normal cruising altitude by day; or

(2) 45 minutes fuel at normal cruising speed by night.

(d) For flights conducted in accordance with IFR the amount of fuel to be carried shall be sufficient:

(1) to fly to the aerodrome/operating site of intended landing, and thereafter to fly 45 minutes at normal cruising altitude, when no alternate is required or no suitable alternate is available (i.e. the aerodrome/operating site is isolated and no suitable alternate is available); or

(2) when an alternate is required, to fly to and execute an approach and a missed approach at the aerodrome/operating site of intended landing, and thereafter: (i) to fly to the specified alternate; and (ii) to fly at least 45 minutes at normal cruising altitude.

Current basic EU-Ops procedures (*EU-Ops 1.255)* require 30mins final reserve fuel to be carried on all flights. The above proposed rule defines an increase in this fuel to 45mins.

Thomas Cook would make the following observations with respect to the proposed rule:

1. We are unaware of safety related issues being raised in respect of the current 30 minute final reserve fuel proving insufficient.

2. If there is an increase required, we are not aware of a previously circulated, currently in process or proposed safety case that evidentially supports an increase in final reserve fuel from the current 30 minutes to 45 minutes.

3. On what analysis has 45 minutes final reserve fuel been selected if no safety case has been made?

4. Finally, if a safety related case exists to increase final reserve fuel, would this not have been implemented within EU-Ops at transition?

• The safety case for an increase in final reserve fuel is not supported by current commercial air transport operations and experience or evidence based analysis.

• There appears no material evidence that supports an increase to 45 minutes reserve fuel.

• Were there such a requirement, this would already have been proposed and implemented.

Recommendation:

We would strongly propose that the long term impact of such a change is detrimental to a commercial airline organisation. The increase proposed would not of itself materially enhance flight safety and safe aircraft operations. It is not supported by a robust safety case.

The existing 30 minutes final reserve fuel is sufficient and does not compromise safe commercial air transport operations in any way. Current EU-Ops 30 minutes reserve fuel should be retained and incorporated into proposed EASA Ops Implementing Rules.

comment *6727* comment by: *Greger Ahlbeck*

Paragraph text: Except for non-commercial flights with other than complex motor-powered aircraft taking off and landing at the same aerodrome/operating site and remaining within 50 nautical miles (nm) of that aerodrome/operating site, flights conducted in accordance with VFR shall carry reserve fuel not less than:

Comment: There is no requirement for a fuel reserve stated for a local flight. A flight can be delayed due to traffic or unforeseen rapid change in weather.

comment *7395* comment by: *Axel Schwarz*

No exemptions are required under (c). This requirement should be applicable to all operations and read: "Flights conducted in accordance with VFR shall ...."

comment *7399* comment by: *Axel Schwarz*

(d): Normally holding is required at 1500 ft above the destination aerodrome, not at normal cruising altitude.

Turbine powered aircraft only require 30 minutes as final reserve. See OPS.CAT.205.

The requirement should be adapted accordingly.

comment *7564* comment by: *AOPA UK*

Why a reference here to Annex 4, the only one in the whole NPA?

comment *7565* comment by: *AOPA UK*

AOPA UK does not see the logic in using cruising altitude during day and cruising speed during night.

What is the reason for more fuel to be carried during night-time than during day-time!

comment *7631* comment by: *Cirrus Design Corporation*

This rule implies that reserve fuel must be carried onboard at all times. However, the traditional approach to this has been that the flight must only be planned in accordance with these reserve fuel quantities. Typically, allowance has been made for reduced fuel reserves if the operator encounters non-forecast weather or other conditions that require alteration of the flight plan. Cirrus recommends the AMC for this requirement states that the reserve fuel minimum can be further reduced when in the best interest of flight safety.

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.210 Refuelling with passengers embarking, on board or disembarking p. 38

comment *401* comment by: *EHOC*

General

1. The philosophy of numbering is not understood with the GEN and CAT rules. They share the same number but deal with different concepts (which is reflected in the respective titles). Would it not be advantageous to provide a different number for the CAT rule (as it was in the original rule)?

2. Missing from this rule is the prohibition from refuelling with Avgas or wide-cut fuels when passengers are embarking or disembarking; although this is contained in the CAT Section, it is important enough to be applied to GA as well. Annex 6 Part II Chapter 2.2.3.7 contains the note:

"Note 3.— Additional precautions are required when refuelling with fuels other than aviation kerosene or when refuelling results in a mixture of aviation kerosene with other aviation turbine fuels, or when an open line is used."

Appropriate text might be:

"(b) an aircraft shall not be re/defuelled with Avgas or wide-cut fuels when passengers are embarking, on board or disembarking."

Renumber existing (b) to (c).

Remove OPS.CAT.210.

Paragraph (b)(2)

This may not be possible (or even necessary) for helicopters (it could be possible if two-way communications does not imply radio communications).

comment *641* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.210(b): change as follows:

(b) All other aircraft shall not be refuelled when passengers are embarking, on board or disembarking, unless:

(1) it is attended by the pilot-in-command or other qualified personnel **under the authority of the pilot in command,** ready to initiate and direct an evacuation of the aircraft; and

(2) for commercial operations, two-way communication is maintained between the personnel involved in the operation supervising the refuelling and the pilot-in-command or other qualified personnel required **and subject to the pilot-in-command's authority**.

Justification:

It is paramount to highlight that an evacuation should only be ordered by

the pilot-in-command or any other crew member under the authority of him/her. This is consistent with paragraph 7.c. of Annex IV to regulation (EC) No 216/2008.

comment *1050* comment by: *AECA helicopteros.*

add to paragraph (b) (1)Missing from this rule is the prohibition from refuelling with Avgas or wide-cut fuels when passengers are embarking or disembarking; although this is contained in the CAT Section, it is important enough to be applied to GA as well. Annex 6 Part II Chapter 2.2.3.7 contains the note:

comment *1051* comment by: *AECA helicopteros.*

Paragraph 2.

It may not be possible (or even necessary) for helicopters (it could be possible if two-way communications does not imply radio communications). Suggest an AMC saying:

AMC OPS.GEN.210(b)(2)
TWO WAY COMMUNICATIONS

Two way communications could be achieved by means of pre-agreed hand signals, or via two-way radio or intercom communication.

comment *1402* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

Fueling during embarkment.

Comment / Proposal:

evacuation during an embarkment is very difficult and needs special non standard procedures adequat to the situation. Such precautions shall be defined.

comment *3040* comment by: *AEA*

Relevant Text:

b) All other aircraft shall not be refuelled when passengers are embarking, on board or disembarking, unless :

(1) It is attended by the pilot-in-command or other qualified perssonel ready to inititiate and direct an evacuation of the aircraft and

(2) For commercial operations, two-way communications is maintained between the personnel involved in the operation supervising the refuelling and the pilot-in-command or other other qualified personnel required

Comment:

For safety reasons, it is essential that ALL operators of complex motor-powered aircraft are subject to identical safety rules (commercial operators as well as non-commercial operators) since the safety risks are the same.

Moreover, this requirement is not in line with EU-OPS (Appendix 1 to EU-OPS 1.305) which states that a two-way communication system 'shall be established and remain available' which different from 'maintained' (see EU-OPS). This EASA proposal will therefore severely impact flight operations without clear safety justification and is unacceptable to AEA.

Proposal:

Align the rules for non-commercial operators with those of commercial operators. Realign with Appendix 1 to EU-OPS 1.305.

comment *3140* comment by: *Axel Ockelmann + Manfred Poggensee Commercial Balloon Operators Germany*

Refuelling will never be with passengers around, the only possibility will be to change complete closed lpg-cylinders.

There is no danger to do so.

The normal procedure is, to leave the inflation-cylinder at the ground before launch.

comment *3629* comment by: *AUSTRIAN Airlines*

Relevant Text:

OPS.GEN.210 Refuelling with passengers embarking, on board or disembarking

(a) A balloon shall not be refuelled with passengers embarking, on board or disembarking.

(b) All other aircraft shall not be refuelled when passengers are embarking, on board or

disembarking, unless:

(1) it is attended by the pilot-in-command or other qualified personnel ready to

initiate and direct an evacuation of the aircraft; and

(2) for commercial operations, two-way communication is maintained between the

personnel involved in the operation supervising the refuelling and the pilot-in-command

or other qualified personnel required.

Comment:

Suggest word "maintained" in point 2 is changed to "available" as maintained suggests a constant contact between the two sides.

Proposed Text:

(2) for commercial operations, two-way communication is ~~maintained between~~ available to the personnel involved in the operation supervising the refuelling and the pilot-in-command or other qualified personnel required.

comment *5124* comment by: *Ryanair*

Any requirement to 'maintain' two way communication during refuelling has no basis in safety. Refuelling aircraft with aviation jet fuel is a low risk activity. This proposal would create the requirement for a dedicated crew member whose sole function would be to monitor this routine function.

Proposal

Revert to EU-OPS wording [Appendix 1 to OPS 1.305, para 2]

"A two way communication is ~~maintained~~ shall be established....."

comment *7655* comment by: *Asociación Española de Pilotos de Aerostación (AEPA)*

OPS GEN 210 (a): It would say "a fuel cylinder shall not be refuelled" instead of "a balloon shall not be refuelled

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.215 In-flight fuel checks p. 38

comment *24* comment by: *George Knight*

Should exclude sailplanes and powered sailplanes.

comment *1381* comment by: *Royal Danish Aeroclub*

It does not make sense to check fuel on electric driven aircrafts and sailplanes without engines.

The text should be changed to this:

"In-flight fuel checks shall be carried out on each flight at regular intervals, except in the cases of electric driven engines or sailpalnes without engine."

comment *1403* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

Fuel and oil supply is abrogated by OPS CAT 205.

Comment / Proposal:

Part OPS.GEN shall be limited to general principles and not show any figures. Moreover, OPS.CAT 205 and following show different figures. The present project, thus, is contradictory, missleading and does not meet good rulemaking practice. Alternative solution: clearly state that the OPS.GEN.205 is valid for non commercial operations only.

comment *2652* comment by: *AOPA-Sweden*

This rule is almost impossible to comply with in some older GA airplanes, because a dip-stick is allowed to measure available fuel, and it is very impractical for a single pilot to creep out on the wing at regular interval to check the fuel during a flight.

comment *5284* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment:

Sailplanes should be excluded.

comment *5321* comment by: *Norwegian Air Sports Federation*

This paragraph is not applicable for sailplanes.

comment *7455* comment by: *David ROBERTS*

It should be made clear that this paragraph is not applicable to sailplanes.

comment *7566* comment by: *AOPA UK*

This rule is almost impossible to comply with in some older GA airplanes, because a dip-stick is allowed to measure available fuel, and it is very impractical for a single pilot to creep out on the wing at regular interval to check the fuel during a flight.

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.220.B Operational limitations - balloons p. 38

comment *7461* comment by: *David ROBERTS*

sub para (a) may restrict a small number of balloon operations, for example in more northerly latitidues in summer, and record attempts in conditions such as full moon.

Proposal: This proposed rule should be discussed with the balloning experts (from industry) to see whether it is unduly restrictive on the sport of ballooning. Maybe the draft rule could be limited to 'commercial' operations.

comment *7530* comment by: *Pascal JOUBERT*

Please exempt tethered balloons (as far as a tethered flight is considered as a flight).

Justification: Some commercial activities may require night tethered flights like night glow. Passengers may be on board during night glow, considering the tether mean safe.

comment *7641* comment by: *European Balloon Corporation*

Please exempt tethered balloons (as far as a tethered flight is considered as a flight).

Justification: Some commercial activities may require night tethered flights like night glow. Passengers may be on board during night glow, considering the tether mean safe.

B. I. Draft Opinion - Part-OPS - Subpart A - Section II - OPS.GEN.222 Ground proximity detection p. 38

comment *2393* comment by: *Denis Ferranti Meters*

OPs.Gen,435 (a) (2) Remove ELT(S) and substitute PLB for small private helicopters. Reasons based on cost and number of private hels flying in such conditions/routes.

comment *6032* comment by: *Irish Aviation Authority*

Comment:

This paragraph is far too vague and gives no guidance as to what is an acceptable method of detection or corrective action.

Justification:

Standardisation with already accepted aviation normal practice.

Proposed text:

Text should be expanded or the paragraph deleted.

comment *7632* comment by: *Cirrus Design Corporation*

This rule needs clarification for the circumstances when the corrective action contradicts Air Traffic Control clearance or airspace requirements. The corrective action for a ground proximity warning may require the pilot to violate another operating rule. Cirrus recommends an AMC be included for this rule stating when this rule should take precedence over another rule.

B. I. Draft Opinion - Part-OPS - Subpart A - Section III p. 39

comment *727* comment by: *ECA - European Cockpit Association*

Comment on Section III – Weighing / Mass and balance:

General comment on weighing and mass and balance :

The extensive transfer of OPS section 1 material into AMC or even GM material opens the field to many possibilities of unharmonized and potentially dangerous practices. In particular, standard masses assessment campaigns shall be very closely monitored, and the use of the results of such campaigns shall be strictly limited to the relevant types of operations and/or operator.

comment *2960* comment by: *Valair AG Switzerland*

Art 84 Flights over a hostile environment

Art.84 : Consultations with helicopter experts involved in the drafting of this provision showed that this was directed to certain types and that it would depend on the discretion of the state.The final decision shall remain with the National Authority.Operations over a hostile environment outside a congested area shall be conducted with a Class A or equivalent and Class B helicopters, if the flight time over this area does not exceed 50% of total flight time, and the flight time over areas not enabling a safe forced landing does not exceed 5 minutes.

comment *6924* comment by: *Christian Hölzle*

Operating limitations : It is not unusual for the CofG to be limited if, for example, using Standard Load Plans (which are not described in the AFM). For this reason it would be appropriate to include: (a) ...shall comply with any limitation specified in the Aircraft Flight Manual (AFM) or the Operations Manual if more restrictive.

comment *2407* comment by: *Denis Ferranti Meters*

Ops.Gen410 (b) (3) requires that a helicopter should have 2 means of displaying attitude should VFR not be maintained.

This for small helicopters is overkill. Pilots must be trusted to maintain sensible VFR. Once VFR is not possible then the ac should have landed or turned around. The chances of loss of VFR and the single AI at the same time are very small.

There are also problems with overcomplicating small helicopters and the weight penalty whilst small is cumulative. (2 ELTs, Flotation kit, second AI, mandated dinghy etc)

Cost also, at a time when the aim should be to keep flying at the GA level affordable not exclusive, is a factor

Recommendation: The requirement for the second AI/AH in small VFR helicopters should be dropped.

Very few GA-airplanes have an AFM, please also allow a Pilot Operating Handbook (POH).

B. I. Draft Opinion - Part-OPS - Subpart A - Section III - OPS.GEN.305 Weighing p. 39

comment *1382* comment by: *Royal Danish Aeroclub*

Weighting should be able to be done by a qualified person - also without a Part-M or Part-145 approval.

Weighting i.e. a sailplane is not complicated and could be done by a normal person able to read the weighting instructions. A number of pilots are able to do this themselves.

To demand a approved organisation to make the weighting is just adding costs to the general aviation and air sports and should be avoid.

We suggest the text to read:

"(d) The weigthing shall be accomplished by the manufactor of the aircraft or by a maintenance organisation or person qualified for the task."

comment *1611* comment by: *Luftfahrt-Bundesamt*

Structure not acceptable. In addition, the entire rule/AMC combination does not properly separate rule and non-rule material. The LBA requests to re-establish requirements of EU-OPS / JAR-OPS 3.

Justification: see LBA - General Comment, reasons 1 and 2.

comment *1913* comment by: *Ingmar Hedblom*

The whole paragraph about weighing is related to airworthiness and defines maintenance tasks and should be transferred to Part M. The responsibility to plan all maintenance activities is now on the CAMO. M.A.708(b)10 requires: *ensure that the mass and balance statement reflects the current status of the aircraft* and this includes control of aircraft weight.

Make appropriate changes to Part M to cater for weighing

comment *2287* comment by: *Austro Control GmbH*

(c)

(1) at least every 4 years if individual aircraft masses are used; or

(2) at least once every 9 years if aeroplane fleet masses are used.

It ist suggested to extend

*(1) ... every **5** years....*

*(2) ... every **10** years....*

Justification:

there is no safety risk if this period extended and has a pratical reason.

(d)

The weighing shall be accomplished by the manufacturer of the aircraft or by a maintenance organisation approved in accordance with Part-M or Part-145 ***as appropriate.***

Justification:

The text gives the impression, that weighing can be done by either a Part M or part 145 maintenance organization, but for aircraft in CAT and for large aircraft maintenance has to be done by a part 145 organisation.

OPS.GEN.305(c):

With the wording '….and aircraft used in commercial operations….' this would appear to include balloons used in commercial ops. It is not clear if this is just badly worded and this is not intended to apply to balloons at all, or if it is a deliberate attempt to include balloons. If it is intended to include balloons, this is clearly nonsense and must be rejected. A balloon will undergo negligible changes to its weight during its lifetime unless it is modified or components change, which is addressed by para b above. It should be reworded with the addition of an 'except balloons' clause – eg at the start so it reads:

c) Except for balloons, the mass and……

comment

We suggest weighing at least every 5 years, which are the limitation today.

comment *6565* comment by: *Baden-Württembergischer Luftfahrtverband*

OPS.GEN.305(c)

Wording in the NPA

(c) The mass and CG of complex motor-powered aircraft used in non-commercial operations and aircraft used in commercial operations shall be re-established by actual weighing:

(1) at least every 4 years if individual aircraft masses are used; or

(2) at least once every 9 years if aeroplane fleet masses are used.

Our proposal

As discussed on Comment 6273 certain flights of non commercial organizations and persons should not be considered as commercial operation although payments for cost sharing are exchanged. So this requirement should not apply for these operations.

Issue with current wording

Non appropriate for flights of non commercial organizations and persons even if payments for cost sharing are exchanged

Rationale

As discussed in detail in comment 6273 several activities of private or club

operations can not be considered as commercial operations although a certain amount of compensation is paid to share costs.

comment *6597* comment by: *European HEMS & Air Ambulance Committee (EHAC)*

OPS.GEN.305 Weighing

(d) The weighing shall be accomplished by the manufacturer of the aircraft or by a maintenance organisation approved in accordance with ~~Part-M or~~ Part-145.

Part M is not approved to perform Weight and balance measurements of aircraft and should therefore be removed here

comment *6655* comment by: *DGAC*

Proposal: Accept weighing by another organisation than Part M or Part 145 and which offers comparable standards.

Justification: Restricting to Part M and Part 145 organisations could be too heavy.

comment *6810* comment by: *EFLEVA*

The EFLEVA suggests that this paragraph should be deleted and moved to Part-21 and Part-M. This paragraph only refers to initial airworthiness and continued airworthiness tasks.

comment *7024* comment by: *IACA International Air Carrier Association*

(d)

Add at the end "…or working under the quality system of such approved organisation as permitted per 145.A.75(b). "

Is there an equivalent reference in Part-M ?

Several operators use a specialised company which does not necessarily carry its own Part-M or Part-145 approval.

comment *7369* comment by: *Europe Air Sports, VP*

Weighing of a non-complex aircraft s not a huge technical demand. Any person with a Part 66 qualification can do that. In addition, it is part of the pilot owner and Part M regulations. We recommend to delete "(d)" as this is a requirement which needs incorporation in Part M.

comment *7401* comment by: *Axel Schwarz*

This requirement should be part of Part-M.

comment *7568* comment by: *AOPA UK*

This paragraph should be transferred to Part M.

This is not an operational issue.

B. I. Draft Opinion - Part-OPS - Subpart A - Section III - OPS.GEN.310 Mass and balance system - complex motor-powered aircraft used in non-commercial operations and aircraft used in commercial operations p. 39

comment *66* comment by: *Air Southwest*

OPS.GEN.310 (b) uses the word 'replicable.' This is an adjective describing the noun 'replica.' One dictionary definition is "The ability to make repeated measurements on the same sample or component where there is no significant physical change to the measurand."

By the use of this word it is not clear as to the meaning of this paragraph. Does it mean: 'where M&B data is electronically calculated, the flight crew is to have a paper copy of the electronic calculations'?

comment *318* comment by: *Aero-Club of Switzerland*

Repetitive pleasure flights on the same day?

comment *404* comment by: *EHOC*

General

It is not clear that a complex rule should be established with bullet list of

points. Simplistically, the intent of the rule could just have been achieved with "(a) An operator shall establish a mass and balance system." - providing the list in an AMC. The original text set objectives for most of the elements contained in this list. An improvement to the rule could be achieved with the following which provides objectives for each element:

(a) An operator shall establish a mass and balance system specifying how the following items are accurately determined for each flight:

(1) the mass of all operating items and crew members included in the aircraft dry operating mass by weighing or by using standard masses. The influence of their position on the helicopter centre of gravity shall be determined.

(2) the mass of the traffic load, including any ballast, by actual weighing or determine the mass of the traffic load in accordance with standard passenger and baggage masses.

(3) the mass of the fuel load by using the actual density or, if not known, the density calculated in accordance with a method specified in the Operations Manual.

(4) the principles and methods involved in the loading and in the mass and balance system. This system must cover all types of intended operations. These shall include:

(i) load distribution;

(ii) take-off mass, landing mass and zero fuel mass, if applicable;

(iii) CG positions, if applicable;

(5) preparation of the mass and balance documentation to enable the pilot-in-command to determine that the load and its distribution is such that the mass and balance limits of the aircraft are not exceeded.

(6) preparation of the mass and balance documentation to enable the pilot-in-command to determine that the load and its distribution is such that the mass and balance limits of the aircraft are not exceeded.

(b)...

(c) For commercial operations:

(1) Mass and balance documentation shall be prepared prior to each flight specifying the load and its distribution.

(2) The person preparing the mass and balance documentation shall be named on the document.

(3) The person supervising the loading of the helicopter shall confirm by signature that the load and its distribution are in accordance with the mass and balance documentation.

(4) This completed document must be acceptable to the commander, his acceptance being indicated by countersignature or equivalent.

Justification: see LBA - General Comment, reasons 1 and 2.

comment *2655* comment by: *AOPA-Sweden*

When reading a paragraph like this, AOPA-Sweden gets a feeling that the agency doesn't want to take responsibility for the next generation of very light jets. It doesn't make any sense to have the same procedures for an individual operating a Piper PA-47 and a major airline operating an Airbus A380, i.e. who shall be the qualified person supervise the loading of a VLJ? Therefore AOPA-Sweden thinks that most of the VLJs will remain in the registers of third countries.

OPS.GEN.310.

With the wording '….and aircraft used in commercial operations….' this would appear to include balloons used in commercial ops. If so, the provisions of this paragraph seem unnecessarily onerous for balloon operations. Particularly so when the definition of commercial operations for some types of balloon flying is unclear (eg, sponsored operations, etc). In the majority of cases (except perhaps for 'public transport' with balloons), there is no difference between 'commercial' operations and private operations. All the requisite calculations for loading are done as part of the basic pre flight routine in accordance with the flight manual and are fairly trivial for balloons. Documenting it all in some form prior to each flight adds nothing but a bureaucratic burden to the operations. Again, an 'except balloons' in the opening line should be included. If balloons are to be included, this must only be balloons engaged in Commercial Air Transport, and the clause should be reworded to reflect that.

Paragraph b) says that the computation shall be replicable by the crew.

- What is meant by this?
- To what tolerance will the computation be considered acceptable?

Computerised load sheets may be seat row based, while manual computation may use average compartment values. This will create differences in values calculated using these systems. Some manual systems use graphical means instead of mathematical. Calculating by hand an A380 passenger load using seat row location, could be lengthy.

comment *6272* comment by: *DAeC LV NRW e.V.*

OPS.GEN.310 Mass and balance system - complex motor-powered aircraft used in non-commercial operations and aircraft used in commercial operations

COMPLEX MOTOR-POWERED AIRCRAFT USED IN NON-COMMERCIAL OPERATIONS AND AIRCRAFT USED IN COMMERCIAL OPERATIONS

(a) An operator of a complex motor-powered aircraft used in non-commercial operations or an aircraft used in commercial operations shall establish a mass and balance system specifying how the following items are accurately determined for each flight: (1) aircraft dry operating mass and CG, if applicable; (2) mass of the traffic load; (3) mass of the fuel load; (4) aircraft loading under the supervision of qualified personnel; (5) load distribution; (6) take-off mass, landing mass and zero fuel mass, if applicable; (7) CG positions, if applicable; and (8) preparation and disposition of all documentation. (b) The mass and balance computation based on electronic calculations shall be replicable by the flight crew.

AIRCRAFT USED IN COMMERCIAL OPERATIONS

(c) For commercial operations, mass and balance documentation shall be prepared prior to each flight specifying the load and its distribution.

OPS.GEN.310(c)

Wording in the NPA

AIRCRAFT USED IN COMMERCIAL OPERATIONS

(c) For commercial operations, mass and balance documentation shall be prepared prior to each flight specifying the load and its distribution.

Our proposal

(c) For commercial operations except on non complex aircraft, mass and balance documentation shall be prepared prior to each flight specifying the

load and its distribution.

Issue with current wording

Not appropriate for Passenger rides on non complex aircraft like e.g. Sailplanes or non complex airplanes even if emunaration is taken typically to share costs.

Rationale

Passenger rides on non complex aircraft in most cases do not require complex weight and balance calculations especially in the case of 2 seaters. Documentation prior to each such flight is not an appropriate requirement.

comment *6522* comment by: *Egon Schmaus*

OPS.GEN.310 ... commercial operations

add para (d)

(d) Aircraft operation of non commercial organizations and persons will not be considered as commercial flight, as long as remuneration is only based on cost sharing of direct flight costs.

Reason:

Private pilots invite friends and other persons to accompany them. There, often passengers take over costs for fuel and fees, or the club hourly rates of this flight without the pilot earning extra money on that.

comment *6566* comment by: *Baden-Württembergischer Luftfahrtverband*

OPS.GEN.310(c)

Wording in the NPA

AIRCRAFT USED IN COMMERCIAL OPERATIONS

(c) For commercial operations, mass and balance documentation shall be prepared prior to each flight specifying the load and its distribution.

Our proposal

As discussed on Comment 6273 certain flights of non commercial organizations and persons should not be considered as commercial operation although payments for cost sharing are exchanged. So this requirement should not apply. Never the less the exemption should be further extended:

(c) For commercial operations except on non complex aircraft, mass and balance documentation shall be prepared prior to each flight specifying the load and its distribution.

Issue with current wording

Not appropriate for Passenger rides on non complex aircraft like e.g.

Sailplanes or non complex airplanes even if emunaration is taken typically to share costs.

Original text:

See NPA text

Suggested new text:

The following insertion is suggested:

AMC5 OPS.GEN.310 (a) (2) (5) (6) (7) Mass and balance system - complex motor-powered aircraft used in non-commercial operations and aircraft used in commercial operations

Aeroplanes

1. For aeroplanes with a maximum certified take-off mass of less than 45.360kg and a MPSC of 19 or less, the applicable mass and centre of gravity may be demonstrated to be in limits of those stated in Aeroplane Flight Manual by determining the most forward and most aft centre of gravity for both the lowest and highest expected traffic load and expected fuel mass.

2. Passenger mass may be taken from a passenger statement which may be used, afterwards, for a maximum of 5 years for adults and 2 years for children. Infants may be counted at a standard mass of 10kg. When a passenger has passed from one category of passenger (infant, child) to another category of passenger (child, adult) a new statement of the passenger's mass must be obtained.

3. Standard baggage mass may be determined as follows:

a. Small sized baggage piece (maximum volume 0.05m^3) – 5kg each

b. Medium sized baggage piece (maximum volume 0.1m^3) – 10kg each

c. Large sized baggage piece (maximum volume 0.2m^3) – 20kg each

d. Larger sized baggage pieces must be weighed prior loading

4. When determining any expectable traffic load mass for the purpose of determining the centre of gravity under this AMC ,each passenger mass should be decreased by 5kg for each passenger seated aft the DOM centre of gravity, and increased by 5kg for each passenger seated forward of the DOM centre of gravity.

5. When determining the most forward expectable centre of gravity

a. If more than one baggage compartment is available or more centre of gravity stations are available for one single baggage compartment the division of baggage in the baggage compartment(s) should be determined in advance and included in the mass and balance documentation or, if standard, in the operations manual.

b. the expected passenger seating configuration should be from the most forward passenger seat(s) backwards starting with the passenger with the highest mass and ending with the passenger with the lowest mass.

c. One expected mass and centre of gravity value should be used for fuel and oil supplies

6. When determining the most aft expectable centre of gravity

a. If more than one baggage compartment is available or more centre of

gravity stations are available for one single baggage compartment the division of baggage in the baggage compartment(s) should be determined in advance and included in the mass and balance documentation or, if standard, in the operations manual.

b. the expected passenger seating configuration should be from the most aft passenger seat(s) forward starting with the passenger with the highest mass and ending with the passenger with the lowest mass

c. One expected mass and centre of gravity value should be used for fuel and oil supplies

7. When the method described in point 5 or 6 above results in the centre of gravity being outside the limits, as stated in the Aeroplane Flight Manual, a fixed seating assignment may be produced that results in the centre of gravity being within the limits stated in the Aeroplane Flight Manual. This fixed seating assignment should be included in the mass and balance documentation and be checked prior to taxi by the Flight Crew or Cabin Crew (as applicable).

Comment / suggestion

On many aerodromes used by business aeroplane operators it is not possible to weigh passengers or baggage. Therefore, a reasonable solution should be available to proof the safe centre of gravity and traffic load.

comment *7238* comment by: *AIR FRANCE*

Relevant Text:

b) the mass and balance computation based on electronic calculations shall be replicable by the flight crew.

Comment:

This requirement is unclear.

Proposal:

Should be clarified.

comment *7323* comment by: *ANE (Air Nostrum) OPS QM*

Paragraph b) says that the computation shall be replicable by the crew.

What is meant by this?

To what tolerance will the computation be considered acceptable?

Computerised load sheets may be seat row based, while manual computation may use average compartment values. This will create differences in values calculated using these systems. Some manual systems use graphical means instead of mathematical. Calculating by hand an passenger load using seat row location, could be lengthy.

comment *7569* comment by: *AOPA UK*

When reading this paragraph, AOPA UK gets a feeling that the agency does not understand proportionate regulation. It does not make sense to have the same requirements for an individual operating a Piper PA-47 and an airline operating an Airbus A380, i.e. who shall be the qualified person supervise the loading of a VLJ?

B. I. Draft Opinion - Part-OPS - Subpart A - Section III - OPS.GEN.315 Performance - general p. 40

comment *936* comment by: *EHOC*

Paragraph (b)

The requirement has been incorrectly transposed from JAR-OPS 0; occupants have been included in the text when, formerly (and in Annex II, Chapter 3.1.2), third parties only were protected.

comment *1420* comment by: *EUROCOPTER*

§ (b):

"Except when necessary for take-off or landing at an approved operating site, an aircraft shall only be operated over the congested areas of cities, towns or settlements or over an open-air assembly of persons, if it is able to make a landing without undue hazard **~~to the aircraft occupants or~~** to third parties, in the event of a power-unit failure."

Substantiation: the aim of the requirement, as applicable to all types of operations, should be to mitigate the risk to third parties, not to the aircraft occupants, taking into account that mitigation of the risks to the aircraft occupants is dealt by the other parts CAT, COM, and SPA.

comment *1613* comment by: *Luftfahrt-Bundesamt*

Structure not acceptable. In addition, the entire rule/AMC combination does not properly separate rule and non-rule material. The LBA requests to re-establish requirements of EU-OPS / JAR-OPS 3.

Justification: see LBA - General Comment, reasons 1 and 2.

comment *3148* comment by: *UK CAA*

Page No: 40

Paragraph No: OPS.GEN.315 (b)

Comment:

The sub-paragraph is superfluous as the requirement is covered by sub-paragraph (a) in that flight over or into congested areas is covered by the relevant State Rules of the Air.

This sub-paragraph should be removed.

Justification:

Unnecessary text whose purpose is covered by State Rules of the Air.

Proposed Text (if applicable):

~~(b) Except when necessary for take-off or landing at an approved operating site, an aircraft shall only be operated over the congested areas of cities, towns or settlements or over an open-air assembly of persons, if it is able to make a landing without undue hazard to the aircraft occupants or to third parties, in the event of a power-unit failure.~~

comment *3765* comment by: *Civil Aviation Authority of Norway*

Comment: Need to define 'open air assembly of persons' in AMC material?

Justification:

The NCAA defines this to mean more than 1000 persons.

Proposed Text

(if applicable):

Except when necessary for take-off or landing at an approved operating site, an aircraft shall only be operated over the congested areas of cities, towns or settlements or over an open-air assembly of persons, notified or estimated to be more than 1000 persons, if it is able to make a landing without undue hazard to the aircraft occupants or to third parties, in the event of a power-unit failure.

comment *3862* comment by: *M Wilson-NetJets*

Original text:

An aircraft shall only be operated if the performance is adequate to comply with the applicable rules of the air and any other restrictions applicable to the flight, the airspace or the aerodromes/operating sites used, taking into account the charting accuracy of any charts/maps used.

Suggested new text:

No suggested text

Comment / suggestion:

This rule does not specify if during emergency situations (mainly loss of engine thrust/power) the provisions are also applicable or not. Clarification required.

comment *4181* comment by: *DGAC*

(b)

First of all the term "approved operating site" is not defined in OPS.GEN.010 (there is only a definition of "operating site"). What does it mean?

Second of all the aim of this paragraph should be to mitigate third party risk, not the risk for aircraft occupants.

Justification:

Refer to annex 6 vol 3:

"3.1.4 Where helicopters are operated to or from heliports in a congested hostile environment, the competent authority of the State in which the heliport is situated shall specify the requirements to enable these operations to be conducted in a manner that gives appropriate consideration for the risk associated with a power-unit failure."

Proposed Text:

Amend (b) as follows:

"Except when necessary for take-off or landing at an **aerodrome or an** ~~**approved**~~ operating site **as accepted by the authority**, an aircraft shall only be operated over the congested areas of cities, towns or settlements or over an open-air assembly of persons, if it is able to make a landing without undue hazard ~~**to the aircraft occupants or**~~ to third parties, in the event of a power-unit failure."

comment *5304* comment by: *Light Aircraft Association UK*

Paragraph b).

Although this requirement is slightly different from the UK Air Navigation Order, the LAA supports this proposal.

comment *6041* comment by: *Irish Aviation Authority*

Comment:

In paragraph (b) there is no mention of property on the ground.

Justification:

Standardisation with already accepted aviation normal practice.

Page No: 40

Paragraph No: OPS.GEN.320.A (a)(1)

Comment:

This rule should refer to the calculated take-off run/distance.

Justification:

Clarification.

Proposed Text (if applicable):

(a)(1) the ***calculated*** take-off distance shall not exceed the take-off distance available….

(a)(2) the ***calculated*** take-off run shall not exceed the take-off run available

comment *3261* comment by: *Aero-Club of Switzerland*

Definition of "clearway distance"?

comment *3546* comment by: *IAOPA Europe*

OPS.GEN.320.A

Since continuing a take-off is not an option for a single engine aircraft or for marginally powered multi-engine aircraft (typically FAR 23 aircraft) the calculation of a V1 is meaningless. There is no such speed where the take-off can be continued. Therefore a V1 does not exist.

In case of an engine failure on the ground the only option is to apply brakes and stop the aircraft. In most cases if the engine failure occurs just after take-off the procedure for such aircraft will also be to reland and apply brakes.

OPS.GEN.320.B

For the same reason as stated under OPS.GEN.320.A it does not make any sense to require a single engine aircraft to be able to stop within the runway available. A V1 is not defined since there is no speed where the aircraft can continue its takeoff.

The proposed wording presumes that any multi-engine aircraft can continue its take-off after a certain speed. That is not the case - and effectively the proposed wording would ground all complex multi-engine aircraft which are certified according to FAR 23 and which cannot continue a take-off after an engine failure.

Both rules should only apply to aircraft which are certified to continue a take-off after an engine failure - they are aerodynamically meaningless for all other aircraft. Whether the aircraft is complex or non-complex does not have anything to do with these characteristics.

comment *3561* comment by: *Walter Gessky*

OPS.GEN.320A(a)(3)

Comment:

It shall be noted that certain data according (a) (3) and (4) are not always available or adequately approved.

comment *3584* comment by: *PPL/IR Europe*

para (b) has the implication of imposing an unneccessary restriction on light mulit-engine turboprop aircraft. Currently, all aircraft over 5.7t and all jet aircraft have to comply with balanced field lenth for departure. All others do not. Under EASA OPS, (non-complex) piston aircraft and single-engine turborprops will not have to comply with para (b).

Therefore, the practical effect of para (b) for non-commercial flight is solely on light (under 5.7t) twin turboprops in private operations. We do not see any need for this restriction, and it may have the undesirable consequence of forcing private operators who require flexibility for short-field operations from turboprop twins into using less safe turboprop singles or piston twins. We do not believe this outcome is merited. We believe para (b) should be amended to exempt multi-engine turboprop aircraft under 5.7t.

The Type Certification regime has adequately dealt with departure performance requirements for private flight and we do not believe stakeholders interests are served by EASA imposing new rules that have not had a proper analysis and review, which is well beyond the scope of the rulemaking process at this point.

comment *4182* comment by: *DGAC*

(a)(3) – V1

Proposal:

- renumber text in (b) as (b)(1)

- move (a)(3) to a new paragraph (b)(2)

Justification:

This paragraph applies to complex motor-powered aeroplanes and aeroplanes used in CAT.

However for performance class B there concept of V1 does not make any sense as the rejected take-off is not formally taken into account for that class of performance.

The requirement in (a)(3) only applies when the rejected take-off is taken into account as per (b).

Note: The explanatory note states that IR OPS is designed to avoid duplication of text, however the text in (a)(3) is repeated in AMC1 OPS.CAT.326.A 1.d (p. 296).

comment *4183* comment by: *DGAC*

(b) - complex motor-powered aeroplanes :

The minimum width of a runway is a parameter which is determined during certification processes by testing the maximum lateral deviation with the

critical engine failure during take-off acceleration. In the Regulation (CE) 216/2008 annex iV Essential rules page 41, § 4.c (v) concerning performance criteria, is not limited to length criteria but "size" then the width of the runway has to be considered in addition to runway/TODA and ASDA lengths as a limitation. Certification rules should also require that these data figures in AFM in order.

Besides, the definition of a contaminated runway (OPS.GEN.010(13)) is based on a surface area which is defined by "required length and width being used" : then the required width must be available.

5887 comment by: *SWISS AERODROMES ASSOCIATION*

At least the complex motor-powered aircraft in non commercial operations should be exempted from these requirements

comment

6502 comment by: *UK CAA*

Page No: 40

Paragraph No:

OPS.GEN.320.A

Comment:

There should also be a clear requirement for all aeroplanes to comply with the WAT (climb) limitations for take-off.

Justification:

The purpose of WAT limits is to ensure that the aeroplane has acceptable minimum climb or acceleration capability to a reasonable height above the take-off and landing aerodrome. Thus, compliance with the WAT limitations should be a basic but important safety requirement for all types of operation. For those Class B aeroplanes which do not have WAT data in their AFMs/POHs, AMC material is also proposed.

Proposed Text (if applicable):

(i) Insert a new paragraph (a) as follows:-

(a) ALL AEROPLANES USED IN ALL OPERATIONS. The take-off mass must not exceed the maximum take-off mass specified in the Aeroplane Flight Manual for the pressure altitude and the ambient temperature at the aerodrome at which the take-off is to be made.

(ii) Add a new AMC OPS.GEN.320(a) as follows:-

CLASS B AEROPLANESIf the Aeroplane Flight Manual does not contain the necessary information to comply with OPS.GEN.320(a), the take–off mass at the altitude and the air temperature at the aerodrome at which the take-off is to be made must not exceed the mass at which the aeroplane is capable, in the en route configuration and with all engines operating within the specified maximum continuous power conditions, of a steady rate of climb of 700 feet per minute if it has retractable landing gear and of 500 feet per minute if it has fixed landing gear.

(iii) Renumber existing paragraphs.

comment *7405* comment by: *Axel Schwarz*

(a)(3): A decision speed V1 is not defined for all aeroplanes (e.g. Performance Class C, or single-engine turbojets). Add "if applicable".

comment *7570* comment by: *AOPA UK*

V1 does not exist for a single engine aircraft, there is no alternative than to apply brakes in case of engine failure whatever speed when the aircraft is still on the ground.

comment *7633* comment by: *Cirrus Design Corporation*

A speed should be specified at which a single-engine airplane must make a full stop within the remaining available runway. Typically, V1 would be the certified decision speed and would be assumed to be used for this requirement. However, the aircraft doesn't begin departing the ground until Vr, which could be interpreted as the required stopping speed. Since V1 is the speed used for published runway data, Cirrus recommends this requirement specify V1 for single-engine airplanes.

comment *3151* comment by: *UK CAA*

Page No: 40

Paragraph No:

OPS.GEN.325 En-route - Critical engine inoperative - complex motor-powered aircraft

Comment:

There is a variety of terms used to refer to the height at which aircraft should fly to avoid obstacles.

This rule uses the phrase "minimum obstacle clearance altitude", which AMC.OPS.CAT 170 explains is one of three methods of calculating 'minimum flight altitudes'.

OPS.GEN.170 uses 'terrain clearance altitude' for IFR circumstances (which may not accurately cover over water flight).

Justification:

Clarity and accuracy for this safety-critical rule is essential.

Proposed Text (if applicable):

OPS.GEN.325 En-route - Critical engine inoperative - complex motor-powered aircraft

In the event of a critical engine becoming inoperative at any point along the route, a multi-engine complex motor-powered aircraft shall be able to continue the flight to an aerodrome without flying below the minimum ~~obstacle clearance~~ *flight* altitude at any point.

(Whatever term is chosen, this should be standard throughout.)

comment *3585* comment by: *PPL/IR Europe*

This is excessively restrictive for private flight in the planning and possible route limitations it imposes. We do no believe there is any evidence for this requirement, and we are not aware of any safety threat ever recorded to a private flight due to drift-down in the event of an engine failure in a multi-engine turbine aircraft.

This has the perverse outcome that a private opertor could be better off operating a single-engine turbine aircraft over terrain which might impose a route restriction on a twin turbine aircraft, which we believe is non-sensical.

The paragraph should be redrafted to apply only to Commercial operations.

comment *3887* comment by: *FOM ANWB MAA*

OPS.GEN.325 En-route - Critical engine inoperative - complex motor-powered aircraft

In the event of a critical engine becoming inoperative at any point along the route, a multi-engine complex motor-powered aircraft shall be able to continue the flight to an aerodrome, or suitable landing site for a helicopter ,without flying below the minimum obstacle clearance altitude at any point.

In the interest of safety continuation of the flight to sites that do not meet the definition of an aerofrome should be allowed as well.

Replace: "At any aerodrome.." with "At any adequate aerodrome

comment *2398* comment by: *IDRF e.V. (association of regional airports)*

Unlike the corresponding AMC for CAT, the non-CAT operations have not to comply with concrete margins. We agree to let this specific item up to the operator. However, in order to compensate variations in the approach and landing technique, we suggest to add guidance material how to consider:

Any excess height and/or speed when passing the treshold

Any temperature deviation from ISA

Any braking action other than "maximum"

Any slope of runway

Any non-standard flare technique

Any allowance for gusts and crosswinds

Any pilot errors

Unpaved runway

Wet or contaminated runway

etc.

comment | *3072* | comment by: *AOPA Switzerland*

It should be in the responsibility of the PIC whether the chosen landing aerodrome is suitable or not for a safe operation. Therefore withdraw OPS.GEN.330.A.

comment | *3099* | comment by: *Michael Hoeck*

First time I have to say good. No additional factor is required as the AOC lobby tried to put on us. Lets just use the guidance material we have on the airplane and we are good to go.

comment | *3280* | comment by: *Aero-Club of Switzerland*

We think, this paragraph is not necessary.

Justification: Any adequately trained pilot will automatically behave according to the rules of good airmanship. The text of the paragraph questions this.

comment | *4185* | comment by: *DGAC*

"At any aerodrome, after clearing all obstacles in the approach path **by a safe margin**". This is a new requirement, not included in previous performance codes. How can an operator ensure compliance with this requirement?

comment | *4186* | comment by: *DGAC*

The text is not adapted to seaplanes landing.

comment | *4187* | comment by: *DGAC*

The notion of landing distance needs to refer to a screen height (when crossing the runway threshold or equivalent).

Justification:

Existing performance codes take into account a screen height above the runway threshold, but no "safe margin" in the approach path.

Proposed Text:

Amend text as follows:

"At any aerodrome **or landing site**, ~~after clearing all obstacles in the approach path by a safe margin,~~ the aeroplane shall be able to land and stop, a seaplane come to a satisfactorily low speed, **from an appropriate screen height,** within the landing distance available.

Allowance ~~may~~ **shall** be made for expected variations in the approach and landing techniques, if such allowance has not been made in the scheduling of performance data."

comment *5888* comment by: *SWISS AERODROMES ASSOCIATION*

At least the complex motor-powered aircraft in non commercial operations should be exempted from these requirements.

comment *6503* comment by: *UK CAA*

Page No: 40 of 464

Paragraph No: OPS.GEN.330.A

Comment:

There should be a clear requirement for all aeroplanes to comply with the WAT (climb) limitations for landing.

Justification:

The purpose of WAT limits is to ensure that the aeroplane has acceptable minimum climb or acceleration capability to a reasonable height above the take-off and landing aerodrome. Thus, compliance with the WAT limitations should be a basic but important safety requirement for all types of operation. For those Class B aeroplanes which do not have WAT data in their AFMs/POHs, AMC material is also proposed.

Proposed Text (if applicable):

(i) Insert a new paragraph (a) as follows:-

(a) ALL AEROPLANES USED IN ALL OPERATIONS. The take-off mass must not exceed the maximum landing mass specified in the Aeroplane Flight Manual for the pressure altitude and the ambient temperature at the aerodrome at which the landing is to be made.

(ii) Add a new AMC OPS.GEN.330(a) as follows:-

CLASS B AEROPLANESIf the Aeroplane Flight Manual does not contain the necessary information to comply with OPS.GEN.330(a), the landing mass at the altitude and the air temperature at the aerodrome at which the landing is to be made must not exceed the mass at which the aeroplane is capable, in the en route configuration and with all engines operating within the specified maximum continuous power conditions, of a steady rate of climb of 700 feet per minute if it has retractable landing gear and of 500 feet per

minute if it has fixed landing gear.

(iii) Renumber existing paragraph.

comment *6504* comment by: *UK CAA*

Page No: 40 of 464

Paragraph No:

OPS.GEN.330.A

Comment:

The proposed text only requires the aeroplane to stop within the landing distance available and not within a safe margin of the landing distance available. Although the requirement "Allowance may be made for expected variations in the approach and landing techniques, if such allowance has not been made in the scheduling of performance data." could be regarded as providing the necessary safeguards, the use of the word 'may' is inappropriate – it implies that compliance is optional. Furthermore, how are operators expected to know the extent to which allowances, if any, have been made "for expected variations in the approach and landing techniques" in the scheduling of performance data? This information is not generally available in the scheduled performance data and therefore compliance will not be possible.

Justification:

For complex aeroplane operations, it is appropriate to require clearly that a full-stop landing can be made within a safe margin of the landing distance available. For standardisation purposes the value of the safe margin needs to be specified, and for non-commercial operations, advisory material should be sufficient. The second sentence of the paragraph could be deleted without any loss stringency, since the provision of a safe margin would achieve the same result.

Proposed Text (if applicable):

At any aerodrome, after clearing all obstacles in the approach path by a safe margin, the aeroplane shall be able to land and stop ***within a safe margin****, a seaplane come to a satisfactorily low speed, within the landing distance available.* ~~*Allowance may be made for expected variations in the approach and landing techniques, if such allowance has not been made in the scheduling of performance data.*~~

Replace "At any aerodrome…" by "At any adequate aerodrome…"

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV p. 41

comment *3043* comment by: *AEA*

Comment:

The content of JAR / EU -OPS 1 Subpart K and L has been re-written and was merged into this NPA. In this process there is a risk of unintentionally changing requirements because revised wording will lead to new interpretations. The cross reference listed in NPA 2009f does not provide assurance that the content and intention of Subpart K and L is transferred "as is". Since these JAR / EU Subparts directly affect aircraft configuration and capabilities, any discrepancy introduced by this NPA has substantial economic impact.

Proposal:

This NPA should literally transpose the content of JAR / EU - OPS 1. Any deviations to the existing JAR / EU - OPS subpart K and L requirements should be specifically highlighted in a RIA

comment *3056* comment by: *Richard Dawson*

My comments are provided as a helicopter pilot of ten years in the UK and an owner of a Robinson R44 which is used for private flights within the UK mainland and its outlying islands and mainland Europe and its islands.

The basis of my comments is that non-complex helicopters being used privately should not be subject to the same regulation as commercial helicopter flights. These proposals do not differentiate between these two types of aviation (whereas they do for fixed wing).

As an owner, the proposed regulation would be in several instances impossible to comply with (retrofitting floats and steerable lighting). Where it was possible, it would be very expensive to comply with (source of static pressure,prevention of condensation/icing on speed measuring devices, ELT) and would provide little improvement in safety.

These proposals would therefore prevent me from freely circulating within the European Union in my helicopter. Indeed, they would curtail my ability to fly within the UK with rivers and estuaries becoming barriers to overflight. As a pilot, I believe that it should be at my discretion as to whether to carry a life raft and to mitigate for overwater flight I propose thw wearing of lifejackets and PLBs when further than 10 minutes from land.

comment *4188* comment by: *DGAC*

As such most of the provisions of Section IV will be applicable to all aircraft, whatever the date of issuance of the first individual certificate of airworthiness might be. This is a huge difference compared to ICAO Annex 6 provisions and to EU/JAR-OPS 1/3 as well as to national rules (e.g. harnesses, TAWS, …). There are cases where imposing the retrofit of aircraft with certain instruments/equipments is feasible and worth the cost of it, because of safety imperatives. In some other cases, the question of cost/benefit of the retrofit must be studied carefully, especially in the case of general aviation or aerial work where situations can be different according to the member states rules, as the only common basis (ICAO annex 6-2) may either be a simple recommendation or a standard that takes into account the date of issuance of the first individual certificate of airworthiness.

comment *4189* comment by: *DGAC*

·In JAR OPS 3, there used to be one section dealing with the equipment needed and another section dealing with operational procedures. In IR OPS everything is mixed and makes things difficult to understand (ex: oxygen, CVR and FDR- see OPS.GEN.510).

comment *4190* comment by: *DGAC*

Besides there are numerous other instruments required by our national safety requirements for general aviation which are missing in this NPA. Drawing the comparison has been really time-consuming. We are not in a position, though, to make deeper comment in such a short time, all the more as the lay out of the provisions contained in the NPA regarding to equipments and instruments is sometime very confusing. This is in favour of our general comment asking that the NPA be converted into an A-NPA to enable stakeholders to give more accurate and in-depth comments

The European Private Helicopter Alliance represents many thousands of pilots and private helicopter owners and operators in the above countries.

Our following objections are primarily based on the fact that the proposals do not distinguish between private and commercial helicopter operations. In these proposals all helicopters are treated the same, whether it be a private 2 seat Robinson R22 or a large commercial Sikorsky S92.

This is in direct conflict with the principles established by the European

Commission's Communication "Agenda for Sustainable Future in General and Business (COM(2007) 869 final) and its endorsement by the European Parliament (2008/2134(INI)) and the Council of Ministers. In particular this NPA does not comply with the "application of the principles of subsidiarity and proportionality"1[1]. Furthermore, it ignores the European Parliament's specific demand that the implementing rules must be *"proportionate and commensurate to the complexity of the respective category of aircraft and operation"* 1[2].

Private, non-commercial helicopter operations should be regulated with a lighter touch than CAT as is the case with the proposals for private fixed wing aircraft. Consequently we consider that some of the EASA proposals are unnecessary, disproportionate, burdensome and costly and have no basis in accident history. There is no safety case for them. Private helicopters have a similar equipment related accident rate to private fixed wing.

The proposals referred to in our following comments to the consultation would severely and detrimentally affect the majority of European helicopter owners and pilots, by both severely restricting their use of helicopters over water and at night, or increasing costs, for no perceptible benefit. Matters that EASA should consider are:

The proportionality of the proposals as regards private helicopter use

The lack of legal necessity of ICAO compliance

The unreasonableness of ICAO helicopter standards as applied to private operations.

The safety benefit of the proposals, if any

The practicality of the equipment which is proposed to become mandatory

The cost of the equipment which is proposed to become mandatory

The need as perceived by a substantial majority of European private helicopter pilots

The arbitrary and discriminatory nature of parts of the NPA as applied to private helicopters (but not to private aeroplanes)

EPHA Comment

The imposition of the Floatation, Life Raft and ELT proposals would adversely affect private, non complex helicopter activities through their cost, weight and practicality. Requiring floatation, life raft and ELT fitment to cross estuaries, lakes, reservoirs, rivers, and offshore isands would clearly be in breach of this policy, and would be grossly disproportionate. Accident data does not support a safety case for the flotation proposal for helicopters.

ICAO Compliance.

EASA perceives the need to comply fully with ICAO standards. However, Article 37 of the Chicago Convention states "Each contracting State undertakes to collaborate in securing the highest practicable degree of uniformity in regulations, standards and procedures...." and Article 38 of the Chicago Convention states "Any State which finds it impracticable to comply in all respects with any such international standard or procedure (.....) shall

give immediate notification to the International Civil Aviation organisation of the differences between its own practice and that established by the international standard". The emphasis being what is practicable.

There is no suggestion that ICAO standards are in some way superior to current member state law, or safer. Member state the UK, for example, enjoys one of the safest aviation environments anywhere in the world, but does not mandate the equipment we object to.

Whilst ICAO Contracting States are obliged to notify differences to International Standards under Article 38 of the Convention, they are only invited to 'extend such notification to any differences from the Recommended Practices….when the notification of such differences is important for the safety of air navigation.

ICAO annex 6 part 111 Chapter 2 - Applicability shows that the SARPs in the Annex do not apply to helicopters engaged in aerial work operations. This therefore calls into question the applicability to private operations.

Thus the picture emerges that there is no necessity for total ICAO compliance. The actual safety case does not support the proposed equipment fit changes for private helicopters.

Small and Medium Enterprises

Many helicopters are operated by small businesses, and would be severely disadvantaged by the cost and practicality of the proposals. They would be forced to spend tens of thousands of Euros in compliance costs, or stop using their helicopters for over water and night time travel.

The unreasonableness of ICAO standards as regards private helicopter operations.

Private non-commercial helicopter operations did not exist when the ICAO standards and recommended practices were written, and ICAO make no provision for such operations to be more lightly regulated. In contrast, however, fixed wing private operations are more lightly regulated.

Whilst there is a clear and large distinction between the ICAO standards applicable to the public transport and non public transport operations of fixed wing aircraft, there is no such clear and large distinction for helicopters. Indeed the proposals for private helicopters in this NPA are the same as for CAT.

This is clearly unreasonable and disproportionate. Proper, less stringent, provision for private helicopter flight has not been made in the ICAO standards. The ICAO standards for helicopters are out of date, and do not take into account present day helicopter demonstrated mechanical reliability.

In the overwater flight case for example, it is not proposed that a private fixed wing aircraft should have a means of flotation, whereas private helicopters would be required to have floats installed. This is not either reasonable or proportionate.

In the ELT case, a private fixed wing with a C of A issued before 1 July 2008 can have any type of ELT, whereas it is proposed that private helicopters should be fitted with a fixed, automatic ELT, as well as an ELT(S). This is not either reasonable or proportionate.

There is no evidence that such private helicopter flights are less safe than fixed wing, indeed the UK CAA's records show that privately operated helicopters have a zero fatality and injury record over water, which is considerably better than fixed wing.

The NPA proposes that private single engine fixed wing aircraft be allowed to fly up to 100nm, or 30 minute's distance at cruising speed, from land without the carriage of flotation devices, but proposes to limit private single engine helicopters to flight within autorotational distance of land. This despite the demonstrated poorer safety record of single engined fixed wing aircraft. This is neither proportionate nor reasonable for private flight in non complex helicopters.

EASA should seek to have ICAO standards changed so as to bring the SARP's for private helicopter operations into line with those existing for private fixed wing. Statistics indicate that overwater, private helicopter operations are safer than those of private fixed wing.

The safety benefit of the proposals (if any)

EASA does not suggest anywhere in the consultation letter that the safety of the current member state regulations is in any way deficient. Indeed there have been very few recorded incidents of private helicopters ditching in water, with crew and passenger escapes at the same or better level as fixed wing aircraft.

These very few incidents do not represent a safety problem, and indeed show that private helicopters are operating with a high level of safety over water, that could hardly be improved. In the UK where floatation devices are not required on private helicopters, there have been no fatalities caused by private helicopters ditching.

This clearly shows that there is no ongoing safety problem with private helicopters flying over water without floatation devices, and that in fact the private helicopter record is considerably better than that of fixed wing.

The need as perceived by a substantial majority of helicopter pilots

There is no perceived need for these additional equipment requirements as proposed

There is overwhelming opposition amongst the members of the European Private Helicopter Alliance to these proposals. Private helicopter pilots are usually high achieving and intelligent people, well used to evaluating risk. Where there is no risk to third parties, they are content to make their own informed choices regarding their own flight safety. They recognise that the proposals in NPA 2009 2b are not based on any safety case, and are not made in response to an existing problem.

EASA should not try to protect the private pilot from himself. They should be free to make their own decisions, as in other activities, e.g. boating, rock climbing etc.

Summary

The European Private Helicopter Alliance is strongly opposed to the proposed regulations commented upon herein. It is simply grossly unreasonable to impose such a heavy burden of compliance when no safety case exists. We

thus urge EASA to either withdraw these proposals entirely, amend them as suggested, define a MTOM weight limit below which they would not apply (e.g. 3175Kg or 2000Kg), or simply apply the fixed wing proposals to helicopters. Other practical mitigation measures could be exemptions for helicopters under 2000kg MTOM, for non-complex helicopters, or for helicopters in private flight.

Our preferred solution is that EASA adopt option 4C as defined in paragraph 2.9 of NOTICE OF PROPOSED AMENDMENT (NPA) NO 2009-02G

Should EASA mandate equipment that is not currently required under a member state's present regulations, it is essential that a practical time period of exemption is allowed for equipage to occur. We would suggest that a major item such a floats should have a 25 year compliance period (this being a reasonable life for the current helicopter fleet). ELTs could have a 10 year compliance period. It would be completely unreasonable and disproportionate to demand immediate compliance, especially when there is no immediate perceived safety need.

Helicopters owners would be asked to comply with these costly proposals merely because of outdated ICAO standards, whereas light fixed wing aircraft operating in the same manner will have almost no changes, or the resulting costs imposed on them.

EASA's policy should be "regulation at a sensible minimum", and "safety in a cost effective manner", as stated by Peter Hunt, Head of Operating Standards Division of the UK CAA in December 1998.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.400 Instruments and equipment – General p. 41

comment *25* comment by: *George Knight*

-(c) (1) This rule seems to have the (unintended?) consequence of prohibiting the use of GPS devices not approved under Part-21 from being used for navigational purposes. In gliding competitions the routes are defined by reference to waypoints that these days are lat/long coordinates. The pilot's achievement is determined by whether he rounded the turning points correctly as determined by GPS derived evidence. For that reason glider pilots use unapproved GPS devices to determine their flight path and whether or not they have reached/rounded a turn-point. Visual navigation using a chart, compass and eyeball is not capable of providing the necessary level of accuracy.

In addition a majority of cross-country glider pilots now carry moving maps showing the locations of controlled airspace and danger areas. They use the data from these unapproved devices to change their flight path to avoid illegal penetration of controlled airspace and restricted areas etc.. One of the benefits of this technology is that glider pilots record a very small number of airspace violations as compared to other GA traffic. The proposed rule stating that pilots "shall not be used by the flight crew to comply with (a);" is perverse.

The rule should be changed to state that the safe navigation of the aircraft must not be dependant on the use of unapproved instruments.

comment *414* comment by: *EHOC*

Paragraph (d)

The original intent of the rules was to ensure that equipment could be operated by a crew member from his station; in addition, for a single piece of equipment that has to be used by more than one crew member, it has to be operable from each station. This paragraph would be improved by making the intent clearer:

"(d) If equipment is to be used by one flight crew member at his station during flight, it must be readily operable from that station. When a single item of equipment is required to be operated by more than one flight crew member it must be installed so that the equipment is readily operable from any station at which the equipment is required to be operated."

Paragraph (d)

The orginal intent of this rule was to ensure that: (a) an instrument dedicated to one of the flight crew members is placed where it might be seen without adjusting the normal field of view; and (b) a single instrument that has to be used by both crew members is placed within the field of view of both pilots. This paragraph would be improved by making the intent clearer:

"(e) Those instruments that are used by any one flight crew member shall be so arranged as to permit the flight crew member to see the indications readily from his station, with the minimum practicable deviation from the position and line of vision which he normally assumes when looking forward along the flight path. Whenever a single instrument is required in a helicopter operated by more than 1 flight crew member it must be installed so that the instrument is visible from each applicable flight crew station."

comment *1020* comment by: *CAA-NL*

Comment CAA-NL Regarding requirement c.

"Instruments and equipment required by Part-OPS which do not need to be approved in accordance with Part-21, as well as any additional equipment which is not required by Part-OPS, but is carried on a flight, shall comply with the following:

(1) The information provided by these instruments, equipment or accessories shall not be used by the flight crew to comply with (a);

(2) The instruments and equipment shall not affect the airworthiness of the aircraft, even in the case of failures or malfunction.

Comment CAA-NL:

All insruments and equipment on board of an aircraft should be approved according to part 21.

Reason:

Airlines must demonstrate in accordance with part 21 that all instruments

and equipment shall not affect the airworthiness of the aircraft, even in the case of failures or malfunction.

comment *1356* comment by: *Helicopter Club of Great Britain*

Reference GM OPS.GEN.400(b)

The Helicopter Club of Great Britain represents the owners of approximately 33% of UK and Irish registered helicopters, as well as several hundred UK & Irish helicopter pilots.

Our following objections are primarily based on the fact that the proposals do not distinguish between private and commercial helicopter operations. All helicopters are treated the same, whether it be a private 2 seat Robinson R22 or a large Sikorsky S92.

This is in direct conflict with the principles established by the European Commission's Communication "Agenda for Sustainable Future in General and Business (COM(2007) 869 final) and its endorsement by the European Parliament (2008/2134(INI)) and the Council of Ministers. The lack of legal necessity of ICAO compliance

The unreasonableness of ICAO helicopter standards as applied to private operations.

The safety benefit of the proposals, if any

The practicality of the equipment which is proposed to become mandatory

The cost of the equipment which is proposed to become mandatory

The need as perceived by a substantial majority of helicopter pilots

The arbitrary and discriminatory nature of parts of the NPA as applied to private helicopters (but not to private aeroplanes)

HCGB Comment

Clearly the imposition of the Floatation, Life Raft and ELT proposals would adversely affect such activities through their cost, weight and practicality. Requiring floatation, life raft and ELT fitment to cross estuaries, lakes, reservoirs, rivers, or to cross to the Isle of Wight and the many Scottish islands would clearly be in breach of this policy, and would be grossly disproportionate. Accident data does not support a safety case for the flotation proposal for helicopters.

(v)

ICAO Compliance.

EASA perceives the need to comply fully with ICAO standards. However, Article 37 of the Chicago Convention states " Each contracting State undertakes to collaborate in securing the highest practicable degree of uniformity in regulations, standards and procedures...." and Article 38 of the Chicago Convention states "Any State which finds it impracticable to comply in all respects with any such international standard or procedure (.....) shall give immediate notification to the International Civil Aviation organisation of the differences between its own practice and that established by the international standard". The emphasis being what is practicable.

There is no suggestion that ICAO standards are in some way superior to current member state law, or safer. The UK, for example, enjoys one of the safest aviation environments anywhere in the world, but does not mandate the equipment we object to.

Whilst ICAO Contracting States are obliged to notify differences to International Standards under Article 38 of the Convention, they are only invited to 'extend such notification to any differences from the Recommended Practices….when the notification of such differences is important for the safety of air navigation.

ICAO annex 6 part 111 Chapter 2 - Applicability shows that the SARPs in the Annex do not apply to helicopters engaged in aerial work operations. This therefore calls into question the applicability to private operations.

Thus the picture emerges that there is no necessity for total ICAO compliance. The actual safety case does not support the proposed equipment fit changes for private helicopters.

Small and Medium Enterprises

Many helicopters are operated by small businesses, and would be severely disadvantaged by the cost and practicality of the proposals. They would be forced to spend tens of thousands of Euros in compliance costs, or stop using their helicopters for over water and night time travel.

(vi)

The unreasonableness of ICAO standards as regards private helicopter operations.

Private non-commercial helicopter operations did not exist when the ICAO standards and recommended practices were written, and ICAO make no provision for such operations to be more lightly regulated. In contrast,

however, fixed wing private operations are more lightly regulated.

Whilst there is a clear and large distinction between the ICAO standards applicable to the public transport and non public transport operations of fixed wing aircraft, there is no such clear and large distinction for helicopters. Indeed the proposals for private helicopters in this NPA are the same as for CAT.

This is clearly unreasonable and disproportionate. Proper, less stringent, provision for private helicopter flight has not been made in the ICAO standards. The ICAO standards for helicopters are out of date, and do not take into account present day helicopter demonstrated mechanical reliability.

In the overwater flight case for example, it is not proposed that a private fixed wing aircraft should have a means of flotation, whereas private helicopters would be required to have floats installed. This is not either reasonable or proportionate.

In the ELT case, a private fixed wing with a C of A issued before 1 July 2008 can have any type of ELT, whereas it is proposed that private helicopters should be fitted with a fixed, automatic ELT, as well as an ELT(S). This is not either reasonable or proportionate.

There is no evidence that such private helicopter flights are less safe than fixed wing, indeed the UK CAA's records show that privately operated helicopters have a zero fatality and injury record over water, which is considerably better than fixed wing.

The NPA proposes that private single engine fixed wing aircraft be allowed to fly up to 100nm, or 30 minutes's distance at cruising speed, from land without the carriage of flotation devices, but proposes to limit private single engine helicopters to flight within autorotational distance of land. This despite the demonstrated poorer safety record of single engined fixed wing aircraft. This is neither proportionate nor reasonable for private flight in non complex helicopters.

EASA should seek to have ICAO standards changed so as to bring the SARP's for private helicopter operations into line with those existing for private fixed wing. Statistics indicate that overwater, private helicopter operations are safer than those of private fixed wing.

(vii)

The safety benefit of the proposals (if any)

EASA does not suggest anywhere in the consultation letter that the safety of the current UK regulations is in any way deficient. Indeed there have been only 4 recorded incidents of private helicopters ditching in water, and no fatalities or injuries at all. Of these, an Enstrom encountered handling difficulties whilst hovering over a lake in Wales, a Bell 206 suffered alleged engine failure off the Isle of Mann, a Bell 206 suffered a gearbox failure near Jersey, and an R22 suffered carburettor icing off the west coast of Ireland, with no confirmed engine failure. These very few incidents do not represent a safety problem, and indeed show that private helicopters are operating with a high level of safety over water, that could hardly be improved. We have excluded the R44 ditching near Antarctica, as this was an unrepresentative adventure/exploration/record flight, which may have run

out of fuel.

In contrast fixed wing aircraft have suffered 24 accidents, 5 fatalities, 13 injuries over water during the same period.

This clearly shows that there is no ongoing safety problem with private helicopters flying over water without floatation devices, and that in fact the private helicopter record is considerably better than that of fixed wing.

(viii)

The need as perceived by a substantial majority of helicopter pilots

There is no perceived need for these additional equipment requirements as proposed

There is overwhelming opposition amongst the members of the Helicopter Club of Great Britain to these proposals. Our typical member is a high achieving and intelligent person, well used to evaluating risk. Where there is no risk to third parties, they are content to make their own informed choices regarding their own flight safety. They recognise that the proposals in NPA 2009 2b are not based on any safety case, and are not made in response to an existing problem.

The UK CAA has never seen its role as being to protect the private pilot from himself. We trust EASA will follow this example.

(ix)

Summary

The Helicopter Club of Great Britain is strongly opposed to the proposed regulations commented upon herein. It is simply grossly unreasonable to impose such a heavy burden of compliance when no safety case exists. We thus urge EASA to either withdraw these proposals entirely, amend them as suggested, define a MTOM weight limit below which they would not apply (e.g. 3175Kg or 2000Kg), or simply apply the fixed wing proposals to helicopters. Other practical mitigation measures could be exemptions for helicopters under 2000kg MTOM, for non-complex helicopters, or for helicopters in private flight.

Our preferred solution is that EASA adopt option 4C as defined in paragraph 2.9 of NOTICE OF PROPOSED AMENDMENT (NPA) NO 2009-02G

Should EASA mandate equipment that is not currently required under a member state's present regulations, it is essential that a practical time period of exemption is allowed for equipage to occur. We would suggest that a major item such a floats should have a 25 year compliance period (this being a reasonable life for the current helicopter fleet). ELTs could have a 10 year compliance period. It would be completely unreasonable and disproportionate to demand immediate compliance, especially when there is no immediate perceived safety need.

Helicopters owners would be asked to comply with these costly proposals merely because of outdated ICAO standards, whereas light fixed wing aircraft operating in the same manner will have almost no changes, or the resulting costs imposed on them.

It is worth repeating the public remarks made by Peter Hunt, then the Head

of Operating Standards Division of the UK CAA in December 1998. He stated that the UK CAA's policy was "regulation at a sensible minimum", and "safety in a cost effective manner" These principals should also be followed by EASA.

comment *1383* comment by: *Royal Danish Aeroclub*

To determine the flight path or to navigate under VFR conditions do not need approved equipment. Modern GPS-equipment together with a map of the area are sufficient for safe navigation.

We suggest the text in (a) (1) to read:

(1) control or, in the case of non-commercial VFR-flight with non-complex aircraft, determine the flight path.

comment *1435* comment by: *Mike Pascall*

Reference GM OPS.GEN.400(b)

I am both a private helicopter pilot and owner of a Robinson R44 ClipperII.

The following objections are primarily based on the fact that the proposals do not distinguish between private and commercial helicopter operations. All helicopters are treated the same, whether it be a private 2 seat Robinson R22 or a large Sikorsky S92.

This is in direct conflict with the principles established by the European Commission's Communication "Agenda for Sustainable Future in General and Business (COM(2007) 869 final) and its endorsement by the European Parliament (2008/2134(INI)) and the Council of Ministers. In particular this NPA does not comply with the "application of the principles of subsidiarity and proportionality"[1]. Furthermore, it ignores the European Parliament's specific demand that the implementing rules must be *"proportionate and commensurate to the complexity of the respective category of aircraft and operation"* [2].

Private, non-commercial helicopter operations should be regulated with a lighter touch than CAT as is the case with the proposals for private fixed wing aircraft. Consequently we consider that some of the EASA proposals are unnecessary, disproportionate, burdensome and costly and have no basis in accident history. There is no safety case for them. Private helicopters have a similar equipment related accident rate to private fixed wing.

The proposals referred to in my following comments to the consultation

would severely and detrimentally affect the majority of UK and Irish helicopter owners and pilots, by both severely restricting their use of helicopters over water and at night, or increasing costs, for no perceptible benefit. Matters that EASA should consider are:

The proportionality of the proposals as regards private helicopter use

The lack of legal necessity of ICAO compliance

The unreasonableness of ICAO helicopter standards as applied to private operations.

The safety benefit of the proposals, if any

The practicality of the equipment which is proposed to become mandatory

The cost of the equipment which is proposed to become mandatory

The need as perceived by a substantial majority of helicopter pilots

The arbitrary and discriminatory nature of parts of the NPA as applied to private helicopters (but not to private aeroplanes)

My Comment

Clearly the imposition of the Floatation, Life Raft and ELT proposals would adversely affect such activities through their cost, weight and practicality. Requiring floatation, life raft and ELT fitment to cross estuaries, lakes, reservoirs, rivers, or to cross to the Isle of Wight and the many Scottish islands would clearly be in breach of this policy, and would be grossly disproportionate. Accident data does not support a safety case for the flotation proposal for helicopters.

(v)

ICAO Compliance.

EASA perceives the need to comply fully with ICAO standards. However, Article 37 of the Chicago Convention states " Each contracting State undertakes to collaborate in securing the highest practicable degree of uniformity in regulations, standards and procedures...." and Article 38 of the Chicago Convention states "Any State which finds it impracticable to comply in all respects with any such international standard or procedure (.....) shall give immediate notification to the International Civil Aviation organisation of the differences between its own practice and that established by the international standard". The emphasis being what is practicable.

There is no suggestion that ICAO standards are in some way superior to current member state law, or safer. The UK , for example, enjoys one of the safest aviation environments anywhere in the world, but does not mandate the equipment we object to.

Whilst ICAO Contracting States are obliged to notify differences to International Standards under Article 38 of the Convention, they are only invited to 'extend such notification to any differences from the Recommended Practices….when the notification of such differences is important for the safety of air navigation.

ICAO annex 6 part 111 Chapter 2 - Applicability shows that the SARPs in the Annex do not apply to helicopters engaged in aerial work operations. This

therefore calls into question the applicability to private operations.

Thus the picture emerges that there is no necessity for total ICAO compliance. The actual safety case does not support the proposed equipment fit changes for private helicopters.

Small and Medium Enterprises

Many helicopters are operated by small businesses, and would be severely disadvantaged by the cost and practicality of the proposals. They would be forced to spend tens of thousands of Euros in compliance costs, or stop using their helicopters for over water and night time travel.

(vi)

The unreasonableness of ICAO standards as regards private helicopter operations.

Private non-commercial helicopter operations did not exist when the ICAO standards and recommended practices were written, and ICAO make no provision for such operations to be more lightly regulated. In contrast, however, fixed wing private operations are more lightly regulated.

Whilst there is a clear and large distinction between the ICAO standards applicable to the public transport and non public transport operations of fixed wing aircraft, there is no such clear and large distinction for helicopters. Indeed the proposals for private helicopters in this NPA are the same as for CAT.

This is clearly unreasonable and disproportionate. Proper, less stringent, provision for private helicopter flight has not been made in the ICAO standards. The ICAO standards for helicopters are out of date, and do not take into account present day helicopter demonstrated mechanical reliability.

In the overwater flight case for example, it is not proposed that a private fixed wing aircraft should have a means of flotation, whereas private helicopters would be required to have floats installed. This is not either reasonable or proportionate.

In the ELT case, a private fixed wing with a C of A issued before 1 July 2008 can have any type of ELT, whereas it is proposed that private helicopters should be fitted with a fixed, automatic ELT, as well as an ELT(S). This is not either reasonable or proportionate.

There is no evidence that such private helicopter flights are less safe than fixed wing, indeed the UK CAA's records show that privately operated helicopters have a zero fatality and injury record over water, which is considerably better than fixed wing.

The NPA proposes that private single engine fixed wing aircraft be allowed to fly up to 100nm, or 30 minutes's distance at cruising speed, from land without the carriage of flotation devices, but proposes to limit private single engine helicopters to flight within autorotational distance of land. This despite the demonstrated poorer safety record of single engined fixed wing aircraft. This is neither proportionate nor reasonable for private flight in non complex helicopters.

EASA should seek to have ICAO standards changed so as to bring the SARP's for private helicopter operations into line with those existing for private fixed

wing. Statistics indicate that overwater, private helicopter operations are safer than those of private fixed wing.

(vii)

The safety benefit of the proposals (if any)

EASA does not suggest anywhere in the consultation letter that the safety of the current UK regulations is in any way deficient. Indeed there have been only 4 recorded incidents of private helicopters ditching in water, and no fatalities or injuries at all. Of these, an Enstrom encountered handling difficulties whilst hovering over a lake in Wales , a Bell 206 suffered alleged engine failure off the Isle of Mann, a Bell 206 suffered a gearbox failure near Jersey, and an R22 suffered carburettor icing off the west coast of Ireland , with no confirmed engine failure. These very few incidents do not represent a safety problem, and indeed show that private helicopters are operating with a high level of safety over water, that could hardly be improved. I have excluded the R44 ditching near Antarctica , as this was an unrepresentative adventure/exploration/record flight, which may have run out of fuel.

In contrast fixed wing aircraft have suffered 24 accidents, 5 fatalities, 13 injuries over water during the same period.

This clearly shows that there is no ongoing safety problem with private helicopters flying over water without floatation devices, and that in fact the private helicopter record is considerably better than that of fixed wing.

(viii)

The need as perceived by a substantial majority of helicopter pilots

There is no perceived need for these additional equipment requirements as proposed

There is overwhelming opposition amongst the members of the Helicopter Club of Great Britain to these proposals. The typical member is a high achieving and intelligent person, well used to evaluating risk. Where there is no risk to third parties, they are content to make their own informed choices regarding their own flight safety. They recognise that the proposals in NPA 2009 2b are not based on any safety case, and are not made in response to an existing problem.

The UK CAA has never seen its role as being to protect the private pilot from himself. We trust EASA will follow this example.

(ix)

comment *1480* comment by: *Des Russell*

Reference GM OPS.Gen.400(b)

I am a privater helicopter pilot and own a privately registered helicopter and provided I comply with the Rules of the Air and my helicopter has a current certificate of airworthiness,I have the right to fly over water, mountains, or inhospitable terrain at my own risk.Any passengers that wish to fly with me also have the right to do so at their own risk.

No one has the right to dictate what an individual should do to minimise the risks to themselves,either in the above senario or indeed if they wish to bungi jump,parachute,climb mountains,row across the atlantic,or even go skiing.

If the risk is only applicable to the individual and does not effect anyone else every person has the human right to make that decision.

Trying to enforce conditions on an individual for his/her sake is a violation of human rights.

It has nothing to do with aviation authorities whether I fly across water in my private helicopter or with a jet pod strapped on my back.

Even if this was not the case the risk involved of a helicopter ditching in the

approx 0.5% of its total flying time over water is extremely small (it runs in to trillions to one).

European Parliament resolution of 3 February 2009 on an Agenda for Sustainable

Future in General and Business Aviation (2008/2134(INI)

Proportionate regulation and subsidiarity

2. Stresses the need to take into account the interests and specificities of

general and business aviation in the development of future air transport policy initiatives, with a view to strengthening its competitiveness; in this respect calls on the Commission to ensure the application of the proportionality and subsidiarity principles in the design and implementation of both existing and future aviation legislation;

3. Reminds the Commission of the need to carry out, on a systematic basis, segmented impact assessments to provide for differentiation of regulations affecting different categories of undertakings and airspace users, if

necessary and in so far as this does not compromise safety;

4. Calls on the Commission when adopting implementing rules on aviation safety, to ensure that they are proportionate and commensurate to the complexity of the respective category of aircraft and operation;

32 Considers as essential the promotion of recreational and sport aviation, as well as of European aero clubs, which constitute an important source of professional skills for the entire aviation sector

33 Calls on the Commission to take account of the important role that this aviation sector plays and can continue to play in the development of vocational training for pilots.

31. Many General and Business aviation stakeholders have expressed concerns related to the proportionality of regulations affecting them.32. Diversification of General and Business aviation as well as high proportion of SMEs and not-for-profit organisations in this sector calls for special vigilance in proper application of proportionality and subsidiarity.

33. The basic EASA Regulation16 and Commission's proposal for its amendment are good examples of the new proportionate rulemaking approach. Only the essential requirements are applicable to all operators while more stringent standards are added subsequently, if justified on the basis of the relevant criteria. This approach should be used in future rulemaking initiatives like aerodrome safety or air traffic management.

34. The Commission will monitor the application of the principles of subsidiarity and proportionality, to ensure that not only the policy and rulemaking processes but also the actual interpretation and implementation of the Community law has due respect for these principles. This monitoring will cover also technical mandates given by the Commission to specialised agencies, such as Eurocontrol Clearly the imposition of the Floatation, Life Raft and ELT proposals would adversely affect such activities through their cost, weight and practicality. Requiring floatation, life raft and ELT fitment to cross estuaries, lakes, reservoirs, rivers, or to cross to the Isle of Wight and the many Scottish islands would clearly be in breach of this policy, and would be grossly disproportionate. Accident data does not support a safety case for the flotation proposal for helicopters.

Many helicopters are operated by small businesses, and would be severely disadvantaged by the cost and practicality of the proposals. They would be forced to spend tens of thousands of Euros in compliance costs, or stop using their helicopters for over water and night time travel.

Private non-commercial helicopter operations did not exist when the ICAO standards and recommended practices were written, and ICAO make no provision for such operations to be more lightly regulated. In contrast, however, fixed wing private operations are more lightly regulated.

Whilst there is a clear and large distinction between the ICAO standards applicable to the public transport and non public transport operations of fixed wing aircraft, there is no such clear and large distinction for helicopters. Indeed the proposals for private helicopters in this NPA are the same as for CAT.

This is clearly unreasonable and disproportionate. Proper, less stringent,

provision for private helicopter flight has not been made in the ICAO standards. The ICAO standards for helicopters are out of date, and do not take into account present day helicopter demonstrated mechanical reliability.

In the overwater flight case for example, it is not proposed that a private fixed wing aircraft should have a means of flotation, whereas private helicopters would be required to have floats installed. This is not either reasonable or proportionate.

In the ELT case, a private fixed wing with a C of A issued before 1 July 2008 can have any type of ELT, whereas it is proposed that private helicopters should be fitted with a fixed, automatic ELT, as well as an ELT(S). This is not either reasonable or proportionate.

There is no evidence that such private helicopter flights are less safe than fixed wing, indeed the UK CAA's records show that privately operated helicopters have a zero fatality and injury record over water, which is considerably better than fixed wing.

The NPA proposes that private single engine fixed wing aircraft be allowed to fly up to 100nm, or 30 minutes's distance at cruising speed, from land without the carriage of flotation devices, but proposes to limit private single engine helicopters to flight within autorotational distance of land. This despite the demonstrated poorer safety record of single engined fixed wing aircraft. This is neither proportionate nor reasonable for private flight in non complex helicopters.

EASA should seek to have ICAO standards changed so as to bring the SARPs for private helicopter operations into line with those existing for private fixed wing.

Statistics indicate that overwater, private helicopter operations are safer than those of private fixed wing.

comment *1516* comment by: *Chris Fox*

Overall, these requirements are disproportionate for for light helicopters operated privately.

Unlike the proposals for fixed wing aircraft, there is no distinction made between large helicopters operating commercially and a simple light helicopter operated privately - and the standards and equipment required for all helicopters are those appropriate for CAT.

This results in many requirements that

- Are technically difficult or impossible to comply with (for example, the fitment of two AI's in all helicopters),
- Effectively prohibit operations that are presently conducted legally and safely (for example, no Robinson R22 helicopter can be retro-fitted with floats, which would make any significant water crossing impossible)
- Can only be complied with at grossly excessive cost (for example, fitment of steerable landing lights, retro-fitment of floats to light helicopters)

There is no safety case offered to justify these proposals, and the Regulatory Impact Assessment is wrong to claim that they will result in little additional cost.

I am strongly opposed to these proposals as they stand. They are also in contravention of a resolution adopted by the European Parliament on 3rd February 2009, which stated that rules should be "*proportionate and commensurate to the complexity of the respective category of aircraft and operation"*

Response to the EASA proposed compulsory equipment

comment *1664* comment by: *JSLEE*

Response to the EASA proposed compulsory equipment changes for Private Helicopters.

(a) General

Reference GM OPS.GEN.400(b)

I am John Lee 69 years old; I own an Augusta Bell206 and a Cessna310. And have held a private pilots licence for nearly30 years both fixed wing and rotary with 3000 combined hours.

A few years ago the UK CAA put forward for discussion similar proposals as these, nothing in aviation safety in the meantime has changed. Their proposals were ill-conceived and impractical then as these are now.

I can only assume that these present proposals have been put forward by non-helicopter pilots and never even taken the trouble to look into a light helicopter.

The proposals are draconian and disproportionate in cost to any safety benefits; they discriminate against private helicopter owners/pilots when compared to private fixed wing owners/pilots.

Private helicopters have a far greater safety record than that of fixed wing aircraft, not a single life has been lost as a result of a private helicopter having to make a force landing on water.

The idea that it is necessary to have floatation equipment, carry a life raft and the installation of a fixed ELT to cross rivers, estuaries, lakes and narrow stretches of sea is ridiculous the safety record clearly shows this.

It appears no serious consideration has been given to the capital cost and maintenance cost involved in implementing these proposals, many of which are physically impractical in light helicopters.

The costs involved are not confined to equipment and labour costs, some of the proposals will involve changes to the Pilot Operators Handbook which can only done by the aircraft manufacturer, this will be a major problem who will bear the cost?

Summary: There is not a safety issue in the UK with private helicopters operating within UK regulations; these proposals will place an unreasonable financial burden on UK helicopter owners/pilots which in some cases will cost more than their helicopter are worth, if they choose not to comply it will severely restrict there use. The UK is an island and occasionally private helicopter pilots find it necessary to cross water in pursuit of business or pleasure. I believe these proposals are prejudicial against the UK. Main land European helicopter pilots will be far less affected by these proposals.

comment *1902* comment by: *Helifly (UK) Ltd*

Before detailing our objection to many of the proposals related to the operation of light helicopters, it is worth explaining how Helifly (UK) Ltd operates and (hopefully) makes money.

Helifly owns a single Robinson R44 helicopter and employs one commercial pilot (JAA CPL(H)) who is also the owner of the business. Helifly works within the AOC of a larger helicopter providing charter flights and aerial work as well as providing its machine on a lease back basis.

Operating a single engined light helicopter Helifly clearly is unable to provide CAT services at night or over water, so it may seem that the proposed equipment regulations should have little effect on us. However, this is not the case.

It is common place in winter months for the pilot to reposition a helicopter back to base following a charter after official night. Just as it is for them to cross and estuary or lake when the only occupant of the aircraft. These periods of flight are conducted with the full knowledge of the limitations of the aircraft and the consequences should their be problems. They are conducted as private flights, but they form part of a commercial operation.

They are also undertaken in the knowledge that, when flown within the limitations set out in the POH, there is negligible risk to the aircraft or pilot.

Estimates for the compliance costs for an R44 Raven II to meet the proposals in this document are in the region of £50,000. It would be unecconomical for Helifly to met the equipment proposals meaning the company would lose revenue.

This would also be the case for the revenues raised through leasing back Helifly's machine to PPL self fly hirers. They would not be able to use the machine to cross to Europe, or even to the Isle of Wight without floats! This will severely restrict their flying and, as a consequence, Helifly's revenue.

The proposals are also dispropotionate and discriminate against owners of light helicopters as opposed to fixed wing owners who will not have to comply due to their machines being regarded differently within ICAO standards. This might be understandable if accident statistics were also different, but they are not. Equipment related accident rates in light helicopters are no different to those of light aircraft, so why should helicopters be subject to further regulation?

comment *1922* comment by: *Tony Castro*

Generally speaking you should make an effort to distinguish between the various sizes of Helicopters, private or comercial. Rules must be proportionate for the purpose, type and use of helicopter surely ?? I have a small Hughes 500 and whislt I am very concious of safety what you propose in these various documents is completely over the top and shows you don't really understand what the helicopter world really needs.

comment *1927* comment by: *Stevens Construction Ltd*

We are very concerned with your proposal to fit floats etc to Helicopters.

Floats on Helicopters that travel for mostly for a very short time over water will not improve safety at all.

Light Helicopters on past statistics do not have a bad safety record, in fact compared to light fixed wing aircraft they have an excellant safety record.

We as a construction company run a helicopter on our business, fitting floats will obviously cost a lot of money and increase our hourly running costs considerably.

The fitment of floats will reduce our airspeed increasing flight hours and fuel costs, and increase maintainance bills.

Safety will not be improved so it will be a complete waste of money and time.

We urge you to re-consider implementing this regulation as it is yet another unnecessary expense on private flying.

comment *2536* comment by: *James Leavesley*

AS a PPL pilot with my own helicopter I feel as if I am being persicuted by this proposed legislation.

I am not allowed to offset the cost of flying and most if not all of these proposals will add weight to my helicopter cost a large amount of money and bring little or no benefit to my safety or that of any passengers I carry.

Some of the suggestions make sense to the commercial operators, none make sense to the privately owned machines.

comment *2615* comment by: *John Matchett*

The requirement for floats, Life Raft and ELT equipment will severely limit the practicality of using small helicopters in terms of weight, deployment and cost, when many flights undertaken in Europe cross rivers, lakes or estuaries. The number of incidents of helicopters crashing over water do not justify the enormous cost of fitting these additions . Pilots are trained to use life vests and other suitable safety equipment appropriate for the occasion and prepare themselves accordingly.

comment *2802* comment by: *Ed Sturmer*

The proposal for small helicopters in VFR to have floats, life raft,ELT, steerable landing light, dual AIs, heated pitot, alternate static, and mandatory knot-calibrated ASI are -

- unnecessary,

- vastly expensive

- of no safety benefit.

No safety benefit can be shown by statistics or experience.

Does EASA want to kill off private helicopter flying? The cost of these in a light helicopter would total approx £50,000 PLUS annual checks and maintenance costs.

comment *3029* comment by: *AOPA Switzerland*

To be added: The natoinal authority may allow exemptions for all instruments and equipment requirement.

Especially older aircraft may have difficulties or are unable to satisfy the proposed requirements.

I would like to make a general comment about the equipment proposal. Either make the proposal for Life Rafts , Jackets,ELT;'s and PLB's commom to both fixed and rotary wing aircraft or else leave it to the discretion of the captain in light GA aircraft. some rotary wing cant fit floats or have enough room for life rafts, No fixed wing aircraft can fit floats. All pilots who fly beyond the gliding range of land in a rotary or fixed wing aircraft, should carry all the saftey kit, if they elect not to there is a case for passing on the cost to the general society for the rescue services. If that was to be the case then self inflicted injury caused by smoking , drinking or dangerous drivng shoild also pass back these costs , we have to be even handed. I fly a twin engined helicopter and also twin engine fixed wing and I feel quite safe in either, but I still carry all these things , and I beleive this is the correct thing to do, but it cant be carried out in a mandatory fashion. I hope this is helpfull? Tony Marmont

APPROVED AND NON-APPROVED EQUIPMENT:

Add a "grand-fathering" provision as laid-down in EU/JAR-OPS 1/3.630(b):

"OPS 1.630 (b)

Instruments and equipment complying with design and performance specifications other than ETSO on the date of OPS implementation may remain in service, or be installed, unless additional requirements are prescribed in this Subpart. Instruments and equipment that have already been approved do not need to comply with a revised ETSO or a revised specification, other than ETSO, unless a retroactive requirement is prescribed."

comment *4192* comment by: *DGAC*

ACCESSIBILITY AND POSITIONING OF INSTRUMENTS AND EQUIPMENT:

(d) « seated » is not applicable to balloons.

Rewrite (d) as follows : "Instruments and equipment shall be readily

operable **by** or accessible **to** ~~from the station where~~ the flight crew member that needs to use it ~~is seated~~."

comment *4278* comment by: *KLM*

Proposal : Replace § OPS.GEN.400 (b) and add a (d) as follows :

"(b) Equipment and instrument required by Part-OPS **or used to perform a function required by Part-OPS** shall be approved, except as specified in (c) **or if deemed not practical,** and installed in accordance with Part-21.

(c) Instruments and equipment required by Part-OPS which do not need to be approved in accordance with Part-21, ~~as well as any additional equipment which is not required by Part-OPS, but is carried on a flight,~~ shall comply with the following:

(1) The information provided by these instruments, equipment or accessories shall not be used by the flight crew to comply with (a);

(2) The instruments and equipment shall not affect the airworthiness of the aircraft, even in the case of failures or malfunction.

(3) The instruments/equipment shall not be installed.

(d) Instruments and equipment not required by Part-OPS or not used to perform a required function, shall comply with the following:

1) if installed, the instrument/equipment shall comply with Part-21.

2) if not installed, the instrument/equipment shall comply with (c)(1) and (c)(2).”

Justification :

® To actually comply with OPS.GEN.400 (a)(1)(2)(3), it is not required that ***any*** equipment shall be approved. This would be inconsistent with GM2 OPS.GEN.400 (c).

® Furthermore, some of the equipment in GM2 OPS.GEN.400 (c) do not meet the criteria of OPS.GEN.400 (a)(1).

comment *5864* comment by: *Ian Casselden*

Reference GM OPS.GEN.400(b)

I am a private operator, I use my helicopter for private flights the propsal appears to treat all helicopters the same, there is a differance between an R22 and a multi seat commercial machine the prosals appear to be on conflict with the principles established by the European Commission's Communication "Agenda for Sustainable Future in General and Business

(COM(2007) 869 final) and its endorsement by the European Parliament (2008/2134(INI)) and the Council of Ministers.

An particularly this NPA does not comply with the "application of the principles of subsidiarity and proportionality"[1]. it ignores the European Parliament's specific demand that the implementing rules must be "proportionate and commensurate to the complexity of the respective category of aircraft and operation" [2].

Surely private non commercial helicopter operations need only light touch regulation (as applied elsewhere and also when appleid to fixed wing aircraft. The EASA proposals appear unnecessary, disproportionate, burdensome and costly and are not based on prevous regulations.

The safety case for them is doubtful

the UK safety record for Private helicopters have a similar equipment related accident rate to private fixed wing.

The proposals would severely and detrimentally affect the majority of UK and Irish helicopter owners and pilots, by both severely restricting their use of helicopters over water and at night, or increasing costs, for no perceptible benefit.

EASA should consider:-

The proportionality of the proposals as regards private helicopter use

The lack of legal necessity of ICAO compliance

The unreasonableness of ICAO helicopter standards as applied to private operations.

The safety benefit

The practicality of the equipment

The cost of the equipment

The need as perceived by a substantial majority of helicopter pilots

The arbitrary and discriminatory nature of parts of the NPA as applied to private helicopters (but not to private aeroplanes)

The imposition of the Floatation, Life Raft and ELT proposals would adversely affect such activities through their cost, weight and practicality. An R22 with floats would not be able to carry two pilots !

Requiring floatation, life raft and ELT fitment to cross estuaries, lakes, reservoirs, rivers, or to cross to the Isle of Wight and the many Scottish islands would clearly be in breach of this policy, and would be grossly disproportionate.

Accident data does not support a safety case for the flotation proposal for helicopters.

ICAO Compliance.

There is no automativ requirement for EASA to meet all ICAO standards Article 37 & 38 allows for each contracting state to apply the standards in a practical fashion.

There is little evidence that safety will improve, UK helicopter safety is already the best in the world !

ICAO annex 6 part 111 Chapter 2 - Applicability shows that the SARPs in the Annex do not apply to helicopters engaged in aerial work operations. This therefore calls into question the applicability to private operations.

the safety case is not proven by these changes

Small and Medium Enterprises

Many helicopters are operated by individuals, groups and small businesses, The cost will be considerable but the benefits are doubtful.

(vi)The unreasonableness of ICAO standards as regards private helicopter operations.

Fixed wing aircraft were in private operation when the ICAO rules were established, not so for Helicopters, so Fixed wing is lightly regulated, helicopters were seen as commercial ony.

Whilst there is a clear and large distinction between the ICAO standards applicable to the public transport and non public transport operations of fixed wing aircraft, there is no such clear and large distinction for helicopters. Indeed the proposals for private helicopters in this NPA are the same as for CAT.

it is disproportionate and unreasonable . Proper, less stringent, provision for private helicopter flight has not been made in the ICAO standards.

The ICAO standards for helicopters are out of date, and do not take into account present day helicopter demonstrated mechanical reliability.

Overwater flight in a fixed wing does not require floats, why so for helicopters ?

ELTS for fixed wing before 1/7/8 can have any type of ELT, why are Helicopters different ?, in any case fixed ELT's sink with the aircraft where personal or handheld ELTs can saty with the personel.

Helicopter flight in the UK is as safe as fixed wing flight, so why are helicopters being treated differently then fixed wings. ther have been no fatalities or injury in over water flight in the UK, which is better then Fixed wing.

fixed wing can fly beyond gluiding distance (100nm or 30 mins), why are helicopters to be forced to be within guilde distance ?

Statistics indicate that overwater, private helicopter operations are safer than those of private fixed wing so why are EASA seeking to have ICAO

standards changed so as to bring the SARP's for private helicopter operations into line with those existing for private fixed wing. (vii)

The safety benefit of the proposals (if any)

Easa has not shown the saefty benefits to delivered from the changes proposed, only four incidents over water have ocured in the UK, non were fatal or caused injury.

In contrast fixed wing aircraft have suffered 24 accidents, 5 fatalities, 13 injuries over water during the same period.

Thre is no safety issue to be addressed, helicopter flight over water is considerably safer than fixed wing. FLoatation gear is no answer to a problem that does not exist.

the Helicopter does not know its above water, the % time spent over water by most private aircraft willbe less than 1%, but the floatation gear will have to be fitted permenantly !

(viii)

I doubt there is any competent helicopter pilot or operator that would supprt the proposal

There is no perceived need for these additional equipment requirements as proposed

Most, if not all, helicopter pilots a cautious and care individuals, if the risks were real and the benefits obtained (tiny) outweighed the disabvantages (considerable) some private helicopters would have floats. I know of no private helicoters with floats fitted except those that are occasionally rented out for commercial flights

as private helicopters are not used to carry paying public the flyer is often the owner and he can make the decission to fit the extra equipment (or not)

The UK CAA has not seen the case to mandate these items, they have not seen an issue, there is no issue, why does EASA think things have changed?

Summary

it is unreasonable and unneccessary to impose these equipment on private flyers

I erge EASA towithdraw or substantually ammend the proposal or exempt small helicopters (say below 3000kg) from them.

my preferred solution is that EASA adopt option 4C as defined in paragraph 2.9 of NOTICE OF PROPOSED AMENDMENT (NPA) NO 2009-02G if his equipment is to be mandated adequate time will be needed to comply, 25 yrs for floats and 10yrs for ELT's would be reasonable. with exemptions were original equipment manufacturers equipment is either not available, no longer made, or was never designed.

The UK CAA has taken the view of "regulation at a sensible minimum", and

"safety in a cost effective manner" These principals should also be followed by EASA.

[1] (COM(2007) 869 final), Point 34.

comment *7371* comment by: *Europe Air Sports, VP*

This requirements needs to be reviewed because, in the case of balloon, no instruments are used to determine the flight path. The pilot is monitoring the air travel of his balloon by external reference.

comment *7464* comment by: *David ROBERTS*

Sub para (c) 'as well as any additional equipment.....' and (c) (1). For many sailplanes that have sophisticated (non-Part 21) flight computers, this would be an unnecessary restriction. These types of equipment are essential for the higher performance end of the sport of gliding, and are generally GPS based. The information provided enables the pilot to fly an accurate route to his planned destination, be it a turning point or the destination airfield. Whilst such sailplanes have, of course, the basic isntruments such as magnetic compass, ASI, altimeter etc (which I suppose would satisfy (a) (1)-(3), nevertheless we must not let rules stand in the way of technological advance. Anothe rexmaple of such instrumentation of 'Flarm', a mutual aircraft-to-aircraft collison path alert system, using GPS.

Proposal: review this draft rule carefully with industry experts to ensure it

does not disenranchise modern non Part 21-required instrumentation / technology in, for example, sailplanes.

comment *7484* comment by: *Arno Glover*

My main objection to many of the proposals is the lack of any recognition of the following;

- Small VFR only helicopters operate very differently to large commercial helicopters under different rules and weather conditions – the circumstance surround the risk of operations are therefore very different
- There is no equality in the proposals to recognize that light fixed wing aircraft are no dissimilar to light helicopters in their operation under VFR conditions – yet the proposed rules are very disproportional

Reference GM OPS.GEN.400(b)

In general the proposals fail to offer any distinction between private and commercial helicopter operations and a such all helicopters types are treated the same

In reality there cannot be rules that fail to distinguish between the operations of say a small light Robinson R22 helicopter and a large offshore helicopter.

I suggest that the proposals should view light helicopters the same as private fixed wing aircraft because statistics reveal that private helicopter flights are no less dangerous than private fixed wing.

Helicopters owners would be subject to costly airframe / equipment refits whereas light fixed wing aircraft operating in the same manner will have almost no changes or further costs imposed on them as a result of the proposals

comment *7531* comment by: *Pascal JOUBERT*

The reader does not understand which equipment may determine the flight path in a balloon. Does it mean the pilot in command should carry on a map? In fact 2: one aeronautical and one detailed (scale adapted to balloon activity). Note: all VFR balloon operations should be performed with the surface in sight.

comment *7642* comment by: *European Balloon Corporation*

surface in sight. Most pilot are flying with GPS.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.405 Equipment for all aircraft p. 41-42

comment *26* comment by: *George Knight*

Whether Powered Sailplanes including SLMGs are included in the definition of aeroplanes is not clearly stated in this NPA. They should be excluded from the requirement to carry fire extinguishers since, as far as I know, none already in service are so fitted and physical constraints may make retrofitting very difficult if not impossible. They are not required under the EASA rules that cover certification of such aircraft.

comment *408* comment by: *EHOC*

General

It is not clear why the previously single rule for seats, safety belts and harnesses has been divided between a number of rules (GEN.405, GEN.480 GEN.545, CAT.406 and CAT.482); it might be more appropriate to put all of the elements concerned with seats into a single rule in GEN.480.

comment *504* comment by: *E.I.S. Aircraft*

(a) (1): replace "except in the case of aerobatic flights" by "except where it adversely affects the safety of crew and/or passengers"

add AMC OPS.GEN.405(a)(1) "Adverse effects on the crew's and/or passenger's safety are expected on aerobatic flights, where the hand fire extinguisher may become a hazard due to high G-loads"

reason: Aerobatic flights are only one (although the most common) example for possible adverse effects on the crew's safety, as stated in the respective Guidance Material.

Following EASA's concept of "hard" and "soft law", the Aerobatic Flights would be subject to the AMC, where other exemptions might be added, in case adverse effects on safety are identified

advantage: the proposed wording gives the same level of safety but offers more flexibility in case other hazards than the one mentioned in the GM will be identified in the future

zu (d) und (e) :

Für Ballone wird ein Handfeuerlöscher und eine zusätzliche Zündquelle gefordert.

Nur für große und kommerziell betriebene Ballone werden unter anderem zusätzlich gefordert: Schutzhandschuhe, Kappmesser und Feuerlöschdecke.

Die hier genannte zusätzliche Ausrüstung die nur für große Ballone gefordert wird, gehört aber grundsätzlich zur Sicherheits-Ausrüstung in jeden Ballon.

Daher sollten die Punkte (1) , (3) und (4) für alle Ballone festgelegt werden.

comment *2023* comment by: *Ulrich Baum*

In small airplances with very limited cockpit space, the requirement to have a hand fire extinguisher

(1) may not be feasible due to space and weight restrictions, in particular for TMGs or small 1- or 2-seat airplanes

(2) may create an additional safety hazard, e.g. when a fire extinguisher is accidentally activated in flight, causing loss of sight and extreme disturbance.

On the other hand, using a hand fire extinguisher in case of an in-flight fire will in most cases not be practical due to restricted cockpit space and the hazard of losing sight and aircraft control. In case of an in-flight fire, small airplanes will therefore usually execute an immediate emergency landing. I am not aware of any case where a hand fire extinguisher was used successfully on an in-flight fire in a small airplane. The only reasonable use would be in a fire on the ground.

Since it creates additional risks, may not be feasible, and appears of little use for increasing flight safety, I suggest to drop the requirement of a hand fire extinguisher for small airplanes (e.g., up to 2000kg MTOW).

comment *2657* comment by: *AOPA-Sweden*

AOPA-S does not consider a child restraint device necessary for small GA piston driven aircraft.

comment *2786* comment by: *Southern Cross International*

It is proposed to change OPS.GEN.405 (a) (5) as follows:

(5) spare electrical fuses, of the ratings required for complete circuit protection, for replacement of those fuses which are required for the correct operation of instruments and equipment required by Part-OPS and that are accessible in flight.

comment *3152* comment by: *UK CAA*

Page No: 41

Paragraph No: OPS.GEN.405(b)

Comment:

There is no AMC or GM material offered for OPS.GEN.405(b) relating to the type of extinguishing agent for the required fire extinguishers. Guidance should be provided similar to AMC.OPS.CAT.405.

Justification:

Clarity of requirement

Proposed Text (if applicable):

AMC OPS.***GEN***.405 Hand fire extinguishers – Motor-powered aircraft

HAND FIRE EXTINGUISHERS – NUMBER, LOCATION AND TYPE

1. The fire extinguishers located in the cockpit should contain Halon 1211 (bromochlorodifluoro-methane, CBrCIF2) or an equivalent extinguishing agent.

2. For aeroplanes with a maximum approved passenger seating configuration between 31 and 60, one of the required fire extinguishers located in the passenger compartment should contain Halon 1211 (bromochlorodi-fluoromethane, CBrCIF2) or an equivalent extinguishing agent.

3. For aeroplanes with a maximum approved passenger seating configuration of more than 61, at least two of the fire extinguishers located in the passenger compartment should contain Halon 1211 (bromochlorodi-fluoromethane, CBrCIF2) or an equivalent extinguishing agent.

comment *3154* comment by: *UK CAA*

Page No: 41, 42, 56

Paragraph No:

OPS.GEN 405 and 410; 600 and 605 and others

Comment: The incremental nature of the requirements in OPS.GEN 600 – all aircraft – and OPS.GEN 605 - non-commercial flights with complex motor-powered aircraft and aircraft used in commercial operations – is clarified by the latter commencing with "In addition…", whereas in the case of OPS.GEN 405 – all aircraft – and then OPS.GEN 410 – VFR flights – the same principle is not followed.

Justification: Consistency throughout the IRs.

Proposed Text (if applicable): Consistent use or deletion of "In addition…"

comment *3233* comment by: *Aero-Club of Switzerland*

To (a) (1): Please delete the requirement for for all aircraft operated by a single pilot, make a change from "shall" to "should".

The wording of (b) is correct in our view, it covers all aspects of fire-fighting during flight. Fighting a fire on ground, after a forced landing for instance, is a different thing.

We ask the Agency to propose adequate fire fighting rules for the different forms of air operations, looking at the very wide variations of aircraft involved.

Justification: The use of any fire extinguisher in a cabin of an aircraft is dangerous for all occupants because of the agents used.

It is much safer to have a pilot concentrating on the emergency procedures learned and on landing the aircraft as quickly as possible than to try to extinguish the fire.

The mission to extinguish a fire on board a an aircraft described cannot reasonably be delegated to a passenger.

comment *3418* comment by: *barry birch*

Why a hook knife? Seems odd. If you need to cut something then you are involved in operating the balloon in a way that is not standard practise!! Barry Birch Balloon Pilot/Instructor, Italy.

comment *3562* comment by: *Walter Gessky*

OPS.GEN.405(f)

Comment:

See OPS.GEN.110 Carriage of persons , AEROPLANES AND HELICOPTERS

"(c) Prior to and during taxiing, take-off and landing, and whenever deemed necessary in the interest of safety by the pilot-in-command, each person on board shall occupy a seat or berth and, except in the case of parachute operations, have his/her safety belt or harness properly secured."

Is it intended that in the case of parachute operation each person on board have his/her safety belt properly secured or what kinds on hold on are required? Clarification requested. When no safety belts are required, than this shall be clarified in OPS.GEN.110 .

comment *4064* comment by: *Ted Moore*

The minimum equipment list for balloons includes a hook knife which is a throwback to gas ballooning.

comment *4193* comment by: *DGAC*

General comment regarding (a)(3) & (a)(4) & (e)(2) ::

Those provisions deal with seat belts and restraining devices. As there is a paragraph dedicated to seat belts and harnesses (OPS.GEN.480 Seat belts & harnesses), move the provisions of (a)(3) & (a)(4) & (e)(2) to OPS.GEN.480).

comment *4194* comment by: *DGAC*

General comment n°2 on (a)(3) & (a)(4) & (e)(2) ::

To avoid any misunderstanding, there should be

- a definition in OPS.GEN.010 for seat belt, seat belt with shoulder strap or harness, harness, in terms of anchorage points, and
- an AMC to these definitions explaining that, unless otherwise provided, a safety harness (5 points) is deemed to be compliant to the requirement for safety belt with shoulder harness (4 points), deemed to be compliant with safety belt with diagonal shoulder strap (3 points), deemed to be compliant with safety belt (2 points)

comment *4195* comment by: *DGAC*

(a)(4): Replace "a restraint device" by "a child restraint device (CRD)". This

will make the link with the AMC more understandable

comment *4196* comment by: *DGAC*

Proposal : Add a new § in (a) as follows :

"For aerobatics, a 5-point harness is required for each seat".

comment *4197* comment by: *DGAC*

(b) : The use of halon as a fire extinguisher should be addressed in the IR not only in the AMC.

Justification : as of today, Halon is the only efficient extinguishing agent. New agents are in the process of being developed by the industry for hand extinguishers. For cargo and engine automatic extinguishers, though, no other agent has been developed so far.

As there are discussions at European level on the topic, for environment concerns, which may impose in a EU regulation the end of the special exemption for aviation, we fear that having the possibility to use halon in a simple AMC will make that provision not usable, as it will be outweighed by the EU regulation. This might cause safety concerns.

comment *4198* comment by: *DGAC*

Rewrite (c) as follows :

"(c) Sailplanes shall be equipped in accordance with (a)(2)**,** ~~and~~ (a)(3) **and (a)(4)"**.

Indeed there is no provision that prevents children under 24 month from being a passenger in a sailplane.

comment *4199* comment by: *DGAC*

Proposal : Add to (c) a provision stating that "a 4-point harness is required. For sailplanes whose airworthiness certificates has been issued **after December, 1st 1990 (Arrêté 24/07/91 § 2.4.5)** on which . no device preventing a pilot from sliding forward is available, a 5-point harness is required."

Justification : This provision is considered important for safety in our national requirements (*Arrêté 24/07/1991 - § 2.4.5*)

comment *4200* comment by: *DGAC*

(d) : add "in the case of "hot air balloons" after "alternative source of ignition"

comment *4201* comment by: *DGAC*

(e)(1), (e)(3) and (e)(4) shall be applicable to all balloons.

comment *4202* comment by: *DGAC*

(e)(2) : Rewrite as follows :

"(e)(2) ~~crew~~ restraint harness(es) **for the minimum required flight crew**;

The harnesses shall not hinder the movements of the crew members.

comment *4203* comment by: *DGAC*

(e)(5) : Rewrite as follows :

"(e)(5) a drop line of at least ~~30~~ **25** metres (m).

Justification :

There are only two length available for drop lines : 25 or 50 metres

comment *4204* comment by: *DGAC*

There is a problem of consistency: "CARRIAGE OF PARACHUTISTS" is not a type of aircraft. For ease of reading and understanding, delete the section "CARRIAGE OF PARACHUTISTS" and move the content of (f) toward (a)(2) to read : "(a)(2)a seat or berth for each person older than 24 months **except in the case of carriage of parachutists, where the floor may be used as a seat, provided means are available for the parachutists to hold on**.

comment *4400* comment by: *Helikopter Air Transport GmbH / Christophorus Flugrettungsverein*

Should state: (4) a restraint device for each person younger than 24 months during transportation; and

comment *5131* comment by: *UK CAA*

Page No: 42

Paragraph No: OPS.GEN.405(e)(3)

Comment:

The requirement to carry a hook-knife in a hot-air balloon should be removed.

Justification:

The carriage of a hook-knife in a hot-air balloon has no safety benefit.

Proposed Text (if applicable):

LARGE BALLOONS AND BALLOONS INVOLVED IN COMMERCIAL OPERATIONS

(e) Balloons with a maximum passenger capacity of more than 11 and balloons used in commercial operations shall, in addition to (d), be equipped with:

(1) protective gloves for each crew member;

(2) crew restraint harness(es);

~~(3) a hook knife;~~

(4) a fire blanket or fire resistant cover; and

(5) a drop line of at least 30 metres (m).

comment *5253* comment by: *Graham HALLETT*

OPS.GEN.405. (d).

In balloons where the lifting gas is inflammable (such as hydrogen gas balloons), sources of ignition are generally discouraged. I assume this is an oversight in the wording, rather than a startling display of ignorance on the subject. I would suggest this should apply to hot air balloons only.

comment *5260* comment by: *Graham HALLETT*

OPS.GEN.405 (e)

Whilst this list generally seems reasonable for large balloons and some smaller balloons, there are certain circumstances where it is not. Again, the definition of what commercial operations encompasses is not totally clear, but it may include passenger transport in smaller balloons, also display flying in single man 'hopper' type balloons.

For balloons with non-compartmented baskets or no turning vents, the use of restraint harnesses is problematic and could prove more dangerous than not using them. Also, it states 'crew harnesses', rather than 'pilot harness'. This would appear to mandate the use of such a harness for any crew who

may be present, even though they may not have any flight duties, effectively flying as passengers. Indeed, the use of the term crew, rather than pilot belies a possible lack of understanding of the nature of balloon operations.

For one-man 'hopper' balloons the carriage and deployment of a fire blanket is awkward at best, so this should not be mandatory. Similarly a drop line is often an unnecessary burden when it is clear that it will not be needed in the forthcoming short duration of the flight.

I do not know what a hook knife is, as opposed to any other sort of knife. A knife is often useful, but a better definition of the type must be given before comment can be passed.

The prudent pilot is likely to be equipped with as many of the above as possible, so it should not be necessary to mandate their carriage in all circumstances. Since I believe the intent of this clause is to apply to passenger carrying balloons, I would suggest that rather than apply to all commercial operations, it should apply to commercial passenger transport operations only:

Change title to:

LARGE BALLOONS AND BALLOONS INVOLVED IN COMMERCIAL PASSENGER TRANSPORT OPERATIONS

Change subclause (2) to:

Pilot restraint harness (for balloons with compartmented baskets and turning vents only).

Provided the change of title is agreed, there is no need to alter subclauses (4) & (5). However, if this restriction is not agreed, then some change tothese subclauses is required to remove this requirement for balloons without traditional baskets.

Paragraph text:

(5) spare electrical fuses, of the ratings required for complete circuit protection, for replacement of those fuses that are accessible in flight.

Comment:

Good clarification

comment

5293 comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

LARGE BALLOONS AND BALLOONS INVOLVED IN COMMERCIAL OPERATIONS

- - -

(e) Balloons with a maximum passenger capacity of more than 11 and balloons used in commercial operations shall, in addition to (d), be equipped with:

(1) protective gloves for each crew member;

(2) crew restraint harness(es);

(3) a hook knife;

(4) a fire blanket or fire resistant cover; and

(5) a drop line of at least 30 metres (m).

- - -

Comment:

Since there is always a risk that the pilot falls out of the basket and the passengers remain inside, the risk for the passengers is unacceptable for CAT. There should always be a requirement for some kind of crew restraint system, however simple it may be.

Reference to a known incident in Sweden:

Incident no 1990-04-07

Upon landing, one passenger as well as the PiC fell out, another passenger jumped out while a third passenger remained onboard and the balloon continued its flight. The commander managed to shout instructions to the passenger on how to cut off the gas supply to the burner. However, the balloon continued to fly for another 15 minutes before it landed without damages.

Proposal (including ***new text***):

There should be a requirement for a crew restraint harness for smaller balloons used for CAT

European Regions Airline Association Comment

AEROPLANES AND HELICOPTERS

(a) Aeroplanes and helicopters shall be equipped with:

(5) spare electrical fuses, of the ratings required for complete circuit protection, for replacement of those fuses that are accessible in flight.

ERA members feel that accessibility is not the criteria. As NPA OPS 43 was not approved and was just a draft , the criteria should be "for use". Therefore please change sub-paragraph 5 to read:

(5) Spare electrical fuses, of the ratings required for complete circuit protection, for replacement of those fuses that are allowed to be changed in flight.

comment *5736* comment by: *AS Miller*

OPS.GEN.405.Equipment for all aircraft

"...(1) except in the case of aerobatic flights...."

AMC.OP.GEN.405(a)(1) Equipment for all aircraft

Aerobatic aircraft are not the only ones to experience frequent, alternating, flight loads during normal operations. Launching gliders into lee wave system can require the tug aircraft to repeatedly climb and descend in the extremely turbulent air associated with strong air flows in the lee of mountains. Once off tow, the glider can climb in the smooth higher air, but the tug immediately returns for a further dose.

Proposal *change the wording in the IR to: "(1) except in the case of aerobatic, and other flights as approved by NAAs, at least one ....."*

and the AMC to:

2. For aerobatic, and other flights as approved by NAAs, the hand fire extinguishers may become a hazard due to frequent, alternating, flight loads.

comment *5860* comment by: *Fédération Française Aéronautique*

For "light" aeroplanes, **i.e. *non complex aeroplane with MTOW below 2T***, the requirement to have on board a "fire extinguisher" is largely questionable : French FFA believes that a hand fire extinguisher in the

cockpit of this category of aeroplane is useless in flight and, moreover, its use can be dangerous.

Justifications : 1) A fire extinguisher, even a hand one, is quite heavy and difficult to store securely in the small cockpit space of that aeroplane category.

2) The in flight use on that category of aeroplane of a fire extinguisher will be very difficult and, moreover, the extinguisher product itself can be dangerous for people on board.

3) Nothing in flight safety analysis shows that a fire extinguisher on board of non complex aeroplanes will improve flight safety by any way.

4) Installation and periodic maintenance of a fire extinguisher on board that category of aeroplane will cost time and money for the operators (mainly aero-clubs) without any actual benefit in flight safety.

FFA proposal : Suppress the fire extinguisher requirement for non complex aeroplane involved in non commercial operations, at least for aeroplanes below 2,000 kg MTOW.

comment *6264* comment by: *Lufthansa CityLine GmbH*

Lufthansa CityLine feels that accessibility is not the criteria. As NPA OPS 43 was not approved and was just a draft , the criteria should be "for use". Therefore please change sub-paragraph 5 to read:

(5) Spare electrical fuses, of the ratings required for complete circuit protection, for replacement of those fuses that are allowed to be changed in flight.

comment *6567* comment by: *Baden-Württembergischer Luftfahrtverband*

OPS.GEN.405(a)(1)

Wording in the NPA

(1) except in the case of aerobatic flights, at least one hand fire extinguisher:

(i) in the cockpit; and

(ii) in each passenger compartment which is separate from the cockpit;

Our proposal

except in the case of aerobatic flights, tow flights or an MTOW of 750kg or less, at least one hand fire extinguisher

Issue with current wording

For small aircraft this requirement is a weight and space issue

Rationale

Small aircraft in many cases will have an issue to place a hand extinguisher at a reasonable location. Tow planes should be kept as light as possible so adding the requirement for ELT, fire extinguisher and first aid kit in sum adds unnecessary weight.

comment *6780* comment by: *ETF*

(a) (4) Comment: The proposed text says restraint device for each person younger then 24 months but does not give any indication on where the infant should sit or if double occupancy is permitted.

comment *6879* comment by: *Luftsport-Verband Bayern*

zu: (1) except in the case of aerobatic flights, at least one hand fire extinguisher:(i) in the cockpit: Für ein Einmanncockpit erscheint die Forderung nach einem Feuerlöscher keinen Sicherheitsgewinn auszulösen. Lediglich beim Brand am Boden könnte dies von Nutzen sein.

Vorschlag Neuformulierung: (1) except in the case of single handed Airplanes, aerobatic flights, at least one hand fire extinguisher:(i) in the cockpit;

comment *7229* comment by: *EPFU is the European Union of national powered flying organisation from the 10 main European countries*

EPFU is of the opinion that the requirement of an hand fire extinguisher in the cockpit of a small aeroplane (non complex aeroplane with MTOW less than 2,000 kg) is not a good idea.

Justification : use in flight of a fire extinguisher inside the small cockpit of a small aeroplane seems too risky for persons on board, pilot included. Additionally, the efficiency to fight a fire on board is questionable. Actually, the EPFU is of the opinion that this efficiency will be close to zero...

So EPFU is of the opinion that this requirement must be suppressed for non commercial operations on non complex aeroplanes.

comment *7289* comment by: *Richard Simpson*

Page 42 OPS GEN 410 (b) (3)

For VFR Flight in a helicopter, even a single AI is not of any real use, having two will not make flying safer. A second indicator would be very expensive to

fit, around £4000 for a typical piston helicopter and there will likely not be a panel aperture spare for this extra instrument. This is not an ICAO recommendation and there is no reason to believe that safety is increased by this recommendation.

comment *7382* comment by: *DAvid Monks*

Response comment to 410b

A VFR certified helicopter does not require an AH.

A non IR pilot is not permitted to fly by sole reference to instruments therefore an AH is not required.

If 2no AH were fitted which could be trusted if 1No were suspect faulty.

This requirement is not a safe reccomendation and would jepodise pilot safety without the ability to cross reference with a known correct instrument unless the conditions were VMC as permitted by type.

comment *7404* comment by: *A. Mertz*

Das Platzangebot in kleinen Flugzeugen lässt oft die sichere Befestigung eines Feuerlöschers an einem geeigneten Ort nicht zu. Der Feuerlöscher muss gleichzeitig leicht erreichbar sein und die Halterung muss im Falle eines Unfalls gegebenenfalls hohe Kräfte aufnehmen können.

Ein geeigneter Formulierungsvorschlag wäre:

(a) Aeroplanes and helicopters with more than 4 seats .....

Ein weiterer gangbarer Weg wäre, Flugzeuge der ELA-Kategorie von der Pflicht einen Verbandskasten und einen Feuerlöscher mitzuführen auszunehmen.

comment *27* comment by: *George Knight*

-(a) (2) Sailplanes should not be required to be equipped with a means to measure time because, (unlike most other types of aircraft) their cross country flight consists of a series of climbs during which they drift followed by short cruises to the next cloud which may be only in the general direction of the next waypoint. Time has little relevance to sailplane navigation since they do not cruise in straight lines between waypoints (even if they

sometimes wish they could).

comment *28* comment by: *George Knight*

-(b) The listed equipment for sailplanes unable to maintain attitude without reference to flight instruments conflicts with the regulations for certification by setting a different requirement.

comment *29* comment by: *George Knight*

(b) (2) & (3) These two points require sailplanes & powered sailplanes to carry an attitude indicator but not a turn and slip when unable to maintain attitude without reference to flight instruments. This is not appropriate or reasonable. A sailplane should be required to carry a T&S OR AI to fly in these conditions but not both.

comment *30* comment by: *George Knight*

(b) (4) I have never seen a sailplane or powered sailplane with a means of displaying a stabilised heading (i.e. a Direction Indicator). Apart from installation issues they are not necessary in gliders even in IMC (currently permitted in the UK). Sailplanes, powered sailplanes, SLMGs and TMGs should be exempted.

comment *122* comment by: *AgustaWestland*

In OPS.GEN.410(b)(5) it seems that a portion of text has been missed.

comment *323* comment by: *AgustaWestland*

1. Why, for a VFR flight, two Attitude Indicators (AI) must be available? This is not required neither by CS27 nor CS29. A standby AI is required only by Appendix B (Airworthiness criteria for helicopter instrument flight) to CS27/29. Similarly JAR-OPS 3.650 (Day VFR Ops) did not require a second AI. While a stby AI is required by JAR-OPS 3.652 (IFR or night ops).
2. ICAO Annex 6 Part III Ch.4 Para.4.4.1 prescribes a secon AI for Night ops
3. This rule seems to be more conservative than ICAO SARP,JAR-OPS 3 and the Airworthiness Rules that are the basis for granting a Type Certificate.Additionally compliance to OPS.GEN.410(c) seems to

require 4 AI's.

4. OPS.GEN.410(b)(5) is incomplete.

comment *412* comment by: ***EHOC***

General

The set of rules for instruments VFR, night VFR and IFR are made extremely complex by the policy of inheritance. It is not certain that the existing text provides a clear and unambiguous text for each and every categorisation that is required. The combination of rules has to provide for simple types and complex types in General Aviation; it must also cater for simple types and complex types in Commercial Air Transport; and simple and complex types in commercial and non-commercial Aerial Work. The criteria for instruments and equipment varies for simple types within GA, CAT and AW and also for complex types in GA, CAT and AW. There are also differences between: single pilot and two pilots; operations when control can be maintained by reference outside the cockpit and those where it cannot - even though all of these are designated as VFR (and even further complicated by the inheritance from VFR to IFR). To maintain a simple operational text, it might be better to establish separate rules in each of the Subparts GEN, CAT and COM.

Paragraph (b)

The text in GEN and CAT are two ways of doing similar things; the discriminant in GEN is objective and superior to CAT (which contains a prescriptive requirement). No further text is required for helicopters in CAT as GEN covers the requirement. Because accuracy is required it may be necessary only to provide a GM for CAT helicopters stating that:

"GM OPS.GEN.410(b)

REDUCED VISUAL CUE ENVIRONMNENT - HELICOPTERS

1. Environmental condition where the risk of loss of control is high and reference to one or more flight instruments may be necessary occurs when:

a. operating over land or water with a visibility of less than 1500m; and/or

b. operating over water and out of sight of land.

2. Because instruments cannot be fitted or removed temporarily, the net effect of not having specified instruments is an operational limitation."

However, that does leave aeroplanes and helicopters with MCTOM > 3175 kg; this can be accommodated with an abbreviated rule text:

"(b) Helicopters with a maximum certificated take-off mass exceeding 3175 kg and aeroplanes shall, in addition to (a), be equipped with a means of measuring and displaying:"

Even with this, a note is required to avoid double compliance.

Paragraph (b)(3)

It is not clear where the requirement for two attitude indicators comes from;

no text that can be found (ICAO or JAR) specifies this for helicopters.

Paragraph (c)

Under existing requirements, attitude and stabilised heading are not required for helicopter, VFR, two crew operations. However, this is a reasonable requirement when two pilots have to be carried.

comment *623* comment by: *ECA - European Cockpit Association*

Comment: change text as follows:

(a) When operating under Visual Flight Rules (VFR), sailplanes, aeroplanes, and helicopters shall be equipped with a means of measuring and displaying:

(1) magnetic heading;

(2) time, in hours, minutes and seconds;

(3) ~~**pressure altitude**~~ **A sensitive pressure altimeter calibrated in feet with a sub-scale setting, calibrated in hectopascals/millibars, adjustable for any barometric pressure likely to be set during flight**; and

(4) ~~**indicated air speed**~~ **An airspeed indicator calibrated in knots**.

Justification:

Text as proposed comes from the original JAR-OPS 3.

comment *825* comment by: *Reto Ruesch*

To maintain a simple operational text, it might be better to establish separate rules in each of the Subparts GEN, CAT and COM.

comment *939* comment by: *Aersud*

First: It does not take sense to talk about "helicopters operating under VFR cannot be maintained in a desiderated attitude without reference to one or more flight instrument...". When we talk about VFR flights we have to consider that the flight is also conducted with a proper outside reference (ground or horizon).

Second: It's not clear what are the "two separate means of indicating attitude". Does it mean two instruments or two different type of instruments? (example: one gyro-horizon + one std-by gyro-horizon or one gyro-horizon + turn and bank indicator).

There are no explanation also on the AMC.

Proposal

Change: (3) attitude. ~~In the case of helicopters, two separate means of indicating attitude shall be available,~~

OR / AND

Specify in the AMC how to comply with this requirement.

Note

Priority: **M**

comment *940* comment by: *Aersud*

Comment

For two pilots you request additional separate means of indicating (a)(3), (a)(4), (b)(1), (b)(2), (b)(3), (b)(4). In case of (b)(3) we talk about an "attitude indicator, in the case of helicopters, two separate means of indication are necessary". Does it mean that we have to install 4 attitude indicators? Can two gyro-horizon + 1 std.by gyro-horizon comply with this requirement?

Proposal

Specify in the AMC how to comply to this requirement

Note

Priority: **M**

comment *1087* comment by: *EUROCOPTER*

Comment on OPS.GEN.410 (b)(2):

It is propose to write:

*(2) turn and slip for aeroplanes**; ~~and~~** slip for helicopters;*

Reason: it has to be clear that only the display of slip is required for helicopters.

comment *1089* comment by: *EUROCOPTER*

Comment on OPS.GEN.410(b)(3):

Wording modification proposal:

(3) attitude. ***~~In the case of helicopters, two separate means of indicating attitude shall be available~~****;*

Rationale:

Flights under VFR which cannot be maintained in a desired attitude without reference to one or more flight instruments are typically flights over calm water.

OPS.CAT.410(b) already requests, in addition to OPS.GEN.410, one attitude indicator for flights over water. The proposal is so: one attitude indicator in GEN + 1 attitude indicator for commercial air transport over water. It would not realistic to request 3 attitude indicators for CAT over water.

comment *1096* comment by: *David COURT*

A means of "indicating envelope temperature" would mean adding thermistors to many balloons which do not have them and do not need them.

If the wording was changed to say "indicating excessive envelope temperature" then a temperature flag would be adequate.

comment *1459* comment by: *Aubrey Bristow*

P42 410 b 3

The need for a second means of indicating attitude under VFR is disproportionate and unecessary. There is no evidence of risk from only a single device. A second device cannot be fitted to smaller aircraft due to both total space and panel space. The additional weight increases risk. For low hours pilots failure of one device in any case would possible simply cause confusion and disorientation, where as failure when only one device is present should result in resumption of flying with reference to the ground visually.

P43 a 3 second static pressure source

There is no evidence a light helicopter in VMC has been at risk with only one stsaic pressure source. By definition the aircraft is not in icing conditions. There is no mechanism for adding a second source and the cost and disruption would be disproportionate

P45 420 f

The need to carry a liferaft should be at the discretion of the commander.

A mandatory liferaft is simply not possible in smaller helicopters. There is no evidence of need based on the very small number of ditchings and high proven safety of over water flight by helicopters. Even if one can be carried, it can be near impossible to jettison it on ditching and there is no case history to prove it is practical. There is a risk of accidental inflation before or during jettisoning which could injure or entrap passengers or crew and the further risk of inadvertant flight outside C of G and weight limits by low hour pilots accustomed to all loading configurations being currently within limits with their family. More experienced pilots who might be asumed to be flying overwater with empty seats or even solo (since single engined helicopters would not carry passengers commercially over water) are best placed to decide whether they could deploy a liferaft on ditching or not.

P45 425.H b

The mandatory demand for floatation devices is unecessary, disproportionate and reduces safety.

There have been very few ditchings by light helicopters within the EU and no loss of life. If a light helicopter ditches without floats the rotors are stopped quickly by contact with the water allowing egress before sinking. The addition of floats would at best result in egress with rotors running or delayed egress such that the hull submerges with the passengers still on board, but in practice a small top heavy aircraft in even a mild swell would invert so that egress would be more difficult and disorientation increased.

It woul be far preferable to mandate underwater breathing equipment to allow less hasty egress as the aircraft settles

Floats are also expensive and cannot be retro fitted to many aircraft , efectively banning them from over water flight even within the UK. Deployment especially for low hours pilots in an emergency engine out descent further increases cockpit workload and the risk of a suboptimal landing on water with risk of death. Floats can fail, need servicing and dramatically add to weight. Most light helicopters can load each seat within C of G and weight limits. Adding floats for helicopter pilots accustomed to this significantly risks overloading and flight outside C of G albeit inadvertantly.

P46 C 1

A fixed automatic ELT is inappropriate for light helicopters. I would suggest mandatory GPS equipped portable ELTs.

A fixed ELT is disproportionate in cost. Most engine off landings involve low G forces which would not activate the device. This could cause death as the pilot may assume the device to have activated. In fact the only circumstance in which it would fire would be a CFIT accident which is invariably fatal.

The greatest advantage of an ELT in the UK is over water. A light helicopter rapidly sinks whilst the crew and passengers float on the tide and current away from the hull. A fixed ELT would delay rescue as SAR would home into the sunken hull and not locate the survivors.

P202 415 H (a) (6)

The mandatory fitting of trainable landing lights is ridiculous.

Light helicopters currently have fixed lights for night flying. These are simple and effective. Trainable lights do not exist for many helicopters and even if they did the weight and cost would be prohibitive. In my experience they not infrequently fail and then cannot illuminate the landing path at all. Fixed lights do not suffer this problem.

Low hours pilots might also suffer as a result of the increased cockpit workload of having to steer the light and there must be a risk of disorientation and inadvertant contact. In summary, no benefit has been shown, it cannot be done and there is a risk of injury

comment *1472* comment by: *EUROCOPTER*

§ (c):

Duplication of attitude ((b)(3)) and stabilised heading ((b)(4)) is not requested by JAR-OPS 3.650 (h). This requirement only concerns helicopters over 3175 kg; or operating over water or when the visibility is less than 1500 m; and is already dealt in OPS.CAT.410 (b).

Proposal:

(c) Whenever two pilots are required for the operation, aeroplanes and helicopters shall be equipped with an additional separate means of indicating (a)(3), (a)(4), (b)(1), (b)(2), ~~***(b)(3) and (b)(4).***~~

comment *1517* comment by: *Chris Fox*

Para (b) (3) - There is no basis for requiring the fitment of a second Attitude Indicator for VFR flight in light helicopters.It is not an ICAO requirement, and there is no evidence or safety case to support this requirement.

For many light helicopters, fitment of a second AI is difficult or impossible due to limitations of panel space and weight.

This requirement should be deleted.

comment *1617* comment by: *Luftfahrt-Bundesamt*

The LBA requests to stay away from the performance base rule making here. If this system shall be used, OPS.GEN 405 should be phrased in a similar way. However, this does not make much sense at all. Same with this paragraph.

Justification: see LBA - General Comment, reason 3.

comment *1665* comment by: *JSLEE*

Page42

Ops.Gen.410 (b) (3)

In the case of helicopters two separate attitude indicators to be available.

Reason for objection

As EASA have not given reasons for the proposed changes to the equipment needed for night flying one can only assume that they are unaware of the limitations of single engine helicopter metrological flying conditions.

A single engine helicopter is only permitted to fly in visual flight conditions.

This means they must remain clear of clouds at all times.

A pilot flying in VFR conditions should never need a second attitude indicator. If the aircraft has entered icing conditions, which would only normally occur in cloud at or above the freezing level. In which case the pilot would not be flying in VFR conditions and flying illegally. The fitting of this instrument may indeed encourage instrument rated pilots to do so.

The fitting of a second attitude indicator is impractical in many single engine helicopter instrument panels! There is just insufficient room. The panels were designed for VFR flying and the size and shape of the panel designed to accommodate those instruments necessary for safe VFR flying Not IFR. The modifications to the instrument panel would require CAA approval with the associated approval costs.

comment *1667* comment by: *JSLEE*

Page 43

Ops.Gen.415 (a) (3)

An alternative static source

As EASA have not given reasons for the proposed changes to the equipment needed for day or night flying one can only assume that they are unaware of the limitations of single engine helicopter metrological flying conditions.

A single engine helicopter is only permitted to fly in visual flight conditions.

This means they must remain clear of clouds at all times.

The only time a pilot flying in VFR conditions would need an alternative static source is if the aircraft has entered icing conditions, which would only normally occur in cloud at or above the freezing level. In which case the pilot would not be flying in VFR conditions and flying illegally. The fitting of these instruments may indeed encourage instrument rated pilots to do so.

The fitting of a second static source would be expensive, disproportionate and only of use when flying in icing conditions. The modifications may require CAA approval with the associated approval costs.

comment *1685* comment by: *Dassault Aviation*

Technical comment.

Page 42 OPS.GEN.410 §(b)(5): how can we measure *when power is not adequately supplied to the instruments* ? also on some a/c, no power is needed for vertical speed required by §(b)(1) - only air pressure is enough - so §(b)(5) can not be complied with. Proposal is to keep this requirement but not under §(b)(5), under a new (c) for example, and also to exempt vertical speed from this requirement.

comment *1714* comment by: *William Harford*

THis is entirely discriminatory against non complex, privately operated helicopters as opposed to non complex, mjotor powered, privately operated aeroplanes.

There is no evidence to support a safety case for such a requirement.

comment *1752* comment by: *Swedish Soaring Federation*

Regarding sailplanes; magnetic heading can be dispayed by a compass or another device that can display magnetic heading.

comment *1828* comment by: *Q Aviation Ltd*

Adding more instumentation to light helicopters will be counter productive.

There is no room for them, and they are not needed.

We cannot afford extra costs on instrumentation and equipment that we will never use.

More people will give up flying.

We fly for fun, and if the weather is so bad as to make extra instrumentation beneficial, then the very weather that necessitates the use of instrumentation will beyond the capabilities of the pilot.

So he will crash anyway.

Better to focus on teaching a pilot when to fly, and when to stay on the ground.

comment *1860* comment by: *SHA (AS)*

The set of rules for instruments VFR, night VFR and IFR are made extremely complex by the policy of inheritance. It is not certain that the existing text provides a clear and unambiguous text for each and every categorisation that is required. The combination of rules has to provide for simple types

and complex types in General Aviation; it must also cater for simple types and complex types in Commercial Air Transport; and simple and complex types in commercial and noncommercial Aerial Work. The criteria for instruments and equipment varies for simple types within GA, CAT and AW and also for complex types in GA, CAT and AW. There are also differences between: single pilot and two pilots; operations when control can be maintained by reference outside the cockpit and those where it cannot - even though all of these are designated as VFR (and even further complicated by the inheritance from VFR to IFR). To maintain a simple operational text, it might be better to establish separate rules in each of the Subparts GEN, CAT and COM.

comment *1903* comment by: *Ian MACDONALD*

Section (b) (3) is not necessary for VFR flight and impossible to achieve in many hundreds of light helicopters such as the R22. There is neither the panel space, electrical capacity or, given the many other proposals for modification, the weight capacity to implement this. It is not proportionate to require such equipment in aircraft which are VFR only. Bear in mind that many early machines are legally flying with no attitude indicator, other than the prime and safest one, looking out of the cockpit.

comment *1905* comment by: *Helifly (UK) Ltd*

Objection to OPS.GEN.410 b3

It would be disproportionately expensive to fit a second AI to the Robinson R44 operated by Helifly. There is no room in the panel which means a complete new panel would need to be fitted. For VFR flights a secondary AI is not needed. If the flight is being conducted in compliance this VFR rules even the primary AI should not be required! It is the understanding of Helifly that a second AI is not even an ICAO recommendation.

comment *2537* comment by: *James Leavesley*

Having to have two seperate altitudes will cause confusion to any pilot in a stressful situation, if showing different readings which one is right.

My instrument panel doesn't have any room for another instrument so it would have to all be changed, otherwise it would look like a "stuck on" and give no reassurance to any first time passengers. A group who frequently fly with the ppl helicopter pilot.

There is no safety benefit to a VFR PPL pilot for having two attitude instruments

Please do not change the claibration of equipment only confusion will occur and the addition aeed for yet more equipment

comment *2616* comment by: *John Matchett*

It is illegal for VFR pilots to fly in cloud. The need for additional

attitude equipment to be fitted is inapprpriate

comment *2658* comment by: *AOPA-Sweden*

(a):

For a VFR flight, there is no need for a precision down to the nearest second. Hours and minutes are enough.

comment *2659* comment by: *AOPA-Sweden*

(b):

A VFR-flight is by definition a flight when the attitude is maintained by visual references out of the cockpit and in VMC. AOPA-Sweden does not agree to a need of additional instruments during operations in VFR/VMC, where the desired attitude not can be maintained to one or more instruments. AOPA-S does not see such a scenario. AOPA-S can see a need for VSI during night and a DG during VFR on top.

comment *2660* comment by: *AOPA-Sweden*

(b) (2): Modern aircraft with glass cockpit does not always have turn and slip indicators. The rule should be modified in order to also allow modern glass cockpit aircraft accordingly. I.e. Garmin 1000 glass cockpit.

comment *2661* comment by: *AOPA-Sweden*

(b) (5): None of the instruments listed in OPS.GEN.410 (a) has a need of external power, AOPA-S suggest this point can be deleted.

comment *2803* comment by: *Ed Sturmer*

Dual AIs in small helicopters in VFR.

Expensive and NO proven safety benefit.

Experience and statistics show no safety benefit to this expensive proposal.

comment *2816* comment by: *Peter Waldron*

As many helictopters do not have panel space for this second indicator it would be extremely expensive to install. It is certainly not necessary for VFR helicopters and is not an ICAO recommendation. Appendix VI, paragraph 40 (p32) states that this is "considered a useful tool to improve safety".

There is absolutely no evidence provided to support this and no proportionality for private flight in non complex helicopters. This is not an ICAO recommendation.

comment *2838* comment by: *Philipp Peterhans*

(b)(3) Delete all after attitude: there is a change from JAR-OPS 3, only one was required. We see no need to carry 4 means of indicating attitude when 2 pilots are required.

comment *3057* comment by: *Richard Dawson*

There should not be a requirement for an additional Attitude Indicator in helicopters. It would not be possible, for example, to fit an additional AI into my R44.

The majority of non-complex helicopters (such as my R44) are rated for VFR flight only and are not allowed to be flown by reference to instruments alone. Therefore there is no requirement for even one AI let alone two in such aircraft.

This seems to be a sensible requirement for commercial aircraft which are flying IFR and need redundancy.

Paragraph No: OPS.GEN.410

Comment:

This paragraph, and OPS.GEN.415, detail the required flight instruments and equipment for various flight regimes. The matter is complex due to the varying requirements of the different types of operation, the flight conditions and the time of day. It is felt that the subject could be simplified, and capture some additional requirements noted in ICAO Annex 6 Part II and III (Section III), by adapting the text as indicated. The comment in NPA 2009-02A (paragraph 40 page 32) regarding the layout as used in JAR-OPS 0 is agreed, subject to the proposed amendments. The full section is reproduced for clarity of the changes.

Justification:

Simplification of the text, correction of errors of commission and inclusion of missing elements of ICAO Annex 6 Part II and III.

Proposed Text (if applicable):

OPS.GEN.410 Flight instruments and equipment - VFR flights

SAILPLANES, AEROPLANES AND HELICOPTERS

(a) When operating under Visual Flight Rules (VFR), sailplanes, aeroplanes, and helicopters shall be equipped with a means of measuring and displaying:

(1) magnetic heading;

(2) time, in hours, minutes and seconds;

(3) pressure altitude; and

(4) indicated air speed.

(5) in the case of aeroplanes with speed limitations expressed in terms of Mach number, a means of indicating Mach number.

(b) When ***a*** sailplane~~s~~, aeroplane~~s~~ ~~and~~ ***or*** helicopter~~s~~ ***is being operated*** ~~operating~~ under VFR ~~cannot be maintained in a desired attitude without reference to one or more flight instruments,~~:

(1) over land or water with a visibility of less than 1500m; and/or

(2) over water and out of sight of land; or

(3) in conditions where the risk of loss of control is high and reference to one or more flight instruments may be necessary,

it shall, in addition to those required in (a), be equipped with a means of measuring and displaying:

(1) vertical speed;

(2) turn and slip for aeroplanes, and slip for helicopters;

(3) attitude. ~~In the case of helicopters, two separate means of indicating attitude shall be available;~~

(4) stabilised heading; and

(5) when power is not adequately supplied to the instruments.

COMPLEX MOTOR POWERED AEROPLANES

(c) Complex Motor Powered Aeroplanes when flying under the conditions of (b) shall additionally be equipped with:

(1) a second independent means of measuring and displaying altitude;

(2) an emergency power supply, independent of the main electrical generating system, for the purpose of operating and illuminating, for a minimum period of 30 minutes, an attitude indicating system clearly visible to the pilot-in-command for aeroplanes first issued with an individual certificate of airworthiness on or after the 1 January 1975. The emergency power supply shall be automatically operative after the total failure of the main electrical generating system and clear indication shall be given on the instrument that the attitude indicator is being operated by emergency power.

AEROPLANES AND HELICOPTERS IN MULTI-PILOT OPERATIONS

(***d***) Whenever two pilots are required for the operation, ***the second pilot station for*** aeroplanes and helicopters shall be equipped with an additional separate means of indicating (a)(3), (a)(4), (b)(1), (b)(2), (b)(3) and (b)(4).

BALLOONS

(***e***) When operating under VFR, balloons shall be equipped in accordance with (a)(2), (a)(3) and also with:

(1) a means of indicating:

(i) drift direction; and

(ii) envelope temperature; and

LARGE BALLOONS AND BALLOONS INVOLVED IN COMMERCIAL OPERATIONS

(***f***) Balloons with a maximum passenger capacity of more than 11 and balloons used in commercial operations, when operating under VFR shall, in addition to (d), be equipped with:

(1) a means of measuring and displaying:

(i) vertical speed; and

(ii) pressure for each ***fuel*** supply line;

comment *3170* comment by: *Richard ALLEN*

(1) (ii) temperature is already catered for with a "temp link" and a flag attached. Electronic temperature devices are useful but should not be mandatory.

comment *3238* comment by: *Suffolk Helicopters*

Ops Gen 410 (b) (3)

The requirement for two Attitude indicators for light, non instrument helicopters is excessive, unnecessary and will not contribute to safety when most pilots of such aircraft are not even instrument rated in the first place.

comment *3419* comment by: *barry birch*

Balloons are already fitted with a means of indicating maximum operational temperature. Regular monitoring of internal envelope temperature even when flying with large passenger balloons is not a standard practise nor is it necessary, as the flight preparation requires a load calculation to be carried out for the meteorological conditions at the time of the flight so that the max. temperature will not be exceeded.

Balloon pilots do not fly and monitor the internal envelope temperature during normal operational procedures. Drift direction would be measured how? And why is this necessary? Barry Birch Balloon Pilot/Instructor, Italy.

comment *3548* comment by: *IAOPA Europe*

It is not clear when the conditions specified under b) would be met since VFR implies that the flight is made with external reference.

The only condition where b) would seem applicable would be for VFR on top operations, however - as already pointed out - there are no provisions anywhere in the regulation for such operations.

Is is suggested that VFR on top operations should be made possible and in this case the equipment requirements under b) would be sensible. Section b) should then explicitly be for this purpose, since in all other cases VFR is made with external reference.

OPS GEN 410: The set of rules for instruments VFR, night VFR and IFR are made extremely complex by the policy of inheritance. It is not certain that the existing text provides a clear and unambiguous text for each and every categorisation that is required. The combination of rules has to provide for simple types and complex types in General Aviation; it must also cater for simple types and complex types in Commercial Air Transport; and simple and complex types in commercial and noncommercial Aerial Work. The criteria for instruments and equipment varies for simple types within GA, CAT and AW and also for complex types in GA, CAT and AW. There are also differences between: single pilot and two pilots; operations when control can be maintained by reference outside the cockpit and those where it cannot - even though all of these are designated as VFR (and even further complicated by the inheritance from VFR to IFR). To maintain a simple operational text, it might be better to establish separate rules in each of the Subparts GEN, CAT and COM.

comment *4069* comment by: *Ted Moore*

The means of indicating drift direction in a balloon must be a gps as a compass cannot be read accurately when the orientation of the basket changes frequently in flight. As the flight speed in generally very low it is possible to assess drift direction by reference to the map and does not require instrumentation.

comment *4110* comment by: *Benedikt SCHLEGEL*

The set of rules for instruments VFR, night VFR and IFR are made extremely complex by the policy of inheritance. It is not certain that the existing text provides a clear and unambiguous text for each and every categorisation that is required. The combination of rules has to provide for simple types and complex types in General Aviation; it must also cater for simple types and complex types in Commercial Air Transport; and simple and complex types in commercial and noncommercial Aerial Work. The criteria for instruments and equipment varies for simple types within GA, CAT and AW and also for complex types in GA, CAT and AW. There are also differences between: single pilot and two pilots; operations when control can be maintained by reference outside the cockpit and those where it cannot - even though all of these are designated as VFR (and even further complicated by the inheritance from VFR to IFR). To maintain a simple operational text, it might be better to establish separate rules in each of the Subparts GEN, CAT and COM.

comment *4205* comment by: *DGAC*

Proposal : Delete § b) « cannot be maintained in a desired attitude ».

Justification : This refers to a British concept ("IMC rating") which is not applicable, even considered as illegal, in the other European countries. This very specificity should only be addressed in a SPA.

As a consequence :

1)1- **Proposal** : Move (b)(1) and (b)(2) to OPS.GEN.410 (a) to read :

"(5) vertical speed only for sailplanes";

"(6) turn and slip for aeroplanes and slip for helicopters".

Justification :this items are necessary for VFR with sailplanes, aeroplanes and helicopters

2)

2- 2- **Proposal** : Move (b)(3) "attitude" and (b)(4) "stabilised heading" to § OPS.GEN.415

3)

3- What kind of instrument or equipment is described by "when power is not adequately supplied to the instruments" ?

comment *4206* comment by: *DGAC*

Proposal : BALLOONS : move (e)(1)(i) "vertical speed" to (d) (1) (iii)

Justification : This provision concerns all balloons, not only large balloons

comment *4207* comment by: *DGAC*

(e) (1) (ii) "pressure for each supply line".

Proposal :

Delete the sentence

Justification :

The amount of gas left in the bottle can easily be estimated by calculation and the pilot is able to assume with the magnetic indicator that the bottle is about to be empty. Also, the total amount of gas shall be sufficient to insure the flight plus 30 minutes.

comment *5041* comment by: *AS Miller*

OPS.GEN.410 Flight instruments and equipment - VFR flights

SAILPLANES, AEROPLANES AND HELICOPTERS

para (b)(4) requires a means of measuring and displaying stabilised heading when the desired attitude can not be maintained without reference to instruments.

The magnetic compasses currently fitted to all gliders have proven to be adequate. Twenty years ago, a particular model, "Bohli", provided a degree of stability, but this facility was found to be unnecessary and the model did not find a place in the market.

Proposal *Para (b)(4) must read "stabilised heading (not sailplanes)";*

comment *5076* comment by: *Trevor Wilcock*

I would hope that if the pilot is wearing a watch this would satisfy para a2! I cannot see the need for this to be mandatory for sailplanes (unless perhaps they are to be in contact with ATC), and sailplane panel space is limited.

comment *5261* comment by: *Graham HALLETT*

OPS.GEN.410(d)

Clause (i). The most practical method of measuring drift is with a map and the mark 1 eyeball. Would it not be simpler to say a map must be carried? Indeed, since a map will always be carried anyway, why not just delete this clause?

Clause (ii)

I do not believe there is a need to indicate envelope temperature in gas balloons.

For hot-air balloons, there is no need to continuously monitor the envelope temperature, there is only a need to indicate excessive temperature. Since this requirement is addressed by the airworthiness requirement to have such an indication (usually a temperature flag), this clause is superfluous and may simply be removed.

comment *5263* comment by: *Graham HALLETT*

OPS.GEN.410 (e).

Whilst this may be reasonable for large balloons and indeed not unreasonble for many others, 'Commercial Operations' will encompass many types of balloons and flying where it is not necessary and/or not practical. For example, tethered flying and flights using one-man 'hopper' type balloons are examples which spring to mind immediately, there are doubtless others.

This clause could be made applicable to just large balloons only, with no detriment to safety. If it must also be applied to some commercial operations, this should be to commercial operations involving the carriage of passengers only.

comment *5295* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

(a) When operating under visual flight rules (VFR), sailplanes, aeroplanes, and helicopters shall be equipped with a means of measuring and displaying:

. . .

(2) time, in hours, minutes and seconds;

Comment:

Delete "shall be equipped with".

Justification: A requirement for a time piece equipment could be subject to an installation, which could be very costly.

Proposal (including ***new text***):

Stipulate that the commander when operating under visual flight rules (VFR) shall have access to a means of measuring and displaying:

(a) When operating under visual flight rules (VFR), sailplanes, aeroplanes, and helicopters shall ~~be equipped with~~ ***have access to*** a means of measuring and displaying:

. . .

(2) time, in hours, minutes and seconds

. . .

comment *5330* comment by: *Norwegian Air Sports Federation*

For VFR flights magnetic heading can be displayed by an compass or other device (GPS etc.) that can display magnetic heading.

We do not understand why sailplanes have to carry equipment to display

time.

Proposal:

(2) except for sailplanes flying VFR, time, in hours, minutes and seconds.

comment *5333* comment by: *European Private Helicopter Alliance*

Page 42

Ops.Gen.410 (b) (3)

In the case of helicopters, two separate means of indicating attitude shall be available.

Reason for Objection

It would be very expensive to install a second AI. Many helicopters do not have the panel space. It is not necessary for VFR helicopters. It is not an ICAO recommendation. Appendix VI, paragraph 40 (p32) concludes thus; *"Although this is not required in ICAO Annex 6 Part II and Part III, it is considered a useful tool to improve safety".* No supporting evidence whatsoever is provided, and no proportionality is considered for private flight in non complex helicopters..

Suggested alternative wording

Ops.Gen.410 (b) (3) attitude. (remainder of text deleted)

Acceptable means of compliance

None – this is not even an ICAO recommendation!

comment *5426* comment by: *ALFA-HELICOPTER*

comment *6425* comment by: *George Heritage*

It is not necessary in VFR helicopters, it is not an ICAO requirement, weight and space would be limited.

comment *6483* comment by: *EUROPEAN GLIDING UNION*

In case of sailplanes, requirement as under (a)(2) for measuring and displaying time (in hours, minutes and seconds) in a sailplane or powered sailplane should be possible also by the pilot having an ordinary watch instead of a fixed one in instrument panel. Justification for this is the limited space sailplanes have, and that there is no time based flight procedures used.

comment *6536* comment by: *European Gliding Union (EGU)*

OPS GEN 410

Proposed wording a(3)"pressure altitude (units of measurement in meters' (m) is acceptable); and

Justification: The ICAO regulation on the use of metric and non metric measurements and indications need to be kept in place. For example, traditionally the Glider Community works in Meters (actually the No1. Choice of ICAO). By going the non metric path thousands of aircraft would need a retrofit in Altimeter and Speedometer.

Recommendation: Keep ICAO regulation in place and allow for all aircraft the use of metric indications.

comment *6538* comment by: *European Gliding Union (EGU)*

Proposed wording: a(2) time, in hours, minutes and seconds (not applicable for sailplanes);

Justification: As the minimum equipment for a sailplane did not foresee a clock for measurement of time up to now, this rule induces heavy load for the installation into all sailplanes in Europe. It means a minor change not only for all types of sailplanes but also for each glider with an individual instrument panel, which are the majority.

As acceptable means of compliance, a wrist watch worn by the pilot shall be

acceptable.

The requirement for a time piece should not be more specifically as the present wording allows for kind of time keeping equipment

Recommendation: leave OPS GEN 410 as written today.

comment *6552* comment by: *Sloane Helicopters Ltd*

All UK single-engined helicopters are VFR only and many do not have an Artificial Horizon. To insist on two AHs being fitted is unacceptable. Most light helicopters would not have the panel space and it would be extremely expensive.

comment *6602* comment by: *European HEMS & Air Ambulance Committee (EHAC)*

OPS.GEN.410 Flight instruments and equipment - VFR flights

B (3) attitude. ~~In the case of helicopters, two separate means of indicating attitude shall be available;~~

This is a change from JAR-OPS 3, only one was required. We see no need to carry 4 means of indicating attitude when 2 pilots are required.

comment *6745* comment by: *Clive Morrell*

In the case of helicopters, two separate means of indicating attitude shall be available.'

Comment; This is completely unnecessary for a VFR helicopter. Many small helicopters (eg R22) have no space for installation of such an additional instrument.

A single Attitude indicator should be acceptable for private VFR helicopters

comment *6790* comment by: *Kinetic Avionics Ltd*

Section 410(b)(3)

If this section is intended to refer to night VFR flight in helicopters, then it is disproportionate to require two separate attitude indicators for private flight in small helicopters given that few will be so equipped and the installation cost would be considerable, even where space permits. Such helicopters are generally approved for VFR flight only and flight in the absence of visual cues is prohibited. Therefore the safety benefit from a back-up attitude indicator does not justify the cost.

The reference to "in the case of helicopters, two separate means of indicating attitude" should be deleted for private VFR operations.

comment *6880* comment by: *Luftsport-Verband Bayern*

…two separate means of indicating attitude shall be available…

Die Mitglieder des Deutschen Hubschrauberclubs, Mitglied im Luftsport-Verband Bayern und DAeC, fürhen ihre Hubschrauberflüge nach Sichtflugregeln durch, zwei Geräte fordert auch die ICAO nicht, Hubschrauber werden zumeist von einem Piloten geflogen.

Wo soll bei einer R-22 ein zweites Gerät installiert werden?

Dieses sollte gestrichen werden.

comment *6903* comment by: *Swiss Helicopter Group*

sub para (a) (1) There is no need for equipment on a sailplane to indicate time in seconds. Further, it is not necessary to have a time-piece in the sailplane itself. A wrist watch on the pilot is sufficient. Sailplane panels are already very crowded. And adding a clock to the panel would no doubt involve a minor modification approval under Part 21, at great certification expense. Totally unnecessary.

Proposal: If EASA insists on sailplane pilots have on board a means of determining the time, then the rule should exclude the need for a time piece in seconds, and a wrist watch on the pilot should be allowed.

comment *7470* comment by: *Henry Pelham*

Page 42 Ops.Gen.410 (b) (3)

It is almost impossible to fit a second AI in my Enstrom 480 the cost would be considerable and out of all proportion to its enhancement of safety the helicopter is not permitted to fly in IFR conditions. AIs are very reliable. This would appear to be complete overkill. It has never been mandatory to fit second a AI and there have not so far as I am aware been any critical failures in non complex private Helicopters.

comment *7479* comment by: *Norwegian Air Sports Federation, Gliding Section*

OPS.GEN.410 Flight Instruments and equipment - VFR flights

(a) (1) A magnetic heading indicator (compass) should not be required for sailplanes.

According to Certification Specification CS-22, para CS 22.1303, a magnetic heading indicator is only required for powered sailplanes, and is not installed in a large number of European sailplanes. Sailplanes do not usually rely on flying precise compass headings for navigation, as they need to follow areas of lift for cross-country flights. Many training sailplanes are only used for local flights, where a compass is a superfluous instrument.

The compass is not normally a very expensive instrument, but periodic calibration of compasses in all sailplanes will place an additional burden on sailplane maintenance organisations/personell, in many cases this is work performed on instrument that provides very little practical benefil to sailplane pilots.

(a) (2) The pilot's personal wrist-watch (or similar) should be sufficient to indicate time.

comment *7481* comment by: *simon lichtenstein*

Night Flight

I just cannot see any justification for these proposals either. The cost, the weight again, would cause performance problems rendering R22s unflyable and R44s hugely more expensive. We already have to add TWO extra lights here in the UK than they do in USA where the original two are fine. These extra lights add weight and cause drag on the aircraft increasing fuel consumption and therefore C02 output and some times if activated accidentally in the daytime can cause people to run their batteries flat, so in effect causing anther potential problem.

Solution

It seems to me that if you were to simply bring the light/private helicopters under the same rules as private fixed wing then most of the objections I have would be removed and that there would be more harmony and clarity to the rules for all concerned. I wish to see the day where there are more light helicopter types around rejuvenating our ailing aviation industry. In Italy there are two different light helicopter types that fly there legally and in France that are not allowed to fly here in the UK. I would like to see the rules go the way the microlight world went, which is now safer than it has ever been.

comment *7485* comment by: *Arno Glover*

In the case of helicopters, two separate means of indicating attitude shall be available.

VFR helicopters do not require a second AI in order operate within the constraints of VFR flight – a single AI is sufficient and its loss in VMC conditions will not prevent a safe powered landing.

comment *7497* comment by: *David George*

"Attitude. In the case of helicopters, two separate means of indicating attitude shall be available."

All UK single engined helicopters are VFR only and many do not have an Artificial Horizon. To insist on two AHs being fitted is ridiculous. Most light helicopters would not have the panel space and it would be extremely expensive.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.415 Flight instruments and equipment - VFR night flights and IFR flights p. 43-44

comment *31* comment by: *George Knight*

This whole section seems to attempt to impose commercial standards where they are not appropriate. Furthermore by combining the requirements for night flying with instrument flying it will make if complexly impossible for sailplanes and many other light aircraft to fly on instruments in daylight if permitted by pilot licensing rules which are not yet finalised.

Sailplanes rarely fly at night and for those that do existing rules are sufficient. I have made a proposal later in this comment.

When sailplanes fly IFR it is only en-route and never for take off or for approach and landing. Invariably they fly IMC / IFR by day. For those reasons most of the proposals in this rule which assume that aircraft that fly IMC will also do so at night are totally inappropriate for sailplanes. There is no safety case for the disproportionate proposal to apply rules designed for CAT to sailplanes. In any case the power required is not available. The requirements for instrument lights and cabin lights in gliders is beyond any reasonable persons comprehension.

I believe a only solution is to separate this section into two. One section covering night flights and the other IFR flights. I propose:

OPS.GEN.415a

Flight instruments and equipment - VFR night flights

AEROPLANES AND HELICOPTERS.

(a) Aeroplanes and helicopters operating Visual Flight Rules (VFR) night flights shall, in addition to complying with OPS.GEN.410(a), (b), and (c), be

equipped with:

(1) a means of measuring and displaying outside air temperature;

(2) a means of preventing malfunction due to either condensation or icing for the means of measuring and displaying indicated air speed;

(3) an alternative source of static pressure;

(4) an anti-collision light system;

(5) navigation/position lights;

(6) a landing light;

(7) lighting supplied from the aircraft's electrical system to provide adequate illumination for all instruments and equipment essential to the safe operation of the aircraft;

(8) lighting supplied from the aircraft's electrical system to provide illumination in all passenger compartments;

(9) an electric torch for each crew member station;

(10) lights to conform with International Regulations for Preventing Collisions at Sea (hereinafter referred to as International Regulations for Preventing Collisions at Sea) if the aircraft is amphibious; and

(11) in the case of aeroplanes with speed limitations expressed in terms of Mach number, a means of indicating Mach number.

(b) Aeroplanes operating VFR night flights shall be equipped with a chart holder in an easily readable position which can be illuminated for night operations.

SAILPLANES

Sailplanes operating VFR night flights shall display either a steady red light of at least five candela, showing in all directions, or lights in accordance (a) (5) and (9). [This is the current UK regulation.]

BALLOONS

(d) Balloons operated at night shall, in addition to complying with OPS.GEN.410a (d) and (e), as applicable, be equipped with:

(1) position lights; and

(2) a means of illuminating all of the instruments used by the flight crew.

OPS.GEN.415b

Flight instruments and equipment – Day IFR/IMC flights

AEROPLANES AND HELICOPTERS.

(a) Aeroplanes and helicopters operating Instrument Flight Rules / IMC flights shall, in addition to complying with OPS.GEN.410(a), (b), and (c), be equipped with:

(1) a means of measuring and displaying outside air temperature;

(2) a means of preventing malfunction due to either condensation or icing for the means of measuring and displaying indicated air speed;

(3) an alternative source of static pressure;

(11) in the case of aeroplanes with speed limitations expressed in terms of Mach number, a means of indicating Mach number.

SAILPLANES

Sailplanes operating day IFR flights, shall comply with OPS.GEN.415b (a) (1)

comment *99* comment by: *EUROCOPTER*

Comment on OPS.GEN.415 (b) (CHART HOLDER):

In order to allow classical charts displayed on chart holders or charts electronically displayed by EFBs (Electronic Flight Bags), it is proposed to change the word "chart holder" to a more generic one, and to transfer into the AMC the installation constraint of the chart illumination.

(b) ... shall be equipped with ***~~a chart holder in an easily readable position which can be illuminated for night operations~~ a means to hold or to electronically display a chart.***

See also the associated proposed modification in AMC OPS.GEN.415 (b)

comment *353* comment by: *ECA - European Cockpit Association*

Comment: as the wording into the parenthesis is redundant, change as follows:

(10) lights to conform with International Regulations for Preventing Collisions at Sea **~~(hereinafter referred to as International Regulations for Preventing Collisions at Sea)~~** if the aircraft is amphibious; and

comment *415* comment by: *EHOC*

Paragraph (a)(3)

The requirement for an 'alternate source of static pressure' is an extremely heavy requirement for GA helicopters; such provisions are usually only provided if an aircraft is certificated for flight in IMC - not for VFR night flights. This requirement would constrain night VFR flight to helicopters which have been certificated to Appendix C of CS-27/29.

These issues have been avoided in Annex 6 Part III - which follows the FARs, and breaks the SARPs for instruments into three sets: VFR Day; VFR Night; and IFR (day and night). If it is decided that this is not appropriate, there must be additional provisions (alleviations) for those helicopters which will be flying VFR Night but not IFR.

Paragraph (a)(4)

Because anti-coll for helicopters already occurs in CAT.410; it appears to be a double requirement.

comment *554* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.415(a)(9): change as follows: choose one of the two options:

(9) an electric torch for each **required** crew**member readily accessible at their designated** ~~**member**~~ station;

OR

(9) an electric torch **at** ~~**for**~~ each crew member station;

Justification:

In line with JAR-OPS and grammatically more correct.

comment *824* comment by: *Reto Ruesch*

At least two landing lights; electric torch for each crew member

ICAO Annex 6 Part III now has separate requirements for night VFR for helicopters.The ICAO designation for helicopters should be used; it removes 'flight in controlled airspace' and has three separate requirements ('Day VFR', 'Night VFR' and 'IFR - day and night').

comment *914* comment by: *CAA-NL*

Comment regarding:

SAILPLANES

(c) Sailplanes operating VFR night flights or IFR flights, shall comply with (a) (4) to (10) inclusive.

Comment CAA-NL:

Sailplanes don’t fly IFR but only temp IMC (cloud flying)

comment *1090* comment by: *EUROCOPTER*

Comment on OPS.GEN.415(a)(3):

Wording modification proposal:

~~***(a)(3) an alternative source of static pressure.***~~

Reason: the requirement of an alternate source of static pressure is not requested by ICAO Annex 6 Part III Section III General Aviation - what is the justification of this requirement? We draw the attention that currently many single helicopters are not equipped with an alternate source of static presure because it is not mandated by ICAO and because JAR-OPS 3 (CAT) forbids to operate in VFR night, as it is a limitation of the Performance Class 3.

comment *1125* comment by: *Heli Gotthard*

comment *1550* comment by: *Des Russell*

Ref: Fitting IFR equipment in a VFR only private helicopter

Fitting a helicopter with equipment that is necessary only in IFR conditions will only serve to encourage pilots to fly in those conditions thereby breaking the law and being a negative as far as safety is concerned.

comment *1618* comment by: *Luftfahrt-Bundesamt*

The LBA requests to stay away from the performance base rule making here. If this system shall be used, OPS.GEN 405 should be phrased in a similar way. However, this does not make much sense at all. Same with this paragraph.

Justification: see LBA - General Comment, reason 3.

comment *1658* comment by: *Netcopter*

As I Director and Pilot in Charge for an SME that has successfully and safely operated a single engine turbine helicopter on self-fly business for almost 10 years, I am very concerned that proposed ICAO standards severely discriminate against the practical and efficient use of this type of helicopter within the British Isles. The proposals will increase operating costs

disproportionately and jeopardise the viability of being able to operate a non-complex turbine helicopter in the manner we have done for many years. Additionally as a PPL(A) holder with some 500+ hours of fixed wing experience, I note that private helicopters are not being treated the same as private fixed wing operations, and in my experience the turbine helicopter engine is substantially a more stable and mechanically reliable device that many piston engines fitted to the fixed wing fleet.

comment *1662* comment by: *Netcopter*

I have safely operated my single engine turbine helicopter on VFR night operations (non-icing conditions). This has been assisted by the fitment of a pilot movable landing light and a radar altimeter. I see no justification in the requirement for a second attitude indicator, installation of pitot tube heater nor alternative static pressure source, which would be economically and technically prohibitive to retro-fit on what is at 1998 model year, a relatively young helicopter. I believe the disadvantages of the ICAO proposal firmly outweighs any likely benefit.

comment *1666* comment by: *JSLEE*

Page43

Ops.Gen.415 (a) (2)

A means of preventing malfunction due to either condensation or icing for means of measuring and displaying indicated air speed

As EASA have not given reasons for the proposed changes to the equipment needed for day or night flying one can only assume that they are unaware of the limitations of single engine helicopter metrological flying conditions.

A single engine helicopter is only permitted to fly in visual flight conditions.

This means they must remain clear of clouds at all times.

The only time a pilot flying in VFR conditions would need a heated pitot tube is if the aircraft has entered icing conditions, which would only normally occur in cloud at or above the freezing level. In which case the pilot would not be flying in VFR conditions and flying illegally. The fitting of these instruments may indeed encourage instrument rated pilots to do so.

The fitting of a heated pitot tube would be very expensive and may need CAA approval with the associated approval costs and would be disproportionate to any benefit.

comment *1716* comment by: *William Harford*

An alternate source of static pressure and provision for preventing icing on airspeed sensors only becomes relevant during flight in cloud or known icing conditions.

Helicopters operating under VFR at night do not require such a provision.

There are no non complex helicopters which are certified to operate in known icing conditions.

comment *1738* comment by: *Richard David Jordan*

We are in disagreement with the proposals for the following reasons:-

There is no safety case for the proposal.

Mechanical failure over water hasn't been a major reason for accidents in the past 20 years.

PPLH pilots have been flying over water without floats and without ELT for many years. There is no good reason to change the current regulations.

Costs of altering small helicopters to fit this extra equipment is expensive (Euro 30,800 just to fit it) and the extra weight would reduce safety and would consume more fuel!

If a helicopter pilots should be fit to decide if they want to install expensive and complex extra equipment.

If a helicopter fitted with floats crashes into anything other than flat-calm water then it will sink and be lost.

comment *1748* comment by: *Richard Dawson*

(a)(2) a means of preventing malfunction due to condensation.....

VFR helicopters are by definition not allowed to flying in icing conditions and therefore a heated pitot tube are unnecessary. This requirement would therefore be a large cost (if it is even possible) for no practical purpose.

comment *1749* comment by: *Richard Dawson*

(a)(3) *alternative source of static pressure*

This is not a reasonable requirement for VFR helicopters which don'talready have this incorporated into the design. This requirement would be valid for a helicopter used for IFR however most privately owned helicopters are non-complex and do not need this. Adding this to a helicopter would be expensive and serve no practical purpose.

comment *1791* comment by: *Heli Gotthard AG Erstfeld*

OPS.GEN.415 At least two landing lights; electric torch for each crew member

ICAO Annex 6 Part III now has separate requirements for night VFR for helicopters.The ICAO designation for helicopters should be used; it removes 'flight in controlled airspace' and has three separate requirements ('Day VFR', 'Night VFR' and 'IFR - day and night').

comment *1792* comment by: *Heli Gotthard AG Erstfeld*

OPS.GEN.410 Flight instruments and equipment-VFR flights

The set of rules for instruments VFR, night VFR and IFR are made extremely complex by the policy of inheritance. It is not certain that the existing text provides a clear and unambiguous text for each and every categorisation that is required. The combination of rules has to provide for simple types and complex types in General Aviation; it must also cater for simple types and complex types in Commercial Air Transport; and simple and complex types in commercial and noncommercial Aerial Work. The criteria for instruments and equipment varies for simple types within GA, CAT and AW and also for complex types in GA, CAT and AW. There are also differences between: single pilot and two pilots; operations when control can be maintained by reference outside the cockpit and those where it cannot - even though all of these are designated as VFR (and even further complicated by the inheritance from VFR to IFR). To maintain a simple operational text, it might be better to establish separate rules in each of the Subparts GEN, CAT and COM

comment *1826* comment by: *Q Aviation Ltd*

This is completely impractical for smaller VFR helicopters

why would we fly in these conditions anyway? We don't now, so there is no need to impose impossible legislation that will acheive nothing.

comment *1853* comment by: *Aeromega*

These requirements are not practical to fit on small helicopters. What evidence is there that accidents have occurred due to the absence of items such as heated pitots on small helicopters flying at night. Weight limitations and system requirements would mean that the useable load of small helicopters such as the R22 would be reduced further by this equipment. Training for night qualifications would therefore have to be carried out on larger more expensive types adding to the costs of obtaining a CPL (H).

comment *1904* comment by: *Ian MACDONALD*

Section (a) (2) There is no VFR helicopter licenced for flight in icing conditions. Installing should equipment would only increase the chance of accidents and the additional weight penalty, complete with all the other modifications, would see many hundreds of light helicopters rendered practically inoperable.

comment *1906* comment by: *Helifly (UK) Ltd*

Objection to OPS.GEN.415 a2

There is no heated pitot option for a Robinson R44, and there does not need to be one! The machine is only certified for flight under VFR rules outside of conditions that could lead to icing. The proposal would be expensive to implement and is disproportionate for a non-complex helicopter operated within the terms of the POH.

Objection to OPS.GEN.415 a3

The objection is the same as for a2. An alternate source of static pressure is not required for a non-complex light helicopter operated in VFR conditions within the terms of the POH.

comment *1916* comment by: *Ingmar Hedblom*

(a)(1) Why only amphibious aircraft and not all aircraft operating from water?

(b) Normally during VFR Day or Night charts are handled in the same way

and chart holders are not used. Why are helicopters not required to carry chart holder at night?

A Chart holder is normally used to hold the approach and landing plates during IFR flights

(d) Normally a balloon is moving with the air mass and how shall the position lights be oriented?

Proposed text: "(b) Aeroplanes operating IFR flights and helicopters operating IFR flights shall be equipped with a chart holder in an easily readable position which can be illuminated for night operations."

comment *1935* comment by: *Berner Oberländer Helikopter AG BOHAG*

ICAO Annex 6 Part III now has separate requirements for night VFR for helicopters.The ICAO designation for helicopters should be used; it removes 'flight in controlled airspace' and has three separate requirements ('Day VFR', 'Night VFR' and 'IFR - day and night').

comment *2029* comment by: *Ulrich Baum*

Ref. (3): many small airplanes currently approved for night VFR (but not for IFR) do not provide an alternate source of static pressure. This requirement would require operators to install such an alternat source, which will result in an undue cost, if it is possible to have it certified in the first place. I suggest to drop this requirement for night VFR flights.

comment *2092* comment by: *Dirk Hatebur*

comment *2535* comment by: *Aerocorp Limited*

The helicopters we safely operate VFR at night are not permitted to fly in icing conditions. Condensation in the pitot lines has never been an issue and it should be borne in mind that helicopters, unlike fixed wing aircraft, are not as critically affected by incorrect airspeed indications or static source line problems. We can always stop and consider the situation!

As far as we are aware, the machines we operate cannot be fitted with pitot heaters and there is no available modification for the provision of an alternate static source.

Being unable to operate at night would severely restrict our winter operations. We could really do without this unjustifiable meddling and intrusion in these difficult times.

comment *2538* comment by: *James Leavesley*

As A PPL pilot my license doesn't allow me to fly in icing conditions therefore this is another expense and adds weight to my machinewaist to weight and money

Same goes for the extra sourse of static, extra weight and would require another instrument where there is no room on the pannel.

Extra Lights - My R44 has already got two very good night light s and two fixed emergency lights, they ppoint in the direction of travel and are excellent at night. Additional requirent are only going to increase wieght and require expensive equipment change,, please no

Knee boards - I do not believe that an illuminiated knee board would help in any way, it would be an additional distraction when flying at night, the less light in the cockpit the better whatever the colour

comment *2549* comment by: *Walter Mayer, Heliswiss*

ICAO Annex 6 Part III now has separate requirements for night VFR for helicopters.The ICAO designation for helicopters should be used; it removes 'flight in controlled airspace' and has three separate requirements ('Day VFR', 'Night VFR' and 'IFR - day and night').

comment *2617* comment by: *John Matchett*

It is illegal for VFR helicopter pilots to fly IFR unless they have an appropiate

rating. In VFR flight such conditions are rarely encountered and are overcoming by applying VFR flying rules

comment *2645* comment by: *British Gliding Association*

OPS GEN 415 presents a number of technical and operational difficulties and indeed impossibilities for sailplanes, which of course cannot generate electrical power.

Sailplanes very occasionally fly at night. Sailplanes that operate at night carry position lights and the BGA supports that continued requirement.

For operational, safety and sporting reasons and where airspace classifications allow, sailplanes can and do fly non-VFR when en-route. Sailplanes do not take off or land non-VFR. When operating non-VFR, sailplanes do not carry the equipment or lights described in this IR and there is no known safety case that would require them to do so.The proposed requirement is disproportional.

The total power drain from the equipment required under OPS GEN 415, ie. navigation/position lights, adequate illumination for all instruments and equipment essential to the safe operation of the aircraft, a landing light and illumination in all passenger compartments would preclude a sailplane from operating other than in day VFR flight. Clearly this is not the intention of this IR.

The BGA propose that the wording of OPS.GEN 415 (c) should be modified

as follows;

SAILPLANES

(c) Sailplanes operating VFR or IFR night flights shall comply with (a) (5), (9) and (10) inclusive.

comment *2662* comment by: *AOPA-Sweden*

(a) (9): A carry-on flash-light should be acceptable for small GA-airplanes with a MTOW <5,700kg.

comment *2663* comment by: *AOPA-Sweden*

(b): This requirement should only be applicable to IFR flights. For VFR flights, AOPA-S does not deem a lighted chart holder necessary and the size of the map will make it impractical to fit in, since the critical parts of the flight will be performed with visual references.

comment *2804* comment by: *Ed Sturmer*

Pitot de-icing night VFR in small helicopters.

VFR is VFR even at night.

Experience and statistics show no safety benefit to this expensive proposal.

comment *2806* comment by: *Ed Sturmer*

Alternate staic small helicopters VFR night.

Ditto

Experience and statistics show no safety benefit to this expensive proposal.

comment *2823* comment by: *Peter Waldron*

In regard to the means of preventing malfunction due to either condensation or icing for the means of measuring and displaying indicated air speed.

This is an unreasonable requirement for VFR flight either by day or by night. When the flight is in visual conditions a heated pilot head is unnecessary. It would be an unnecessary and expensive requirement which would only be of use in icy flying weather and such flight is prohibited in VFR helicopters.

comment *2827* comment by: *Peter Waldron*

An alternative source of static pressure.

This is an unreasonable requirement for VFR flight whether by day or night. If the flight is on a visual basis an alternative static source would be completely unnecessary. Private VFR helicopters are not generally equipped as per this proposal. Again this is unnecessary and would be an expensive requirement which would only be of use in icy conditions. This is prohibited in VFR helicopters.

Paragraph No: OPS.GEN.415

Comment:

This paragraph, together with OPS.GEN.410, detail the required flight instruments and equipment for various flight regimes. The matter is complex due the varying requirements of the different types of operation, the flight conditions and the time of day. It is felt that the subject could be simplified by breaking out the lighting requirements from the instrument requirements into a new section (OPS.GEN.XXX) as there are several errors of commission included in the NPA. It is also necessary to capture some additional requirements noted in ICAO Annex 6 Part II and III (Section III). The full section is reproduced for clarity of the changes. It is not clear, other than as mentioned in draft JAR-OPS 0, where the requirement at (a)(3) for an alternative source of static pressure arises from so it has been deleted. Nor is it clear where the requirement at original paragraph (c) for a Sailplane to have an anti-collision light arises from, so this has also been deleted.

These changes will require consequential adjustments to be made to the associated AMCs and GM.

Justification:

Simplification of the text, correction of errors of commission and inclusion of missing elements of ICAO Annex 6 Part II and III. Deletion of need for an alternative source of static pressure as no requirement can be found at this level of regulation. Original paragraph (a)(10) has been corrected to delete duplication of text and to change 'amphibious' to *'operation on the water'* as some seaplanes are not amphibious.

Proposed Text (if applicable):

OPS.GEN.415 Flight instruments and equipment - VFR night flights and IFR flights

AEROPLANES AND HELICOPTERS.

(a) Aeroplanes and helicopters operating Visual Flight Rules (VFR) night flights and Instrument Flight Rules (IFR) flights shall, in addition to complying with OPS.GEN.410(a), ***and*** (b) ~~and (c),~~ be equipped with:

(1) a means of measuring and displaying outside air temperature;

(2) a means of preventing malfunction due to either condensation or icing for the means of measuring and displaying indicated air speed;

~~(3) an alternative source of static pressure;~~

~~(4) an anti-collision light system;~~

~~(5) navigation/position lights;~~

~~(6) a landing light;~~

~~(7) lighting supplied from the aircraft's electrical system to provide adequate illumination for all instruments and equipment essential to the safe operation of the aircraft;~~

~~(8) lighting supplied from the aircraft's electrical system to provide illumination in all passenger compartments;~~

~~(9) an electric torch for each crew member station;~~

~~(10) lights to conform with International Regulations for Preventing Collisions at Sea (hereinafter referred to as International Regulations for Preventing Collisions at Sea) if the aircraft is amphibious; and~~

~~(11) in the case of aeroplanes with speed limitations expressed in terms of Mach number, a means of indicating Mach number~~.

(b) Aeroplanes operating VFR night flights and IFR flights and helicopters operating IFR flights shall be equipped with a chart holder in an easily readable position which can be illuminated for night operations.

(c) Helicopters operating IFR flights shall be equipped with an additional means of measuring and displaying attitude.

(d) Complex Motor Powered Aeroplanes operating IFR flights shall

comply with OPS.GEN.410(c).

~~SAILPLANES~~

~~(c) Sailplanes operating VFR night flights or IFR flights, shall comply with (a) (4) to (10) inclusive.~~

~~BALLOONS~~

~~(d) Balloons operated at night shall, in addition to complying with OPS.GEN.410(d) and (e), as applicable, be equipped with:~~

~~(1) position lights; and~~

~~(2) a means of illuminating all of the instruments used by the flight crew.~~

OPS.GEN.XXX Aircraft Operating Lights

AEROPLANES AND HELICOPTERS

(a) Aeroplanes and helicopters operating at night shall be equipped with:

(1) an anti-collision light system;

(2) navigation lights;

(2) a landing light;

(3) lighting supplied from the aircraft's electrical system to provide adequate illumination for all instruments and equipment essential to the safe operation of the aircraft;

(4) an electric torch for each crew member station;

(5) lighting supplied from the aircraft's electrical system to provide illumination in all passenger compartments; and

(6) lights to conform with International Regulations for Preventing Collisions at Sea if the aircraft is ~~amphibious~~ operated on the water.

(b) Aeroplanes and helicopters fitted with an anti-collision light system shall display that light in flight during the day.

SAILPLANES

(c) Sailplanes operated at night shall comply with (a) (2) to (4) inclusive.

BALLOONS

(d) Balloons operated at night shall be equipped with:

(1) position lights; and

(2) a means of illuminating all of the instruments used by the flight crew

comment *3241* comment by: *Suffolk Helicopters*

OPS.GEN.415 Flight instruments and equipment - VFR night flights and IFR flights a means of preventing malfunction due to either condensation or icing for the means of measuring and displaying indicated air speed;

This is unnecessary and excessive as helicopters are prohibited from flying in icing conditions.

comment *3246* comment by: *Suffolk Helicopters*

OPS.GEN.415 Flight instruments and equipment - VFR night flights and IFR flights

AEROPLANES AND HELICOPTERS.

(a) Aeroplanes and helicopters operating Visual Flight Rules (VFR) night flights and

Instrument Flight Rules (IFR) flights shall, in addition to complying with OPS.GEN.410(a), (b), and (c), be equipped with:

(3) an alternative source of static pressure;

Comment

This is an unnecessary and excessive requirement, with no safety justification, and virtually impossible to implement for most light helicopters.

comment *3251* comment by: *Aero-Club of Switzerland*

(a) (2) is disproportionate for aircraft engaged under VFR it is reasonable under IFR, please adapt your proposal.

Justification: If flights are undertaken in VMC under VFR a heated pitot head is not necessary in our view.

(a) (3) We do not see a need for an alternative source of static pressure an all aircraft. Please adapt your proposal.

Justification: An alternative source of static pressure would be of use only while flying in icing conditions. We think such flights are not undertaken under VFR.

(c): We ask the Agency to exclude (a) (4) ... (10) as requirement for cloud flying with sailplanes.

Justifications: We do not see a reasonable possibility to install an appropriate power source.

Sailplanes very rarely fly at night.

General question: Is this paragraph in line with the latest ICAO Annex 6 Part III requirements?

comment *3380* comment by: *guy Corbett*

Paragraph (c) Sailplanes operating VFR night flights or IFR flights, shall comply with (a) (4) to (10) inclusive.

should be changed to

(c) Sailplanes operating VFR night flights shall comply with (a) (4) to (10) inclusive.

As sailplanes do not have sufficient electrical power to comply with these rules and the IFR flight will only be en-route and exclude take-off and landing

comment *3549* comment by: *IAOPA Europe*

To require that VFR night flight are subject to the same equipment requirements as IFR flights is not reasonable.

For VFR night flight the following equipment is not relevant as compared to VFR day flights:

* Means of measuring and displaying outside air temperature (no difference from VFR day operations)

* Pitot heating (since the aircraft will not enter clouds - no difference from VFR day operations)

* Mach indicator (no difference from VFR day operations)

* illuminated chart holder (cockpit lighting or a torch will be be sufficient and most VFR maps will not fit a chart holder anyway)

comment *3563* comment by: *Walter Gessky*

OPS.GEN.415 Flight instruments and equipment - VFR night flights and IFR flights

(a)(1) Lights required at Sea shall be mentioned in this point and not a reference used to other regulations.

SAILPLANES

(c) Sailplanes operating VFR night flights or ~~IFR flights~~ **flights in clouds**, shall comply with (a) (4) to (10) inclusive.

Justification:

Delete IFR flights, no controlled flight under IFR possible.

comment *3590* comment by: *PPL/IR Europe*

Para (b) is not a certification requirement for night VFR or IFR and should be deleted for non-commerical operations. The varierty of suitable cockpit lighting, accessories and layout is captured during certification of individual types, and should not be constrained by this kind of "one-size-fits-all" regulation.

comment *3739* comment by: *Civil Aviation Authority of Norway*

OPS GEN 415: ICAO Annex 6 Part III now has separate requirements for night VFR for helicopters. The ICAO designation for helicopters should be used; it removes 'flight in controlled airspace' and has three separate requirements

('Day VFR', 'Night VFR' and 'IFR - day and night').

comment *4109* comment by: *Benedikt SCHLEGEL*

ICAO Annex 6 Part III now has separate requirements for night VFR for helicopters.The ICAO designation for helicopters should be used; it removes 'flight in controlled airspace' and has three separate requirements ('Day VFR', 'Night VFR' and 'IFR - day and night').

comment *4153* comment by: *colin rosenberg*

I feel the instruments currently used now for the night flight to be more than adequate, and unnessary to add more, obviously from a cost point of view, and feel very safe flying at night with what we have now.

comment *4208* comment by: *DGAC*

Amend the title as follows to take into account the fact that not only VFR night flights and IFR flights are dealt with in this paragraph and that the criteria are not only the flight rules but the meteorological conditions :

"Flight instruments and equipment – **Flight at night or in IMC and** VFR night flights and IFR flights"

comment *4209* comment by: *DGAC*

O **Proposal:** Add to (a)(1) '… **for IMC flights** » and add the following instruments :

1) 1) attitude

2) stabilized heading

3) vertical speed

4) a second attitude instrument or a turn and slip indicator with an electrical supply independent from the first one

comment *4210* comment by: *DGAC*

O Besides there are numerous other instruments required by our national safety requirements for general aviation which are missing in this NPA. Drawing the comparison has been really time consuming. We are not in a position, though, to make deeper comment in such a short time. This is in favour of converting this NPA into an A-NPA to enable stakeholders to give deeper comments

comment *4211* comment by: *DGAC*

O There seems to be provisions missing, compared to annex 6 and our national rules, requiring minimum performance specifications for instruments such as failure indicators, etc. We might be wrong but the reading is not always easy.

comment *4212* comment by: *DGAC*

Proposal : Rewrite "Sailplanes operating ~~VFR night flights~~ **at night** or **in IMC** ~~IFR flights~~"

Justification : No sailplanes are allowed in IFR flights (some are allowed in IMC in some MS)

comment *4401* comment by: *Helikopter Air Transport GmbH / Christophorus Flugrettungsverein*

Should state: (a) Aeroplanes and helicopters operating Visual Flight Rules (VFR) night flights and Instrument Flight Rules (IFR) flights shall, in addition to complying with OPS.GEN.410(a), (b), **and if applicable** (c), be equipped with:

OPS.GEN.415 Flight Instruments & Eqpt. VFR Night Para. (a) , (2)

Fitting a heated pitot to an aircraft such as a small helicopter which is not cleared for flight into icing conditions is quite simply not necessary. This item should be removed.

comment *5600* comment by: *Peter Moeller*

415(a)(6) this should be two landing lights of which one at least is adjustable

comment *5604* comment by: *Peter Moeller*

415(b) For IFR flights with helicopters a kneeboard which can be iluminated for night flights should be enough to provide adequate safety.

comment *5674* comment by: *DON BURT*

A (2) A headed pitot tube would be needed in icing conditions. Helicopters are not allowed to fly in icing conditions and therefore a heated pitot tube would appear not to be needed. Such a fitment would be an expensive as there is no provision for this item in a R44

A (3) As helicopters can't fly in icing conditions where is the need for an alternative source of static pressure.

comment *5697* comment by: *Avon CAYZER*

OPS GEN 415. Why do you need a second alternative static preessure source & gauge, a backup portable gps with speed and altitude covers this for £300-£1,000.

OPS GEN 425 DITCHING

Private Helicopters have a excellent safety record with very few machines having ditched and almost zero loss of life. These machines have not had floats which add weight and maynot inflate or partly inflate causing rollover. If the owner wants floats due to extended water flying that should be his /her / companies choice.

comment *5772* comment by: *Norsk Luftambulanse*

(a)(6) For helicopter 2 landing lights required, one at least trendable in the vertical plane (Search and landing light)

comment *5773* comment by: *Norsk Luftambulanse*

(b) For helicopter IFR operations a (lighted) kneeboard should be acceptable to fulfil this requirement.

comment *5799* comment by: *Ph.Walker*

ICAO Annex 6 Part III now has separate requirements for night VFR for helicopters.The ICAO designation for helicopters should be used; it removes 'flight in controlled airspace' and has three separate requirements ('Day VFR', 'Night VFR' and 'IFR - day and night').

comment *5869* comment by: *Ian Casselden*

Reason for Objection

Is this needed for light helicopters only cleared for VFR and non icing conditions

there is no history of this being a cause of any incident or accident in the UK

most (if not all) light helicopter are not equiped, the modification cost would high and for some machines not possible.

the disadvantages of reduces battery life if an electrical fault occured and harder work altenators, reduce engine power etc would far outweigh the benefits

flight in icing conditions is prohibited in VFR helicopters.

Ops.Gen.415 (a)(2)

Except for non complex helicopters in private visual flight, a means of preventing malfunction due to either condensation or icing for the means of measuring and displaying indicated air speed.

Acceptable means of compliance

None -

(a) (2) - Not necessary for VFR flight - not allowed to fly IMC or icing conditions.

comment *6440* comment by: *George Heritage*

(a) (3) - Unnecessary for private VFR helicopters and would be only of use in icing conditions, which are prohibited anyway.

comment *6531* comment by: *TG WHITING*

This section presents a number of difficulties for sailplanes, which only rarely fly at night and do not take off or land non-VFR. For those sailplanes that fly at night (not permitted in the UK) then these should carry position lights and this seems a necessary requirement.

For the vast majority of sailplane flights carried out in VFR conditions (on non-VFR en route where airspace classifications permit) do not require any of the lighting systems described here. The power drain on the equipment listed here would render a sailplane unable to operating in anything but a daytime VFR flight. This requirement seems disproportionate for the effect that it would have on sailplane operations, and I would like to see the wording modified to ensure that sailplanes comply with a (5), (9) and (10) when operating in VFR or IFR night flying.

comment *6553* comment by: *Sloane Helicopters Ltd*

Whilst this is a reasonable requirement for instrument flight, it is not for VFR flight, regardless of whether it is by day or by night. OPS.GEN.415 Flight instruments and equipment - VFR night flights and IFR flights AEROPLANES AND HELICOPTERS.

(b) Aeroplanes operating VFR night flights and IFR flights and helicopters operating IFR flights shall be equipped with a chart holder in an easily readable position which can be illuminated for night operations.

Remark: For helicopter IFR operations a (lighted) kneeboard should be acceptable to fulfil this requirement.

comment *6699* comment by: *Finnish Aeronautical Association - Kai Mönkkönen*

This OPS.GEN.415 creates several technical problems and clear impossibilities for sailplanes, that do not have a generator for making electric power.

We consider night flight operations occasionally only, but need for position lights for such cases seems to be obvious.

In case of part of a sailplane flight is made non-VFR (in case of a sailplane

cloud flying activity as allowed in several Member States like in Finland and Sweden among several others), there has not been need for this kind of set of an additional electrical equipment for internal or external lighting or illumination of a sailplane as now proposed in this IR. There are not known safety cases either to justify why this IR should now lay down requirements for sailplanes in this width.

The total power drain from the equipment required under OPS.GEN.415, i.e. navigation/position lights, adequate illumination for all instruments and equipment essential to the safe operation of the aircraft, a landing light and illumination in all passenger compartments would preclude a sailplane from other operations than in day in VFR. We can not believe this is the intentions of this IR.

We support that the wording of OPS.GEN.415 item (c) should be modified as proposed by the BGA in their relevant comment:

SAILPLANES

(c) Sailplanes operating VFR or IFR night lights shall comply with (a)(5), (9) and (10) inclusive.

comment *6713* comment by: *Kinetic Avionics Ltd*

415(a) (2) and (3). Comment

Small helicopter types are generally not equipped for IFR flight and are approved for day and night VFR operation only. Flight in cloud or icing conditions for these types is generally prohibited. Therefore these proposed requirements would lead to a high modification cost for no safety benefit, effectively prohibiting night flight for many helicopters.

Proposed wording change for (a) (2) and (3)

... except for helicopter types where flight in IMC or icing conditions is prohibited.

comment *6754* comment by: *Clive Morrell*

'A means of preventing malfunction due to either condensation or icing for the means of measuring and displaying indicating air speed.'

Comment; VFR helicopters are prohibited from entering icing conditions. If they inadvertently do so, they will have bigger problems to solve than air speed indication.

In addition, I do not believe that=2 0condensation is a problem in Indicated air speed systems.

In view of the above, heated pressure sensors would be totally unnecessary and an excessively expensive item to install in light VFR helicopters.

comment *6756* comment by: *Clive Morrell*

'An alternative source of static pressure.'

Comment; Failure of the main static source is an icing related problem. Icing conditions are prohibited in VFR helicopters. Few light VFR helicopters are equipped with an alternate static source and this does not seem to have been a problem in the past.

This should not be a requirement for simple VFR helicopters.

comment *6765* comment by: *Greger Ahlbeck*

Paragraph text: (a)(10) lights to conform with International Regulations for Preventing Collisions at Sea (hereinafter referred to as International Regulations for Preventing Collisions at Sea) if the aircraft is amphibious; and …

(b) Aeroplanes operating VFR night flights and IFR flights and helicopters operating IFR flights shall be equipped with a chart holder in an easily readable position which can be illuminated for night operations.

(d) Balloons operated at night shall, in addition to complying with OPS.GEN.410(d) and (e), as applicable, be equipped with: (1) position lights; and

Comment: (a)(1) Why is this paragraph only valid for amphibious aircraft and not all aircraft operating from water or moorining during darkness?

(b) Why are helicopters not required to carry chart holder at night?

(d) Normally a balloon is moving with the air mass and how shall the position lights be oriented?

comment *6778* comment by: *Greger Ahlbeck*

Paragraph text:

(b) Aeroplanes operating VFR night flights and IFR flights and helicopters operating IFR flights shall be equipped with a chart holder in an easily readable position which can be illuminated for night operations.

Comment:

(b) Helicopters are not required to carry chart holders during night operations. If chart holder means a device holding a landing plate or a approach chart this paragraph is then not applicable to aircraft operating VFR during night. Of course there must be necessary light available to read maps

Proposal (including ***new text***):delete the requirement to have chart holders on airplanes operating VFR night.

ICAO Annex 6 Part III now has separate requirements for night VFR for helicopters.The ICAO designation for helicopters should be used; it removes 'flight in controlled airspace' and has three separate requirements ('Day VFR', 'Night VFR' and 'IFR - day and night').

comment *6926* comment by: *Christian Hölzle*

The set of rules for instruments VFR, night VFR and IFR are made extremely complex by the policy of inheritance. It is not certain that the existing text provides a clear and unambiguous text for each and every categorisation that is required. The combination of rules has to provide for simple types and complex types in General Aviation; it must also cater for simple types and complex types in Commercial Air Transport; and simple and complex types in commercial and noncommercial Aerial Work. The criteria for instruments and equipment varies for simple types within GA, CAT and AW and also for complex types in GA, CAT and AW. There are also differences between: single pilot and two pilots; operations when control can be maintained by reference outside the cockpit and those where it cannot - even though all of these are designated as VFR (and even further complicated by the inheritance from VFR to IFR). To maintain a simple operational text, it might be better to establish separate rules in each of the Subparts GEN, CAT and COM.

Ops.Gen.415(a) (2) and (3). I object to these proposals. It's unnecessary and expensive equipment which would only be used if flying in icing conditions.

Such flights are prohibited in VFR helis.

comment *7180* comment by: *DHV*

Ops.Gen.415 (a) (2)

A means of preventing malfunction due to either condensation or icing for the means of measuring and displaying indicated air speed

Reason for Objection

Whilst this is a reasonable requirement for instrument flight, it is not for VFR flight, regardless of whether it is by day or by night. If the flight is in visual conditions, a heated pitot head is unnecessary. Many private VFR helicopters are not equipped as proposed. It would be an unnecessary, disproportionate and expensive requirement, and would only be of use if flying in icing conditions. Such flight is, in any case, prohibited in VFR helicopters.

Suggested alternative wording

Ops.Gen.415 (a)(2)

Except for non complex helicopters in private visual flight, a means of preventing malfunction due to either condensation or icing for the means of measuring and displaying indicated air speed.

Acceptable means of compliance

None -

Ops.Gen.415 (a) (3)

An alternative source of static pressure

Reason for Objection

Whilst this is a reasonable requirement for instrument flight, it is not for VFR flight, regardless of if it is by day or by night. If the flight is in visual conditions an alternate static source is unnecessary. Most private VFR helicopters are not equipped as proposed. It would be an unnecessary, disproportionate and expensive requirement, and would only be of use if flying in icing conditions. Such flight is prohibited in VFR helicopters.

Suggested alternative wording

Ops.Gen.415 (a)(3):

Except for non complex helicopters in private visual flight, an alternative source of static pressure.

Acceptable means of compliance

None -

comment *7293* comment by: *Richard Simpson*

OPS GEN 415 (a) (2)

A heated pitot tube is not a reasonable requirement for VFR flight in a non-complex piston helicopter. A heated pitot tube is only of use in icing conditions for which such machines are not cleared to fly i the first place. Fitting of such equipment is expensive and not in proportion with the use and complexity of such machines

OPS GEN 415 (a) (3)

An alternate static source is not a reasonable requirement and unnecessary for VFR flight in a non-complex piston helicopter either by day or night. Most aircraft are not equipped in this way. Fitting of such equipment is expensive and not in proportion with the normal use and complexity of such machines

comment *7318* comment by: *Danish Powerflying Union*

(b)

In several aeroplanes/aircrafts, especially other than complex motor-powered aircrafts, it will be difficult or impossible to fit a stationary chart holder in an easily readable position without interfering access to other equipment/functions during flight.

Instead we suggest following text:

(b) **.....shall be equipped with a stationary light, supplied from the aircrafts electrical system, to provide illumination for charts.**

comment *7392* comment by: *DAvid Monks*

A means of anti Icing is not required in VMC conditions whether operations is day or night. Under VFR flight in icing conditions is prohibited.

comment *7397* comment by: *DAvid Monks*

415 a3

It is not a reasonable request for an alternate static pressure source for a non complex VFR machine. It should not be required for a VFR flight.

comment *7453* comment by: *European Sailplane Manufacturers*

Sailplanes (c): Anti-collision lights, nav-lights and landing lights are not necessary for cloud flying with gliders.

Proposal: Exclude (a) (4) to (10) for cloud flying with sailplanes.

comment *7467* comment by: *David ROBERTS*

sub para (c) Sailplanes: Whilst the intro sub para (a) refers to VFR night flights and IFR, the case of sailplanes flying non VFR / IMC (vide FCL.008 discussion) needs to be considered.

The night flying rquirements are sensible, subject to the proposal modification below. To my knowledge in EU gliding, only the Poles do night flying in sailplanes (as I pointed out in the drafting discussion!)

Sailplanes fly non-VFR day in many EU states, and safely without the requirements set out in these proposed rules (a) (4) - (10). Sailplanes cannot generate power and have limited battery capacity, which is needed for the panel instrumentation and other equipment.

The external surfaces of sailplanes are designed for maximum efficiency and therefore any addtion / protusion would have an adverse impact on performance.

There is no safety case presented for these proposed rules, and as far as I am aware, there is no history of a lack of lighting being the cause of accidents in day-non VFR / IMC in sailplanes.

Proposal: Sailplanes to be excluded from these rules, except for night flight VFR where rules (a) (5) (9) and (10) only should apply.

comment *7473* comment by: *Henry Pelham*

Page 43

Ops.Gen.415 (a) (2) & (3)

These two items are just not available for an Enstrom 480 or for many non complex helicopters used for general aviation. If it were possible to fit them they would have to be designed and manufactured specially at considerable cost as the majority of non complex helicopters are manufactured in America where there is no such requirement it is likely that such modification would be very difficult to achieve.

comment *7486* comment by: *Arno Glover*

Ops.Gen.415 (a) (2)

A means of preventing malfunction due to either condensation or icing for

the means of measuring and displaying indicated air speed

A pitot head heater is required in icing conditions not normally associated with VFR flights in private VFR helicopters – to fit such an item is disproportionate in cost in relation to the perceived safety benefit particularly as flight in icing conditions is not permitted for VFR compliance.

comment *7487* comment by: *Arno Glover*

Ops.Gen.415 (a) (3)

An alternative source of static pressure

If the flight is conducted in VMC conditions an alternate static source is unnecessary – therefore this requirement is unnecessary for VFR only helicopters

comment *7498* comment by: *David George*

OPS.GEN.415 a2:-

"A means of preventing malfunction due to either condensation or icing for the means of measuring and displaying indicated air speed."

All UK single engined helicopters are VFR only. Fitting a heated pitot would only be worthwhile if a helicopter was flying IFR in icing conditions.

comment *7499* comment by: *David George*

Once again the decision what safety equipment is carried in a private helicopter is up to the pilot.

comment *1566* comment by: *Richard Paul Bateman*

There is no evidence base that this massive expense (floats etc) will save lives.

Helicopter regulations should be proportionate.

comment *1591* comment by: *Royal Danish Aeroclub*

Electric illuminations on flotation devices is all right.

But we do think that demanding electric illumination on each life jacket is to much. To keep the electric illumination is good shape and working is demanding. The same lightning can be supplied by chemical lights.

Electric or chemical illumination should be an option - not a demand.

comment *1619* comment by: *Luftfahrt-Bundesamt*

In our view, the text of GM OPS.GEN 420 (a)-(e) needs to be incorporated in the rule, as it is the case in EU-OPS. The text has clear rule character.

Applicability date 1 July 2008 needs to be adjusted.

comment *1659* comment by: *Peter Winslow*

This proposed legislation seems absolutely disproportionate to the risk. I do not believe there has ever been a case of an R22 or R44 ditching. Surely the kind of requirements that you outline should be confined to helicopters over 3175kg. Please don't spoil or make unaffordable the genuine enjoyment of visiting countries outside the UK.

What is the logic for wanting to apply this legislation to helicopters and not fixed wing?

comment *1660* comment by: *Netcopter*

My single engine turbine helicopter was originally delivered new with floats due to it's original base postioning on the Isle of Wight. With operational experience and with no likely probability of a mechanical failure over water, these floats were removed after less than 12 months. With float packs in place, airspeed performance reduced by 15 kts, useable payload reduced by 300 kgs, duration reduced by almost 30% and with corresponding increase in fuel consumption. In our experience, the limited time spent flying over water (beyond 10 mins flying time from land) cannot justify the additional capital and maintenance costs, and operational penalties associated with the requirement to carry floats. It is unreasonable to effectively ban a large proportion of the UK/Ireland helicopter fleet from crossing stretches of water.

comment 1668 comment by: *JSLEE*

Page45

Ops.Gen.420 (e) & Ops.Gen.425.H (b)

Over Water Equipment requirements

This proposal is prejudiced against non Main Land European helicopter owners/pilots.

UK owners/pilots live on an island and very occasionally wish to cross to main land Europe or to Ireland. The cost of carrying float equipment all year round for the occasional flight is quite ridiculous and out of proportion to the risk. The initial cost of fitting floatation equipment to my B206 is about £50,000.00 and would involve changing the skids from low to high. The cost of maintenance would also increase significantly.

Many helicopters such as the R22 cannot be retro fitted with floatation equipment.

The hourly cost of running a helicopter would increase due to the reduced air

speed caused by the additional drag and weight. Performance figures would change; this may require changes to the Pilots Operator Handbook? If this is the case the aircraft manufacturer can only do so who would pay his cost? Does the manufacturer still exist? In addition the payload would be reduced as the equipment weighs at least 50 kilos which means less fuel and or baggage can be carried.

The European Community are supposed to be leading the world in reducing carbon emissions this will only add to it.

There is also a very important safety issue. Most private helicopter pilots would never have operated a helicopter fitted with floatation equipment. All helicopter pilots practice autorotation as part of their training. I am reliably informed the technique may well be different when fitted with floatation equipment. An engine off landing onto water with the floats deployed will definitely be different and will normally result in the aircraft rolling and being lost.

Flying in and around the UK often involves flying for a short time over water, for example crossing rivers, reservoirs and lakes. For many years there has been a special helicopter route through London following the Thames which is in regular use by single engine helicopters without floatation equipment. To my knowledge there has never been an occasion where a helicopter using this route has landed on water due to an engine failure or any other malfunction.

Therefore to impose such a restriction as proposed serves no safety benefit whatsoever, but those owners/pilots whose aircraft are unable to comply will have severe flying restrictions, those who choose to comply will have significant capital and revenue expenditure. Private helicopter pilots are aware of the risks of flying over large expanses of water; but I suggest it is far less dangerous than when flying in mountainous areas such as the Alps. How long before EASA tries to ban single engine helicopters mountain flying.

Why is EASA trying to impose far more restrictions on helicopters than single engine fixed wing aircraft? A single engine aircraft crossing the channel from the UK flying below controlled airspace would not be able to make land from mid channel in the event of an engine failure; the requirements should be the same for both forms of aircraft.

comment *1673* comment by: *Dassault Aviation*

Editorial comment:

Page 44 : OPS.GEN.420 §(d)(2)(ii) : "is" seems superfluous.

comment *1717* comment by: *William Harford*

(e) (2) seems to assume that non complex single engined helicopters are less reliable that non complex motor powered single engined aeroplanes

which are permitted to fly up to the lesser of 30 minutes at cruising speed or 100nm from land without the carriage of life rafts.

Many small non complex privately operated helicopters do not have sufficient space within the cabin to carry a life raft.

Life rafts themselves represent a danger to flight should they inflate spontaneously.

UK CAA statistics demonstrate that privately operated single engined helicopters have a substantially better safety record with regard to flight over water than do privately operated single engined aeroplanes.

This proposal discriminates against privately operated single engined helicopters in an entirely arbitrary way.

Privately operated single engined helicopters should have parity with privately operated single engined aeroplanes.

comment *1740* comment by: *Richard David Jordan*

We are in disagreement with the proposals for the following reasons:-

There is no safety case for the proposal.

Mechanical failure over water hasn't been a major reason for accidents in the past 20 years.

PPLH pilots have been flying over water without floats and without ELT for many years. There is no good reason to change the current regulations.

Costs of altering small helicopters to fit this extra equipment is expensive (Euro 30,800 just to fit it) and the extra weight would reduce safety and would consume more fuel!

If a helicopter pilots should be fit to decide if they want to install expensive and complex extra equipment.

If a helicopter fitted with floats crashes into anything other than flat-calm water then it will sink and be lost.

comment *1750* comment by: *Richard Dawson*

(f)

The need to take a life raft on a private helicopter flight should be made at the discretion of the pilot. It should not be a requirement.

Some helicopters e.g. R22 are too small for a life raft to be realistically carried. In addition, there are significant dangers associated with doing so e.g. what the pilot (who may be alone) will do if the life raft inflates during flight - this could have catastrophic effect as controls are interfered with. Finally, and assuming the pilot has successfully ditched, it may be impossible for the pilot to manhandle the raft from the sinking helicopter while saving

themself and/or passengers.

comment *1827* comment by: *Q Aviation Ltd*

I fly a Robinson R22 helicopter, which is a small two seater.

there is no room for a dingy when there are two people on board.

it is completely impactical to insist on a dingy being carried.

I also fly a R44 4 seat helicopter. The dingy would have to be carried in the back, and the chance of getting it out and successfully inflated is about zero in the event of an emergency.

Fitting floats is either prohibitively expensive or impractical or impossible or all three.

There is no evidence to prove that fitting floatation devices will save lives. I don't think there are any cases of fatalities from drowning in UK waters after a survivable crash landing in water in private helicopters.

Flying for leisure carries a risk, just like everything else in life and I choose to mitigate this risk over water by

- checking the engine and other guages even more dilligently prior to "coasting out"

- choosing the shortest practical route over water to reach my intended destination

- wearing a life jacket and warm clothes

- carrying a PLB

- maintaining radio contact with the appropriate ground based service.

I am capable of making my own decisions to mitigate the risks of flying, and would suggest that no more regulation is required.

The cost of compliance - if possible - would be utterly disproportionate with the perceived benefits gained.

Why should there be any difference in the rules for a landplane and a helicopter?

In a typical year, a private pilot would fly between 30 and 75 hours. Of these, maybe 30 minutes would be over water. It doesn't make any sense to try and legislate against a problem that simply doesn't exist.

martin rutty

PPL with 2,500 TT and who regularly flies across the English Channel.

comment *1920* comment by: *Tony Castro*

Unless I understood incorrectly you want to prescribe floatation equipment for light helicopters. This is unreasonnbale and very expensive. I have been

flying over water for 10 years on a Hughes 500 and wilst I appreciate the potential advantages of floats I cannot afford them and they are also heavy !!. On some short skid helicopters you cannot fit them at all..

comment *1924* comment by: *Malcolm BIRD*

I am very concerned about the proposals to require new levels of equipment on small helicopters. Helicopters by their very nature are very sensitive to carried weight and as more equipment becomes mandatory so the useful load carrying capacity reduces - and there is usually not much capacity to start with. Hence, it is important to critically consider any and all requirements that add weight, as well as cost, to the aircraft.

To consider the new proposals:

Life raft requirement - it is already accepted that life jackets should be worn for flight over substantial areas of water. Small helicopters do not have the weight lifting capacity or space to handle a life raft. To carry such equipment would compromise the safety of every flight for the very small possibility of being useful on a very small number of occasions. Thousands of water crossings have been carried out, the risk is understood, the need for a life raft is not proven and should be left to the discretion of the pilot.

Overall the proposals seem to treat small helicopters as if they were major commercial, passenger carrying aircraft. What might be reasonable for a large multi-engined aircraft is most certainly not necessarily reasonable on a small aircraft where every person on board has their own door. I ask that any proposals be proprortional to the risk and size of the aircraft involved.

comment *1980* comment by: *Andrew Price*

I own and lease out a Robinson R44 hence am an extremely small operator.

These changes especially the floats would basically put me out of business. The extra equipment for everything that is proposed would cost approximately £50,000 which I couldnt afford.

comment *1984* comment by: *Helifly (UK) Ltd*

Objection to OPS.GEN.420 e & OPS.GEN.425.H b

There is no accident data to support this requirement. As an island state this ruling would unfairly restrict the private use by UK owners / pilots of helicopters to visit Europe or even some of the islands close to the UK mainland. It would also restrict commercial positioning operations as inefficient routing would have to be taken to avoid any water crossings.

Floats would be a massive expense to any light helicopter operator / owner and in many cases there is no float option available. For the R44 that Helifly

operates the cost would be circa £23,000! This would not be commercially viable.

Fixed wing aircraft in the same category as the R44 are not proposed to have the same restrictions. Why not? Statistically they are just as likely to have to ditch? Once again this proposal seems to be disproportionate, expensive to implement and founded on no real evidence.

There is not comparable UK CAA regulation with regard to floats. In fact as recently as 2004 a CAA study concluded: "*The CAA has considered comments … and information available from the UK accident record. It appears that, for small helicopters at least, ditchings may be generally survivable even without floatation equipment. Although the technical requirements of floatation equipment are common to all helicopters, irrespective of the purpose of the flight, it is accepted that the requirements for General Aviation do not have to be the same as for public transport operations.*"

comment *2030* comment by: *Ulrich Baum*

For non-commercial operations, safety measures for flights over water should be left entirely at the pilot's discretion. I suggest to apply OPS.GEN.420 to commercial operations only.

comment *2252* comment by: *Roy MURPHY*

I agree for commercial flights, but this is ridiculous for private flights in the UK! We're an island for goodness sake with more water than any other country in the EU!

comment *2253* comment by: *Patrick Wilkinson*

Life rafts and flotation equipment are unnecessary for single engine helicopter flights for moderate distances over water. In an autorotative water landing a helicopter, unlike a fixed wing aircraft sinks quickly and there is no chance of deploying a life raft. Neither is there anywhere to stow it in a R44. The equipment proposed to be mandatory for both over water flights and night flights are wholly excessive and will cost over £60,000 i.e. half the cost of my aircraft. The equipment will never be fitted to light helicopters and so the effect of the proposed new regulations will be to completely prevent flights by private light helicopters over water. This is an outrageous infringement of my personal liberty. No commercial provate helicopter flights with non-fee paying passengers do not need protecting from themselves! We all knowingly accept the risks and assess these carefully before flight. We do not need these new regulations!

comment *2255* comment by: *Ian MACDONALD*

Section (e) There has not been a fatality due to ditching a light helicopter in the UK whilst there have been several involving light aircraft. To impose additional requirements is unnecessary, disproportionate and discriminatory. The economic use of helicopters used for travel to other EU states, over large estuaries and lakes would become illegal.

comment *2277* comment by: *Austro Control GmbH*

General comment: Flight over water should be defined more clearly for balloons (e.g. the size of lakes, rivers...)

(a) (3) (i)

A definition *"over water beyond gliding distance from the shore"* is not practicable for Balloons, therefore there should be a distinction between sailplanes and balloons.

comment *2539* comment by: *James Leavesley*

In a R44 helicopter there is no room to store a life raft where it would be of any use to the occupants after ditching in water.

The only space is under the seats and noone would be looking to go back into the machine they had just left to lift yhr seat and pull out the lieraft.

There woudl be great chance of anyone getting caught or snagged when trying to do so and be pulled down under the water by the sinking machine.

Any Fire officier will advise any mamber of the public to leave a burning building asap and let it burn. Why do you want some one who has escaped an ditching helicopter to go back to it and try and retrieve a liferaft.

Any sensible pilot in command wears and askes their passengers to wear the life jackets when flying over large areas of water. THis is common sense but shouldn't be manditory as often could cause fear in pasengers even before they set off.

Lifejackets maybe liferafts no they only add a disproportanant amount of wieght and are inaccesable when needed. There isn't sufficient room in most small helicopters for anything else. We don't need the extra weight either.

comment *2618* comment by: *John Matchett*

Small helicopters are not designed to carry life rafts.

Trying to extract a life raft in a small helicopter in an emergenvcy is likely to create a fatality rather than save it

comment *2664* comment by: *AOPA-Sweden*

(h): An electric illumination should not be necessary for non-commercial flights in small aircraft. It will require a huge investments for the owners, because there is no such a requirement today.

comment *2666* comment by: *AOPA-Sweden*

(a) (1) (j): Should be 12,500 ft and 14,000 ft respectively, according to above mentioned.

comment *2807* comment by: *Ed Sturmer*

Small helicopters over water -

Floats should be optional. expensive and of dubious practical use.

ELTs proven unreliable, stay with helicopter and sink with it. personal beacons better.

comment *2885* comment by: *Peter Waldron*

Over Water Equipment Requirements

There needs to be proportionality for private helicopter flights. Storage and accessibility would be difficult as there is not enough room and successful deployment would be unlikely. Inadvertant inflation of the life raft could occur and could cause loss of control of the helicopter.

For non-complex private helicopter flight life raft carriage is at the pilots discretion.

comment *3156* comment by: *UK CAA*

Page No: 44

Paragraph No: OPS.GEN.420 (d)

Comment:

The requirement of the text has not faithfully reproduced the ICAO Annex 6 Part II standard at 2.4.4.3.

Additionally, it is noted that the ICAO definition of 'Extended flight over water' as the distance of 93 km (50 nm) or 30 minutes at normal cruising speed, has been extended to 100 nm, in the proposal (mirrored by EU-OPS).

Justification:

Editorial and standardisation

Proposed Text (if applicable):

AEROPLANES

(d) The pilot-in-command of an aeroplane operated at a distance away from land where an emergency landing is possible greater than that corresponding to:

(1) 120 minutes at ***normal*** cruising speed or 400 nautical miles (nm), whichever is the lesser, in the case of aeroplanes capable of continuing the flight to an aerodrome with the critical power unit(s) becoming inoperative at any point along the route or planned diversions; or

(2) 30 minutes at ***normal*** cruising speed or 100 nm, whichever is the lesser, for all other aeroplanes,

shall determine the risks to survival of the occupants of the aeroplane in the event of a ditching, based on which he/she shall determine the carriage, in addition to (b) or (c) ~~and (a)(3),~~ of:

(i) (a)(3);

(i***i***) life-saving rafts in sufficient numbers to carry all persons on board, stowed so as to facilitate their ready use in emergency; and (ii***i***) life-saving equipment, including means of sustaining life, as is appropriate to the flight to be undertaken.

comment *3157* comment by: *UK CAA*

Page No: 45

Paragraph No:

OPS.GEN.420 (e), (f) and (g)

Comment:

The text of the paragraphs would be improved by amending as indicated

Justification:

Clarity of purpose and standardisation.

Proposed Text (if applicable):

(e) Helicopters shall be equipped with (a)(1), when operated in:

(1) Performance Class 1 or 2 on a flight over water at a distance ***from land*** corresponding to more than 10 minutes flying time at normal cruising speed; ……..

(f) When operated in Performance Class 1 or 2 on a flight over water at a distance ***from land*** corresponding to more than 10 minutes flying time at normal cruising speed or in Performance Class 3 on a flight over water at a distance corresponding to more than three minutes flying time at normal cruising speed, helicopters shall, in addition to (a)(1), and when not precluded by considerations related to the type

of helicopter used, be equipped with (a)(3) and (d) ***(i) and (ii)***.

(g) The pilot-in-command of a helicopter operated in Performance Class 3 shall determine the risks to survival of the occupants of the helicopter in the event of a ditching~~, based on which he/she shall determine~~ ***when deciding*** if the life jackets required in (e) shall be worn by all occupants.

comment *3158* comment by: *UK CAA*

Page No: 45

Paragraph No: OPS.GEN.420(h)

Comment:

The requirement for lifejackets to be equipped with a means of electric illumination, according to the title, is for all aircraft and yet sailplanes and balloons (paragraph (a)) are omitted from the list.

Justification:

Consistency

Proposed Text (if applicable):

ALL AIRCRAFT

(h) Each life jacket or equivalent individual flotation device, when carried in accordance with ***(a),*** (b), (c), (d), (e), (f) or (g) shall be equipped with a means of electric illumination for the purpose of facilitating the location of persons.

comment *3248* comment by: *Suffolk Helicopters*

HELICOPTERS

(e) Helicopters shall be equipped with (a)(1), when operated in:

(1) Performance Class 1 or 2 on a flight over water at a distance corresponding to more than 10 minutes flying time at normal cruising speed; (2) Performance Class 3 on a flight over water beyond autorotational distance from the land; or

(3) Performance Class 2 or 3 when taking off or landing at an aerodrome/operating site where the take-off or approach path is over water.

Comment

This requirement is excessive and unnecessary with no basis in the safety record of light helicopters over water.

It would prevent the use of the vast majority of UK based light helicopters outside the UK, and make many over water flights in the UK impossible.

There is much evidence, supported by the CAA, that ditching is

survivable for light helicopters.

comment *3550* comment by: *Alexander Economou*

How many helicopter flights have flown over water going to and from mainland UK in the last 5 years?

How many helicopters have ditched in UK coastal waters in the last 5 years?

How do you intent to regluate this proposed rule? Will you be carrying out ispections?

I am opposed to this illogical proposal which will:

a) Have a negative impact and not a positive impact on flying.

b) Impossible to regulate.

How many lives/year to you intend to save with this rule? And how much does it cost for each life saved?

comment *3764* comment by: *Civil Aviation Authority of Norway*

Comment:

(g) The pilot-in-command of a helicopter operated in Performance Class 3 shall determine the risks to survival of the occupants of the helicopter in the event of a ditching~~, based on which he/she shall determine~~ ***when deciding*** if the life jackets required in (e) shall be worn by all occupants.

comment *3990* comment by: *Bill Pitcher*

The extra expense will put new helicopter purchases off, especially if they do not have any need or desire to cross water.

The helicopter industry is already overburdened with legislation and taxation making ownership a borderline achievement for most people without extra expenses being imposed.

Self fly hire helicopters will become uneconomic to hire due to rising costs which have to be passed on to the hirer.

There is no evidence that these new policies will improve safety and save lives, which would otherwise have been lost

comment *4155* comment by: *colin rosenberg*

The installation of floats on my companies helicopter is prohibitively expensive, and unesscesary, having flown regularly over water to Ireland, France, even the Isle of White, I feel it totally unreasonable to expect such changes and restrict the business and commerce that this means of transport allows.

comment *4213* comment by: *DGAC*

O **Proposal** : Delete (a)(2)

Justification : We do not require ELT for sailplanes and balloons. Besides balloons are always followed by a vehicule.

comment *4214* comment by: *DGAC*

HELICOPTERS (e) (3) delete § and move it to Part CAT.

comment *5116* comment by: *peter barker*

I have read the detailed comments submitted by the Helicopter Club of Great Britain (HCGB) relating to document numbers NPA 2009-02b & 02g and agree with all the comments made.

I would also express my alarm that in drafting these proposals EASA have demonstrated a worrying lack of understanding of: the practicalities of flying a light helicopter, the difference between private and commercial flying and the risks and costs implicit to their proposals. Also, the proposed requirements are unfair in that they discriminate between light fixed wing aircraft and light helicopters and take no account that Britain is an island and so would be at a disadvatage in comparison with the countries of mainland

Europe.

comment 5322

comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

SAILPLANES AND BALLOONS

(a) The pilot-in-command of a sailplane or balloon shall determine the risks to survival of the occupants of the aircraft in the event of a ditching, based on which he/she shall determine the carriage of:

(1) life jackets, or equivalent floatation devices, for each person on board, stowed in a position which is readily accessible from the seat or berth of the person for whose use it is provided;

…

Comment: The entire section refers to other sub-paragraphs earlier in the section. For example, requirements for helicopters flying over water refers to (a)(1) as well as (a)(3) and (d). These sub-paragraphs have headings like "Sailplanes and Balloons" as well as "Aeroplanes". The sub-paragraph Aeroplanes continues with even more referrals, and the referred sub-paragraphs have even more referrals.

All referrals and especially the headings on the sub-sections are confusing

Proposal:

The entire section OPS.GEN.420 needs reconstruction with common requirements without sub headings that refer to other aircraft types than the one in focus.

comment 5324

comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

HELICOPTERS

(e) Helicopters shall be equipped with (a)(1), when operated in:

…

(2) Performance Class 3 on a flight over water beyond autorotational distance ***from*** the land; or

Comment: All distances stated as time "from land" should be exchanged with "to land". This since a strong wind from land would carry an aircraft further from land and result in grater distance to land. Furthermore, if the return heading towards land results in a headwind the time to reach land

will increase. This scenario would produce a lower level of safety level than anticipated.

Proposal (including ***new text***):

HELICOPTERS

(e) Helicopters shall be equipped with (a)(1), when operated in:

…

(2) Performance Class 3 on a flight over water beyond autorotational distance ~~from~~ ***to*** the land; or

comment *5341* comment by: *European Private Helicopter Alliance*

Page 45 Over Water Equipment Requirements

Ops.Gen.420 (f)

For private helicopter flights in non complex helicopters it should be the pilots option to carry a liferaft or not.

Reason for Objection

Proportionality for recreational and private helicopter flights. Where the helicopter is non-complex there is not room in the helicopter for safe storage of an accessable life raft when only one person is in the helicopter. successful deployment is unlikely. There is also a danger of inadvertant inflation which could cause loss of control of the helicopter.

Suggested alternative wording

Add new sentence at the end of current text.

For non-complex private helicopter flight life raft carriage is at the pilots option.

comment *5364* comment by: *Norwegian Air Sports Federation*

(H) illumination is good.

We do propose to include chemical illumination in the paragraph.

comment *5562* comment by: *James Tuke*

A Personal Locator beacon is perfectly sufficent for this not a fitted ELT. The benefits derived from this fitted unit are tottally disproportionate to the cost of fitting and the potential lives saved. It could be argued that a PLB may be disproprtionate as well. There is no history suggesting that this measure is necessary, in fact it is an accepted fact that constant RPM, de-reted piston engines are more reliable than a) small turbine units and b) the variable

revving piston engines fitted into fixed wing aircraft.

comment *5677* comment by: *DON BURT*

f. There is no where a life raft can be carried in a R44 when there are four people flying. Use of Life jackets should suffice.

comment *5705* comment by: *Brian KANE*

Dear Sirs

As a private pilot and operator of small helicopters for more than 10 years I write to object to the proposal to insist upon floats being a requirement for over water flight.

The cost of retro-fit would be seriously prohibitive and probably prevent me flying in the future should such legislation becoming a requirement.

I can see no logic in such a requirement; any flight I have conducted over water has been with the benefit of both an immersion suit, life jacket and mini life raft on board. None have been ever been required.

If I had an issue over water I believe I would have much more success in ditching through controlled autorotation than any fixed-wing aeroplane could come near to achieving.

If you are able to acknowledge this message I would be grateful.

Yours faithfully

Brian Kane

comment *5878* comment by: *Danish Powerflying Union*

Electric illumination of floating devices is a good safety. But it is demanding to maintain the equipment and therefore we suggest illumination or use of chemical light to be an option instead of a demand.

comment *6006* comment by: *Fédération Française Aéronautique*

OPS.GEN.420 "Flight over water", LAND-PLANE (b) (2) :

French FFA believes that this proposal is not adapted to non commercial sports and recreational operations, even for initial flight training.

Justifications : Life jackets for each person on board seems disproportionate and very difficult to implement for the numerous sports and recreational flying organisations (aero-clubs) based on aerodromes or airfields situated next to a shoreline (sea, lakes or ponds).

Flight safety statistics do not show specific problems justifying that requirement.

FFA proposal: Delete the OPS.GEN.420 (b) (2) requirement for non commercial operations on non complex aeroplanes, and at least for non complex aeroplanes below 2,000 kg MTOW.

comment *6141* comment by: *ADAC Luftrettung GmbH*

OPS:GEN.420 (e)

In JAR-OPS 3.843 Amdt. 5, steht geschrieben:

(a) An operator shall not operate a helicopter in Performance Class 1 or 2 on a flight over water in hostile enviroment at a distance **from land** corresponding to more than 10 minutes flying time at normal cruise speed unless that helicopter is so disigned for landing on water or is certificated in accordance with ditching provisions.

In der NPA OPS.GEN.420(e) fehlt der Zusatz **from land. Dies ändert die Bedingungen elementar und die Vorschrift wird unnötig verschärft!** HEMS-Flüge nach Helgoland sind dannach nur noch mit entsprechend zertifizierten und ausgestatteten Hubschraubern möglich. Dies ist nicht verhältnismäßig!!

Vorschlag:

1. Der Text wird so übernommen, wie es in der JAR-OPS vorgesehen war:

Helicopter shall be equipped with (a)(1); when operated in:

(1) Performance Class 1 or 2 on a flight over water at a distance **from land** corresponding to more than 10 minutes flying time at normal cruising speed;

oder

2. HEMS-Flüge werden von dieser Regelung explizit ausgenommen.

In HEMS ist es aus medizinischen Gründen nicht immer möglich den transportierten Patienten eine Schwimmweste "Life Jacket" anzulegen. In den meisten Fällen sind die Patienten nicht in der Lage sich die Schwimmweste im Falle eines Unfalles selbst anzulegen. Für solche Fälle muss eine Ausnahmeregelung geschaffen werden.

comment *6236* comment by: *Aero-Club of Switzerland*

(a) (1) life jackets stowed in a position...readily accessible...? We think optimum safety will be reached if life jackets are worn.

Justification: In many cases such a situation does not exist, specially not in the cabins of smaller aircraft.

HELICOPTERS

(e) (f) (g) We think the timeframes proposed are too strict, especially for private operations. Please bring these requirements in line with the ones you propose for fixed wing aircraft.

Justification: In our view it is not proportionate to have the same set of rules for all that different aeronautical activities.

comment *6459* comment by: *George Heritage*

(e) - Is costly - approaching £20000 for floats, which would lower VNE and critically affect the safety of the helicopter (Enstrom 280Cpiston). Likelihood of helicopter remaining upright in anything but dead calm conditions would be impossible and totally impracticable.

comment *6500* comment by: *Beoley Mill Software Ltd*

Dear Sirs/madams,

I would like to object to part of your proposal NPA 2009-02b

The enforcement to fit floats to a helicopter when flying over water is not in my view a good idea, I fly over water about once a year and I have never experienced a problem, in fact I have made extensive searches for any R44's or R22's ditching over water and I have found none, it also seems to be a very rare event throughout the helicopter world except in the case of a few the military helicopters but you don't see the Royal air force with girly pop up floats. As a pleasure flyer I feel fitting floats would be a totally unwanted cost for small helicopters, and would change all the speeds and characteristics of the R44. In truth all it would do is prevent most pleasure pilots from going on the annual visit to France with the flying club. The £20,000 to fit floats is a bit more then I am comfortable with, and I believe floats would not show as a safety feature that saved lives to any pleasure pilot. I think bringing in new legislation for ELT (Which I do carry) isn't such a bad idea although I would suggest a hand held version that fits to the life jacket rather than one fitted to the helicopter. The number of Helicopter crashes in the UK is very small and to keep changing things wont in my view change the number of accidents, its just sods law that accidents happen, someone will cock up whether bad piloting or maintenance but I don't think floats will save anyone. Except the bank balance of the chap who owns the float manufacturing company. (I hope know one on the board of EASA). To finish please feel for the little helicopter pilots who cross the channel once in

a blue moon, at least give us similar dispensation as the little fixed wind pilots flying over water. I know you have a tuff job and it probably seems unfair that everyone is complaining about NPA 2009-02a but for the pleasure flyer its unfair that these very costly additions should be law when it benefits no one. I know you have the power to say no to NPA 2009-02b. Please be on our side.

Best regards

Stuart Rimmer

comment

6550 comment by: *EPFU is the European Union of national powered flying organisation from the 10 main European countries*

EPFU is of the opinion that life jackets requirement for all persons on board as soon as take-off or landing are partially conducted above water is not necessary on non commercial operations on non complex aeroplanes.

Justifications :

Decades of air operations without life jackets in those circumstances (i.e. flight over water during take-off or landings) on non commercial operations on non complex aeroplane show no flight safety problem, so there is no justification for this requirement.

Section (f) - comment

Many types of small helicopter would not have room to carry a life raft safely. In addition there seems little justification on the basis of safety for distinguishing between private helicopter and aeroplane flights.

suggested wording..

shall determine the risks to survival of the occupants of the aeroplane in the event of a ditching, and the ability of the aircraft type to safely carry the equipment, based on which he/she shall determine the carriage...

comment *6702* comment by: *Finnish Aeronautical Association - Kai Mönkkönen*

In Finland there is propably the largest amount of inland lakes in the world. Due to this reason there are also several aerodromes/gliding sites having a lake in their vicinity. There has, however, not been a safety case that would justify that vicinity of a lake in a takeoff or approach path would create such a risk that this kind of an oversized wide equipment list as required under (a)(ii) for sailplanes would be needed for ensuring safe operations.

It is understandable require safety equipment if a enroute or cross-country flight is made over a water beyond the gliding performance of a sailplane, but that is not comparable with "speculative possibility" as expressed by (2)(ii) of a possible choice of a pilot to make a ditching within a small swimming distance from the nearest land in case of very rare launch failure during a take-off, instead of trying to make a forced landing into a deep forest as a secondary option. We must remark sailplanes have very limited rooms to store wide emergency equipment and in case of a ditching very near the runway end within short swimming distance would be much more safe than choosing a forced langing into 15…25 meter tall pine forest. It should also be noted that sailplanes are normally made either of glassfiber or wood with quite a good floating properties. We must also remark that there has not been a case in Finland where any of a sailplane launch failure or a missed approach would have lead to lost of lives because of a ditching in a lake immediately nearby a runway end.

Therefore, we consider requirement (ii) under item (a) Sailplanes and balloons clearly inappropriate for sailplanes and it should be deleted. There is no justified risk on this and the requirement would be technically difficult of impossible to be fulfilled.

comment *6764* comment by: *Clive Morrell*

OPS. GEN. 420 (f)

'A requirement for carriage of a liferaft.'

Comment; In many small helicopters there is little or no space for stowage of a liferaft. There are also considerations of safe deployment in a ditching situation in a small helicopter. There is also a very large difference between fixed wing and helicopter requirements. Why? Accident data does not support this difference.

Carriage of a liferaft in non complex helicopters should be left to the discretion of the pilot.

comment *6885* comment by: *Luftsport-Verband Bayern*

…Over water equipment requirements…..

Die Forderung gibt es nicht für private Flächenflugzeuge.

Hubschrauber sind nicht weniger sicher! Wenn diese Forderung für

kommerziell genutzte Hubschrauber bei „ausgedehnten Flügen über See" erhoben wird, so mag dies anders bewertet werden.

Manche Hubschrauber können nicht nachgerüstet werden. Dies betrifft auch unsere „Kleinen" ("unsere"=Mitglieder des Deutschen Hubschrauberclubs, Mitglied im Luftsport-Verband Bayern und DAeC; Ausrichter von DM, EM, WM).

Generell gilt: Nachrüstungen sind sehr teuer.

comment *7013* comment by: *John Carr*

The proposal is very bias against helicopters, allowing any aeroplane, singel engined or otherwise, to fly to a distance of 30 minutes/100 miles before the requirement is effective, however a single engine helicopter is effected once outside of autorotive distance and a twin beyond 10 munites flying time, Does not seem to be an even hand here, are helicopter that more prone to alighting on the water?

comment *7170* comment by: *Paul Monahan*

Ops.Gen.420(e) and Ops.Gen.425.H(b). I object to these proposals. They are unnecessary, expensive and disproportionate.

comment *7280* comment by: *DHV*

Ops.Gen.420 (e)

Reason for Objection

There is no safety case for the additional overwater helicopter requirements of emergency flotation equipment for private flight. The private fixed wing requirements would provide adequate safety for private helicopters. Helicopters are no less reliable than fixed wing. The proposed requirements are unnecessary, disproportionate, burdensome, costly and have no basis in accident history.

Especially for private non-commercial use, they would prevent the economic use of many hundreds of helicopters in the UK & Ireland, and prevent access to other EU member states. Flight to the many islands around the UK coast would become illegal, as would flight across river estuaries such as the Severn, Thames, Mersey, Clyde,

Firth or Forth, The Wash, and the Solent, as well as many lakes. Many helicopter types cannot be fitted with floats at all, or only at great cost, which is totally disproportionate to the risk of the occasional flight over water. There are over 1000 helicopters in the UK, most without floats.

There is no comparable UK CAA requirement for private flight, and the UK CAA agreed in their 2004 decision that emergency floatation equipment

should not be mandated for private helicopter flight. The text of their decision said:

The CAA has considered comments … and information available from the UK accident record. It appears that, for small helicopters at least, ditchings may be generally survivable even without floatation equipment. Although the technical requirements of floatation equipment are common to all helicopters, irrespective of the purpose of the flight, it is accepted that the requirements for General Aviation do not have to be the same as for public transport operations.

Implementation of requirements for helicopter floatation equipment would mean that many owners would be unable to comply, and would in effect be prohibited from flying to many destinations in accordance with established custom and practice. For the types of helicopter where compliance is feasible, the costs of compliance may be considered to be unjustified, particularly where owners fly over water for only a few hours each year.

Having considered all of the foregoing, the CAA has decided that it would be inappropriate to mandate permanent or rapidly deployable means of floatation for General Aviation helicopter flights over water, although owners may of course continue to fit such equipment if they wish.

Suggested alternative wording

comment *7402* comment by: *DAvid Monks*

The requirements for fixed wing requirements would suffice for private helicopters .

Indeed the CAA which have the most respected safty record in the world have currently filed a difference with regards to this recommendation.

comment *7463* comment by: *Richard Simpson*

OPS GEN 420

(f)

Not all rotorcraft are capable of carrying a liferaft and the process of deployment of these items is not a straightforward process.

At the discretion of the captain, it should be sufficient to carry personal flotation devices for each passenger.

comment *7480* comment by: *simon lichtenstein*

Emergency floation equipment other than life jackets, again is out of proportion to the problem. No R22 or R44s to my knowledge have ditched in the last 11 years I have been flying helicopters. Floats for R22s would put

them overweight again and for the 44s would make an unecessary extra cost and burden.

comment *7482* comment by: *Tingdene*

I understand that EASA are again looking into the feasibility of fitting floats to all light aircraft which cross water. I would as a PPL(H) holder and owner of a Robinson R44 object to such stringent measures. Currently lifejackets and ELTs used at the discretion of the Pilot for recreation situations should suffice. Making the fitting of floats mandatory would have an enormous impact on cost and more importantly performance. I trust that you take these comments on board. Many thanks Jeremy Pearson

comment *7483* comment by: *Dr John Sargent*

As the owner of a Robinson R22 may I add my voice to the chorus of objections being raised with regard to the proposed imposition of a requirement to have floats fitted for flights over water.

As a private individual and a private pilot only, I feel I should have the right to assess my own risk.

As long as I don't put any one else in danger I think it is wrong to impose legislation which in my case, (since Floats cannot be fitted retrospectively to an R 22), woulfd in theory prevent me crossing the Solent to the Isle of Wight, or flying around the Scottish Western Isles.

The time actually spent over water is very small compared to our annual flight time around the UK, and the proposed legislation is regulation far out of proportion to the flying time at risk.

Please do not add this legislation to Private Flying.

comment *7488* comment by: *Arno Glover*

Over Water Equipment Requirements

Ops.Gen.420 (e) &Ops.Gen.425.H (b)

Again there appears to be inequality in these proposals when comparisons are made between helicopter and fixed wing aircraft. The safety record for private helicopter flights is no worse than fixed wing aircraft - hence the argument on safety grounds for the additional over water requirements of emergency flotation equipment for private helicopters is unnecessary

Most light helicopters cannot be cost effectively retro fitted with flotation gear.

This matter has been recently investigated by the CAA (2004) in the past and there findings stated that it was not necessary to mandate for flotation

gear to be fitted to all private helicopters for short flights across water.

comment *7500* comment by: *David George*

OPS.GEN.420 e and OPS.GEN.425 h:-

Requirement for Emergency Floatation Equipment to be fitted for over water helicopter operations.

I object to these proposals because:-

1. There is no safety case for these proposals.

2. These proposals would, effectively, prohibit helicopter flights over water without emergency floatation equipment.

3. Many helicopters cannot be fitted with floats.

4. The cost of fitting floats is very high - disproportionate to the risk.

5. There is a strong argument that ditching without floats is safer than ditching with floats.

6. Floats increase the operating costs and decrease the performance of helicopters - fuel efficiency is also reduced.

comment *7507* comment by: *Jonathan Palmer*

I consider myself well qualified to comment on these matters. I have 25 years' experience as a helicopter pilot and hold a JAR CPL (H) IR licence. I have over 6000 hours PIC time in mainly Eurocopter AS355N (Class 1 twin engine) AS350, Bell 206 (Class 3 – single engine) helicopters. I have always owned and operated these helicopters too so have substantial experience of costs and economic viability. Furthermore I operate my aircraft for private business purposes, rather than commercial air transport.

OPS.GEN.420 Flights over water

I am concerned that I am not able to comment confidently on this section as I am unsure of the reference under the HELICOPTERS paragraph (f) section of the meaning of being equipped with (d). I assume it refers to the requirement for live rafts and life saving equipment. However I feel the references could be much clearer in general.

comment *7523* comment by: *Deutscher Aero Club E.V.*

comment *7540* comment by: *Pascal JOUBERT*

Replace 'ELT' by 'PLB'.

Justification: landings and route transport may cause inappropriate activations of any automatic ELT. An ELT is necessary for each basket. A personal locator beacon (PLB) is really better for the ballooning activity.

comment *7543* comment by: *Joe More*

Requiring floatation, life raft and ELT fitment to cross estuaries, lakes, reservoirs, rivers, or to cross to the Isle of Wight and the many Scottish islands would be a grossly disproportionate requirement compared to the risk involved. Also the cost implication would prevent many of my clients from introducing the required equipment.

I am therefore strongly opposed to the proposed regulations, it is simply grossly unreasonable to impose such a heavy burden of compliance when no safety case exists. I thus urge EASA to either withdraw these proposals entirely, amend them as suggested, define a MTOM weight limit below which they would not apply (e.g. 3175Kg), or simply apply the fixed wing proposals to helicopters. Other practical mitigation measures could be exemptions for helicopters under 3000kg MTOM, for non-complex helicopters, or for helicopters in private flight

comment *7577* comment by: *AOPA UK*

An electric illumination should not be necessary for non-commercial flights in small aircraft. It will require a huge investments for the owners, because there is no such a requirement today.

comment *7650* comment by: *European Balloon Corporation*

(a) 2

ELT is used only on really long flights above water like Gordon Bennett flights. These are really rare flights and there is an internal regulation at this type of competition that imposes a minimum equipment list. I would remove the paragraph : simply overruled.

comment *7653* comment by: *Felix Baumgartner*

We strongly oppose to the proposed regulations commented upon the proposed rules for Air-Ops.

It is simply grossly unreasonable to impose such a heavy burden of compliance when no safety case exists.

It would be completely unreasonable and disproportionate to demand immediate compliance, especially when there is no immediate perceived safety need, not to talk about the added costs.

Being a private pilot of an R22 I just want to pick an example of the requested changes: Life rafts

Where the helicopter is non-complex there is not room in the helicopter for safe storage of an accessable life raft when only one person is in the helicopter. Successful deployment is unlikely. There is also a danger of inadvertant inflation which could cause loss of control of the helicopter.

Most pilots who have space in their helicopter would choose to carry a life raft. However for private flights in non-complex helicopters it should be left to the pilot's free choice whether or not to carry a life raft. The rule needs to be proportionate.

It would theoretically mean that I wouldn´t be able to fly over e.g. the Attersee without a life raft?!

As mentioned above, we strongly oppose the adaptations that ought to be agreed upon.

Regulations have to be proportionate!!

Page 45 Over Water Equipment Requirement

Ops.Gen.425.H (b)

Reason for Objection

There is no safety case for the additional overwater helicopter requirements of emergency flotation equipment for private flight. The private fixed wing requirements would provide adequate safety for private helicopters. Helicopters are no less reliable than fixed wing. The proposed requirements are unnecessary, disproportionate, burdensome, costly and have no basis in accident history.

Especially for private non-commercial use, they would prevent the economic use of many hundreds of helicopters in the UK & Ireland, and prevent access to other EU member states. Flight to the many islands around the UK coast would become illegal, as would flight across river estuaries such as the Severn, Thames, Mersey, Clyde, Firth or Forth, The Wash, and the Solent, as well as many lakes. Many helicopter types cannot be fitted with floats at all, or only at great cost, which is totally disproportionate to the risk of the occasional flight over water. There are over 1000 helicopters in the UK, most without floats.

There is no comparable UK CAA requirement for private flight, and the UK CAA agreed in their 2004 decision that emergency floatation equipment should not be mandated for private helicopter flight. The text of their decision said:

The CAA has considered comments … and information available from the UK accident record. It appears that, for small helicopters at least, ditchings may be generally survivable even without floatation equipment. Although the technical requirements of floatation equipment are common to all helicopters, irrespective of the purpose of the flight, it is accepted that the requirements for General Aviation do not have to be the same as for public transport operations.

Implementation of requirements for helicopter floatation equipment would mean that many owners would be unable to comply, and would in effect be prohibited from flying to many destinations in accordance with established custom and practice. For the types of helicopter where compliance is feasible, the costs of compliance may be considered to be unjustified, particularly where owners fly over water for only a few hours each year.

Having considered all of the foregoing, the CAA has decided that it would be inappropriate to mandate permanent or rapidly deployable means of floatation for General Aviation helicopter flights over water, although owners may of course continue to fit such equipment if they wish.

Suggested alternative wording

Ops.Gen.425.H (b) .

In addition, for Commercial flight, helicopters shall comply with (a) or be fitted with emergency flotation equipment when operated in:

Acceptable means of compliance

Wearing lifejackets whilst more than 10 minutes flying time from land.

Otherwise the same regulation as fixed wing.

HCGB Comment

a) Floatation Devices

Whilst some helicopters on the UK register are fitted with floats for public transport use, they are expensive to buy, install and maintain, and would be of strictly limited value should a water landing be required. The installation usually consists of a large inflatable 'balloon' attached to both the left and right skids of the helicopter, and a compressed air or other gas bottle installed in the body of the helicopter, together with electronics and buttons in the cockpit to 'fire' them. Their effectiveness requires them to perform perfectly. Should one float fail to inflate, then the helicopter would immediately roll over in the water, and be suspended beneath the working float, severely impeding crew and passenger exit. In anything but a flat calm sea, small helicopters would quickly roll over. The very few ditching incidents show that crews do escape from ditched helicopters not fitted with floats, and that water contact slows and stops the rotor blades allowing that escape. Rotating rotor blades on a float equipped small helicopter, rocking with the waves would become a great impediment to escape.

The writer has personally experienced, over land, an in-flight helicopter emergency in which the helicopter's vibration was so severe that the pipe connections from the compressed air bottle to the floats were severed. Had the emergency occurred over water, the floats would not have functioned.

There are substantial performance and weight penalties when floats are fitted. They can reduce cruising speeds by around 10 knots, thus lengthening every flight, and thus risk exposure and fuel costs. Flying time based maintenance costs are also increased. Float installations typically weigh 30 - 50 kg. Such a decrease in payload could lead to unintentional overloading, which would be a safety hazard. Fuel efficiency is also reduced.

b) The cost of Floatation Devices

The following is the year 2004 cost of fitment of floats to helicopters as quoted by UK maintenance organisations, excluding VAT and installation costs, are as follows:

			Source
Augusta 109 Helicopters		€73.333	Sloane
Enstrom Piston Helicopters	Fixed floats only	€11,280	E. Atlantic
Enstrom turbine		€26,460	"
Eurocopter AS350 and 355 Squirrel:		€49,155.	McAlpine

Helicopters		
Eurocopter EC120	€60,619.	"
Eurocopter EC135	€102,358	"
Bell 206 Helicopters	€33,332	Sloane
MD 500 Helicopters	€50,000	E. Atlantic
MD 600	€85,999	"
MD 902	€100,000	"
Schweizer 300 & 330:	None available	CSE
Robinson R44:	€30,800	London Heli Centre
Robinson R22	Floats cannot be retro-fitted.	

(Float equipped R22 helicopters are no longer manufactured).

Annual Costs: Floats must be test fired each year, have to be left inflated overnight and then repacked. There is a similar repacking error risk as in parachute repacking. The pressurised bottle has to be refilled, and all pipe and electrical connections inspected. There are considerable ongoing costs and aircraft down time incurred.

These costs are very substantial, and are out of all proportion to the risk exposure of private flights. The average helicopter probably crosses small stretches of water for only a few minutes on most domestic flights, whilst it might fly internationally perhaps once or twice a year. It would be surprising therefore if there was over water exposure for more than a few hours per year. The costs of the proposed equipment are out of all proportion to the risk, which as we have previously stated, is negligible.

Otherwise the same regulation as fixed wing.

comment *1469* comment by: *John Henshall*

These proposals for GA helicopters are not sensible or proportionate to the risk involved with flight over water.

Some helicopters cannot be float equipped, and the cost (for those that can be) is prohibitive.

For my machine enquiries show that the float bags will cost me US$60,000 plus additional costs for fitting (I am furtunate to have fixed parts for floats already installed). That cost is high given the risk involved in 2 or 3 channel crossings / Irish sea crossings. I have looked at the AAIB site record on-line and can find no helicopter accident record where the absence of floats was a factor in the accident risk.

How can this be a justifiable step?

comment *1477* comment by: *Philip GEORGE*

It is not practical to fit floatation equipment to my helicopter. There will be a weight and fuel penalty which does not not add a proportional margin of

safety. I occasionally fly to Ireland in my helicopter and am happy to continue with out the need for floatation equipment. I therefore dissagree with this proposal, the decision should be mine to make. I do not fly public transport.

comment *1524* comment by: *Chris Fox*

There is no basis for requiring light helicopters operated privately to be fitted with floation devices, and this requirement would in effect prohibit many operations that are presently conducted legally and safely.

The UK CAA considered this matter in 2004 and concluded that it was inappropriate to mandate the requirement of floats for private flight in light helicopters.

Fitment of floats to light helicopters, where it is possible at all, carries very significant costs both for initial installation and ongoing maintenance.

The requirements for light helicopters should be the same as those for aeroplanes.

comment *1552* comment by: *Des Russell*

Once again it is the private pilots decision

The criterion for operations in PC3 over water identifying when Emergency Floatation Equipment is needed and when Life Jackets are needed has to be harmonised:

- OPS.GEN.425.H.(b)(2) uses 'PC3 beyond a safe forced landing distance from land

- OPS.GEN.420(e)(2) uses 'PC3 on a flight over water beyond autorotational distance from land'

comment *1603* comment by: *Elitop*

This is crazy for a private owner!!

comment *1718* comment by: *Michael Cuttell*

I am writing to you as the safety concious owner of an Alouette helicopter. I

have just become aware of proposed changes in EASA documents NPA2009-2b and NPA2009-02g which in part refer to the mandatory fitment and use of floats and automatic ELT's for ANY flights carried out over water by privately owned light helicopters.

I find these proposals utterly astonishing and I fail to see how flight over water can be made any safer by the implemenation of either proposal. It is, apparently, an established fact that 50% of people who experience an emergency imersion in British waters will die of cold within 10 minutes whether they are wearing a lifejacket or not. So how will these proposals help them?

The skid width of all light helicopters is very narrow in proportion to its height and so even on one of those very rare calm sea days even the most skilled pilot will be unable to prevent his helicopter from overturning which, due to disorientation, will further reduce the risk of survival.

If the aircraft sinks your proposal guarantees that the ELT goes with it. It simply does not make sense. The correct place for any ELT is fastened to the jacket of floating survivors, who may well drift away.

Most light helicopters would be unable to carry the considerable weight of flotation equipment without seriously compromising their range and speed.

It is my belief that EASA should treat light helicopters in the same way as light aircraft for whom floats do not apply.

Surely part of EASA's duty is to consider whether ANY proposals are proportionate and whether ANY lives would be saved.

These proposals are even more surprising due to the fact that there has not been one single ditching fatality in a light helicopter operating areound The British Isles. A record that provides no justification whatsoever for the imposition of crippling expenditure for just one section of the private flying community without a shred of evidence that even one life will be saved.

The Helicopter Club of Great Britain, representing several hundred pilots and owners, have put together an exceeding well presented and balanced response to these new proposals. I would urge you to read it. It cannot be ignored.

Please prove to us all that you are not automatons. You have, each one of you, the ability to think and be reasonable and rational in your appraisal of these proposals and any counter proposals.

I am sure that you willl reach the inevitable conclusion that YOU MUST STRIKE THEM OUT.

comment *1758* comment by: *Richard Dawson*

H Ditching (b)

There is no requirement currently within the UK for helicopters to be fitted with flotation equipment for flight over water. This requirement would

prevent my helicopter from crossing into mainland Europe and indeed many islands of the UK.

There would be a considerable additional cost to retrofit floats (if indeed it is possible) to my helicopter and many other helicopters in the UK. Further, these systems require regular maintenance to ensure their safe operation - this is an additional cost to the owner/operator. Given the reliability of non-complex helicopters any such cost would be disproportionate to the benefit that would be provided.

comment *1824* comment by: *Q Aviation Ltd*

I fly a Robinson R22 helicopter, which is a small two seater.

there is no room for a dingy when there are two people on board.

it is completely impactical to insist on a dingy being carried.

I also fly a R44 4 seat helicopter. The dingy would have to be carried in the back, and the chance of getting it out and successfully inflated is about zero in the event of an emergency.

Fitting floats is either prohibitively expensive or impractical or impossible or all three.

There is no evidence to prove that fitting floatation devices will save lives. I don't think there are any cases of fatalities from drowning in UK waters after a survivable crash landing in water in private helicopters.

Flying for leisure carries a risk, just like everything else in life and I choose to mitigate this risk over water by

- checking the engine and other guages even more dilligently prior to "coasting out"

- choosing the shortest practical route over water to reach my intended destination

- wearing a life jacket and warm clothes

- carrying a PLB

- maintaining radio contact with the appropriate ground based service.

I am capable of making my own decisions to mitigate the risks of flying, and would suggest that no more regulation is required.

The cost of compliance - if possible - would be utterly disproportionate with the perceived benefits gained.

In a typical year, a private pilot would fly between 30 and 75 hours. Of these, maybe 30 minutes would be over water. It doesn't make any sense to try and legislate against a problem that simply doesn't exist.

martin rutty

PPL with 2,500 TT and who regularly flies across the English Channel.

comment *1871* comment by: *Aeromega*

It is not proportionate to the risk of ditching to require flotation devices on small helicopters with limited space and weight restrictions. EASA must demonstrate a sufficient safety case to justify the requirement add these expensive and restrictive requirements to small helicopters. What statistics are there showing that following a successful small helicopter ditching, casulties have been suffered due to the helicopter sinking.

comment *1925* comment by: *Malcolm BIRD*

Install emergency floatation equipment - unfortunately a small helicopter needs very calm conditions for floats to be useful. The number of times that floatation equipment on small helicopters would actually help in an emergency is probably very small, whereas the extra weight involved would pose a much greater risk to safety on every flight. A small helicopter is very likley to be lost on a ditching, the best course is to accept this, let the pilot and passenger leave the aircraft with their lifejackets and PLB and allow the aircraft to go down. Small helicopters have an excellent safety record on water crossings and the pilot should be responsible for deciding the risks. Overflying water puts very few others, if any at risk. In addition, the cost of fitting emergency floats to a small helicopter is out of all proprtion to risks involved and the cost of the helicopter itself.

comment *1982* comment by: *Peter Waldron*

One of the paramount requirements of the helicopter is to quickly and easily travel to other countries as well as to journey within the UK and cross any water as necessary. The requirement of flotation, Life raft and ELT would adversely affect these activities due to the practicality, cost and weight issues. It would be clearly disproportionate to stipulate these requirements in order to cross estuaries, lakes, rivers and waterways. There is no accident data to support the safety case for this flotation proposal for helicopters.

comment *2256* comment by: *Ian MACDONALD*

Section (H) (b) is not only unnecessary but also dangerous. Whilst there has not been a fatality over water in a Robinson helicopter there have been several over land. The 5000 psi activation bottle for Clipper pop-out floats is located under the pilots seat, thereby reducing crash stroke protection. It follows that the mandatory fitting of such devices to the Robinson UK fleet would, therefore, result in more injuries.

In addition there is no possibility of fitting such devices to R22s, thus relegating many hundreds of machines to the status of toys.

comment *2388* comment by: *Denis Ferranti Meters*

Gen.425.H b(2) requires fittment of flotation equipment for flight out of autorotational distance from land.

This should be rejected as:

1. Class 3 hels have a good overall overwater safety record.

2. The weight addition to some of the smaller hels will reduce performance, challenge the Cof G limits and add drag reducing speeds and leading to longer overwater flights as a result.

3. Some hel types will not have a flotation system available for the type. Some types will be structurally unable to support flotation equipment.

4. Cost of the equipment will in many cases be prohibitively expensive especially if compared to a low risk of ditching. It will drive some GA private hel owners from the helicopter sector.

Recommendation: That private use VFR ac are exempted from the legal requirement to carry floatation equipment

comment *2533* comment by: *Aerocorp Limited*

We live on an island! We have been safely crossing water on private flights in helicopters for many years. Requiring the fitment of floats would lock us onto this island. We would no longer be able to travel freely to mainland Europe in our helicopters. There is no record of any R44s ditching, as far as we are aware. The cost of fitting floats (if it can be done at all) is out of all proportion to the risk of mechanical failure. In any event, the likelyhood of floats saving the helicopter is remote, in the extreme. This ICAO idea has surely been thought up by someone living in the USA, where you can fly for 4000 miles without crossing water. Europe can and should opt out of this absurd requirement.

comment *2540* comment by: *James Leavesley*

PPL pilots, do fly over water, but again a simple lefjacket would proportainaly give greater safety than floatation pods on my machine.

The extra drag casued by them would increade the cost of every flight I made. it reduces the weight I am able to carry, (passengers aren't getting smaller only heavier!!)

It will make the machine less fuel efficient, and we are having enough flack from thoes who opppose flying. It woudl also cost a great deal to install agan disproportinate to the benefits.

comment *3123* comment by: *Peter Waldron*

Helicopters are proven to be no less reliable than fixed wing planes and therefore the private fixed wing requirements would give adequate safety for private helicopters. The proposed requirements are unnecessary and costly with no supporting evidence through accident records.

This would prohibit the use of hundreds of private non-commercial helicopters in the UK and Ireland. Flights to the islands around the UK coast would become illegal as would flights across estuaries and lakes. There are over 1000 helicopters in the UK and most are without floats.

The UK CAA agreed in 2004 that emergency flotation equipment should not be mandatory for flights by private helicopters.

The installation of floats is costly and expensive to maintain. Small helicopters can be adversely affected if the floats do not inflate perfectly. If only one inflates the helicopter would instantly roll over and be suspended beneath the water severely impeding escape.

The cost of float installation for an R44 would be 30,800 Euros with high maintenance costs thereafter.

The approximate time that a private helicopter may be over water during a one year period is negligable and therefore the proposed equipment and associated costs are out of proportion to the risk.

(c) Helicopters shall be equipped with:

(1) at least one automatic ELT;

Comment

This is an unnecessary and excessive requirement. They would not work for light helicopters when ditching and add to weight and be extremely expensive to install for non commercial light helicopters.

comment *3253* comment by: *Suffolk Helicopters*

Comment

Floats are expensive and potentially hazardous. The only times I have known floats inflate (three occasions to my personal knowledge to colleague pilots) is when they were not required to do so - accidental,

uncommanded inflation - they create more hazard than potential safety.

In addition floats reduce cruising speed and add to weight - increasing fuel costs and energy consumption.

This rule would be a nightmare. Millions and millions of pounds are spent making helicopters light weight and fast. You want us to put floats on our machines? You've got to be kidding. And flying 10 per cent slower, have a weight penalty of 50kg.

"But you dont have to put floats on your machines", you might say. Then all helicopter pilots are bound by the UK borders. Great. No more trips for EVERYONE. Fuck you.

comment

3599 comment by: *Juliet Stocks*

Comments also relevant ot Ops.Gen.420(e).

Many helicopter types cannot be fitted with floats at all. I am a holder of a R22 licence to which floats cannot be retro-fitted, as such I would be prohibited from flying to France, Isle of Wight, across the Thames estaurary and along the Thames over London in a R22.

In addition the costs of fitting floatation devices is out of all proportion to the risks, given that the average helicopter in the UK crosses water for only a few minutes on most domestic flights. The addition of floatation devices would also impact the performance, reducing cruising speeds and increasing weight and fuel consumption. This reduced efficiency increases flight time and fuel consumption. As a non-owner, but frequent flyer from the UK and Spanish based companies this cost will ultimately be transferred the the end-user, i.e. the self flyer hirer.

comment *3615* comment by: *IAOPA Europe*

What is meant by a safe forced landing distance from land?

If it meant to be equivalent to gliding distance then there is absolutely no justification why for non-commercial flights a performance class 3 helicopter must be equipped with flotation device when flying beyond a safe forced landing distance from land.

A single engine fixed wing aircraft is allowed to fly beyond gliding distance from land even if the the outcome of ditching is more uncertain than for a helicopter. For non-commercial operations a performance class 3 helicopter should have the same option as a single engine fixed wing aircraft.

I operate and run hotels. I travel frequently from Cardiff,to other hotels, about 10 in the west country. This involves me flying across the Bristol channel regularly,about 10miles. In order to achieve what you are proposing means a substantial diversion of some 80miles!!!! What a complete waste of fuel and time!!! And i have been flying these routes for about 13years.

comment *4215* comment by: *DGAC*

We consider that (a) and (b) are too demanding for general aviation and commercial aviation other than CAT.

Proposal:

Move (a) the CAT section

Rewrite the beginning of (b) as follows :

"(b) In addition, helicopters shall **be :**

(1) designed for landing on water; or

(2) certificated in accordance with ditching provisions in the relevant airworthiness code, or

(3) ~~comply with (a)~~ be fitted with emergency flotation equipment,

when operated in:

(4)~~(1)~~ Performance Class 1 or 2 on a flight over water ~~in a non-hostile environment~~ at a distance corresponding to more than 10 minutes flying time at normal cruising speed;"

(5)~~(2)~~ […]

comment *4216* comment by: *DGAC*

In COM it is not always possible to have the helicopter fitted with a floatation (because of the specific equipment). Alleviation should be given for helicopters in COM to reach the work area if a flight over water is needed.

comment *5343* comment by: *European Private Helicopter Alliance*

Page 45 **Ditching Requirements**

Ops.Gen.425.H (b)

Reason for Objection

There is no safety case for the additional overwater helicopter requirements of emergency flotation equipment for private flight. The private fixed wing requirements would provide adequate safety for private helicopters.

Helicopters are no less reliable than fixed wing. The proposed requirements are unnecessary, disproportionate, burdensome, costly and have no basis in accident history.

Especially for private non-commercial use, they would prevent the economic use of many hundreds of helicopters in Europe. In the case of the UK & Ireland, it would prevent access to other EU member states. Flight to the many islands around the European coast would become illegal, as would flight across river estuaries, channels, and lakes. Many helicopter types cannot be fitted with floats at all, or only at great cost, which is totally disproportionate to the risk of the occasional flight over water. There are over 1000 helicopters in the UK alone, most without floats.

In 2004 the UK CAA considered imposing a flotation device requirement for private helicopters but decided not to. The text of their decision said:

The CAA has considered comments … and information available from the UK accident record. It appears that, for small helicopters at least, ditchings may be generally survivable even without floatation equipment. Although the technical requirements of floatation equipment are common to all helicopters, irrespective of the purpose of the flight, it is accepted that the requirements for General Aviation do not have to be the same as for public transport operations.

Implementation of requirements for helicopter floatation equipment would mean that many owners would be unable to comply, and would in effect be prohibited from flying to many destinations in accordance with established custom and practice. For the types of helicopter where compliance is feasible, the costs of compliance may be considered to be unjustified, particularly where owners fly over water for only a few hours each year.

Having considered all of the foregoing, the CAA has decided that it would be inappropriate to mandate permanent or rapidly deployable means of floatation for General Aviation helicopter flights over water, although owners may of course continue to fit such equipment if they wish.

Suggested alternative wording

Ops.Gen.425.H (b) .

In addition, for Commercial flight, helicopters shall comply with (a) or be fitted with emergency flotation equipment when operated in:

Acceptable means of compliance

Wearing lifejackets whilst more than 10 minutes flying time from land.

Otherwise the same regulation as fixed wing.

EPHA Comment

a) Floatation Devices

Whilst some helicopters are fitted with floats for CAT use, they are expensive to buy, install and maintain, and would be of strictly limited value should a water landing be required. The installation usually consists of a large inflatable 'balloon' attached to both the left and right skids of the helicopter, and a compressed air or other gas bottle installed in the body of the helicopter, together with electronics and buttons in the cockpit to 'fire' them.

Their effectiveness requires them to perform perfectly. Should one float fail to inflate, then the helicopter would immediately roll over in the water, and be suspended beneath the working float, severely impeding crew and passenger exit. In anything but a flat calm sea, small helicopters would quickly roll over. The very few ditching incidents show that crews do escape from ditched helicopters not fitted with floats, and that water contact slows and stops the rotor blades allowing that escape. Rotating rotor blades on a float equipped small helicopter, rocking with the waves would become a great impediment to escape.

There are substantial performance and weight penalties when floats are fitted. They can reduce cruising speeds by around 10 knots, thus lengthening every flight, and thus risk exposure and fuel costs. Flying time based maintenance costs are also increased. Float installations typically weigh 30 - 50 kg. Such a decrease in payload could lead to unintentional overloading, which would be a safety hazard. Fuel efficiency is also reduced.

b) The cost of Floatation Devices

The following is the year 2004 cost of fitment of floats to helicopters as quoted by UK maintenance organisations, excluding VAT and installation costs, are as follows:

			Source
Augusta 109 Helicopters		€73.333	Sloane
Enstrom Piston Helicopters	Fixed floats only	€11,280	E. Atlantic
Enstrom turbine		€26,460	"
Eurocopter AS350 and 355 Squirrel: Helicopters		€49,155.	McAlpine
Eurocopter EC120		€60,619.	"
Eurocopter EC135		€102,358	"
Bell 206 Helicopters		€33,332	Sloane
MD 500 Helicopters		€50,000	E. Atlantic
MD 600		€85,999	"
MD 902		€100,000	"
Schweizer 300 & 330:		None available	CSE
Robinson R44:		€30,800	London Heli Centre
Robinson R22		Floats cannot be retro-fitted.	

(Float equipped R22 helicopters are no longer manufactured).

Annual Costs:	Floats must be test fired each year, have to be left inflated overnight and then repacked. There is a similar repacking error risk as in parachute repacking. The pressurised bottle has to be refilled, and all pipe and electrical connections inspected. There are considerable ongoing costs and aircraft down time incurred.

These costs are very substantial, and are out of all proportion to the risk exposure of private flights. The average helicopter probably crosses small stretches of water for only a few minutes on most domestic flights, whilst it might fly internationally perhaps once or twice a year. It would be surprising therefore if there was over water exposure for more than a few hours per year. The costs of the proposed equipment are out of all proportion to the risk, which as we have previously stated, is negligible.

comment *5382* comment by: *David Chisnall*

In regard to this life raft proposal this is not practical in many instances. Many helicopters do not have open access between the cockpit and passenger seating areas (e.g. Jetranger) and therefore this proposal if made legislation would serve for no valuable purpose.

Floats on a helicopter will only be of value in a very calm sea. The amount of time that a small helicopter spends over water is low in comparison with its total flying hours. For small helicopters the addition of pop out floats is not only a considerable expense but also drives the AUW of the machine closer to its maximum on regular land based flights, increases fuel consumption and reduces cruising speeds.

These proposals are not reasonable and disproportionate.

In summary I must object strongly to these proposals as they discriminate against non complex private helicopters. ICAO should be changed so the private helicopters are treated the same as private fixed wing aircraft.

comment *5596* comment by: *James Tuke*

Once again the benefits derived from fitting emergency floats are without foundation. There is no evidence whatsover of this equipment being necessary for helicopters over and above fixed wing where it quite simply wouldn't be possible to fit them in any case. On and R22 for example, where there has only been one isnstance of ditching (to my knowledge) it is impossible to retro-fit floats and making them mandatory is a gross invasion of the freedom currently afforded to owners of non-float equipped machines which would prevent them visiting other countries or even flying over certain areas of water within the UK itself, plainly a ridiculous proposal.

comment *5682* comment by: *DON BURT*

(b) (2) Flying from Humberside this would mean fitting floats to cross the Humber as there is frequently insufficient cloud base to be able to obtain sufficient height to autorotate to land.

comment *5764* comment by: *Tim Virdee*

OBJECTIONS TO PROPOSED CHANGES - HELICOPTERS

OPS.GEN.425.H DITCHING

I wish to register an objection to this section on the basis of the fact that, to my knowledge, there has never been a ditching of a light, single engine helicopter over water in Europe.

it is difficult to see how this impeccable record could possibly be improved upon rendering the proposed changes to flying law utterly pointless!

Furthermore, in comparison to fixed wing aircraft, helicopter piston engines are significantly lower powered than the equivalent fixed wing installation and therefore this makes engine failure extremely unlikely. When considering that less than 0.5% of an average flying year will be spent over water, the proposed changes offer no significant increase in passenger safety to those rules already in place.

in addition to the above, landing a float-equipped helicopter in autorotation into the sea and resultant wave activity is highly likely to result in a roll-over situation (where the floats force the helicopter to become inverted), thus making it extremely difficult for the passengers to escape safely due to spatial disorientation. In these circumstances, floatation equipment would contribute to likely loss of life, not prevent it.

AUTOMATIC ELT's

I wish to object to the proposed changes on the basis of the fact that ditching of light helicopters into water are not likely to trigger an automatic ELT beacon. It would be inadvisable for the pilot to attempt to manually trigger a built-in ELT because his main concern should be exiting the the helicopter after evacuating his passengers. It is far better to have the device in the hands of the pilot who can activate as necessary and carry the beacon (PLB) it on his person. Saving the lives of people is far more important than being able to find the aircraft (see recent Air France accident off the coast of Brazil).

LIFE RAFTS

It seems unnecessary for a light, non-complex helicopter to be forced to carry a life raft where existing legislation ensures the occupants are wearing life jackets AND they are carrying a PLB. in addition, there is the practical issue of having enough luggage space to stow an adequately large life raft for the number of people on board.

PROPORTIONATE REGULATION

Proposed changes to helicopter rules and laws should only apply to

helicopters over 3,175Kg as per EASA definitions and guidelines - there is a significant difference between general aviation and commercial flights. Non-complex helicopters should enjoy a less stringent regulation which, as drafted, the changes would prevent.

It is my understanding that EASA are under direction form the European Parliament and the EU Commission to be proportionate in their regulation based on weight of helicopter. It is clear that the proposed changes are unreasonable, excessive and disproportionate in respect of non-complex helicopters.

i am prepared to discuss any of these and other proposed changes in regulations at any time on th enumbers supplied to you on my registration.

Sincerely

Tim Virdee

comment *5883* comment by: *Michael Taylor*

I wish to object to the proposal requiring light helicopters to be equipped with floats for flight over water. As far as I am aware there have been no light helicopter ditchings resulting from engine failures over water in Europe. Fitting floats can therefore not hope to improve safety.

Helicopter piston engines are de-tuned to derive less horse power than when installed in fixed wing aircraft. This makes helicopter engine more reliable than those in fixed wing aircraft.

Overwater operation accounts for less than 0.3% of annual use.

Floats are not an available option for my existing R44 Raven 1 helicopter and if this proposal was introduced into law it would prevent me from making use of my helicopter for cross channel trips.

Lightweight inflatable floats are unlikely to provide a safe landing in the normal weather of the English Channel, due to the probability of the helicopter overturning when auto-rotating to touchdown with forward momentum into waves. The result is highly likely to be an inverted helicopter with only the soles of the floats above water. Getting out of an inverted helicopter hampered by the floatation equipment would be very difficult.

Given the reduced failure risk and superb safety record in overwater operation, I believe that requiring floats to be fitted to small helicopters would provide no safety benefit and is unwarranted.

I understand that there is an EU requirement for proportionality in legislation. I believe that helicopters should be treated on a better than equal footing with fixed wing aircraft. The present proposals are poorly drafted and fail to distinguish between aircraft types. They dicriminate against light helicopters compared to fixed wing. This is clearly not proportionate legislation.

comment *6143* comment by: *ADAC Luftrettung GmbH*

In JAR-OPS 3.843 Amdt. 5, steht geschrieben:

(a) An operator shall not operate a helicopter in Performance Class 1 or 2 on a flight over water in hostile enviroment at a distance **from land** corresponding to more than 10 minutes flying time at normal cruise speed unless that helicopter is so disigned for landing on water or is certificated in accordance with ditching provisions.

In der NPA OPS.GEN.420(e) fehlt der Zusatz **from land. Dies ändert die Bedingungen elementar und die Vorschrift wird unnötig verschärft!** HEMS-Flüge nach Helgoland sind dannach nur noch mit entsprechend zertifizierten und ausgestatteten Hubschraubern möglich. Dies ist nicht verhältnismäßig!!

Vorschlag:

1. Der Text wird so übernommen, wie es in der JAR-OPS vorgesehen war:

Helicopter shall be equipped with (a)(1); when operated in:

(1) Performance Class 1 or 2 on a flight over water at a distance **from land** corresponding to more than 10 minutes flying time at normal cruising speed;

oder

2. HEMS-Flüge werden von dieser Regelung explizit ausgenommen.

comment *6464* comment by: *George Heritage*

425.H (b) - Impracticable and totally unrealistic, lifejackets serve a much safer alternative.

comment *6554* comment by: *Sloane Helicopters Ltd*

Ops.Gen.425.H (b)

Reason for Objection

Ditching – Helicopters appears to be incorrect or in contradiction to the table of reference as described below:

OPS.GEN.425.H Ditching - Helicopters

(a) Helicopters operated in Performance Class 1 or 2 on a flight over water in a hostile environment at a distance corresponding to more than 10 minutes flying time at normal cruising speed shall be: (1) designed for landing on water; or (2) certificated in accordance with ditching provisions in the relevant airworthiness code.

(b) In addition, helicopters shall comply with (a) or be fitted with emergency flotation equipment when operated in: (1) Performance Class 1 or 2 on a flight over water in a non-hostile environment at a distance corresponding to more than 10 minutes flying time at normal cruising speed; (2) Performance

Class 3 on a flight over water beyond a safe forced landing distance from land; or (3) Performance Class 2 when taking off or landing over water, except in the case of Helicopter Emergency Medical Services (HEMS) operations, where for the purpose of minimising exposure, the landing or take-off at a HEMS operating site located in a congested environment is conducted over water.

TABLE OF REFERENCE FOR NPA 2009-02:

(52) 'Non-hostile environment' means an environment in which: (i) A safe forced landing can be accomplished; (ii) The helicopter occupants can be protected from the elements; (iii) Search and rescue response/capability is provided consistent with the anticipated exposure; and (iv) those parts of a congested area with adequate safe forced landing areas shall be considered non-hostile.

Over water hostile environment is defined as:

(41) Hostile environment: (i) An environment in which: (A) A safe forced landing cannot be accomplished because the surface is inadequate; or (B) The helicopter occupants cannot be adequately protected from the elements; or (C) Search and rescue response/capability is not provided consistent with anticipated exposure; or (D) There is an unacceptable risk of endangering persons or property on the ground. (ii) In any case, the following areas shall be considered hostile: (A)

For overwater operations, the open sea areas North of 45N and South of 45S designated by the Authority of the State concerned; and (B) those parts of a congested area without adequate safe forced landing areas.

Comment:

The proposal places the whole of the UK in a hostile environment and therefore would severely prejudice private flights between the UK mainland, Ireland and all UK islands as compliance would be very expensive to achieve and in some cases impossible. We suggest that compliance for private flights can be achieved as detailed below.

Acceptable means of compliance

Wearing lifejackets whilst more than 10 minutes flying time from land when operating over open water.

comment *6759* comment by: *Kinetic Avionics Ltd*

425.H Comment

Fitting emergency floats would be very expensive for most helicopter types, if possible at all. The proposed requirements would in effect prevent most small helicopters from being able to cross between the UK and continental Europe, causing incovenience and economic disadvantage to their operators. The safety benefits of the proposal would appear to be minimal in comparison to the costs. Helicopters have high required standards of maintenance and are very reliable, and there have been very few incidents

involving helicopter flight over water, where floats would have been of any use. Emergency floats are also unlikely to prevent a helicopter capsizing when ditching on open sea.

Section 425.H should not apply to private helicopter operations.

comment *6767* comment by: *Clive Morrell*

'The requirement to be20fitted with emergency flotation equipment.'

Comment; This is disproportionate when compared with fixed wing. Accident statistics do not show a significant difference between the two. There are some small helicopters that cannot be fitted with emergency flotation equipment and would thus be severely restricted in their operation.The cost of fitting emergency flotation equipment is very considerable and would make many light helicopters uneconomical. The fitting of emergency flotation equipment should not be a requirement for private helicopter flight.

comment *7035* comment by: *John Carr*

Again a bias approach for this regulation. Whilst the protection of fare paying passengers is reasonable, inflicting this regulation on all helicopoters doesn't seem fair. This requirement which covers private sighle engined helicopters does not appear to be a something that is also required by private ingle engined aeroplanes

comment *7196* comment by: *Jennifer Murray*

I consider this requirement totally out of proportion to risk. I have over 3,500 hours in R44's and Bell 407 helicopters and have flown in excess of 30,000 nautical miles over the world's oceans without floatation gear. M decision was taken having studied accident/fatality records. I believe fatality incidences of controlled ditchings at sea of civilian helicopters to be negligable. Today's helicopters are extremely reliable and pilots treat water crossings with respect and preparaion.

I agree with all the comments made by the HCGB (of which I am a member)

Small helico0pters are severely discriminated against by the ICAO standards. Why are there no 'non-commercial air transport' equipment standards like there are for fixed wing aircraft?

The ICAO standards are unreasonable and disproportionate, unfair and excessive in the case of non commercial helicopters.

The EASA proposalsare poorly drafted and mix up airlines, balloons, gliders and helicopters all in one document.

Jennifer Murray

Annual Costs: Floats must be test fired each year, have to be left inflated overnight and then repacked. There is a similar repacking error risk as in parachute repacking. The pressurised bottle has to be refilled, and all pipe and electrical connections inspected. There are considerable ongoing costs and aircraft down time incurred.

These costs are very substantial, and are out of all proportion to the risk exposure of private flights. The average helicopter probably crosses small stretches of water for only a few minutes on most domestic flights, whilst it might fly internationally perhaps once or twice a year. It would be surprising therefore if there was over water exposure for more than a few hours per year. The costs of the proposed equipment are out of all proportion to the risk, which as we have previously stated, is negligible.

comment *7302* comment by: *Richard Simpson*

OPS GEN 425 H Ditching

(b) For private flight over water there is no reason to make the restrictions imposed any different to Fixed wing. The stipulations for private fixed wing would serve perfectly adequately for private flights in rotorcraft. the proposals are unnecessary, disproportionate and would rule out private flying in unmodified rotorcraft between the uk and mainland Europe, as well

as many islands off the coast of the UK, as well as estuary crossing. Fitting such floats would cost tens of thousands of pound for the typical non-complex piston helicopter - at least £35000 for a Robinson R44 - and is not possible for some models, rendering them seriously restricted in their utility for private flying.

This has previously been considered, debated and rejected by the CAA and I see no reason to resurrect this idea under easa.

Fatal accidents cue to ditching over water do not figure in statistics over the last ten years. No lives would have been saved by this very expensive and disproportionate suggestion.

comment *7410* comment by: *DAvid Monks*

Life jackets would fulfill this requirement.

comment *7476* comment by: *Henry Pelham*

Ops. Gen 420 (e) & Ops. Gen 425.H (b)

There is no safety case for the fitting of Floatation equipment to non complex helicopters there have been considerably fewer accidents involving helicopters than fixed wing planes and the deaths and injuries in these have been many more than in helicopters, yet there is no requirement for fixed wing planes to carry floatation devices.

This requirement lacks proportionality bearing in mind the cost of fitting floatation devices in my case of the order of 50,000 euros! and there are many helicopters on which itis impossible to fit floatation devices in the case of the UK imprisoning them. UK helicopters would not be able to visit the rest of the EU or even parts of their own country. The whole of the UK and Europe has been open to helicopters for many years without the requirement of floatation devices without a single fatality and only 4 ditchings over a considerable period

comment *7489* comment by: *Arno Glover*

Over Water Equipment Requirements

Ops.Gen.420 (e) &Ops.Gen.425.H (b)

Again there appears to be inequality in these proposals when comparisons are made between helicopter and fixed wing aircraft. The safety record for private helicopter flights is no worse than fixed wing aircraft - hence the argument on safety grounds for the additional over water requirements of emergency flotation equipment for private helicopters is unnecessary

Most light helicopters cannot be cost effectively retro fitted with flotation

gear.

This matter has been recently investigated by the CAA (2004) in the past and there findings stated that it was not necessary to mandate for flotation gear to be fitted to all private helicopters for short flights across water.

comment *7501* comment by: *David George*

OPS.GEN.420 e and OPS.GEN.425 h:-

Requirement for Emergency Floatation Equipment to be fitted for over water helicopter operations.

I object to these proposals because:-

1. There is no safety case for these proposals.

2. These proposals would, effectively, prohibit helicopter flights over water without emergency floatation equipment.

3. Many helicopters cannot be fitted with floats.

4. The cost of fitting floats is very high - disproportionate to the risk.

5. There is a strong argument that ditching without floats is safer than ditching with floats.

6. Floats increase the operating costs and decrease the performance of helicopters - fuel efficiency is also reduced.

comment *7508* comment by: *Jonathan Palmer*

OPS.GEN.425H Ditching - Helicopters

I am extremely concerned about the proposed requirement in the above section for helicopters to be equipped with emergency floatation equipment as specified and object strongly to this.

Whilst I am in full agreement with a requirement for the carriage of life jackets and a life raft providing there is space to accommodate it safely, a requirement for private and corporate helicopters to be equipped with emergency floatation equipment is not justified on safety grounds, reasonable or proportionate in terms of cost and the environment in which such UK helicopters are used is such that the proposed regulation is inappropriate.

For non-commercial air transport there should be no mandatory requirement for Class 1 and 2 helicopters to be equipped with emergency floatation equipment for the following reasons:

There is no evidence that their absence creates a safety risk. I believe there have been no fatalities in the last 25 years at least from private or corporate helicopters ditching in UK waters. There have been only 4 cases of private helicopters ditching and these involved no fatalities or injuries, and none of

corporate helicopters ditching.

The pattern of use of the vast majority of private and corporate helicopters is very different from the circumstances for which the requirement for floats was conceived – intensive offshore operations. Clearly in such operations the risk exposure of ditching is relatively high. For most UK private and corporate helicopters the amount of time spent over water is a very small proportion – probably usually less than 1% - of total flight time.

The fitting of emergency floatation equipment has a number of major negative consequences:

High purchase cost.

For my AS355N the capital cost would be around €60,000 – a very substantial sum of money. And all for something that would be used for just 1% of the aircraft's operation. Other helicopters have proportionally similar high purchase cost.

Reduction in payload.

The AS355N loses about 60kg of payload with emergency floatation equipment fitted. Payload is always at a premium, and such reduced payload is at best a major inconvenience, either reducing passenger and baggage carrying capacity, fuel load and therefore range, or most likely both. A significant cause of aircraft accidents is related to low fuel status, either through exhaustion or more often poor decision making through stress at critically reducing levels. Another is high operating weights, which reduce performance and safety margins, even when within permitted MTOW.

Reduction in performance

With many helicopters such as the AS350 the EME is external not only adding substantial weight but drag too, typically loosing 10 kts cruise speed and also reducing range commensurately. Fuel burn and CO2 emissions will also be increased.

The UK Environment

The UK is a unique environment in that it is not only an island, but one whose coastline is riddled with large and small estuaries and inlets, as well as featuring many surrounding islands. In no other European country is there such a necessity to fly over water. Furthermore in order to fly to other European countries which many private and corporate helicopters do, we have to fly over water every time. In most of Europe no such requirement exists. Therefore any unjustified regulations that mean such transits require an onerous equipment burden is plainly unfair and prejudicial to the UK helicopter operators who occasionally wish to visit Europe, yet would be obliged to incur the substantial performance compromises of EFE unnecessarily for the potentially long duration of a European trip.

The UK environment nevertheless benefits from a highly developed SAR service and a relatively high level of shipping and general aviation air traffic, all of which provides increased safety in the extremely remote event of a ditching being necessary.

The limited benefits of EME

The circumstances when emergency floatation equipment will significantly

increase safety are very limited in a Class 1 or 2 twin engine helicopter.

It is possible to successfully ditch a light (under 3175kg) helicopter, without injury or loss life, and this has been the case in all four of the recorded ditchings of private helicopters.

The chance of both engines failing over water due to mechanical failure is extremely remote. I suspect this has never occurred within Europe. The least unlikely cause would be fuel exhaustion and the chances of this would be significantly increased by the reduction in payload available for fuel by the requirement to fit emergency floatation equipment.

There are very few circumstances that might require an immediate emergency ditching in a twin engine helicopter.

Any catastrophic aircraft failure of the rotor or transmission system is likely to lead to loss of a non-survivable crash regardless of floats.

Any rapidly developing problems such as lubricant loss or electrical failure are likely to provide either opportunity to land on a ship, or sufficient time for a controlled ditching, dropping off passengers with life rafts first, under power, before leaving the pilot to ditch the aircraft alone.

Risk assessment

It is onerous upon EASA to perform a reasonable risk assessment regarding the risk of a twin engined helicopter actually needing EME.

When an IFR helicopter is flying in IMC it is rightly and reasonably considered adequately safe even if IMC conditions extend below 1000ft AGL, and potentially to the ground. The risk of flying over land in such conditions is no less, and may be greater, than flying over water. The equipment levels required for IFR certification should therefore enable flight over water for at least 60 minutes without EME.

I hope these comments are helpful and will assist EASA in providing regulations that are reasonable and not unreasonably and unnecessarily burdensome for private and corporate use. It must be stressed that any operator whether private or corporate is quite able to (and some do) upgrade his aircraft equipment levels according to operational requirements, preferences and budget availability, and this is the way it should be.

comment *7510* comment by: *Tim Hall*

The fitting of floats and a life raft for small non commercial private helicopters when crossing the channel seems to be a disproportionate proposal given the amount of ditching .Flying to France once every year or so being over the water about five minutes out of 150 hours per year would be better odds than the lottery. R 44's such as mine cannot be retrofitted with floats and would effectively be stopped from flying to France as I also believe many other models would to. The weight and space would also restrict what else could be carried. I believe the current law allowing the pilots discretion is sufficient.

While I welcome changes to safety regulation light non complex helicopters

are struggling for weight without equipment that will rarely be used by even one helicopter in the U K .Would it not make more sense to treat small private helicopters separately from the larger ones as with fixed wing?

comment *7511* comment by: *Bruce Hall*

I feel that the the changes that have been proposed are extremely disproportionate to the amount of ditching's that occur while crossing water. The extra weight would not only drastically cut gross weight but would take up limited cargo space that would be used for luggage. Also Our make of helicopter and many others others cannot have floats retro fitted this would mean not being able to carry on flying France for holidays.

comment *7544* comment by: *DR SMITH*

Attachment #7

The attached quantified risk assessment argues the case that neither ELT nor flotation equipment are necessary in order to meet current risk targets. It shows that, not only are risk targets met without them but, that their cost is grossly disproportional to the benefit. If you have any queries concerning the methodology please contact the undersigned."

comment *7654* comment by: *Felix Baumgartner*

We strongly oppose to the proposed regulations commented upon the proposed rules for Air-Ops.

It is simply grossly unreasonable to impose such a heavy burden of compliance when no safety case exists.

It would be completely unreasonable and disproportionate to demand immediate compliance, especially when there is no immediate perceived safety need, not to talk about the added costs.

Being a private pilot of an R22 I just want to pick an example of the requested changes: Life rafts

Furthermore, floats cannot be retro-fitted. Float equipped R22 helicopters are no longer manufactured.

Floats must be test fired each year, have to be left inflated overnight and then repacked. There is a similar repacking error risk as in parachute repacking. The pressurised bottle has to be refilled, and all pipe and electrical connections inspected. There are considerable ongoing costs!!

As mentioned above, we strongly oppose the adaptations that ought to be agreed upon.

Regulations have to be proportionate!!

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.430 Emergency Locator Transmitter (ELT) p. 45-46

comment *622* comment by: *Mc Murdo*

I would like to place comment on the above document following discussions with EASA representatives at Aero Expo Freidrikshaven, and, discussions with the Helicopter Club of Great Britain. I am not an Aviator, but, a manufacturer of 406 MHz Personal Location Beacons - Mc Murdo.

I would ask you to consider the following points surrounding the mandatory fit of ELT & ELT(S) to General Aviation Aircraft.

1: If the intention of the legislation is to save lives rather than locate wreckage I would suggest that a 'Body or, Life Jacket worn' location device would be a great benefit. Surely it should be the Pilot and his / her passengers who are the primary consideration - not the airframe?

2:A fixed ELT is of very little benefit to an Aircraft which has ditched in water - broken Airframes (according to Newtons Law) do not float - nor do the ELT's attached to them. The vast majority of controlled ditchings are reportedly survivable. It is therefore essential that the survivors can be rapidly located and recovered. If the ELT has sunk with the Aircraft this is impossible.

3:Similar comments apply to forced landings. If the Pilot / Passengers survive the event the first thing they will do is move well away from the Aircraft. ELT antennas are usually mounted underside of the fuselage and, are often ripped off on ground impact. So, potentially there no means of sending a distress alert once evacuated.

4: Speed of rescue response is always a critical factor. (The Golden Hour). With a conventional 406 / 121.5MHz ELT positional accuracy on initial activation is no better than 2oo-300 sq kilometers at best. This accuracy improves with additional transmissions as Dopler shift calculations are made. After approx 1 hour the loction accuracy is around 40 sq kilometers.

Details are available on the COSPAS-SARSAT web site www.cospas-sarsat.org

5: In the past 5 years substantial advances have been made in Marine 406MHz EPIRB, and 406MHz Personal Location Beacon technologies. By far the greatest advance has been the inclusion of GPS technology to give an almost instant high accuracy position fix from the point of activation. This technology does not have appeared to have reached the ELT market.

6: New generation 406 / GPS equipped Personal Location Beacons have been adopted by several national aviation authorities for G.A. including the UK's C.A.A. in deferrence to ELT / ELT(S) carriage. I find it very disturbing that the GPS benefit is not a mandatory requirement for any GA ELT or, ELT(S),

and, that PLB carriage is not included in the scope of your consultation document. It may well be that the ELT term is being applied generically and, might actually include PLB's, but, unless this is made clear it is a very grey area and, a good deal of confusion surrounds this nuance.

In summary, I would ask that EASA give serious thought to the benefits of GPS equipped PLB carriage, and, to embrace GPS technologies in all ELT / ELT(S) and PLB units to give the Aviator the maximum chance of rescue / survival should the worst occur.

I attach for your information a link to our GPS equipped PLB which is being purchased by 1000's of GA pilots Europe wide.

Page 46

Ops.Gen 430 (ELT)

Reason for Objection

Fitment of ELT should be voluntary for private, non-commercial aircraft and helicopters. Automatic ELTs have a poor record of working correctly e.g. Air France.

There is no safety case for the additional ELT helicopter requirements over fixed wing. If mandatory ELT fitment becomes law, the fixed wing requirements should apply to helicopters, including the pre July 1 2008 certificate of airworthiness provision.

There should also be an acceptable Means of Compliance that carriage of a PLB with GPS position information would satisfy the requirement, as is currently the case in France.

There is no current UK CAA requirement for private non commercial aircraft to be fitted with ELT.

Suggested alternative wording

Ops.Gen 430 (ELT)

AEROPLANES and HELICOPTERS

(a) Aeroplanes and Helicopters first issued with an individual certificate of airworthiness before and including 1 July 2008 shall be equipped with an Emergency Locator Transmitter (ELT) of any type.

HELICOPTERS

(c) Helicopters used in commercial flight shall be equipped with:

Acceptable means of compliance

For private flights, carriage of a Personal Locator Beacon or ELT(S) with GPS position information. This is currently an acceptable alternative in France and the UK. It is of greater safety benefit than a fixed ELT, as these personal beacons also transmit a homing signal on 121.5.

HCGB Comment

Fixed automatic Emergency locator transmitter installation.

A fixed automatic ELT is expensive to install and maintain, and many light helicopters do not have the physical space, within an acceptable C of G envelope, to install it.

There is also little practical value in such an installation over water. Either the helicopter will quickly sink, and the equipment will not work under water, or if a soft touchdown on floats is achieved, the automatic ELT will not activate, as it requires a substantial G force to do so. Such a force will often break off the tail boom where the ELT or its antenna is often situated, and the boom sinks, making the automatic ELT useless, e.g Bond Helicopters North Sea 2009.

It is unnecessary to carry an additional ELT in the life raft if the pilot already carries a portable one.

The UK CAA, in their year 2004 decision about ETL carriage in helicopters said;

Since the implications for survival after ditching are similar, irrespective of the class of aircraft flown, the disparities between the ICAO standards for aeroplanes and helicopters seem unjustified. Therefore it is proposed that the circumstances in which aeroplanes and helicopters will be required to carry an ELT will be the same. In assessing the likelihood of ditching it seems that the most important factor to be considered is the amount of time that will be spent exposed to the risk of flying over water and this is more significant than any perceived differences between different classes of aircraft. The revised proposal gives responsibility for the commander to decide if an ELT is to be carried, e.g. on shorter flights when the prescribed distances will not be exceeded and the time exposed to the risks of flight over water may be limited.

This decision was subsequently modified by deciding that carriage of a PLB would satisfy the ELT requirement, the principal being that the location of the survivors is more important than location of the aircraft. Consequently few private UK General Aviation aircraft are fitted with an ELT or any sort.

Portable Emergency locator transmitter (PLB or ELT(S))

There is an obvious safety benefit if pilots carry a portable ELT about their person. It is of greater safety benefit than a fixed ELT, as these personal beacons also transmit a homing signal on 121.5.

Cost

An automatic ELT would cost around €5,000 to install. A PLB can be

purchased for around €300.

comment *1470* comment by: *John Henshall*

For small GA helicopters I am fairly sure that there is no space / weight for an ELT.

comment *1478* comment by: *Philip GEORGE*

I am happy to carry a hand held elt. I do not agree with having to have an automatic version. There is no safety reason I can see for it either.

comment *1527* comment by: *Chris Fox*

The evidence for the additional requirements for helicopters is poor - a ditching is unlilely to trigger the ELT, and it will rapidly sink along with the aircraft.

The UK CAA considered this matter in 2004 and concluded that there was no basis for additional requirements for helicopters over as compared with fixed wing aircraft.

Fitment of a fixed automatic ELT is difficult (for reasons of space and weight) in many light helicopters. It should not be mandated for private operations.

The carriage of Personal Locator Beacons provides a much greater safety benefit at far lower cost.

comment *1620* comment by: *Luftfahrt-Bundesamt*

The ELT rule does not include the frequency requirement, asking for 121,5 and 406 MHz capability. This, however, is included in AMC OPS.GEN.430 No.2, which is not acceoptable

comment *1661* comment by: *Netcopter*

I am not against the carraige of an ELT however I ask that ICAO reflect on the practicalities that may prevent, due to weight and space, the fitting of automatic ELT equipment.

comment *1669* comment by: *JSLEE*

Page 46

Ops.Gen. 430 (ELT)

Why should helicopters be treated any different from fixed wing? I can fly my C310 to France and elsewhere carrying a PLB fitted with a 121.5 homing signal and global alerting. This surely makes more sense than one fitted to the aircraft which would be useless at the bottom of the sea. I am assuming that commercial aircraft such as the Airbus have some form of ELT fitted, if so it did not seem to help in locating the one that went down recently. Maybe if some of the Air France passengers or crew had been carrying a PLB they may have been located quicker.

Surely it is more important to locate the passengers and crew than the aircraft.

I have been quoted £5000.00 to fit an ELT to a B206 which in my opinion would serve no more purpose than a PLB which would cost £300.00.

The UK CAA regulations only require a PLB or a ELT to be carried for flights longer than 10 minutes from land. I can see no reason why EASA should require anything different.

comment *1759* comment by: *Richard Dawson*

P46 ELT Helicopters

ELT's should not be mandatory for private, non-commercial helicopters:

- Recent experience (Air France Airbus) has demonstrated that even the most expensive and sophisticated aircraft will not benefit from them when ditching - once the aircraft sinks it provides no further function. Light helicopters generally sink immediately!
- There is no requirement in the UK for ELTs

- There is no provision for this to be fitted non-complex helicopters.

A better solution would be to require that the pilot carries a Personal Locator Beacon attached to their person and additionally mandate the use of lifejackets for all onboard

comment *1825* comment by: *Q Aviation Ltd*

I fly a Robinson R22 helicopter, which is a small two seater.

there is no room for a dingy when there are two people on board.

it is completely impactical to insist on a dingy being carried.

there is no benefit to having a ELT transmitter fitted to a helicopter that will sink immediately on landing on the sea. It will not go off if the landing is successful and it will be of no use if it is on the sea bed.

A PLB is what is needed.

I also fly a R44 4 seat helicopter. The dingy would have to be carried in the back, and the chance of getting it out and successfully inflated is about zero in the event of an emergency.

Fitting floats is either prohibitively expensive or impractical or impossible or all three.

There is no evidence to prove that fitting floatation devices will save lives. I don't think there are any cases of fatalities from drowning in UK waters after a survivable crash landing in water in private helicopters.

Flying for leisure carries a risk, just like everything else in life and I choose to mitigate this risk over water by

- checking the engine and other guages even more dilligently prior to "coasting out"

- choosing the shortest practical route over water to reach my intended destination

- wearing a life jacket and warm clothes

- carrying a PLB

- maintaining radio contact with the appropriate ground based service.

I am capable of making my own decisions to mitigate the risks of flying, and would suggest that no more regulation is required.

The cost of compliance - if possible - would be utterly disproportionate with the perceived benefits gained.

In a typical year, a private pilot would fly between 30 and 75 hours. Of these, maybe 30 minutes would be over water. It doesn't make any sense to try and legislate against a problem that simply doesn't exist.

martin rutty

PPL with 2,500 TT and who regularly flies across the English Channel.

comment *1872* comment by: *Aeromega*

A hand-held ELB is a sensible precaution when flying over hostile terrain, particularly water, but it is neither necessary nor justified when flying over populated areas. It would be expensive, contrary to EASA's opinion that the cost of compliance is negligible and may not be practical in some small helicopter types. It would also reduce usable load, restricting fuel reserves. Fitting every helicopter with a fixed ELB is dispropotionate to the risk. It should be the pilot's discretion what equipment to carry on any given flight. It is not EASA's place to regulate to a degree which makes it impractical to comply with legislation.

comment *1921* comment by: *Tony Castro*

A fixed ELT on a light helicopter ditching (over water) is useless because the impact can be very smooth and will not trigger the ELT. So why spend money, add weight ???? . Better to carry a portable one as I have been doing for years.

comment *1926* comment by: *Malcolm BIRD*

Install an automatic ELT - may seem a good idea but if an emergency causes an autorotation it is very likely that the landing would not trigger the ELT. If the landing was into water it is a great concern that the ELT would soon be underwater and useless. Far better to have the pilot carry a PLB which will stay on their person and operate for far longer. Surely better to allow the pilot to choose between an ELT or PLB? It is also interesting to note that PLBs are far more competitively prociced and can be maintained at lower cost.

comment *1986* comment by: *Helifly (UK) Ltd*

Objection to OPS.GEN.430

It is the opinion of Helifly that automatic ELTs have yet to prove their worth in helicopters, especially in operations over water where the machine may be lost, but the occupants survive. It is felt that an ELT(S) or a Personal Locator Beacon (PLB) with GPS position information is a more appropriate requirement for private operations. These PLBs also transmit a homing signal on 121.5 making rescue quicker.

Given that a PLB gives greater flexibility to the occupants of the aircraft, particularly in relation to flights over water, it seems disproportionate to require an ELT to be fitted at a cost circa £3,000 when a PLB can be purchased for around £250.

comment *2036* comment by: *Ulrich Baum*

OPS.GEN.430 (b) requires an automatic ELT for newer airplanes. Since such an ELT must be permanently installed in the aircraft with a cockpit control unit, this is much more expensive than a non-automatic ELT. For small airplanes used in non-commercial operations, this results in an undue cost burden. I suggest to drop this requirement for small aiplanes (e.g. up to 2000kg MTOW) used in non-commercial operations.

comment *2257* comment by: *Ian MACDONALD*

In the event of a successful autorotation an automatic ELT is not going to activate. Furthermore such a device, mounted centrally in the aircraft is unlikely to be accessible after ditching and as such is simply going to show the location where the helicopter sank. With currents in the Irish sea of up to 4 knots a survivor could be 4 nm away from crash site by the time a rescue helicopter or lifeboat arrived on scene. The rescue services themselves have stated that the need to be within a MAXIMUM of 1 nm to spot a person in the water. A PLB on the other hand, secured to a life jacket, would direct a rescue helicopter to within 10m of the object of the recue, namely the person in the water.

comment *2290* comment by: *Austro Control GmbH*

HELICOPTERS

(e) Helicopters shall be equipped with (a)(1), when operated in: (1) Performance Class 1 or 2 on a flight over water at a distance corresponding to more than 10 minutes flying time at normal cruising speed; (2) Performance Class 3 on a flight over water beyond autorotational distance ***from the land***; or

change wording "***to the land***"

comment *2291* comment by: *Austro Control GmbH*

OPS.GEN.430 Emergency Locator Transmitter (ELT)

AEROPLANES

(a) Aeroplanes first issued with an individual certificate of airworthiness before and including 1 July 2008 shall be equipped with an Emergency Locator Transmitter (ELT) of ***any type***.

Type shall be defined otherwise there will be different regulations in the

member states.

comment *2392* comment by: *Denis Ferranti Meters*

Ops.Gen.430 (ELT) Helicopters (c) (1) refers.

ELTs are not particulaly reliable. They are very expensive to fit (11000 euros for an AS350) and because they are designed to remain in the ac then should survivors leave the crash site then location information is lost. Additioanally, a water impact/landing may not trigger the ELT in any case thus rendering it useless.

Recommendation: That the CAA guidance be followed which allows for the carriage of a PLB instead of the proposed ELT. This also falls into line with the French viewpoint.

Sub para (2) (i) also states that a second ELT should be carried for overwater flights. This may be suitable for commercial concerns but is a step too far for the small private helicopter on grounds of cost and redundancy.

Recommendation. The requirement be dropped. A requirement for all private hels to carry one PLB on board at all times overland and sea would be sufficient.

comment *2534* comment by: *Aerocorp Limited*

An automatic ELT, fitted to a helicopter, is not likely to activate if the machine is autorotated into water. It would also sink with the helicopter or be immersed when the helicopter inverted, which is most likely if the helicopter is fitted with floats. Personal location beacons remain with the floating survivors - a far more sensible scenario.

comment *2541* comment by: *James Leavesley*

I accept the intention of this proposed legislation but do not believe that currently the technology exists that is reliable enough to achieve the desired outcome.

The carrying to personal beacons should be encouraged or made manditor, which would provide an acceptable cost to benefit outcome. The fitting of the ELT on the machine would be very expensive woudl not provide an acceptable cost to benefit outcome.

comment *2673* comment by: *British Gliding Association*

<![endif]-->

ELT's are designed to alert the SAR/emergency services of an aircraft crash and are permanently installed. An ELT installation, whether or not aircraft modification is required, is a relatively expensive purchase for sporting clubs, and clearly a disproportional requirement when they do not operate aeroplanes in areas designated by member states as those in which search and rescue would be especially difficult. Sailplane towing aeroplanes, for example, invariably operate in sight of and within a few km's of the base airfield.

The BGA supports a proportional approach to flight safety improvements. Therefore we propose that the wording of OPS.GEN.430 Emergency Locator Transmitter (ELT) as applicable to aeroplanes should be modified as follows;

AEROPLANES

(a) Aeroplanes operated in areas designated by member states as those in which search and rescue would be especially difficult and first issued with an individual certificate of airworthiness before and including 1 July 2008 shall be equipped with an Emergency Locator Transmitter (ELT) of any type.

(b) Aeroplanes operated in areas designated by member states as those in which search and rescue would be especially difficult and first issued with an individual certificate of airworthiness after 1 July 2008 shall be equipped with an automatic ELT.

comment *2798* comment by: *jack froggatt*

ELT's are already carried in the GPS on board the Robinson R44 helicopter which I own. Fixed automatic ELTs are expensive to install and maintain and I do not have the space to fit such a device. In water the equipment would be of little value as the helicopter would quickly sink and the equipment would not work. If a soft touchdown is achieved the automatic ELT would not work as it requires G force. Such force may break off the tail boom where the ELT or its antenna may be situated and the boom sinks rendering the automatic ELT useless. For example Bond Helicopters in the North Sea in 2009.

comment *2915* comment by: *Pietro Barbagallo ENAC*

Comment: please consider to show on this paragraph the operational frequencies (121.5, 406.0 MHz) shown on AMC2 OPS.GEN.430 item 4 only.

comment *3162* comment by: *UK CAA*

Page: 45

Paragraph No: OPS.GEN.430

Comment:

Carriage of an approved ELT at all times in light aircraft operated for private purposes is seen to be too onerous and the requirement would impose a large and very costly retrofit programme. Carriage should only be required by law in situations where the device would aid search and rescue significantly i.e. over water and hostile areas. The UK CAA files a difference against the ICAO Standards in Annex 6 Parts II and III accordingly.

Furthermore, it is considered that:

a) The installation of a fixed ELT in light aeroplanes and helicopters can be difficult or in some cases impossible due to lack of available space and availability of auxiliary power.

b) The installation of a fixed ELT must be conducted as a minor modification approved in accordance with the Part M airworthiness standards. This results in considerable additional complication and cost.

c) A fixed ELT is likely to be ineffective in the event that a light aircraft ditches because the aircraft will sink very quickly, taking the ELT below the surface where its signal will be interrupted.

d) The impact forces experienced during a survivable light aircraft accident are thought to be below that required to activate an automatic ELT when compliant with ED-62 specifications.

For the reasons highlighted above, it is the opinion of the UK CAA that portable ELT devices i.e. (ELT(S)) or (ELT(AP)) are the most appropriate device for use in light aircraft. However, there are few products on the market that are approved to EUROCAE Document ED-62 specifications, suitable and affordable for use in light aircraft. Availability of such equipment is not expected to improve in the short term due to the cost of demonstrating compliance.

There are a growing number of portable devices available that have not been demonstrated to comply with the ED-62 specifications but operate in accordance with the same transmission standards as an approved ELT and in many cases have identical functionality. Those operating non-complex aircraft on non-commercial flights should not be required to carry approved ELT equipment all the time but have available the option of carrying an alternative non-approved survival locator beacon instead. Those who wish to have the additional assurance that an approved device offers will continue to have the option of voluntarily equipping with such a device. This is in line with the policy for other items of survival equipment such as life jackets which do not need to be approved (OPS.GEN.400(c) and GM OPS.GEN.400(c))

In order to prevent interference with other emergency transmissions, non-approved devices used in aircraft should at least conform to ITU Standards (as specified by ICAO) and be Type Approved by Cospas-Sarsat.

The text of OPS.GEN.430 should be deleted and replaced with that below. A new AMC OPS.GEN.430 and an amendment to GM OPS.GEN.430 are also proposed.

Justification:

Disproportionate approach toward light aircraft operated for non-commercial purposes.

Proposed Text (if applicable):

Delete existing OPS.GEN.430. Insert new text as follows:

OPS.GEN.430 Emergency Locator Transmitter (ELT)

COMPLEX MOTOR-POWERED AEROPLANES USED IN NON-COMMERCIAL OPERATIONS AND AEROPLANES USED IN COMMERCIAL OPERATIONS

~~*(a) Aeroplanes first issued with a certificate of airworthiness before and including 1 July 2008 shall be equipped with an Emergency Locator Transmitter (ELT) of any type.*~~

~~*(b) Aeroplanes first issued with a certificate of airworthiness after the 1 July 2008 shall be equipped with an automatic ELT (ELT(A)).*~~

NON-COMPLEX MOTOR-POWERED AEROPLANES USED IN NON-COMMERCIAL OPERATIONS

(c) Aeroplanes operating at a distance corresponding to more than 10 minutes flying time at normal cruising speed away from land suitable for an emergency landing shall be equipped with an ELT of any type.

COMPLEX MOTOR-POWERED HELICOPTERS USED IN NON-COMMERCIAL OPERATIONS AND HELICOPTERS USED IN COMMERCIAL OPERATIONS

(d) Helicopters shall be equipped with:

(1) at least one automatic ELT (ELT(A)); and

(2) one Survival ELT (ELT(S)) in a life-saving raft or life jacket when the helicopter is operated in:

(i) Performance Class 1 or 2 on a flight over water at a distance corresponding to more than 10 minutes flying time at normal cruising speed away from land; or

(ii) Performance Class 3 over water at a distance beyond autorotational of safe forced landing from land.

NON-COMPLEX MOTOR-POWERED HELICOPTERS USED IN NON-COMMERCIAL OPERATIONS

(e) Helicopters shall be equipped with one ELT of any type when operating away from land suitable for an emergency landing at a distance corresponding to:

1) in the case of a helicopter operating in Performance Class 1 or 2, more than 10 minutes flying time at normal cruising speed; or

(2) in the case of a helicopter operating in Performance Class 3, more than 3 minutes flying time at normal cruising speed.

AMC OPS.GEN.430 Emergency Locator Transmitter (ELT)

NON-COMPLEX MOTOR-POWERED AIRCRAFT USED IN OTHER THAN COMMERCIAL OPERATIONS

Non-complex aircraft operating for other than commercial purposes may, in place of an approved ELT, carry a transmitter device that incorporates a GNSS receiver, operates on 121.5Mhz and 406Mhz, that is of a type approved by COSPAS-SARSAT and operates in accordance with ITU-R Recommendation M.690-1.

GM OPS.GEN.430 Emergency Locator Transmitter (ELT)

DEFINITION

1. An Emergency Locator Transmitter (ELT) …..

USE OF NON-APPROVED EQUIPMENT

2. ELT devices that have been manufactured and approved in accordance with EUROCAE Document ED-62 "Minimum operational performance specification for aircraft emergency locator transmitters" are demonstrably capable of continuing to operate at optimum levels despite being subjected to severe adverse conditions such as immersion in water, impact shock and fire that may be experienced following an accident. It is therefore strongly recommended that operators carry an approved ELT at all times.

comment *3407* comment by: *George Knight*

It is not clear why aeroplanes issued with a C of A **AFTER** 1 July 2008 do **NOT** need to be fitted with an ELT.

This retrospective rule is an expensive and disproportionate rule for e.g aircraft used to tow gliders. These aircraft rarely travel more than a few km from their base.

The rule should be changed to require aircraft to carry an ELT only when flying over areas where SAR would be difficult or over water when more than 30 km from the nearest shore. Portable devices should be permitted to eliminate the cost of modifications, and to avoid adding weight to very light aircraft.

comment *3429* comment by: *Peter Waldron*

There is no current UK CAA requirement for private non commercial aircraft to be fitted with ELT.

Fitting of an ELT should be voluntary for private non-commercial helicopters; automatic ELT's have a poor record of working correctly, i.e. Air France. Should the fitting of an ELT become mandatory the fixed wing requirements should apply to helicopters, including the pre July 1st 2008 Certificate of Airworthiness provision.

An acceptable Means of Compliance should be that carriage of a PLB with GPS position information would meet the requirement as is the case in France.

An automatic ELT would cost approximately 5,000 Euros to install whereas a PLB would cost around 300 Euros.

There is a clear safety benefit if pilots carry a portable ELT and this is likely to be of greater benefit as these personal beacons also transmit a homing signal on 121.5.

comment *3468* comment by: *Aero-Club of Switzerland*

We think installation of ELT on aircraft used for private flight should remain voluntary.

We invite the Agency to make a proportionate approach to the ELT and to modify its proposal by taking into account the nature of the environment in which a rescue operation will take place:

Our proposal:

~~AEROPLANES~~ AIRCRAFT

(a) Aircraft operated on other than private flights in areas designated by the Member State to be difficult to undertake search and rescue operations in and first issued with an individual certificate of airworthiness before and including 1 July 2008 shall be equipped with an ELT of any type.

(b) Aircraft operated on other than private flights in areas designated by the Member State to be difficult to undertake search and rescue operations in and first issued with an individual certificate of airworthiness after 1 July 2008 shall be equipped with an automatic ELT of any type.

Justification: We think our proposal fits better with the missions operated by aeroplanes and helicopters, we see no need for additional requirements for helicopters.

(c) can be deleted.

Additional remark: We know of different accidents in mountain areas where victims were found because their mobile phone was switched on or because of their Breitling Emergency watch

OPS.GEN.430 Emergency Locator Transmitter (ELT)

Comment:

The minimum standards are not regulated (406 MHz, according Annex 10). This shall be added under d) according EU-OPS 1.820(c) or included in the AMC.

comment *3631* comment by: *IAOPA Europe*

It should possible to satisfy the ELT requirement by carrying a PLB (Personal Locator Beacon) approved by Cospass Sarsat and coded for aviation use.

The PLB has several advantages over the ELT. First of all it stays with the crew/person carrying it allowing search and rescue to find the pilot and passengers instead of the aircraft wreck. Secondly - in case of a survivable crash on water - it will remain useful even if the aircraft with a fixed ELT installation sinks and is made useless.

The automatic activation of the fixed ELT installation has a long track record for not activating on impact making the pilot activated PLB also here a good option.

For the same reasons PLB should be able to replace both requirements c(2) I and II for helicopters

comment *3742* comment by: *Civil Aviation Authority of Norway*

Comment: Carriage of an approved ELT at all times in light aircraft operated for private purposes is seen to be too onerous. Carriage should only be required by law in situations where the device would aid search and rescue significantly i.e. over water and hostile areas. The UK CAA files a difference against the ICAO Standards in Annex 6 Parts II and III accordingly.

Furthermore, it is considered that:

a) The installation of a fixed ELT in light aeroplanes can be difficult or in some cases impossible due to lack of available space and availability of auxiliary power.

b) The installation of a fixed ELT must be conducted as a minor modification approved in accordance with the Part M airworthiness standards. This results in considerable additional complication and cost.

c) A fixed ELT is likely to be ineffective in the event that a light aircraft ditches because the aircraft will sink very quickly, taking the ELT below the surface where it's signal will be interrupted.

d) The impact forces experienced during a survivable light aeroplane accident are thought to be below that required to activate an automatic ELT.

For the reasons highlighted above, it is the opinion of the CAA-N that portable ELT devices i.e. (ELT(S)) or (ELT(AP)) are the most appropriate device for use in light aircraft. However, there are few products on the market that are approved to ED-62 specifications, suitable for use in light aeroplanes and affordable for light aircraft operators. Availability of such equipment is not expected to improve in the short term due to the cost of demonstrating compliance.

There are a growing number of portable devices available that have not been demonstrated to comply with the ED-62 specifications but operate in accordance with the same transmission standards as an approved ELT and in many cases have identical functionality. It is felt that those operating light aeroplanes on private flights should not be required to carry approved ELT equipment all the time but have available the option of carrying an

alternative non-approved survival beacon instead. Those who wish to have the additional assurance that an approved device offers will continue to have the option of voluntarily equipping with such a device. This is in line with the policy for other items of survival equipment such as life jackets which do not need to be approved (OPS.GEN.400(c) and GM OPS.GEN.400(c))

In order to prevent interference with other emergency transmissions, non-approved devices used in aircraft should at least conform to ITU Standards (As specified by ICAO) and be Type Approved by Cospas-Sarsat.

Justification:

Disproportionate approach toward light aircraft operated for private purposes.

Proposed Text

(if applicable):

OPS.GEN.430 Emergency Locator Transmitter (ELT)

AEROPLANES

(a) Aeroplanes operating at a distance corresponding to more than 10 minutes flying time away from land suitable for an emergency landing shall be equipped with:

(1) in the case of an aeroplane first issued with a certificate of airworthiness before and including 1 July 2008, an ELT of any type; or

(2) in the case of an aeroplane first issued with a certificate of airworthiness after 1 July 2008, an automatic ELT (ELT(A))

HELICOPTERS

(b) Helicopters operating at a distance corresponding to more than 10 minutes flying time away from land suitable for an emergency landing shall be equipped with one ELT of any type

(c) In addition to (b) helicopters over water shall:

(1) in the case of a helicopter operating Performance Class 1 or 2 at a distance corresponding to more than 10 minutes flying time away from land suitable for an emergency landing; or

(2) in the case of a helicopter operating Performance Class 3 at a distance corresponding to more than 3 minutes flying time away from land suitable for an emergency landing,

be equipped with one Survival ELT (ELT(S)) in a life-saving raft or life jacket.

AMC OPS.GEN.430 Emergency Locator Transmitter (ELT)

OTHER THAN COMMERCIAL OPERATIONS

Aircraft with a Maximum Take-off Mass of 5700kg or less operating for other than commercial purposes may, in place of an approved ELT, carry a transmitter device that incorporates a GNSS receiver, operates on 121.5Mhz and 406Mhz, that is of a type approved by COSPAS-SARSAT and operates in accordance with ITU-R Recommendation M.690-1.

GM OPS.GEN.430 Emergency Locator Transmitter (ELT)

USE OF NON-APPROVED EQUIPMENT

ELT devices that have been manufactured and approved in accordance with EUROCAE Document ED-62 "Minimum operational performance specification for aircraft emergency locator transmitters" are demonstrably capable of continuing to operate at optimum levels despite being subjected to severe adverse conditions such as immersion in water, impact shock and fire that may be experienced following an accident. It is therefore strongly recommended that operators carry an approved ELT at all times.

comment *4152* comment by: *colin rosenberg*

i cannot see the point ofsuch piece of equipment here in ther u.k. as being so populated, there is rarely a place so isolated that warrants a locator. I have flown in both Australia and New Zealand, where the terrain is hostile and barren. But certainly not here in the u.k.

comment *5081* comment by: *Trevor Wilcock*

Para a: What is the safety case that justifies every aeroplane having an ELT? Many flight operations are conducted in areas where an ELT will provide little additional benefit, and the more ELTs there are the more likelihood there is of inadvertent operation and a nuisance workload on S&R organisations.OPS.GEN.435 seems a more realistic requirement, taking into account the likely benefit of an ELT.

If an ELT "of any type" is acceptable, is the aircraft "equipped" if an ELT(S) is carried by the pilot?

comment *5307* comment by: *Light Aircraft Association UK*

ELTs are expensive items of equipment that have arguable safety benefits in normal operation. The LAA therefore proposes that the wording for OPS.GEN.430 should read as follows, to make the rule appropriate and proportional for light aircraft:

"a) Aeroplanes first issued with an individual certificate of airworthiness before and including 1 July 2008 and operated over areas where Search and Rescue cover is limited or difficult shall be equipped with an Emergency Locator Transmitter (ELT) or Personal Locator Beacon (PLB) of any type.

b) Aeroplanes first issued with an individual certificate of airworthiness after 1 July 2008 and operated over areas where Search and Rescue cover is limited or difficult shall be equipped with an automatic ELT or PLB."

Also, this requirement only applies to aeroplanes and helicopters: presumably there should be similar requirements for other aircraft types, e.g. gyroplanes, and so the requirement should be amended accordingly.

comment

5328 comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

(b) Aeroplanes first issued with an individual certificate of airworthiness after 1 July 2008 shall be equipped with an automatic ELT.

Comment:

The requirement in Annex 10 Vol V about the remote control in cockpit for ELT (in order to switch between OFF, ARM an ON) should be clarified in this paragraph or in an AMC.

Page 46

Ops.Gen 430 (ELT)

Reason for Objection

Fitment of ELT should be voluntary for private, non-commercial aircraft and helicopters. Automatic ELTs have a poor record of working correctly.

There is no safety case for the additional ELT helicopter requirements over fixed wing. If mandatory ELT fitment becomes law, the fixed wing requirements should apply to helicopters, including the pre July 1 2008 certificate of airworthiness provision.

There should also be an acceptable Means of Compliance that carriage of a PLB with GPS position information would satisfy the requirement, as is currently the case in France and the UK.

Suggested alternative wording

Ops.Gen 430 (ELT)

AEROPLANES and HELICOPTERS

(a) Aeroplanes and Helicopters first issued with an individual certificate of airworthiness before and including 1 July 2008 shall be equipped with an Emergency Locator Transmitter (ELT) of any type.

HELICOPTERS

(c) Helicopters used in commercial flight shall be equipped with:

Acceptable means of compliance

For private flights, carriage of a Personal Locator Beacon or ELT(S) with GPS position information. This is currently an acceptable alternative in France and the UK. It is of greater safety benefit than a fixed ELT, as these personal beacons also transmit a homing signal on 121.5.

EPHA Comment

Fixed automatic Emergency locator transmitter installation.

A fixed automatic ELT is expensive to install and maintain, and many light helicopters do not have the physical space, within an acceptable C of G envelope, to install it.

There is also little practical value in such an installation over water. Either the helicopter will quickly sink, and the equipment will not work under water, or if a soft touchdown on floats is achieved, the automatic ELT will not activate, as it requires a substantial G force to do so. Such a force will often break off the tail boom where the ELT or its antenna is often situated, and the boom sinks, making the automatic ELT useless, e.g Bond Helicopters North Sea 2009.

It is unnecessary to carry an additional ELT in the life raft if the pilot already carries a portable one.

The UK CAA, in their year 2004 decision about ETL carriage in helicopters said;

Since the implications for survival after ditching are similar, irrespective of the class of aircraft flown, the disparities between the ICAO standards for aeroplanes and helicopters seem unjustified. Therefore it is proposed that the circumstances in which aeroplanes and helicopters will be required to carry an ELT will be the same. In assessing the likelihood of ditching it seems that the most important factor to be considered is the amount of time that will be spent exposed to the risk of flying over water and this is more significant than any perceived differences between different classes of aircraft. The revised proposal gives responsibility for the commander to decide if an ELT is to be carried, e.g. on shorter flights when the prescribed distances will not be exceeded and the time exposed to the risks of flight over water may be limited.

This decision was subsequently modified by deciding that carriage of a PLB would satisfy the ELT requirement, the principal being that the location of the survivors is more important than location of the aircraft. Consequently few private UK General Aviation aircraft are fitted with an ELT or any sort.

Portable Emergency locator transmitter (PLB or ELT(S))

There is an obvious safety benefit if pilots carry a portable ELT about their person. It is of greater safety benefit than a fixed ELT, as these personal beacons also transmit a homing signal on 121.5.

Cost

An automatic ELT would cost around €5,000 to install. A PLB can be purchased for around €300.

comment *5384* comment by: *David Chisnall*

It is reasonable that small helicopters carry a PLB but not reasonable for it to be required to be fitted with an ELT. ELTs are expensive to purchase, maintain and are of dubious value when compared with a PLB. If a smooth autorotation is made onto water there is no guarantee that an ELT will be

triggered. The ELT will go down with the Helicopter whereas the PLB remains with the crew.

In summary I must object strongly to these proposals as they discriminate against non complex private helicopters. ICAO should be changed so the private helicopters are treated the same as private fixed wing aircraft.

comment *5595* comment by: *DGAC*

Proposal:

Insert AMC OPS.GEN.430

"For non-commercial operations of non-complex-motor-powered-aircraft, a PLB emitting on the same frequencies, can be used as qualified means for emergency localisation applicable to operate with these aircraft, instead of an ELT".

Justification:

French national regulation for light aircraft.

comment *5602* comment by: *James Tuke*

My previous comments to this also apply here. Also there is no guarantee that following a ditching an ELT will start to operate. The proposal to fit a PLB to a life jacket is perfectly sufficient but once again, due to the absence of any relevant evidence of ditching in single engined piston machines, seems to me to be totally unnecessary. Simply put, it will not contribute to the saving of lives.

comment *5685* comment by: *DON BURT*

Helicopters.

This requirment appears to be over the top for the limited amount of time spent flying over water.

I would suggest that one portable device should be sufficient similar to the requirments of light fixed wing aircraft.

comment *5722* comment by: *Avon CAYZER*

Personel ELT are fine, (only £300-500) against £1,000's and should only be needed if the flight time is over ten minutes over water. Why fit more systems that may fail when one or two portable units per 10 seat aircraft will work. The pilot has been taking with airtraffic crossing boundies so can get

a mayday call out on position prior to ditching.

comment *5885* comment by: *Michael Taylor*

I wish to object to the proposal to mandate the fitting of a fixed ELT to light helicopters. I believe that the existing regulation requiring a PLB is sufficient to provide for the rescue of passengers. A fixed ELT would be unlikely to be triggered by a soft water landing and manual triggering of such a device would delay egress from the helicopter. On the other hand, a PLB stays on the surface with the crew or passengers to assist in their rescue.

comment *5972* comment by: *DGAC*

Proposal:

Add AMC.OPS.GEN.430 (a) & (b)

"The ELT installed on aircraft used for aerobatic flights will be deactivated for such flights, unless it can be demonstrated it cannot be triggered by the load factors met during these flights".

Justification:

There is a risk of false alarms with an active ELT during aerobatic flights.

comment *6468* comment by: *George Heritage*

(c) - There is no case for the additional ELT safety requirements for helicopters against that of fixed wing aircraft. A PLB may be useful.

comment *6534* comment by: *TG WHITING*

A permanently fitted ELT appears a disportionate requirement in sailplanes, particularly for sailplane clubs where the majority of aeroplanes and sailplanes are operated locally to the club, and not in areas deemed difficult for search and rescue. A large proportion of the club owned sailplane training fleet will never leave the vicinity of the club. In addition, sailplane pilots are generally equipped with parachutes and in the event of a mid air accident they are likely to abandon the sailplane, so having the ELT fitted to the aircraft may not be of assistance. It would seem preferable to make an ELT mandatory in those areas where the member states deem that serach and rescue would be very difficult, and to recommend that a PLB be carried with the pilot in preference.

comment *6540* comment by: *European Gliding Union (EGU)*

OPS.GEN.430 Emergency Locator Transmitter (ELT)

ELT's were designed to alert the SAR/emergency, but are not reflecting the fast improvement in communications. Modern mobile communication i.e. by mobile phone, satellite phone etc. make ELTs superfluous as modern communication means are more useful and definitely cheaper. The ICAO requirement has no certified background. No numbers are in Germany available to proof the affectivity of ELT. What is known is the high amount of false alarms due to poor design and mishandling and the costs involved.

ELT installation, whether or not aircraft modification is required, is a relatively expensive purchase for sporting clubs, and clearly a disproportional requirement when they do not operate aeroplanes in areas in which search and rescue would be especially difficult. Tow aeroplanes and parachutist drop planes for example, invariably operate in sight of and within a few km's of the base airfield.

Recommendation: No requirement for an ELT for any small aircraft i.e up to 2000kg

comment *6555* comment by: *Sloane Helicopters Ltd*

Ops.Gen 430 (ELT)

Reason for Objection

Fitment of ELT should be voluntary for private, non-commercial aircraft and helicopters.

There is no safety case for the additional ELT helicopter requirements over fixed wing. If mandatory ELT fitment becomes law, the fixed wing requirements should apply to helicopters, including the pre July 1 2008 certificate of airworthiness provision.

There should also be an acceptable Means of Compliance that carriage of a PLB with GPS position information would satisfy the requirement, as is currently the case in France.

There is no current UK CAA requirement for private non commercial aircraft to be fitted with ELT.

Acceptable means of compliance

For private flights, carriage of a Personal Locator Beacon or ELT(S) with GPS position information. This is currently an acceptable alternative in France and the UK. It is of greater safety benefit than a fixed ELT, as these personal beacons also transmit a homing signal on 121.5.

Portable Emergency locator transmitter (PLB or ELT(S))

There is an obvious safety benefit if pilots carry a portable ELT about their person. It is of greater safety benefit than a fixed ELT, as these personal beacons also transmit a homing signal on 121.5. The cost of a personal ELT is significantly cheaper.

comment *6568* comment by: *Baden-Württembergischer Luftfahrtverband*

OPS.GEN.430

Wording in the NPA

(a) Aeroplanes first issued with an individual certificate of airworthiness before and including 1 July 2008 shall be equipped with an Emergency Locator Transmitter (ELT) of any type.

(b) Aeroplanes first issued with an individual certificate of airworthiness after 1 July 2008 shall be equipped with an automatic ELT.

Our proposal

This requirement should be optional for aeroplanes not used commercially

Issue with current wording

This requirement is not appropriate for many operations in non commercial operations

Rationale

Apart from cost and possible weight and space issues many operations experience no additional safety by ELT e.g. tow planes or parachute lifting operating in close vicinity to the base airport. In these cases the danger of false alarms is much higher than the danger of not being found. Germany is so densely populated that any accident will almost always be noticed. Not that many aeroplanes are used for extensive traveling in other countries. Therefore it also is inappropriate to burden every aeroplane holder with the costs for installing and maintaining an ELT.

comment *6772* comment by: *Clive Morrell*

'Requirement for an automatic ELT to be fitted to the aircraft'.

Comment; An automatic ELT in a helicopter is of less use than one carried on the person. In a controlled autorotation onto water, it probably would not activate as there would be insufficient G. In a violent impact it would go down with the wreckage and be useless. One carried by the pilot or one of the occupants could be activated at will, and it would remain with the survivors.

In the case of non complex helicopters engaged in private flight, one portable ELT should be carried by an occupant of the helicopter.

comment *6783* comment by: *Kinetic Avionics Ltd*

Section 430 - comment

ELTs are costly to fit and carry a weight penalty that might adversly affect operations of small helicopter types. Once again there appears to be no justification for the different treatment of aeroplanes and helicopters, for example regarding the 1 July 2008 date. For most private flights the additional cost and weight are not proportionate to any increased safety benefit over carrying a PLB.

comment *6791* comment by: *simon lichtenstein*

I have flown many times over water in Robinson helicopters and in a weightshift microlight. I have even been on the helicopter dunker course. I wear a life jacket and carry a PERSONAL locator beacon, far more useful than something attached to the aircraft from which you may well get separated if you did ditch. It would be daft to attach a fixed locator beacon to a Robinson 22, which already struggles with its payload, and for which there is no room anyway. The cost of certifying it would totally be out of proportion to the problem and effectively ban legal cross channel flights. It really is a case of a solution being found to a problem that does not exist. It is essential that the law reflects common sense.

comment *6816* comment by: *EFLEVA*

It is the EFLEVA view that ELTs have arguable safety benefits in normal operation. The EFLEVA therefore proposes that the wording for OPS.GEN.430 should be revised to read:

"a) Aircraft first issued with an individual certificate of airworthiness before and including 1 July 2008 and operated over areas where Search and Rescue cover is limited or difficult shall be equipped with an Emergency Locator Transmitter (ELT) or Personal Locator Beacon (PLB) of any type.

b) Aircraft first issued with an individual certificate of airworthiness after 1 July 2008 and operated over areas where Search and Rescue cover is limited or difficult shall be equipped with an automatic ELT or PLB.

comment *6888* comment by: *Luftsport-Verband Bayern*

zu: AEROPLANES

(a) Aeroplanes first issued with an individual certificate of airworthiness before and including 1 July 2008 shall be equipped with an Emergency Locator Transmitter (ELT) of any type.

(b) Aeroplanes first issued with an individual certificate of airworthiness after 1 July 2008 shall be equipped with an automatic ELT:

Es wird eine grundsätzliche Forderung nach einem ELT aufgestellt.

Vorschlag Neuformulierung: AEROPLANES

(a) Aeroplanes with a certified take off mass of 2000 kg and higher first issued with an individual certificate of airworthiness before and including 1 July 2008 shall be equipped with an Emergency Locator Transmitter (ELT) of any type.

(b) Aeroplanes with a certified take off mass of 2000 kg and higher first issued with an individual certificate of airworthiness after 1 July 2008 shall be equipped with an automatic ELT.

Bezogen auf den nicht kommerziellen Hubschrauberflug von dieser Seite der Kommentar: "

…Mitführen eines automatischen Notsenders…

Der spektakuläre kürzliche Unfall eines Air France Luftfahrzeuges (Brasilien-Frankreich) hat die Schwachstellen eines automatischen ELT gezeigt.

Das Mitführen eines Personal Locator Beacon mit GPS Information – getragen durch ein Besatzungsmitglied – bei „längeren Flügen über See" bei Einzelflug kann als Kompromiss akzeptiert werden. Dies wäre auch finanziell vertretbar.

comment *7043* comment by: *John Carr*

Again, bias against helicopters. Pre 1 July 08 aeroplanes are allowed any type of ELT however helicopters of the same age are required to at least one automatic ELT plus a survival ELT. The later not being required for aeroplanes.

Acceptable means of compliance

For private flights, carriage of a Personal Locator Beacon or ELT(S) with GPS position information. This is currently an acceptable alternative in France and the UK. It is of greater safety benefit than a fixed ELT, as these personal beacons also transmit a homing signal on 121.5.

HCGB Comment

Fixed automatic Emergency locator transmitter installation.

A fixed automatic ELT is expensive to install and maintain, and many light helicopters do not have the physical space, within an acceptable C of G envelope, to install it.

There is also little practical value in such an installation over water. Either the helicopter will quickly sink, and the equipment will not work under water, or if a soft touchdown on floats is achieved, the automatic ELT will not activate, as it requires a substantial G force to do so. Such a force will often break off the tail boom where the ELT or its antenna is often situated, and the boom sinks, making the automatic ELT useless, e.g Bond Helicopters North Sea 2009.

It is unnecessary to carry an additional ELT in the life raft if the pilot already carries a portable one.

The UK CAA, in their year 2004 decision about ETL carriage in helicopters said;

Since the implications for survival after ditching are similar, irrespective of the class of aircraft flown, the disparities between the ICAO standards for aeroplanes and helicopters seem unjustified. Therefore it is proposed that the circumstances in which aeroplanes and helicopters will be required to carry an ELT will be the same. In assessing the likelihood of ditching it seems that the most important factor to be considered is the amount of time that will be spent exposed to the risk of flying over water and this is more significant than any perceived differences between different classes of aircraft. The revised proposal gives responsibility for the commander to decide if an ELT is to be carried, e.g. on shorter flights when the prescribed distances will not be exceeded and the time exposed to the risks of flight over water may be limited.

This decision was subsequently modified by deciding that carriage of a PLB would satisfy the ELT requirement, the principal being that the location of the survivors is more important than location of the aircraft. Consequently few private UK General Aviation aircraft are fitted with an ELT or any sort.

Portable Emergency locator transmitter (PLB or ELT(S))

There is an obvious safety benefit if pilots carry a portable ELT about their person. It is of greater safety benefit than a fixed ELT, as these personal beacons also transmit a homing signal on 121.5.

Cost

An automatic ELT would cost around €5,000 to install. A PLB can be purchased for around €300.

comment *7414* comment by: *DAvid Monks*

A PLB with GPS would be more suitable in a non complex helicopter. Each passenger could have their own in case the pob became separate. A GPS PLB will guide the rescue services within 45 mins to a position unlike an ELB.

comment *7462* comment by: *Richard Simpson*

OPS GEN 430 ELT

It is very expensive to fit and maintain a fixed ELT. In the event of an accident, a hand-held ELT with GPS and locator beacon would be much more effective , the fixed ELT having sunk to the bottom of the sea. There is no practical location for a fized ELT i many light rotorcraft. Carrying a fixed ELT should not be mandatory.

This has already been considered by the CAA and the decision to allow the captain to decide on ELT usage was sensibly made. Portable ELTs are inexpensive and can be shared between more than one aircraft as and when required.

comment *7468* comment by: *David ROBERTS*

(a) Aeroplanes. ELTs are not the only solution, and having a fixed ELT in an aeroplane is costly, particularly with the attendant certification costs. Many pilots prefer to have a PLB, for reasons of cost and also they would prefer the SAR to find them rather than the aeroplane, if the pilot(s) / crew become separated from the aeroplane on crashing.

There is a variety of requirements for ELT / PLB in member states at present, which is creating confusion and unneccesary cost.

Proposal: Allow either PLBs or ELTs

(a) Aeroplanes and (b) Helicopters. There should not a blanket requriement for ELTs (or PLBs) as there is no proven safety case in many habited parts of the EU. However, it may be reasonable to require either the fitting of ELTs or carriage of PLBs in areas designated by Member States as those in whcih search and rescue would be difficult.

Proposal: Limit the requirement for ELTs / PLBs to flights over areas designated by Member States as those in which search and rescue would be difficult.

comment *7478* comment by: *Henry Pelham*

Ops. Gen. 430 Emergency locator Transmitters.

It is my understanding that automatic locator transmitters have a poor record of functionality. They are impossible to fit to some helicopters and are very expensive to fit to others (3000 euros in the case of an Enstrom 480). In a ditching they will be of no use if as is probable the helicopter sinks - a PLB. In addition this would provide a homing signal to rescuers. The regulation as drafted lacks proportionality when there is better cheaper and more useful equipment available.

comment *7502* comment by: *David George*

OPS.GEN.430 ELT:-

"Helicopters shall be equipped with: (1) at least one automatic ELT; and (2) one Survival ELT (ELT(S)).....

A fixed automatic ELT is very expensive (approximately €5,000) and is of little use over water. In the event of an emergency landing on water, a helicopter without floats will sink very quickly and the ELT does not work under water. A helicopter equipped with floats landing on water will probably not activate the automatic ELT.

I support the proposal for the carriage of an ELT(S) - Personal Locator Beacon. There is a brilliant new product called "buddi" (www.buddi.co.uk) which is a Personal Locator Beacon with a voice facility.

comment *7514* comment by: *John Castle*

ELT's are of limited usefulness in sailplanes and of absolutely no use in the tow planes used for aerotow launching.

Sailplanes raely operate in inaccessible regions in Britain and Europe other than mountain areas. It would be more practical to specify those areas where ELT's should be carried by the pilot and passenger (if a 2 seater). They should also be attached to the persons rather than the aircraft because a parachute escape may be made and therefore the persons may not be near crash wreckage. Tow planes normally operate within visual range of airfields and only go cross country to execute an aerotow retrieve following an out landing. This could be the case for an ELT to be carried by the pilot.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.435 Survival equipment – Motor-powered aircraft p. 46

comment *1461* comment by: *keith TOLLEY*

As helicopter pilot/owner my previous machine was fitted with floats,and having flown over water, English channel, Irish sea etc I always felt that in a true emergency I would not have the expertise to deploy the floats correctly. There is no way of training to use them safely other than theory. Correct procedures appear complicated and if not done correctly can cause far more danger and problems than they solve, especially for a private pilot. I have just purchased a new helicopter and purposely did not have floats fitted. I am far happier flying over water now than I was with the extra problems floats can bring, as in the few emergency situations I have had everything happens so fast even a mayday call is not always possible. I also think the cost of maintenance far out ways any benefits, especially when I am told by the manufacturer than the machine will sink anyway. On a similar note I was a passenger in a Bell 206 at Wolverhampton airfield when the pilot set off the floats by mistake when lifting off, this was both dangerous and expensive.

One extra I did have with the new machine was a night kit, this works very well and is used regularly. I do not however see what use adjustable lights can be as who will operate them as most of my night flying is solo? When landing at night the cockpit is very busy and all my hands and feet are in use. One switch is enough.

Pitot heat is pointless as flying in icing conditions is not permitted.

comment *1686* comment by: *Dassault Aviation*

Technical comment.

Page 46 OPS.GEN.435: §(b)(2) is applicable to complex motor powered aircraft, so does it means that §(b)(1) is applicable to non-complex motor powered aircraft, since an operator has to comply with §(b)(1) OR (§(b)(2)? If yes, it should be written that §(b)(1) is applicable to non-complex motor powered aircraft.

comment *1737* comment by: *Richard David Jordan*

We are in disagreement with the proposals for the following reasons:-

There is no safety case for the proposal.

Mechanical failure over water hasn't been a major reason for accidents in the past 20 years.

PPLH pilots have been flying over water without floats and without ELT for many years. There is no good reason to change the current regulations.

Costs of altering small helicopters to fit this extra equipment is expensive (Euro 30,800 just to fit it) and the extra weight would reduce safety and would consume more fuel!

If a helicopter pilots should be fit to decide if they want to install expensive and complex extra equipment.

If a helicopter fitted with floats crashes into anything other than flat-calm water then it will sink and be lost.

comment *2057* comment by: *Ulrich Baum*

The title of OPS.GEN.435 obviously applies to motor-powered aircraft only. For additional clarity, please explicitly state in text of regulation that it applies to motor-powered aircraft only.

Oxygen : Alleviation for short periods up to 16,000 ft shall be possible according to the kind of work and the training of the crew flying in mountain area. Alleviation shall be approved by the National Authority.

comment | *2619* | comment by: *John Matchett*

Emergency locators should concentrate on finding people not a helicopter has sunk and that people have escaped from.

PLB's are already in general use and are considered more effective as a location device

comment | *3276* | comment by: *British Gliding Association*

The occupants of motor powered sailplanes carry emergency parachutes. In the event of an accident, whether or not in areas in which search and rescue would be especially difficult, the occupants may well abandon the aircraft. An ELT would be of little assistance in this case. CS22 motor powered sailplanes are not designed with ELT installation in mind. In addition, an ELT installation, whether or not aircraft modification is required, is a relatively expensive purchase for an owner, and clearly a disproportional requirement where they do not operate the aircraft in areas in which search and rescue would be especially difficult.

The BGA propose that the wording of OPS.GEN 435 Notor-powered aircraft (b) should be modified as follows;

Sailplanes

(c) Powered sailplanes shall comply with (a) (1) and (3). Additionally, each occupant shall each carry a personal locator beacon (PLB)

comment | *3408* | comment by: *George Knight*

Because glider pilots wear parachutes they may well abandon their glider. For this reason PLBs are a more appropriate solution than ELTs in gliders.

Most gliders do not fly in areas where SAR is difficult frequently.

Furthermore gliders are not designed with ELT installation in mind and would result in expensive modifications with increased drag from external antennae on carbon fibre fuselages.

Please change to allow PLBs as an alternative in sailplanes.

comment | *3412* | comment by: *Peter SCHMAUTZER*

If you fly over the alps you have to be equipped with signalling equipment. This will interfere with security regulations. If a pilot carries a signal device to his aircraft he will have problems with the police.

comment *3476* comment by: *Aero-Club of Switzerland*

An ELT in powered sailplanes would be of little help. Please add

SAILPLANES

(c) Powered sailplanes shall comply with (a) (1) and (3).

Justification: Occupants of powered sailplanes carry parachutes, the locator has to be where the occupants are, not were the aircraft is.

Additional remark: In mountain areas Breitling Emergency watches and switched-on mobile phones helped in serveral cases to locate victims.

comment *6289* comment by: *EUROPEAN GLIDING UNION*

If this requirement set in OPS.GEN 435 (a)(2) is applied to powered sailplanes, then we see that this is a disproportional requirement. It would be better for a voluntary choise.

comment *6703* comment by: *Finnish Aeronautical Association - Kai Mönkkönen*

Requirement set in OPS.GEN.435 (a)(2) is applied to powered sailplanes also. CS22 motor powered sailplanes are however not designed with ELT installation in mind. Furthermore, gliding in rarely populated areas is not common at all and such would now require also substantially expensive costs for an owner.

We see that it is essential to rationalize the requirement not to require ELT for powered sailplanes; having such may be left for a voluntary choice for a pilot making gliding activity in such areas.

comment *6927* comment by: *Christian Hölzle*

Oxygen : Alleviation for short periods up to 16,000 ft shall be possible according to the kind of work and the training of the crew flying in mountain area. Alleviation shall be approved by the National Authority.

comment *7053* comment by: *John Carr*

Again bias against helicopters. Aeroplanes allowed to not carried the required survival equipment subject to the stipulated clauses which allow fllight in some cases up to 90 minutes from an area suitable for an emergency landing. No such clauses for helicopters which must carry the equipment even if they are just inside the area.

comment *7177* comment by: *Paul Monahan*

Ops.Gen 430 (ELT). I object to this proposal. Automatic ELTs have a poor record of working correctly and fitment should be voluntary. A PLB is of greater safety benefit.

comment *7454* comment by: *European Sailplane Manufacturers*

If this requirement set in OPS.GEN 435 (a)(2) is applied to powered sailplanes, then we see that this is a disproportional requirement. It would be better for a voluntary choice.

comment *7459* comment by: *European Sailplane Manufacturers*

The occupants of motor powered sailplanes carry emergency parachutes. In the event of an accident, whether or not in areas in which search and rescue would be especially difficult, the occupants may well abandon the aircraft. An ELT would be of little assistance in this case. CS22 motor powered sailplanes are not designed with ELT installation in mind. In addition, an ELT installation, whether or not aircraft modification is required, is a relatively expensive purchase for an owner, and clearly a disproportional requirement where they do not operate the aircraft in areas in which search and rescue would be especially difficult.

The manufacturers propose that the wording of OPS.GEN 435 Notor-powered aircraft (b) should be modified as follows;

Sailplanes
(c) Powered sailplanes shall comply with (a)

(1) and (3). Additionally, each occupant should each carry a personal locator beacon (PLB) and/or the aircraft should be fitted with an ELT.

comment *7469* comment by: *David ROBERTS*

sub para (a) 'across areas in which SAR would be expecially difficult' is open to interpretation, and therefore lacks legal certainty.

Proposal; specify 'over areas designated by Member States as especially difficult for SAR'.

sub para (a) (2) should not apply to CS 22-designed powered sailplanes, for two reasosns: (1) they are not designed for the carriage of a fixed ELT installation (2) sailplane pilots wear emergency parachutes, and therefore a PLB is more appropriate, if any requriement is needed at all.

Further, ELTs and their associated modification / certification costs are expensive and therefore this proposal is disproportionate, and not justified

by an objective safety case.

Proposal: CS22-designed powered sailplanes shall comply with (a) (1) and (3) (only).

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.440 High altitude flights - Oxygen p. 46-47

comment *33* comment by: *George Knight*

-(b) "…shall use breathing oxygen continuously…". This phrase should not exclude use of electronic pulse demand systems that are widely used in GA and gliding.

comment *34* comment by: *George Knight*

-(c) (a) portable systems as used in GA and gliding should not be excluded.

comment *35* comment by: *George Knight*

SAILPLANES & POWERED SAILPLANES

Should be exempt from the requirement to have available and use oxygen for short flights between 10,000' and 13,000' of less than 30 minutes. Usually flights in this altitude range are short duration to achieve an FAI GOLD gliding badge and as soon at the required gain of height has been achieved (3,000 metres above low point) the glider will descend. 20 minutes would be an acceptable alternative to 30 minutes if 30 is thought to be too long.

comment *68* comment by: *Air Southwest*

OPS.GEN.440(a) doesn't read correctly. Suggest "When an aircraft is operated such that the pressure altitude of the passenger compartment is above 10 000ft, enough breathing oxygen shall be carried to supply:"

comment *359* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.440(a2ii): change as follows:

(ii) all the occupants of the passenger compartment for no less than 10 minutes, in the case of aeroplanes operated at pressure altitudes above 25

000 ft, or operated below that altitude, but under conditions that will not allow them to descend safely to a pressure altitude of 13 000 ft within four minutes; ~~**and**~~

comment *418* comment by: *EHOC*

General

This is a mix of an equipment and operational rule. The text should be divided (as it is in most operational codes and in ICAO) and put into respective parts.

Paragraph (b)

The original rule contained an instruction to provide a supply of oxygen; this clause is an operation instruction which might better be contained in the Operational Procedures (Section II). A suitable text for Section II might be:

"OPS.GEN.XXX Use of supplemental oxygen

A pilot-in-command shall ensure that flight crew members engaged in performing duties essential to the safe operation of an aircraft in flight use supplemental oxygen continuously whenever cabin altitude exceeds 10 000 ft for a period in excess of 30 minutes and whenever the cabin altitude exceeds 13 000 ft"

This is also in line with ICAO which has two Chapters 'Oxygen supply' and 'Use of oxygen'.

comment *826* comment by: *Reto Ruesch*

Alleviation for short periods up to 16'000 ft shall be possible due to the kind of work and the training of the crew flying in mountain area. Alleviation shall be approved by the National Authority.

comment *990* comment by: *REGA*

The originally JAR *(JAR-OPS 3.385)* rules for high altitude helicopter (e.g. hems) operations take into account the performance decline due to the increased weight of oxygen equipment (=less power available) at higher altitudes.

Experience did not show any incident or accident during HEMS operations in relation to oxygen supply. Many ski, hiking and climbing areas within the Alps are situated above 10’000 ft. To be able to continue HEMS operations - guarantee rescue service - in the mountains, duration of maximum 30 minutes between 10’000 ft and 13’000 ft without supplemental oxygen shall be allowed.

Proposal (a) (1) (ii) (12)

Use of supplemental oxygen. With prior approval of the authority, HEMS operations between 10 000 ft and 13 000 ft for a duration of maximum 30 minutes may be undertaken without the use of supplemental oxygen in accordance with procedures contained in the Operations Manual. (In such circumstances, the HEMS operator must ensure that the passengers are informed before departure that supplemental oxygen will not be provided).

comment *2044* comment by: *Ulrich Baum*

Gliders and small single-engine airplanes in non-commercial operations frequently fly at altitudes in the range of 10.000-12.000 feet. Today, these aircraft are not equipped with supplementary oxygen, and current regulations (at least in Germany) do not require them to. Requiring oxygen for flights over 30 minutes over 10.000 feet would practically make flights above 10.000 feet impossible for non-commercial operators since the cost of oxygen systems is prohibitive and in many small aircraft there is insufficient cockpit space for installing such systems. On the other hand, I am not aware of any evidence that hypoxia at altitudes of 10.000-12.000 feet is a significant contributing factor to small-aircraft accidents.

I therefore suggest not to require any oxygen supply for non-commercial operations up to an altitude of 12.000 feet.

Concern detail:

High altitude flights - Oxygen

Comment / Proposal:

Alleviation needed for flight in the mountains up to 16'000 ft (limited time).

Modify text:

(a)(1)(ii): With prior approval of the authority, excursions between 10 000 ft and 16 000 ft for a short duration may be undertaken without the use of supplemental oxygen in accordance with procedures contained in the Operations Manual. (In such circumstances, the operator must ensure that the passengers are informed before departure that supplemental oxygen will not be provided.

comment *2355* comment by: *Dassault Aviation*

Technical comment:

Page 47 OPS.GEN.440 §(b) High Altitude Flights Oxygen: the reference to §(a) may be misinterpreted, as one could interpret the "circumstances specified in (a)" as being a requirement to breath oxygen continuously above 10,000 ft because actions of the flight crew are essential to the safe operation and a cabin decompression will lead to a cabin altitude above the 10,000 ft criteria. This is not the intent of the proposed requirement. To avoid misinterpretation, we suggest to replace (b) by text of JAR/EU-OPS1.385: "A commander should ensure that flight crew member engaged in performing duties essential to the safe operation of an aeroplane in flight use supplemental oxygen continuously whenever cabin altitudes exceeds 10,000 ft for a period in excess of 30 minutes and whenever the cabin altitude exceeds 13,000 ft".

comment *2419* comment by: *Jan Brühlmann*

Continuity

Proposed Text (if applicable):

OPS.GEN.440(d)

Pressurised aeroplanes operated at flight altitudes above 25 000 ft, ~~*or pressurised aeroplanes used in commercial air transport*~~, shall, in addition, be equipped with a device to provide a warning indication to the flight crew of any loss of pressurisation.

OPS.CAT.440

AEROPLANES

(b) …..

(c) Notwithstanding OPS.GEN.440(d) pressurised aeroplanes used in commercial air transport shall, in addition, be equipped with a device to provide a warning indication to the flight crew of any loss of pressurisation.

Renumber subsequent paragraphs.

comment *3263* comment by: *Aero-Club of Switzerland*

Please add:

ALL AIRCRAFT

(a) (1) (iii) The PiC of aircraft engaged in parachute operations and high altitude aerial work decides on the use of oxygen for his own supply and for the supply of the other occupants.

Justification: Crews and passengers are well treined prepared for this kind of mission, therefor, it should be the PiC who decides.

comment *3591* comment by: *PPL/IR Europe*

The 10,000ft altitude should be increased to 12,500ft for non-commercial flights, in accordance with common aviation practice worldwide, and in Europe until recent years. The 10,000ft limit is unnecessarily restrictive given terrain in some parts of Europe, and the relatively high bases of the low level airway system in many other parts where terrain is not a factor.

Many pilots use supplemental oxygen below 10,000' (eg. at night), and many general health and physiological factors determine the requirement for supplemental oxygen under different circumstances. Nevertheless, we are not aware of any safety case for mandating oxygen at the more restrictive 10,000' level. We are aware of the argument for "higher European standards" and the reluctance to use the FAA as pointer towards European regulation. However, we do not believe that there can be any systematic requirement, due either to pilot physiology in Europe or the oxgen content of the atmosphere in Europe, to impose a standard more restictive than 12500', which has been, and continues to be, effective and safe in the majority of private GA operations worldwide.

We do support most of the regulatory work of EASA, but this is an example of "higher standards" which creates the negative impression that GA is over-regulated in Europe by authorities willing to impose restrictions that have the "appearance" of enhancing safety without evaluating the practical safety cost-benefits that are an essential part of good aviation regulation.

comment *3644* comment by: *IAOPA Europe*

The rigid limit to 10.000 ft for flights without supplemental oxygen is a recipe for disaster.

Particularly in mountaineous regions it will make flying less safe since it will force pilots to cross mountain tops with less clearing than what is advicable. It will give the pilot less options in case of an engine failure over hostile terrain and it will force the pilot to fly into potential dangerous down-drafts and weather which could be avoided if the pilot was allowed to climb to a higher and more safe altitude for a short duration of time.

As pointed out by EASA CFIT accidents account for a relatively high percentage of accident and this limitation will increase that number. There is no doubt that a persons skill and faculty is affected at high altitudes, but this is a matter of balancing risks and choosing the safest flight path and the safest decision may well be to climb to a higher altitude for a short duration of time.

As far as IAOPA Europe is aware there is not a high rate of accidents in Europe where hypoxia was the cause. Specially not when compared to the number of CFIT accidents.

It therefore shoud remain possible to climb to higher altitudes for short durations best on the pilots assessment on what is the safest flight path.

It is noted that ICAO allows for operations up to 13.000 ft for up to 30

minutes without the use of supplemental oxygen.

comment *4217* comment by: *DGAC*

Proposal : Amend the firs sub heading and (a)(1) as follows :

"~~ALL~~ **NON PRESSURISED** AIRCRAFT

(a) Aircraft flying above altitudes at which the pressure altitude in the passenger compartments is above ~~10000 ft~~ **12500 ft** (feet) shall carry enough breathing oxygen to supply **at least a pilot** :

(1) ~~in the case of non-pressurised aircraft:~~

~~(i) all crew members and at least 10% of the passengers~~ for any period in excess of 30 minutes when the pressure altitude in the passenger compartments will be between ~~10 000 ft~~ **12500 ft** and ~~13 000 ft~~ **14500 ft**; and

(2) ~~(ii) all crew members and passengers~~ for any period that the pressure altitude in passenger compartments will be above ~~13 000 ft~~ **14500 ft**."

Justification : (a)(1)(i) providing for oxygen for passengers should only be applicable for CAT operations and is already covered by OPS.CAT.440 and Table 2 OPS.CAT.440 page 79. This provision should not be in GEN. Besides (a) as written is not achievable for sailplanes or parachutes droppings that encounter high altitude incursions (e.g. mountain areas). Therefore alleviation has been granted by national authorities replacing the thresholds of 10000ft and 13000ft by FL125 and FL 145)

Proposal : Move § (a)(2) and (a)(3) in the subheading "PRESSURISED AEROPLANES".

Justification : § (a)(2) and (a)(3) address pressurised aeroplanes and there is actually a subheading "PRESSURISED AEROPLANES" just below.

Proposal : due to the preceding modifications, insert and rename § (2) (i) (ii) and (3) as follows :

PRESSURISED AEROPLANES :

§ (2) (i) & (ii) becomes § (d) (i) & (ii)

§ (3) becomes § (e)

§ (d) becomes § (f).

comment *4403* comment by: *Helikopter Air Transport GmbH / Christophorus Flugrettungsverein*

There should be an exemption for HEMS operation, due to the short time nature of missions in high mountain area, where such flights will need only a few minutes and oxygen will be an additional weight for those flights. Less

than 2% of HEMS flights are conducted above 10 000 feet and all of these flights are conducted under local operation

comment *4526* comment by: *Christophe Baumann*

comment *5801* comment by: *Ph.Walker*

Oxygen : Alleviation for short periods up to 16,000 ft shall be possible according to the kind of work and the training of the crew flying in mountain area. Alleviation shall be approved by the National Authority.

comment | *6022* | comment by: *Fédération Française Aéronautique*

OPS.GEN.440 "Oxygen",

§ (a) (1) (i) flight between 10,000 ft and 13,000 ft :

French FFA believes that requirement of oxygen equipment between 10,000 ft and 13,000ft for all non pressurised aircrafts is disproportionate. We think that this requirement is not adapted and not justified for non commercial operations on non complex aeroplanes, and particularly on aeroplanes below 2,000 kg MTOW.

Justifications : Experience accumulated in mountainous areas by sports and recreational flying operations on non complex aeroplanes shows no actual problems up to FL125. Present regulation asks for oxygen for more than 30 minutes flights between FL 125 and FL 145 only. Then oxygen is required for all persons on board when flying above FL145.

Nothing in flight safety asks for a change.

Additionally, this requirement will induces costs and technical problems on many non complex aeroplanes, mainly for small aeroplanes with 2,000 kg MTOW.

FFA proposal :

For non commercial operations, on non complex aeroplanes, and at least for small aeroplanes with 2,000 kg MTOW.

- Up to FL125, delete this oxygen requirement.
- From FL125 to FL145, oxygen supply equipment is required only if it's a more than 30 minutes flight at this block of altitude.
- Above FL145, oxygen supply equipment is required for all persons on board.

comment | *6130* | comment by: *Hans MESSERLI*

Oxygen : Alleviation for short periods up to 16,000 ft shall be possible according to the kind of work and the training of the crew flying in mountain area. Alleviation shall be approved by the National Authority.

zu: ALL AIRCRAFT (a) Aircraft flying above altitudes at which the pressure altitude in the passenger compartments is above 10 000 ft (feet) shall carry enough breathing oxygen to supply: (1) in the case of non-pressurised aircraft: (i) all crew members and at least 10% of the passengers for any period in excess of 30 minutes when the pressure altitude in the passenger compartments will be between 10 000 ft and 13 000 ft; and (ii) all crew members and passengers for any period that the pressure altitude in passenger compartments will be above 13 000 ft:

Klarstellung ob "Passengercompartment" ein abgetrenter Raum ist und damit z.B. doppelsitzige Segelflugzeuge nicht darunter fallen. Ansonsten müsste auch für jeden Gastsegelflug über diesen Höhen Suerstoff in der beschriebenen Menge mitgeführt werden. Bislang lag die Höhe bei 12.000ft (30 Minuten) und 13.000 ft. Die 10.000 ft Regelung betraf nur dne kommerziellen Bereich.

Vorschlag zur Neuformulierung: ALL AIRCRAFT (a) Aircraft flying above altitudes at which the pressure altitude in the passenger compartments is above 10 000 ft (feet) shall carry enough breathing oxygen to supply: (1) in the case of non-pressurised aircraft: (i) all crew members and at least 10% of the passengers for any period in excess of 30 minutes when the pressure altitude in the passenger compartments will be between 10 000 ft and 13 000 ft; and (ii) all crew members and passengers for any period that the pressure altitude in passenger compartments will be above 13 000 ft. For non comercial operations: (a) Aircraft flying above altitudes at which the pressure altitude in the passenger compartments is above 12 000 ft (feet) shall carry enough breathing oxygen to supply: (1) in the case of non-pressurised aircraft: (i) all crew members and at least 10% of the passengers for any period in excess of 30 minutes when the pressure altitude in the passenger compartments will be between 10 000 ft and 13 000 ft; and (ii) all crew members and passengers for any period that the pressure altitude in passenger compartments will be above 13 000 ft.

comment *6904* comment by: *Swiss Helicopter Group*

Oxygen : Alleviation for short periods up to 16,000 ft shall be possible according to the kind of work and the training of the crew flying in mountain area. Alleviation shall be approved by the National Authority.

comment *6973* comment by: *Eliticino SA*

Oxygen : Alleviation for short periods up to 16,000 ft shall be possible according to the kind of work and the training of the crew flying in mountain area. Alleviation shall be approved by the National Authority.

comment *7237* comment by: *EPFU is the European Union of national powered flying organisation from the 10 main European countries*

EPFU is of the opinion that requirement of oxygen supply in all non pressurized aeroplane above 10,000 ft is non proportionate to the risk on non commercial operations with non complex aeroplanes.

Justification : there is not special concerns about the present situation, at least for non commercial organisations on non complex aeroplane, especially for small aeroplane with 2,000 kg MTOW. So, in the present situation, why the agency push for a change?

Action proposed : Keep the requirements of oxygen supply as they are presently and remove new oxygen requirements between 10,000 ft and 13,000 ft.

comment *7471* comment by: *David ROBERTS*

The generally accepted height above which O2 is required in sailplanes is 12,000ft. To have this requirement set at 10,000ft would be unnecessary, and particualrly inconvenient in Alpine flying where much activity takes place up to FL120.

Proposal: Amend to 12,000ft for sailplanes.

comment *7578* comment by: *AOPA UK*

(a) Should be 12,500 ft just to be harmonized with most third country rules.

comment *7579* comment by: *AOPA UK*

(a)(1)(i) Should be 12,500 ft and 14,000 ft respectively, according to above mentioned.

comment *7580* comment by: *AOPA UK*

(c) Not an OPS-requirement, should be moved to Part 21! It is a requirement that is impossible to retro-fit on small GA airplanes.

comment *7636* comment by: *Cirrus Design Corporation*

This rule has not been harmonized with the FAA. Is there a reason as to why these altitudes were selected to be more restrictive than the FAA operational requirements? Cirrus recommends this rule be harmonized with the FAA to minimize the difference between authorities and reduce the burden on industry.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.445 Operations in icing conditions at night p. 47

comment *419* comment by: *EHOC*

General

See the comment on OPS.GEN.100 above (the absence of an objective requirement for flight in expected or actual icing conditions).

comment *670* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.445: <![endif]-->add following text as para (a), change original text to paragraph (b):

a. (a) An operator shall not operate an aeroplane in expected or actual icing conditions unless it is certified and equipped to operate in icing conditions.

(b) Aircraft flying in expected or actual icing conditions at night shall be equipped with a means to illuminate or detect the formation of ice. Such illumination shall not cause glare or reflection that would handicap flight crew members in the performance of their duties.

Justification:

The proposal brings into line with JAR-OPS and not just at night.

comment *1348* comment by: *AECA helicopteros.*

See our comment to OPS GEN 100

comment *1917* comment by: *Ingmar Hedblom*

Corresponding text in CS 23.1419(d) is : (d) When monitoring of the external surfaces of the aeroplane by the flight crew is required for proper operation of the ice protection equipment, external lighting must be provided which is adequate to enable the monitoring to be done at night.

Proposal: Introduce the text from CS 23.1419(d)

comment *5282* comment by: *DGAC*

Proposal : **introduce AMC OPS.GEN 445** :

"For non complex aircraft (excluded CAT and COM) a portable light can be used to illuminate or detect the formation of ice."

Justification :This requirement is applicable for CAT and COM but not in non complex aircraft.

comment *5308* comment by: *Light Aircraft Association UK*

This requirement is covered in the aircraft airworthiness Certification Specification (CS-23.1419d)). There is therefore no need to duplicate requirements in the OPS rules, especially when they differ from the CS. The CS should be modified if the wording is deemed insufficient.

comment *5603* comment by: *DGAC*

Proposal:

Amend the title:

OPS.GEN.445 IN-FLIGHT Operations in icing conditions

at night

Justification:

Equipment designed to cover the **in-flight part of the flight only**, not the ground (i.e.taxiing) part of it .

comment *5606* comment by: *DGAC*

Proposal: Add subtitle "AEROPLANE AND HELICOPTER"

Justification: No other category of aircraft is certified to fly in icing conditions

comment *6758* comment by: *Greger Ahlbeck*

Paragraph text: Aircraft flying in expected or actual icing conditions at night shall be equipped with a means to illuminate or detect the formation of ice. Such illumination shall not cause glare or reflection that would handicap flight crew members in the performance of their duties

Comment: Corresponding text in CS 23.1419(d) is: (d) When monitoring of the external surfaces of the aeroplane by the flight crew is required for proper operation of the ice protection equipment, external lighting must be provided which is adequate to enable the monitoring to be done at night.

***Proposal** (including **new text**):*

Introduce the text from CS 23.1419(d)

comment *6819* comment by: *EFLEVA*

The EFLEVA notes that "a means to illuminate or detect the formation of ice" is included in CS 23. 1419(d)., although in a different form of words. EFLEVA suggests that EASA either removes this paragraph from OPS GEN or uses the same wording as CS 23.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.450 Marking of break-in points p. 47

comment *797* comment by: *French SAMU using helicopters for medical transport*

After approved operating sites add " and a HEMS operating site"

A HEMS operating site even in a congested area does not need to be approved if used for a single operation but should be approved if scheduled to be used several times

In E(2) insert "except for hospital site where special approval has been grantedby the Authority " after public interest site or

Add a new point (4)

For hospitals approved operating sites where economic or technical reasons do not permit to upgrade the site to the level of an aerodrome, HEMS operations will be permitted to continue with the approval of the authority. On those approved sites the non accountability of an engine failure shall be limited to the vertical climb segment, up to the rotating point.

Justification :

In France a large number of small hospitals have a very limited number of flights and it will be non economical to create an aerodrome.

In addition the back- up protection area introduced recently in the HFM may

preclude the use of a category A flight profile on heliports already in service. It should be left to the national Authority to decide if the site is safe enough to continue to operate with the conditions mentioned here above.

In (e) (3) at the end of the sentence after performance Class 1 add" CAT A Helipad" this is the minimum level required, leaving performance Class 1 alone means that OEI OGE is imposed . Some helicopters do not have such a performance level with an acceptable take off mass.

Add a new section:

"OPS SPA036 Helicopter HEMS Additional equipment

HEMS helicopter operating with an exposure time in a congested hostile environment shall be equipped with pilots crash absorbing seats and crash resistant fuel cells if introduced into service after the 8 April 2008"

Improve the safety for in case of a crash landing

Justification:

The new generation of helicopters operating in HEMS operations is fitted with crash absorbing seats and crash resistant fuel cells.

Older one should be equipped or be removed from the HEMS operations

After approved operating sites add " and a HEMS operating site"

A HEMS operating site even in a congested area does not need to be approved if used for a single operation but should be approved if scheduled to be used several times

In E(2) insert "except for hospital site where special approval has been grantedby the Authority " after public interest site or

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.455 First-aid kits p. 48

comment *36* comment by: *George Knight*

Powered sailplanes should be excluded. It's not clear if they are aeroplanes or sailplanes in this NPA.

comment *555* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.455(d): change as follows:

(d) First-aid kits shall be maintained **and replenished at regular intervals**.

Justification:

In line with JAR-OPS.

comment *1337* comment by: *Southern Cross International*

For ferry flights, especially those ferry flights from an aircraft storage location to a maintenance facility, it is an undue burden to require one maintained first aid kit for every 100 seats. For ferry flights of aircraft with 100 or more seats no more than 1 maintained and accessible first aid kit should be required.

It is suggested to add:

In exceptional cases, such as test or ferry flights, the competent Authority may grant exemptions.

comment *1918* comment by: *Ingmar Hedblom*

DIN is a German norm. What about other norms?

Proposal: Introduce all other accepted norms in the AMC

comment *3166* comment by: *UK CAA*

Page No: 48

Paragraph No: OPS.GEN 455 (a) Table 1

Comment:

The number of kits does not match the ICAO SARPS in Annexe 6, Chapter 6 that will be applicable from November 2009.

Justification:

The proposal will be sub-ICAO from November 2009 unless amended.

Proposed Text (if applicable):

Number of passenger seats installed	Number of first–aid kits required
0 – 100	1
101 – 200	2

201 – 300	3	
301 – 400	4	
401 – 500	5	
More than 500	6	

comment *6034* comment by: *Fédération Française Aéronautique*

French FFA believes that equipment of all aeroplanes with at least one "first aid kit" is disproportionate as this kit is of poor utility on small non complex aeroplanes flying non commercial operations.

Justifications : No flight safety statistics shows any problem in that field.

Additionally, installation and **maintenance**of this "first aid kit" will be very difficult for non commercial sports and recreational flying organisations as aero-clubs and associations, without clear improvement in flight safety. One more time, costs will be increased without any clear necessity.

FFA proposal : Delete this requirement of a "first aid kit" on non commercial and non complex aeroplanes operations, and at least on non commercial, non complex aeroplanes below 2,000 kg MTOW.

comment *6542* comment by: *European Gliding Union (EGU)*

OPS.GEN.455 First-aid kits

A requirement for a First-Aid Kit in an aircraft where each occupant is forced to stay in their seats (size of aircraft) does not make any sense. In an Aircraft flown by a single pilot/person there is anyhow no way to perform any kind of first aid, as it would mean to let the flight controls unattended.

As this requirement was not foreseen up to now, the installation of a first aid kit in safe manner does require sufficient space which is not easily available in smaller aircraft and a minor change is required for all affected aircraft.

Recommendation: no requirement for a first-aid-kit in small air planes and single seat aircraft.

comment *6569* comment by: *Baden-Württembergischer Luftfahrtverband*

OPS.GEN.455 First-aid kits(a)

Wording in the NPA

(a) Aeroplanes and helicopters. Aeroplanes and helicopters shall be equipped with first-aid kits in accordance with Table 1 of OPS.GEN.455:

Our proposal

(a) Aeroplanes and helicopters. Aeroplanes and helicopters when carrying more than 2 people shall be equipped with first-aid kits in accordance with Table 1 of OPS.GEN.455:

Issue with current wording

The requirement is not appropriate small aeroplanes or aeroplanes involved in aerobatic flying or tow operations

Rationale

Small aeroplanes with only 2 seats will have space and weight problems especially if now required to additionally carry a fire extinguisher, an ELT and a first aid kit. If only 1 or 2 people are on board an in flight use of the first aid kit is hardly possible. On the ground at an airport first aid kits must be available and in the more rare case outside of an airport there will be cars with first aid kits. In the case of small airplanes or airplanes used for aerobatic flying or tow flights with only a single pilot on board the advantage of the availability of a first aid kit on board is non existent versus the burden to find a sensible location for it and to maintain it.

comment *6753* comment by: *Greger Ahlbeck*

Paragraph text: OTHER THAN COMPLEX MOTOR-POWERED AIRCRAFT AND BALLOONS

First-Aid Kits (FAKs) according to DIN 13164 or DIN 13157 are considered to meet the objective of OPS.GEN.455.

Comment: DIN is a German norm. What about other norms?

Comment: *DIN is a German norm. What about other norms?*

comment *6823* comment by: *EFLEVA*

Comment on OPS.GEN 455 and AMC1 OPS.GEN 455 (page 206)

EFLEVA suggests the removal of the reference to a German Standard for first aid kits, and replacement with reference to an International Standard

comment *7245* comment by: *EPFU is the European Union of national powered flying organisation from the 10 main European countries*

EPFU is of the opinion that a "First aid kits" is not usefull in the small cockpit of a small aeroplane. In addition the control and replacement of too old medical products and medicines of the kit will be very difficult for our non commercial organisations. This is an example of disproportionate and unadapted requirement for the sports and recreational aviation organisations

as aero-clubs.

EPFU proposes to delete this requirement for "small aeroplanes" operated by non commercial organisations.

comment *7472* comment by: *David ROBERTS*

I am pleased that my advice that there is often insufficient room in a sailplane cockpit to accommodate a first aid kit has been taken on board by EASA in final the drafts, and therefore excluded!

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.460 Airborne Collision Avoidance System (ACAS) II p. 48

comment *67* comment by: *Air Southwest*

OPS.GEN.460(a) This paragraph doesn't read very well.

OPS.GEN.460(b) Typographical error: 'an RA' should be 'a RA'. The abbreviation should be treated in the same manner as the noun etc....

OPS.GEN.460(b) grammar: ' is in conflict with' should be 'conflicts with'

OPS.GEN.460(b) the last sentence doesn't read well. Suggest: "When the situation is resolved the aircraft will thereafter be flown in accordance with the previously received and acknowledged ATC instructions or clearance."

comment *420* comment by: *EHOC*

These are clearly operational instructions and should therefore be contained within Operational Procedures (Section II). This is adequate text already and only needs to be put into an appropriate rule. This could be:

"OPS.GEN.XXX Use of Airborne Collision Avoidance System

(a) Whenever an Airborne Collision Avoidance System (ACAS) II is installed, it shall be used in normal conditions during flight in a mode that enables Resolution Advisories (RAs) to be produced for the pilot flying when undue proximity to another aircraft is detected.

(b) When an RA is produced by ACAS II, the pilot flying shall immediately take the corrective action indicated by the RA, even if this is in conflict with an Air Traffic Control (ATC) instruction. The aircraft shall be promptly returned to the terms of the ATC instructions or clearance when the situation is resolved.

(c) Operators of aircraft equipped with ACAS shall establish standards of training and operation before authorising crews to use ACAS."

comment *992* comment by: *REGA*

(b) To do not delay urgent HEMS-missions, Helicopters usually are allowed to cross center-line or approach-/landing sectors during IFR traffic on the aerodrome. ATC advises all aircraft crew about the helicopter traffic within their approach or take-off sectors to avoid unessential ACAS advices. Following the rule (b) hems-mission are forced to make a detour and will be unacceptable delayed.

Proposal (b)

When an RA is produced by ACAS II, the pilot flying shall immediately take the corrective action indicated by the RA, even if this is in conflict with an Air Traffic Control (ATC) instruction. Except in the vicinity of an aerodrome and under VFR conditions, when visual contact between all involved aircraft is established and controlled by ATC, the RA could used as an traffic information. ~~The aircraft shall be promptly returned to the terms of the ATC instructions or clearance when the situation is resolved.~~

comment *3046* comment by: *AEA*

Relevant Text:

b) When an RA is produced by ACAS II, the pilot flying shall immediately take the corrective action indicated by the RA, even if this is in conflict with an Air Traffic Control (ATC) instruction. The aircraft shall be promptly returned to the terms of the ATC instructions or clearance when the situation is resolved.

Comment:

Suggest aligning the text with the EU-OPS 1.398 text, as the EU-OPS is not only clearer, but also contains an important prerequisite for initiating any corrective action indicated by the RA, that is "*unless doing so would jeopardise the safety of the aeroplane*".

Proposal:

Realign with EU-OPS 1.398

(b) when undue proximity to another aircraft (RA) is detected by ACAS, the commander or the pilot to whom conduct of the flight has been delegated must ensure that any corrective action indicated by the RA is initiated immediately, unless doing so would jeopardise the safety of the aeroplane.

The corrective action must:

(i) never be in a sense opposite to that indicated by the RA;

(ii) be in the correct sense indicated by the RA even if this is in conflict with the vertical element of an ATC instruction;

(iii) be the minimum possible to comply with the RA indication

Paragraph No:OPS.GEN.460

Comment:

Paragraphs (a) and (b) are operational rules and not equipment requirements and they should be transferred to Subpart A Section II under Operational Procedures.

Justification:

Incorrect equipment requirements.

comment *3634* comment by: *AUSTRIAN Airlines*

Relevant Text:

b) When an RA is produced by ACAS II, the pilot flying shall immediately take the corrective action indicated by the RA, even if this is in conflict with an Air Traffic Control (ATC) instruction. The aircraft shall be promptly returned to the terms of the ATC instructions or clearance when the situation is resolved.

Comment:

Suggest aligning the text with the EU-OPS 1.398 text, as the EU-OPS is not only clearer, but also contains an important prerequisite for initiating any corrective action indicated by the RA, that is "*unless doing so would jeopardise the safety of the aeroplane*".

Proposal:

Realign with EU-OPS 1.398

(b) when undue proximity to another aircraft (RA) is detected by ACAS, the commander or the pilot to whom conduct of the flight has been delegated must ensure that any corrective action indicated by the RA is initiated immediately, unless doing so would jeopardise the safety of the aeroplane.

The corrective action must:

(i) never be in a sense opposite to that indicated by the RA;

(ii) be in the correct sense indicated by the RA even if this is in conflict with the vertical element of an ATC instruction;

(iii) be the minimum possible to comply with the RA indication

comment *3877* comment by: *M Wilson-NetJets*

Original text:

(b) When an RA is produced by ACAS II, the pilot flying shall immediately

take the corrective action indicated by the RA, even if this is in conflict with an Air Traffic Control (ATC) instruction. The aircraft shall be promptly returned to the terms of the ATC instructions or clearance when the situation is resolved.

Suggested new text:

When an RA is produced by ACAS II, the pilot flying shall immediately take the corrective action indicated by the RA, even if this is in conflict with an Air Traffic Control (ATC) instruction. The aircraft shall be promptly returned to the terms of the ATC instructions or clearance when the situation is resolved. **If during corrective action, indicated by the ACAS II RA, a warning or alert is generated by TAWS equipment in order to avoid terrain or obstacles, the TAWS warning or alert corrective action takes precedence over ACAS II generated RA corrective action.**

Comment/suggestion:

To further increase safety, a clause should be added that TAWS alerts or warnings to avoid terrain or obstacles take precedence over ACAS II RA instructions.

comment *4218* comment by: *DGAC*

The text is different from the text of EU-OPS though we can not find any related explanation in the Explanatory note in NPA 2009-02-a.

The highlighted text is missing, where can we find this very important material?

EU-OPS

OPS 1.398

Use of airborne collision avoidance system (ACAS)

An operator shall establish procedures to ensure that:

(a) when ACAS is installed and serviceable, it shall be used in flight in a mode that enables resolution advisories (RA) to be produced unless to do so would not be appropriate for conditions existing at the time.

(b) when undue proximity to another aircraft (RA) is detected by ACAS, the commander or the pilot to whom conduct of the flight has been delegated must ensure that any corrective action indicated by the RA is initiated immediately, unless doing so would jeopardise the safety of the aeroplane.

The corrective action must:

(i) never be in a sense opposite to that indicated by the RA;

(ii) be in the correct sense indicated by the RA even if this is in conflict with the vertical element of an ATC instruction;

(iii) be the minimum possible to comply with the RA indication.

(c) prescribed ACAS ATC communications are specified.

(d) when the conflict is resolved the aeroplane is promptly returned to the

terms of the ATC instructions or clearance.

comment *4569* comment by: *Bristow Helicopters*

ACAS II has been certified on helicopters. For commercial operations helicopters should have the same requirement to carry ACAS II as aeroplanes. Unless this is implemented, helicopters will have a lower standard of collision avoidance than aeroplanes of a similar weight when flying in the same IFR airspace.

comment *4660* comment by: *British Airways Flight Operations*

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.465.A Terrain Awareness Warning System (TAWS) - Aeroplanes p. 48-49

comment *1015* comment by: *Michael Kroell*

Why is this for aeroplanes only??

TAWS Systems are available for helicopters;

NOTE:

FAA supports the voluntary implementation of TAWS systems, however the FAA concluded that there is a number of unique issues to VFR helicopter operations that must be resolved before the FAA considers mandating the use of TAWS in these areas.

comment *1431* comment by: *British Parachute Association*

We suggest that an additional paragraph (d) be added with the following wording....

"A TAWS need not be fitted to aircraft manufactured before January 2010 which are routinely used in parachute operations in VFR conditions, provided that no persons other than flight crew are carried when the aircraft is engaged on flights other than parachute operations and provided that such other flights only take place in daylight and VFR conditions."

Many older aircraft are used solely for parachute operations which only take place in VFR conditions. To retro fit TAWS systems could be prohibitively expensive and would be pointless in this particular role. The amendment is worded to prevent abuse by prohibiting any other use for the aircraft apart from ferry flights in VFR conditions. New aircraft will anyway have to be fitted with TAWS which means that there will be a historical evaporation of none TAWS aircraft, but existing operators/parachute clubs will be able to continue without the possibility, in some cases, of having to cease operations or scrap their aircraft altogether.

comment *1983* comment by: *Pilatus Aircraft MRO*

Comment

Small airplanes certified to regulations preceding FAR 23 and CS 23, should be exempted from this requirement even if they have more than nine seats.

Justification

Due to the limitations stated in the requirement, it seems that FAR/CS 23 small airplanes in the Normal, Utility and Acrobatic category are excluded from this requirement, and it is rather aimed at the Commuter category airplane.

Small airplanes designed and certified to different regulations i.e. CAR-3 (preceding FAR/CS 23) were only limited to a MTOW of 12 500 lbs with **no** limitation on the number of seats. It is therefore unreasonable to mandate airplanes designed and certified to these earlier regulations which may have a seating capacity of one more than is required in the modern regulations to also comply with the latest regulatory requirements purely based on the number of seats.

END OF COMMENT

comment *2506* comment by: *Royal Aeronautical Society*

The list of warnings that a TAWS shall provide, listed in subparagraph (c), cannot be fulfilled by *basic* TAWS Class B equipment which is limited to: excessive descent rate; excessive altitude loss after take-off or go-around; and unsafe terrain clearance. It is suggested that EASA should:

either

remove the clauses 'that meets the requirements for Class A (subparagraph (a)) equipment' or 'Class B (subparagraph (b)) equipment', and leave the contents of subparagraph (c) unchanged;

or

amend subparagraph (c) to read, '**A TAWS Class A equipment shall provide … etc**' and add a new subparagraph (d) that begins, '**A TAWS Class B equipment shall provide … etc**', then list the capabilities associated with Class B equipment.

comment *2749* comment by: *AOPA Switzerland*

Point (a) and (b): The limitation should be 5700 kg or a maximum PAX seating configuration of more than NINETEEN (and not nine).

comment *2916* comment by: *Pietro Barbagallo ENAC*

Comment: new requirement introduced for reciprocating-engined-powered aeroplanes with a maximum certificated take-off mass exceeding 5 700 kg, or a maximum passenger seating configuration of more than nine and used in CAT . Please consider a proper implementation date.

comment *3047* comment by: *AEA*

Relevant Text:

(a) Turbine-powered aeroplanes with a maximum certificated take off

mass exceeding 5700 kg or a MAPSC of more than 9 shall be equipped with a TAWS that meets the requirements for Class A equipment.

Comment:

This requirement for Class A equipment is not line with EU-OPS 1.665

Proposal:

comment *3283* comment by: *Aero-Club of Switzerland*

(a): We think the correct MPSC figure must be 19, not 9, in words nineteen, not nine.

Justification: This would bring the text in line with analogue texts in this NPA.

comment *3314* comment by: *UK CAA*

Page No: 48

Paragraph No:

OPS.GEN.465.A

Comment:

This rule requires a higher standard of TAWS equipment than is required by ICAO Annex 6 Part II. The requirement in OPS.GEN should be Class B TAWS as the basic standard applicable to non-CAT operations. Class A TAWS is restricted to OPS.CAT and therefore the requirement should be moved to Subpart B.

Justification:

Incorrect equipment standard.

Proposed Text (if applicable):

OPS.GEN.465.A Terrain Awareness Warning System (TAWS) - Aeroplanes

(a) Turbine-powered aeroplanes with a maximum certificated take-off mass exceeding 5 700 kg, or maximum passenger seating configuration of more than nine, shall be equipped with a TAWS that meets the requirements for Class ***B*** equipment.

(b) ~~(b) Reciprocating-engined-powered aeroplanes with a maximum certificated take-off mass exceeding 5 700 kg, or a maximum passenger seating configuration of more than nine and used in commercial air transport, shall be equipped with a TAWS that meets the requirement for Class B equipment.~~ ~~(c)~~ A TAWS Class B shall provide, automatically, a timely and distinctive warning to the pilot flying, of:

(1) sink rate;

(2) ground proximity; and

(3) altitude loss after take-off or go-around.

~~(4) incorrect landing configuration; and~~

~~(5) downward glide-slope deviation.~~

OPS.CAT.465.A Terrain Awareness Warning System (TAWS) – Aeroplanes

(a) Turbine-powered aeroplanes with a maximum certificated take-off mass exceeding 5 700 kg, or maximum passenger seating configuration of more than nine, shall be equipped with a TAWS that meets the requirements for Class A equipment.

(b) Notwithstanding (a) reciprocating-engined-powered aeroplanes with a maximum certificated take-off mass exceeding 5 700 kg, or a maximum passenger seating configuration of more than nine and used in commercial air transport, shall be equipped with a TAWS that meets the requirement for Class B equipment.

(c) A TAWS Class A shall provide, automatically, a timely and distinctive warning to the pilot flying, of:

(1) sink rate;

(2) ground proximity;

(3) altitude loss after take-off or go-around;

(4) incorrect landing configuration; and

downward glide-slope deviation.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.475 Emergency lighting - Aeroplanes and Helicopters p. 49-50

comment | *37* | comment by: *George Knight*

-(c) (a) (2) (i), (a) (2) (ii) and (a) (2) (iii) do not exist.

comment | *38* | comment by: *George Knight*

-(d) (a) (2) (i) does not exist, but is assumed to mean (b) (2) (i).

This bullet point seems to conflict with the intention of bullet point (a). Point (a) suggests that only a/c with more than 19 seats need an emergency lighting system. Bullet point (d) then extends the requirement to all aircraft – even those that are day VFR and may not even have a lighting system. Light aircraft and sailplanes should be exempt from the requirement to have emergency lighting – especially those not used for night or IFR flight and those not approved for night flight!

comment | *421* | comment by: *EHOC*

Paragraph (f)

This text is too loose as it makes a requirement (flight over water - what does that mean exactly?) without setting any discriminants. The requirement is already contained in OPS.CAT.420 and therefore doesn't need to be repeated here.

It should be removed!

comment | *556* | comment by: *ECA - European Cockpit Association*

Change text as follows:

(c) For aeroplanes with a maximum passenger seating configuration of 19 or less and issued with a type certificate in accordance with the European Aviation Safety Agency's (hereinafter referred to as the Agency) airworthiness codes, the emergency lighting system shall include ~~**(a)(2)(i), (a)(2)(ii) and (a)(2)(iii)**~~ **(b)(2) and (b)(3)**.

Justification:

References in current text are wrong; they are the JAR-OPS references. Proposed text references correctly to OPS.GEN.475 (b).

comment | *557* | comment by: *ECA - European Cockpit Association*

Change text as follows:

(d) For aeroplanes with a maximum passenger seating configuration of 19 or less and not issued with a type certificate in accordance with the applicable airworthiness codes, the emergency lighting system shall include ~~**(a)(2)(i)**~~ **(b)(1)**.

Justification:

References in current text are wrong; they are the JAR-OPS references. Proposed text references correctly to OPS.GEN.475 (b).

comment *941* comment by: *Aersud*

Comment

The requirement asks for CAT operations the "emergency exit illumination" which means "the exit should be illuminated".

Comparing CS29 and CS27 concerning this requirement there is a big difference.

The CS 29.811 Emergency exit marking and CS 29.812 Emergency lighting reports specific requirements as requested by this paragraph of EU.OPS. In case of CS27 we do not have any requirements about Emergency illumination neither in "CS 27.807 Emergency exits".

So it is an inconsistency that in the Operative requirements foresees to add the exit illumination not requested in the CS.

For light helicopter the exit it's very close to the passengers, so it's not necessary an illumination of the exit, but it's maybe enough an emergency exit marking. A different and acceptable proposal could be a fluorescent sticker.

Consider also that this topic was discussed also in a JAA HSST meeting held between Monday 14th June - Wednesday 16th June 2004. It emerged the same problems and Authorities agreed that this requirement could be applied only for helicopters with Maximum Certified Take-off Mass greater than 3.175 kg.

Proposal

Change: (f) Helicopter operating over water in commercial air transport operation, *with a Maximum Certified Take-off Mass greater than 3.175 kilograms (kg) and up to 7.000 kilograms (kg), shall be equipped with emergency exit illumination marking. Helicopter over 7.000 kilograms (kg)* shall be equipped with emergency exit illumination.

Note

Priority: **H**

comment *1228* comment by: *EUROCOPTER*

Comment on § (f) (Emergency exit illumination):

This requirements states that it only concerns 'commercial air transport operations'. It should be transferred to Part CAT. Moreover the requirement is already covered by OPS.CAT.420 (c). **Proposal is to delete OPS.GEN.475 (f)**

comment *1776* comment by: *Dassault Aviation*

(c)Shall include what?? The references seem not to be valid.

comment *7583* comment by: *AOPA UK*

(d) Shall include what?? The reference seems not to be valid.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.480 Seat belts and harnesses p. 50

comment *422* comment by: *EHOC*

General

It is not clear why the previously single rule for seats, safety belts and harnesses has been divided between a number of rules (GEN.405, GEN.480 GEN.545, CAT.406); it might be more appropriate to put all of the elements concerned with seats into a single rule in GEN.480.

Paragraph (a)(2)

This text, which is not modified for CAT, does not meet the previous requirement because of the discriminant that comes from Annex 6 Part II. Either the text should be modified to be applicable only to aeroplanes or a separate rule provided for CAT.

comment *1471* comment by: *John Henshall*

The requirement to have a diagonal shoulder strap on the seat-belt should be a minimum not an absolute requirement. Machines fitted with "H" belts offer superior protection but would be required to down-grade by this rule.

comment *1687* comment by: *Dassault Aviation*

Technical comment.

Page 50 OPS.GEN.480 Seat belts and harnesses: Our comment is to highlight the different terms used between "*safety belt with shoulder harness*", "*safety harness*", "*safety belt with diagonal shoulder strap*" since it may cause confusion. Our understanding is that a " *safety belt with shoulder harness*" equals a "*safety belt with diagonal shoulder strap*" because the word harness is singular (plural is harnesses). Clarification that "*safety belt with shoulder harness*" and "*safety belt with diagonal shoulder strap*" have only one band on the torso should be part of an AMC or GM. This AMC or GM should also provide some more clarification on what a "*safety harness*" is compared to the two other terms.

comment *1919* comment by: *Ingmar Hedblom*

Why no requirements for non commercial flights and why not for passengers?

Proposal: Expand the text to include requirements also for non commercial operation and also for passengers.

comment *2672* comment by: *AOPA-Sweden*

Seems to be a design requirement, doesn't fit in here.

comment *4078* comment by: *PremiAir Aviation Servcies Limited*

(c). Except for flight crew seats, the date should be 31 July 2009 and not 1999.

comment *4193* ☐ comment by: *DGAC*

General comment regarding (a)(3) & (a)(4) & (e)(2) ::

Those provisions deal with seat belts and restraining devices. As there is a paragraph dedicated to seat belts and harnesses (OPS.GEN.480 Seat belts & harnesses), move the provisions of (a)(3) & (a)(4) & (e)(2) to OPS.GEN.480).

comment *4194* ☐ comment by: *DGAC*

General comment n°2 on (a)(3) & (a)(4) & (e)(2) ::

To avoid any misunderstanding, there should be

- a definition in OPS.GEN.010 for seat belt, seat belt with shoulder strap or harness, harness, in terms of anchorage points, and
- an AMC to these definitions explaining that, unless otherwise provided, a safety harness (5 points) is deemed to be compliant to the requirement for safety belt with shoulder harness (4 points), deemed to be compliant with safety belt with diagonal shoulder strap (3 points), deemed to be compliant with safety belt (2 points)

comment *4219* comment by: *DGAC*

The wording "safety belt with shoulder harness", "safety harness", "safety belt with diagonal shoulder strap" is very confusing. It is not clear whether "safety belt with shoulder harness" = "safety belt with diagonal shoulder strap".

Therefore we propose to harmonize the wording by using the word "x point-harness", "x" being the number of points of anchorage

comment *4220* comment by: *DGAC*

Proposal : At the end of (c) add "on each passenger seat"

Justification : this provision is inapplicable in the case of parachutists carriage when no seat is required according to OPS.GEN.405 (f).

comment *5628* comment by: *DGAC*

Proposal: ALL AIRCRAFT EXCEPT BALLOONS

Add a new (b) as follows and renumber "(b)" into "(c)" :

All non-complex motor-powered aeroplane lightweight aeroplanes to carry harnesses, for those light weight aeroplanes first issued with an individual certificate of airworthiness **after April, 1st 1989**

Justification:

This provision is deemed applicable in France only for lightweight airplanes first issued with an individual certificate of airworthiness **after April, 1st 1989 (Arrêté 24/07/91 § 2.4.3)**.

comment *5676* comment by: *ERA*

European Regions Airline Association Comment

There is some confusion regarding the references to safety Harnesses and all other similar references: The NPA states many times safety belts, safety belts with shoulder harness and safety harness. Seat belt and seat belt with shoulder harness seems well defined. However, what is considered as a safety harness? Does a diagonal shoulder strap count? Some clarification is required as to safety harness is acceptable

comment *5702* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

ALL AIRCRAFT EXCEPT BALLOONS

(a) All aircraft, excluding balloons, used in commercial operations and complex motor-powered aircraft shall be equipped with.

Comment:

From a safety point of view, a balloon used in commercial operations should be equipped with a life-line for the commander.

Proposal (including ***new text***):

ALL AIRCRAFT EXCEPT BALLOONS

(a) All aircraft, excluding balloons, used in commercial operations and complex motor-powered aircraft shall be equipped with.

BALLOONS

(d) Balloons used in commercial operations should be equipped with a life-line for the commander. The life-line shall be used during

landing.

OPS.GEN.485.A(b)

Comment:

The text must refer to CAT aeroplanes requirement and therefore should be moved to OPS.CAT.

Justification:

Consistency

Proposed Text (if applicable):

OPS.CAT.485.A Crash axes and crowbars - Aeroplanes

When the aeroplane has a maximum passenger seating configuration of more than 200, an additional crash axe or crowbar shall be carried and located in or near the most rearward galley area.

comment *5701* comment by: *Irish Aviation Authority*

Paragraph (b)

Comment:

Requirement to conceal 2nd axe or crowbar in the cabin area should be included/retained

Justification:

Security

comment *7052* comment by: *IACA International Air Carrier Association*

(b)

Further elaboration by EASA is required on the balance between security risks and safety benefits of a Crash axe being located with access by Passengers.

comment *7338* comment by: *FAA*

1. OPS.GEN.485.A, (b)

Comment:

The requirement for crash axe or crowbar in rearward galley could create safety/security hazard. The requirement would add risk, because passengers could broach the cockpit using a crash axe or crowbar. There could be a potentially serious impact on safety/security of flight if axe or crowbar is available in the passenger compartment, even when not visible to passengers.

Recommendation:

Justify the risk of making an axe or crowbar available to passengers versus not having one available in the event of an emergency, or provide a means of locking the compartment where axe/crowbar will be stored.

Paragraph No: OPS.GEN.490(c) and (d)

Comment:

The FDR requirements listed are those for helicopters undertaking CAT. OPS.GEN should reflect the requirements published in ICAO Annex 6 Part III Section III.

Justification:

Incorrect rules for helicopter FDRs under OPS.GEN.

Proposed Text (if applicable):

HELICOPTERS

(c) Helicopters:

(1) with a maximum certificated take-off mass exceeding 3 175 kg and first issued with an individual certificate of airworthiness after 1 January 2005;

~~(2) with a maximum certificated take-off mass exceeding 7 000 kg and first issued with an individual certificate of airworthiness after 1 August 1999 up to and including 31 December 2004; and~~

(2) with a maximum certificated take-off mass exceeding 7 000 kg and first issued with an individual certificate of airworthiness after 31 December 1988 ~~up to and including 31 July 1999~~,

shall be equipped with an FDR which uses a digital method of recording and storing data and has a method of retrieving that data from the storage

medium available.

(d) The FDR for helicopters shall be capable of retaining data recorded during at least ***the last 10 hours***:

~~(1) the last eight hours, for helicopters referred to in (c)(1) and (c)(2);~~

~~(2) the last five hours, for helicopters referred to in (c)(3); and~~

~~the last 10 hours, for helicopters with a maximum certificated take-off mass exceeding 3 175 kg and first issued with an individual certificate of airworthiness after 31 December 2009.~~

comment *3586* comment by: *Aero-Club of Switzerland*

Please bring the FDR requirement in line with the CVR requirement!

Justification: We see no need for FDR requirements differing from CVR requirements.

comment *3759* comment by: *Civil Aviation Authority of Norway*

Paragraph No:

OPS.GEN.490(c) and (d)

Comment:

The FDR requirements listed are those for helicopters undertaking CAT. OPS.GEN should reflect the requirements published in ICAO Annex 6 Part III Section III.

Justification:

Incorrect rules for helicopter FDRs under OPS.GEN.

comment *4903* comment by: *BEA*

OPS.GEN.490 (a)

The wording "FDR which uses a digital method of recording and storing data and has a method of retrieving that data from the storage medium available" is not precise enough:

- Does digital storing of the data implies that a non magnetic FDR is referred to ? ICAO is planning to issue shortly a new version of Annex 6 which deals with discontinuing the use of magnetic tape FDR after 2016, but until this date some airplanes will still be using magnetic tape FDR.
- The FDR does not usually contain a method to fully retrieve data from its storage medium, some additional information is needed, in

particular the parameters frame layout.

comment *5983* comment by: *DGAC*

Proposal:

For GEN: apply dates and weights according to ICAO Annex 6 (2nd part for aeroplanes and 3rd part for helicopters)

For CAT: apply dates and weights from EU-OPS / JAR-OPS3

Justification:

Avoid costly retrofit.

comment *6171* comment by: *Air Accidents Investigation Branch*

This rule does not address the possibility of using a combined recorder (CVR and FDR) as permitted by ICAO. Could be included in AMC material.

comment *7587* comment by: *AOPA UK*

Seems to be a design requirement, does not fit in here.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.495 Cockpit voice recorder - Aeroplanes and Helicopters p. 51-52

comment *423* comment by: *EHOC*

Paragraph (c)

This requirement does not include ICAO Annex Part III Section 4.7.5.2

Recommendation.— All helicopters of a maximum certificated take-off mass of over 3 175 kg, up to and including 7 000 kg, should be equipped with a CVR, the objective of which is the recording of the aural environment on the flight deck during flight time. For helicopters not equipped with an FDR, at least main rotor speed should be recorded on one track of the CVR.

We therefor have the anomalous situation in OPS.GEN.490(c)(1) that for a helicopter with a CofA after 2005 an FDR is required but not a CVR.

It might be a good idea to reconcile the ICAO Recommendation and the lack of a requirement in Part OPS by specifying a CVR from the date of the requirement for a Type IVA recorder. This is particularly relevant as most recorders fitted to helicopters are combination recorders.

Second paragraph (c) and (d) - numbering error (might be (e) and (f)).

comment *1622* comment by: *Luftfahrt-Bundesamt*

The LBA cannot agree to the move of parts of CVR– requirements into the AMC – material. JAA especially prepared an NPA to move these tables in Section 1 of JAR-OPS in order to provide legal clarity.

Justification: see LBA - General Comment, reasons 1 and 2.

Technical comment.

Page 52 OPS.GEN.500 Data link recording aeroplanes and helicopters: OPS.GEN.500 requires data ling recording for aircraft with first individual certificate of airworthiness on or after 08-apr-2012 depending on described conditions. Our comment is to highlight that this date of 08-apr-2012 does not match the mandate given by the European Commission through (EC)29/2009 where the European Commission requires aircraft first issued with an individual certificate of airworthiness on or after 01-jan-2011 to be equipped with data link CPDLC ATN (see Article 3 §2 of (EC)29/2009). There will be actually a period during which there are no mandate to actually record the data link messages, this period being the period staring 01-jan-2011 and ending 08-apr-2012. We suggest that both dates are aligned. Otherwise, there may be aircraft equipped with data link but without its recording which may be very burdensome for investigation in case of incident or accident, because the crew oral communications to ATC (and vice versa) will not have been recorded in the CVR.

comment *2293* comment by: *Austro Control GmbH*

(a) Aeroplanes and helicopters first issued with an individual certificate of airworthiness on or after 8 April 2012, which have the capability to operate data link communications and are required to be equipped ....

Suggestion:

this date should be extended anyway

Justification:

an early date will provoke a lot a of exemptions, since industry might not be ready at this time.

European Regions Airline Association Comment

(a) Aeroplanes and helicopters first issued with an individual certificate of airworthiness on or after 8th April 2012 which have the capability to operate data link communications.

IR-OPS requires forward fit from 8 April 2012 on the basis of NPA 48A. ERA members would point out that NPA 48A has not been approved. The latest JAA position was that the results of ICAO developments and the available draft would be taken into account in future IRs' amendments as appropriate."

It should be ensured that all aircraft manufacturers are able to deliver aircraft compliant with this new requirement. The date of 8th April 2012 should be subject to further review with the different airframe manufacturers (small and large)

Propose:

1. EASA review the implementation date taking into account the possibility of airframe manufacturers.
2. The ICAO decision taken in March 2001 has faced continuous challengers by stakeholders including Eurocontrol. Therefore until this is resolved EASA should consider deleting this paragraph and seek to file a difference with ICAO

comment *5712* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

(a) Aeroplanes and helicopters first issued with an individual certificate of airworthiness on or after 8 April 2012, which have the capability to operate data link communications and are required to be equipped with a cockpit voice recorder, shall be equipped with a means of recording the following, where applicable:

Comment:

If a decision about IR-OPS is delayed, it could result in a too short implementation time for new aircraft. A specification for a new aircraft is often decided more than a year before delivery of the aircraft. Therefore an implementation date should be set to 2 years after a decision on IR-OPS.

Proposal (including ***new text***):

(a) Aeroplanes and helicopters first issued with an individual certificate of airworthiness ***two years*** ~~on or~~ after ~~8 April 2012~~ ***the IR-OPS has come into force***, which have the capability to operate data link communications

and are required to be equipped with a cockpit voice recorder, shall be equipped with a means of recording the following, where applicable:

comment *5985* comment by: *DGAC*

There must be enough time between the official release of this regulation and the applicability date to allow time for installation on new aircraft. (Aircraft first issued with an individual certificate of airworthiness on the 8th April 2012 will have been manufactured and equipped prior to this date). A retrofit would be too complicated.

comment *7051* comment by: *Embraer - Indústria Brasileira de Aeronáutica - S.A.*

Several operators will be required to implement ATN-CPDLC according to (EC) No 29/2009 until 5 February 2015.

Embraer is concerned that with this 8 April 2012 datalink recording requirement, operators would postpone ATN-CPDLC implementation to last minute in order to avoid the costs of datalink recording implementation, jeopardizing Eurocontrol ATN-CPDLC Link 2000+ program.

To avoid this issue, Embraer suggests the date for datalink recording requirement to be postponed to 5 February 2015.

Furthermore, for aircraft currently in production, avionics suppliers may not be able yet to provide a technical solution for datalink recording that would comply with 2012 timeframe.

comment *7415* comment by: *General Aviation Manufacturers Association / Hennig*

GAMA members have reviewed the requirement for data link recording for aircraft that have a capability to operate data link communications if they have a certificate of airworthiness on or after April 8, 2012.

While this is an aggressive timeline for forward-fit, GAMA members are working to meet the FAA data link recording requirement for forward-fit (new certificate of airworthiness) in parallel. April 2012 is a date which we support.

GAMA weighed in on JAA NPA OPS-48A (forward fit) stating that: "GAMA believes that the dates proposed in the NPA are more realistic than the dates listed in original NPA versions, but still does not consider the needed time to align manufacturer type design and suppliers for aeroplanes first type certificated on or after 1 January 2008, and therefore the mandate for new type certificates should be extended to 36 months after the publication of the final amendment.". GAMA also raised concern about the practicality of meeting the in-production aircraft (new certificate of airworthiness) for the fleet when filing comments to the JAA NPA in 2006.

We are pleased to see that the retrofit requirement (i.e. OPS-007 / JAA NPA OPS-48B) not being included in NPA 2009-02 and instead included in the EASA Rulemaking Programme for future action and consideration. When

evaluating the JAA NPA for retrofit scenario for data-link recording, our members identified significant cost implications.

comment *7589* comment by: *AOPA UK*

Seems to be a design requirement, does not fit in here.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.505 Preservation of FDR and CVR recordings - Aeroplanes and Helicopters p. 52-53

comment *126* comment by: *Thormodur Thormodsson*

The procedures for the inspection and maintenance of FDRs specified in Attachment A of ICAO Annex 6, Part II are applicable only for General Aviation aeroplanes. Paragraph 2 of GM OPS.GEN.505(b) and (c) refers to this attachment A and Part II. Suggest only reference Annex 6 and not the specific parts and attachments of the Annex to ensure that all categories of aircraft are covered.

comment *424* comment by: *EHOC*

General

It is important that the structure of the regulation is as logical as is possible. The placing of operational instructions within the equipment section will not assist in the provision of SOPs or OM procedures.

This is an operational procedure and part of the responsibilities of PIC and operator; it should be relocated to Section I or II of Subpart A.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.515 Microphones - Aeroplanes and Helicopters p. 53

comment *117* comment by: *tbone aviation a/s*

Propose new wording for section (a):

Flight crew members on flight deck duty om complex motor-powered aeroplanes and aeroplanes used in commercial operations shall communicate through boom, throat or equivalent microphones, when flying below the transition level/altitude.

This new proposed wording include the "equivalent" phrase to allow the use

of other and newer technologies compared to the boom microphone.

comment *426* comment by: *EHOC*

General

As this text includes, for helicopters, headsets, perhaps it needs a different title.

According to the cross reference table, the original rule on which this is based was an equipment rule for the fitting of equipment for radio communications. As it is now an operational rule (the original requirement was not transposed) it should be replaced into Section II.

Paragraph (b)

It is not clear why this is only applicable to complex helicopter (which excludes all light twins) and commercial operations. It should apply to all helicopters - if only to meet the EU noise exposure requirements. Suggested text is:

(b) Flight crew and technical crew members shall wear a headset with boom microphone or equivalent and use it as the primary device for all communications.

comment *1345* comment by: *AECA helicopteros.*

(b) Proposal of a new text.

(b) Flight crew members shall wear a headset with boom microphone or equivalent and use it as the primary device for all communications.

comment *3333* comment by: *UK CAA*

Page No: 53

Paragraph No:

OPS.GEN.515 (b)

Comment:

It is not clear why this is only applicable to complex helicopter (which excludes all light twins) and commercial operations other than to mirror Aeroplanes in (a). It should apply to all helicopters - if only to meet the EU noise exposure requirements. Amend text as indicated which reflects ICAO Annex 6 Part III Section III recommendation.

Justification:

Clarity of purpose and practical application.

Proposed Text (if applicable):

(b) ***Flight crew and technical crew members shall wear a headset with boom microphone or equivalent and use it as the primary device for all communications***.

comment *3749* comment by: *Civil Aviation Authority of Norway*

Comment:

Proposed Text

(if applicable):

Flight crew and technical crew members shall wear a headset with boom microphone or equivalent and use it as the primary device for all communications

comment *5713* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

HELICOPTERS

(b) Flight crew members on flight deck duty of complex motor-powered helicopters and helicopters used in commercial operations shall wear a headset with boom microphone or equivalent and use it as the primary device for all communications.

Comment:

In all helicopters, regardless of complexity and type of operations, the pilot generally uses both hands for controlling the aircraft. Even considering that it is often possible to let go of the collective, safety demands a requirement for a "hands-free" system.

Proposal (including ***new text***):

HELICOPTERS

(b) Flight crew members on flight deck duty ~~of complex motor-powered helicopters and helicopters used in commercial operations~~ shall wear a headset with boom microphone or equivalent and use it as the primary

device for all communications.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.520 Flight crew interphone system p. 53

comment *39* comment by: *George Knight*

-(a) This rule inadvertently makes intercom systems necessary in two-seater training sailplanes & powered sailplanes. They are not necessary in those environments due low noise levels.

comment *40* comment by: *George Knight*

-(b) This is an excessive requirement for SAILPLANES & POWERED SAILPLANES used for training. They should be exempted from this provision. Some microlight aircraft used for training use handheld radios and are not designed for two pilot operation. They should also be exempted.

comment *998* comment by: *British Gliding Association*

There is no requirement for an interphone system in a sailplane. It is a quiet environment. Additionally, the BGA also questions the need to regulate this requirement in single crew powered aircraft, regardless of use – if cockpit noise requires it, in single crew aeroplanes the pilot and the passenger(s) or student(s) use interphone systems as required to achieve the flight objectives.

The BGA proposes that sailplanes should be excluded from this requirement and proposes that the wording of OPS.GEN.520 Flight crew interphone system (a) is modified to read;

(a) Where implementing rules require operation by more than one flight crew member, Aeroplanes and helicopters shall be equipped with a flight crew interphone system, including headsets and microphones for use by all flight crew members.

comment *2966* comment by: *AOPA Switzerland*

Crews of aircraft certified with overhead loudspeaker(s) shall not forced to use headsets. However, they may use additional headsets if available.

comment *3381* comment by: *guy Corbett*

This should not apply to gliders as it is unnecessary in a quiet cockpit

comment *3480* comment by: *Aero-Club of Switzerland*

For sailplanes a flight crew interphone system is absolutely unnecessary, nearly impossible to install, with very limited electric power supply possibilities. Besides, all occupants are in a quiet environment. Therefore please re-word:

(a) Where implementing rules require operation by more than one flight crew, aeroplanes and helicopters shall be equipped with flight crew interphones, including headsets and microphones for use by all flight crew members.

comment *3983* comment by: *Chris Fox*

This requirement is inappropriate for two-seater sailplanes. There is no need for headsets and microphones in sailplanes, other than Self-Launching sailplanes.

comment *5064* comment by: *AS Miller*

OPS.GEN.520 Flight crew interphone system

This requires an interphone system for all aircraft with more than one flight crew member.

Another risible requirement for sailplanes.

Proposal *Exclude sailplanes*

comment *5095* comment by: *Trevor Wilcock*

This is totally inappropriate for sailplanes, where the low noise levels make such eqipment unnecessary. In addition (unless perhaps this para is intended to apply just to aircraft where operation requires more than one crew member), for non-complex powered aircraft noise levels may permit adequate communication without headsets.

comment *5385* comment by: *Norwegian Air Sports Federation*

There is no need for interphone system in sailplanes etc.

proposal:

(a) Aircraft required to be operated by more than one flight crew member shall be equipped with a flight crew interphone system for use by all flight crew members.

comment *6291* comment by: *EUROPEAN GLIDING UNION*

We don not know any of the Member States currently requiring interphone system in a sailplane. There is not engine noise, only a quiet environment.

We suggest the wording of OPS.GEN.520 to be modified so that sailplanes are excluded from this requirement.

comment *6535* comment by: *TG WHITING*

This seems a totally unnecessary requirement for a sailplane, especially a single seater. I would propose that sailplanes are excluded from this requirement.

comment *6546* comment by: *European Gliding Union (EGU)*

OPS.GEN.520 Flight crew interphone system

In the quiet environment of a sailplane is no need for an interphone system. If this rule would be applicable for a sailplane flown by an flight instructor and his/her student, the German Aero Club refuses this rule as it is not proportional to the kind of operation and the related risk. The use of headsets in a sailplane is abnormal as the surrounding does not produce significant noise. Finally, the power delivered by the electric system of the sailplane has to be used efficiently for the major tasks of the operation of the sailplane.

The DAeC suggests the following wording:

(a) Aircraft required to be operated by more than one flight crew member shall be equipped with a flight crew interphone system, including headsets and microphones for use by all flight crew members.

comment *6570* comment by: *Baden-Württembergischer Luftfahrtverband*

OPS.GEN.520(a)

Wording in the NPA

(a) Aircraft operated by more than one flight crew member shall be equipped with a flight crew interphone system, including headsets and microphones

for use by all flight crew members.

Our proposal

(a) Aircraft requiring more than one flight crew member shall be equipped with a flight crew interphone system, including headsets and microphones for use by all flight crew members.

Issue with current wording

Not clear if student pilot + instructor also meant here in which case some aircraft would have to be excluded from this requirement.

Rationale

We assume that actually aircraft requiring a crew of more than one member is meant and want the wording to express this more clearly.

If the wording "operated by more than one flight crew member" also is meant to include student pilot + instructor crews then sailplanes and balloons must be excluded. We would though strongly prefer that this requirement is limited to aircraft requiring multiple crew members since quite a few training aeroplanes also are not equipped with intercom especially in the TMG space.

comment *6704* comment by: *Finnish Aeronautical Association - Kai Mönkkönen*

We don not know any of the Member States currently requiring interphone system in a sailplane. There is not engine noise, only a quiet environment.

We suggest the wording of OPS.GEN.520 to be modified so that sailplanes are excluded from this requirement.

comment *6893* comment by: *Luftsport-Verband Bayern*

zu: (a) Aircraft operated by more than one flight crew member shall be equipped with a flight crew interphone system, including headsets and microphones for use by all flight crew members. (b) When a radio communication system is required, and in addition to (a), the aircraft shall be equipped with a transmit button on the flight controls at each pilot's station:

Dies darf nicht dazu führen, dass auch Segelflugzeuge Interkomanlagen benötigen.

Vorschlag zur Neuformulierung: (a) Aircraft except gliders operated by more than one flight crew member shall be equipped with a flight crew interphone system, including headsets and microphones for use by all flight crew members. (b) When a radio communication system is required, and in addition to (a), the aircraft shall be equipped with a transmit button on the flight controls at each pilot's station.

comment *7456* comment by: *European Sailplane Manufacturers*

We don not know any of the Member States currently requiring interphone system in a sailplane. There is not engine noise, only a quiet environment. We suggest the wording of OPS.GEN.520 to be modified so that sailplanes are excluded from this requirement.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.525 Communication equipment p. 53-54

comment *41* comment by: *George Knight*

This proposal is not appropriate for Sailplanes and Powered Sailplanes when other than VFR as permitted in the UK at present. Currently there is no requirement for them to have a radio when IFR in class G airspace. Some sailplanes are still fitted with radios that operate only on the UK glider frequencies and are not capable of transmitting or receiving on 121.500 MHz. Many UK glider pilots do not have a flight operator's radio licence and are restricted to the UK dedicated glider frequencies. Sailplanes should be exempt unless operating as a controlled flight.

comment *389* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.525:

Change text as follows:

"...each system ~~**should**~~ **must** have an independent antenna installation..."

Justification:

Use text from the previous requirement stated in EU OPS 1.850 (b)

comment *390* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.525:

ECA requests clarification:

Communication equipment is not required for VFR flights when not controlled.

comment *427* comment by: *EHOC*

General

This rule is not compliant with ICAO Annex 6 Part II Chapter 2.5.1.4 and 2.4.5; areas in which radios should be carried.

It is also not compliant with Chapter 3.7.1 - for which the Standard is un-conditional.

comment *3691* comment by: *IAOPA Europe*

There is no justification to require two way radio communication for VFR night flights. If the VFR night flight takes place in areas where communication is not required there should be no mandate to carry a radio.

Requiring a radio for making traffic patterns at night on an uncontrolled airfield with no assigned radio frequency is absolutely meaningless.

comment *5056* ☐ comment by: *AS Miller*

OPS.GEN.415 Flight instruments and equipment - VFR night flights and IFR flights

OPS.GEN.525 Communiation equipment

In the colder and wetter parts of Europe much glider flying takes place in IMC, under IFR, principally within the 1,000' layer just below cloud base.

None of the equipment listed here is appropriate for this flying.

It is risible to specify a landing light.

Proposals

OPS.GEN.415

Replace SAILPLANES wording with:

(c) Sailplanes operating at night shall comply with (a)(5), (9) & (10)

OPS.GEN.525

Replace the wording in para (a) with:

Where communication with outside agencies is required, aircraft shall be provided with radio communication equipment.

comment *6038* comment by: *Fédération Française Aéronautique*

FFA asks for a **clear statement** saying that in non controlled airspace, a radio communication equipment is not mandatory.

Justification : many non complex aeroplanes (mainly below 2,000 kg MTOW) operated in sports and recreational flying organisations and in non controlled airspace from non controlled airfields, are not equipped with radio communication and do not need one.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.530 Pressure-altitude-reporting transponder p. 54

comment *403* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.530:

Previously EU-OPS 1.865(a) and 1.866. Now pressure-altitude-reporting transponder is prescribed for all flights, irrespective of the conditions of flight, when required by the airspace requirements. The requirement for RVSM operation, previously in EU-OPS 1.872 remains the same in OPS.SPA.010.RVSM. There is a discrepancy as the transponder is necessary in the Implementing Rule, and left to the operators decision in the GM text.

ECA requests clarification:

GM available for operation in RVSM, stating that the transponder may not be necessary in some RVSM areas. But AMC OPS.GEN.530 states that compliance with requirements stated by Single European Sky should be met. Which text applies?

comment *627* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.530: change as follows:

Aircraft shall be equipped with a pressure-altitude-reporting Secondary Surveillance Radar (SSR) transponder ~~**when required by the airspace requirements**~~.

Justification:

While historically a transponder "C" may have been an airspace requirement, the fact that the transponder constitutes the required co-operative element for current collision avoidance systems requires transponder carriage and operation for all aircraft to protect against intruders (from unregulated airspaces).

comment *2507* comment by: *Royal Aeronautical Society*

As specified in ICAO Annex 6 Parts I, II and III, carriage of a pressure-altitude-reporting transponder in a non ACAS-equipped aircraft enables ACAS-equipped aircraft to avoid collisions regardless of the transponder-carriage rules applying to the airspace in which either aircraft is flying, **and is the primary reason why this requirement was specified in JAR-OPS 1/EU-OPS without any airspace rule qualification**. A functioning pressure-altitude-transponder enables ACAS (TCAS II) equipment to determine relative altitude between both aircraft and to compute whether or not a threat exists. Failure to transmit pressure-altitude information from an

operating transponder will prevent ACAS from generating and displaying any Resolution Advisories, and in other circumstances it can result in the generation of multiple 'nuisance' alerts to the crews of the ACAS-equipped aircraft, which can be highly distracting. Such a failure will occur if the transponder does not have a pressure-altitude-reporting capability or if the altitude-reporting function is not enabled. It is suggested that OPS.GEN.530 should include a requirement applicable to aeroplanes and helicopters based upon the text currently published in (EU) OPS 1.866; **'An operator shall not operate an aeroplane or a helicopter unless it is equipped with 1. a pressure-altitude-reporting SSR responder; and 2. any other SSR transponder capability required for the route being flown.'**

comment *7378* comment by: *Europe Air Sports, VP*

It should be added that the Air Traffic Provider can grant exemptions depending on the traffic situation for aircraft not fitted with such a transponder.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.535 Navigation equipment p. 54

comment *42* comment by: *George Knight*

-(c) This inadvertently prevents use of published approaches using other than those using pilot interpreted aids - for example SRA. It also prevents aircraft conducting a part of their flight in IMC, even if there is no intention to perform an instrument approach, without such equipment. The rule is phrased with CAT in mind.

It would be better to re-phrase this rule to say,

"An aircraft intending to perform an approach other than under VFR must be equipped so that it is capable of following a published approach procedure at each aerodrome at which it intends to land in IFR and for each designated alternative." This has the same general effect without being so prescriptive.

comment *428* comment by: *EHOC*

General

It is somewhat surprising that here is a requirement for navigational equipment applying to all but there is no similar provision for radios!

Paragraph (b)

It comes as a complete surprise that there is no method of compliance for

this (extremely objective) GEN rule.

Most States will be shipwrecked on the rock of this imaginative policy.

In previous discussion on JAR-OPS 0, 2 and 4, a number of States would not move away from the specification of ADF, VOR, DME and ILS.

At least some guidance on the use of GPS would be welcome.

What is the pass/fail criteria for reliability of navigation equipment that is required in order to establish a policy for redundancy.

The objective text is supported provided guidance is provided to ensure that there remains a level playing field for all.

Paragraph (c)

Because this text has been shortened from that in ICAO Annex 6 Part II Chapter 2.5.2.9, its meaning has been lost; it is no longer clear that the intention was to set the objective for an Approach Aid (which might be satisfied by any number of methods of compliance). The text should be returned to its purity in the ICAO form.

"(c) On flights in which it is intended to land in instrument meteorological conditions, an aircraft shall be provided with radio equipment capable of receiving signals providing guidance to a point from which a visual landing can be effected. This equipment shall be capable of providing such guidance for each aerodrome at which it is intended to land in instrument meteorological conditions and for any designated alternate aerodromes."

comment *3334* comment by: *UK CAA*

Page No: 54

Paragraph No:

OPS.GEN.535 (b)

Comment:

The rule needs to be more specific in terms of required navigation equipment, either here, or in the AMC.

For an IFR flight, it requires equipment as an aid to landing, but has no navigation requirements.

Justification:

Proposed Text (if applicable):

(b) An aircraft flying under IFR, or under VFR over routes not navigated by reference to visual landmarks shall be equipped with navigational equipment that comprises not less than:

(1) Two independent navigation aids appropriate to the route/area to be flown;

(2) An approach aid suitable for the destination and alternate heliports;

(3) An Area Navigation System when area navigation is required for the route/area being flown;

(4) Two VOR receiving systems on any route, or part thereof, where navigation is based only on VOR signals; and

(5) Two ADF systems on any route, or part thereof, where navigation is based only on NDB signals,

comment *3791* comment by: *IAOPA Europe*

OPS.GEN.535 a(1) should be ammended to read

"the original flight plan or an alternative procedure; and..."

It should not be a requirement that the aircraft can always continue according to the original plan in case of equipment malfunction. It should be sufficient that the pilot has planned for an alternative course of action since otherwise equipment duplication will often be required when this is not necessary.

For instance the following scenario should be allowed without requiring two NDB receivers or RNAV:

In case of a flightplan involving an NDB in the enroute part the pilot should have the option to proceed along an alternative route constituted of VORs if the aircraft's NDB receiver fails.

With the current wording this scenario would not be allowed.

comment *6707* comment by: *Finnish Aeronautical Association - Kai Mönkkönen*

Requirement set in OPS.GEN.535 (a) should be clarified so that having a magnetic compass as required for sailplanes and powered sailplanes according to OPS.GEN.410 (a)(1) does not require a secondary instrument for the same purpose - due to measuring a magnetic heading together with an aeronautical map is part of visual navigation. We see this is not intention of this IR but this kind of interpretation may easily occur.

Furthermore, in case of sailplane cloud flying activity as made in non-VFR –conditions, requirement of OPS.GEN.535 (c) shall not be made applicable for sailplanes.

comment *6709* comment by: *Finnish Aeronautical Association - Kai Mönkkönen*

In case of sailplane cloud flying activity as made in non-VFR –conditions, requirement of OPS.GEN.535 (c) may be interpretated to apply also for sailplanes. We do not see any examples where sailplanes flying in non-VFR (or meteorologically in IFR conditions) would be used for low visibility

landing operations. We suggest OPS.GEN.535 (c) should be modified not applicable for sailplanes. Furthermore, limited capability of sailplanes to carry electric consuming instruments would create a problem if this item would be considered also in case of sailplane cloud flying activity despite of take-off and landing for such is made in VFR.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.540.A Electronic navigation data management - Complex motor-powered aeroplanes p. 54

comment *430* comment by: *EHOC*

General

It is not clear why this only applies to aeroplanes. The 'A' should be removed from the title.

comment *1842* comment by: *Airbus SAS*

No technical specification or safety objective for equipment is part of this requirement. All details are related to operator procedures.

==> Airbus proposes to include these requirements in Part OR, or in OPS Section II operational procedures.

comment *2294* comment by: *Austro Control GmbH*

General comment for reflexion:

AIRAC Cycles for electronic navigation data and hard copy prints may be different (e.g. issue dates.) This creats in praxis SAFA findings in some occasions.

Therefore it is recommended to define which of the sources are the primary ones for the intendant operation.

comment *2680* comment by: *AOPA-Sweden*

(c):

AOPA-S does not see that an individual owner of an airplane can comply with this paragraph.

comment *3335* comment by: *UK CAA*

Page No: 54

Paragraph No:

OPS.GEN.540.A

Comment:

This requirement should apply to all aircraft not just aeroplanes and therefore 'A' and 'Complex motor-powered aeroplanes' should be removed from the title.

Justification:

This requirement should be applied to all aircraft.

Proposed Text (if applicable):

OPS.GEN.540.~~A~~ Electronic navigation data management

~~- Complex motor-powered aeroplanes~~

comment *3879* comment by: *M Wilson-NetJets*

Original text:

(c) An operator shall continuously monitor both the process and the products.

Suggested new text:

An operator shall continuously monitor both the process and the products, either directly or **by monitoring the compliance of third party providers.**

Comment/suggestion:

Many operators outsource electronic navigation or chart database management to third party providers. Directly monitoring the process of third party providers is not efficient and should be done by established compliance monitoring procedures and practices.

comment *5070* comment by: *IAOPA Europe*

It seems not reasonable that a one-man non commercial operator should have to demonstrate to the authority that the delivered products meet standards of integrity. This is in no way propartional regulation.

comment *7591* comment by: *AOPA UK*

(c) AOPA UK does not see that an individual owner of an airplane can comply

with this paragraph.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.545 Cabin Crew Seats p. 54

comment *431* comment by: *EHOC*

General

It is not clear why the previously single rule for seats, safety belts and harnesses has been divided between a number of rules (GEN.405, GEN.480 GEN.545, CAT.406); it might be more appropriate to put all of the elements concerned with seats into a single rule in GEN.480.

comment *1489* comment by: *ECA - European Cockpit Association*

Comment: change as follows:

Each seat for the minimum required cabin crewmember shall be forward or rearward facing, within 15° of the longitudinal axis of the aircraft. **When it is required for the crew member seat to be able to swivel during flight, then the seat should be locked within 15 degrees of the longitudinal axis of the aircraft for take off and landing.**

comment *2681* comment by: *AOPA-Sweden*

Seems to be a design requirement, doesn't fit in here.

comment *4221* comment by: *DGAC*

This paragraph is not applicable to balloons, because there is no seat.

comment *5630* comment by: *Peter Moeller*

add: during take-off and landing.

comment *7592* comment by: *AOPA UK*

Seems to be a design requirement, does not fit in here.

B. I. Draft Opinion - Part-OPS - Subpart A - Section IV - OPS.GEN.550 Minimum equipment for flight p. 54-55

comment *70* comment by: *Air Southwest*

OPS.GEN.550 (a)(1) The word 'such' is erroneous - remove.

OPS.GEN.550 (a)(2) change "the aircraft has been subject to a permit to fly..." to " the aircraft is subject to a permit to fly..."

OPS.GEN.550 (b) suggested re-write: "The MEL shall not conflict with agency adopted ADs and SDs when the directive proscribes MEL application.

OPS.GEN.550 (c) Suggest: "Any inoperative (unserviceable) aircraft instrument or item of equipment shall not be removed from the aircraft unless:..."

OPS.GEN.550 (c)(3) amend to read as (a)(2) above

comment *432* comment by: *EHOC*

Paragraph (a)(1)

Editorial: incorrect use of the definite article. "such the aircraft..."

comment *680* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.550(a): change as follows:

(a) A flight of a complex motor-powered aircraft or an aircraft involved in commercial operations shall not be commenced when any of the aircraft instruments, items of equipment or functions are inoperative, except if:

(1) such ~~**the aircraft instrument, item of equipment or function**~~ d**efect is allowed according to** ~~**is part of the operator**~~ minimum equipment list (MEL); or

(2) the aircraft has been subject to a permit to fly issued by the competent authority **on the basis of MMEL** ~~**or organisations approved in accordance with Part-21**~~; or

Justification:

(1) wording not understandable, is contradictory to the intention of the MEL, items mentioned in the MEL may be required for all flights, or may be inoperative under certain conditions only.

The system of MEL/MMEL will be eliminated if there is no possibility to allow dispatch below MEL but above MMEL with the permission of the authority .This means that operators are not encouraged to establish safety standards

higher than MMEL.

(2) deviation below MEL shall not be given by organisations approved i.a.w. Part 21, only by authorities.

comment *994* comment by: *REGA*

(c) Following the rule: the inoperative equipment, e.g. rescue winch/spectro/cargo-hook, shall remain mounted respectively shall not be removed from the helicopter even when not used for further missions or non optional for the flight according the MEL or the AFM/RFM (= transport of unnecessary weights).

Proposal (c)

(c) *Any instrument or item of equipment that has been installed in an aircraft and becomes inoperative shall not be removed thereof, unless:*

(...)

(4) *the instrument or item of equipment is optional for flying according the AFM/RFM and the approved maintenance organisation.*

comment *1338* comment by: *Southern Cross International*

(a)(1)

For operators only performing contracted ferry flights or test flights for MRO's, maintaining individual operator MELs for each type/model/variant of aircraft that could potentially be flown is not practicable. Therefore use of an Agency approved MMEL issued by the manufacturer should be considered as an acceptable means of compliance with an equivalent level of safety. Where there is a conflict between the MMEL and an Airworthiness Directive or any other Mandatory Requirement, it is the data or information contained in the Airworthiness Directive or the Mandatory Requirement (e.g. Continued Airworthiness requirement) which shall override.

comment *2682* comment by: *AOPA-Sweden*

There is for some VLJs no MEL issued.

comment *3186* comment by: *Austro Control GmbH*

~~*(2) the aircraft has been subject to a permit to fly issued by the competent authority or organisations approved in accordance with Part-21; or*~~

Justification:

This requirement is missleading and gives the impression that commercial operation is possible with a permit to fly.

To avoid misinterpretation of the requirement clarification with regard to minimum equipment for a flight under a permit to fly has to be added.

There fore delete point (2) and add a new paragraph (d) at the end.

(d) For aircraft operated under a permit to fly issued by the competent authority or organisations approved in accordance with Part-21 the minimum equipment required for the flight has to be regulated under the flight conditions.

comment *3336* comment by: *UK CAA*

Page No: 54

Paragraph No:

OPS.GEN.550(a)(1)

Comment:

Remove the superfluous 'such'.

Justification:

Typographical error

Proposed Text (if applicable):

OPS.GEN.550 Minimum equipment for flight

(a) A flight of a complex motor-powered aircraft or an aircraft involved in commercial operations shall not be commenced when any of the aircraft instruments, items of equipment or functions are inoperative, except if:

(1) ~~such~~ the aircraft instrument, item of equipment or function is part of the operator minimum equipment list (MEL); or

comment *3565* comment by: *Walter Gessky*

OPS.GEN.550 Minimum equipment for flight

Delete (2) ~~the aircraft has been subject to a permit to fly issued by the competent authority or organisations approved in accordance with Part-21; or~~

Add a new "(d) For aircraft operated under a permit to fly issued by the competent authority or organisation approved in accordance with Part-21 or Part M, the minimum equipment required for the flight has to be regulated under the flight conditions."

Justification:

To avoid misinterpretation of the requirement, clarification is required. The requirement gives the impression that commercial operation with a permit to

fly is possible. For clarification with regard to minimum equipment for a flight under a permit to fly (d) has to be added.

comment

3895 comment by: *FOM ANWB MAA*

OPS.GEN.550 Minimum equipment for flight

(c) Any instrument or item of equipment that has been installed in an aircraft and becomes inoperative shall not be removed thereof, unless:

(1) it is replaced by an operative instrument or equipment; or

(2) it is specifically permitted by the MEL; or

(3) the aircraft has been subject to a permit to fly issued by the competent authority or approved organisations.

(4) the aircraft instrument, item of equipment or function is not required for the safe operation of the aircraft.

It should be possible to remove equipment not required for safe operation. Example: it would not be possible to take a broken winch off the helicopter, which is allowed when it is operative.

comment

(a) On any aircraft, the following documents shall be carried on each flight:

(1) the Aircraft Flight Manual or equivalent documents, ***which shall contain the performance data of the relevant aircraft***

Justification:

Addition of information is in the interest of safety.

B. I. Draft Opinion - Part-OPS - Subpart A - Section V - OPS.GEN.600 Documents and information to be carried on all aircraft p. 56

comment *43* comment by: *George Knight*

-(a) (6) Whilst this may be appropriate for commercial flying and aerial work it has no relevance to light general aviation and gliding.

For aircraft with 4 or fewer seats (including crew) the requirement for a journey logbook should be waived. Sufficient data will exist in the pilots' log books, existing design aircraft log books and airfield flight records to meet all conceivable requirements. This additional bureaucracy is over-regulation for private, recreational and sporting aviation – especially gliding.

comment *44* comment by: *George Knight*

-(b) The waiver not to carry all documents on some flights is reasonable, however, the need to leave the documents at the aerodrome/operating site is big aeroplane thinking. Some private syndicate aircraft may be parked at an airfield but it is likely that there is no secure place to store documentation the aircraft operators/owners having no premises at the site. Since several owners may share the a/c on a rotating basis they may not meet often and handing over documents is logistically difficult.

Propose change "…may be retained at the aerodrome…" with, "…may be retained at a safe place"

comment *45* comment by: *George Knight*

-(a) (8) Currently this is a legal requirement (UK) only for flights crossing an international boundary. Non-commercial aircraft conducting flight entirely within the airspace of a single state should be exempted.

Regardless, sailplanes should be exempt on flights conducted entirely within then airspace of a single state because they are not capable of following intercepting aircraft's instructions – and I doubt that any intercepting aircraft could fly slowly enough to conduct their part of the drill.

comment *708* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.600(a)(1): "equivalent documents" is ambiguous, the wording from EUOPS 1.130(3): "The current Aeroplane Flight Manual is carried in the aeroplane unless the Authority has accepted that the Operations Manual prescribed in JAR-OPS 1.1045, Appendix 1, Part B contains relevant information for that aeroplane" should be maintained in

the rule.

comment *709* comment by: *ECA - European Cockpit Association*

General comment on OPS.GEN.600: Documents and manuals should be divided into those that should be easily accessible to the crew according to EUOPS 1.130(2): "Those parts of the Operations Manual which are required for the conduct of a flight are easily accessible to the crew on board the aeroplane" [a/c flight ,manuals, aeronautical charts, interception procedures and signals, technical logbook, ATS flight plan, relevant parts of the OPS manual, MEL, OPS FPL, briefing documents (according OPS.GEN605 (8)(i)-(v)] accessibility of documents not to be regulated by AMC.

comment *711* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.605(a)(8): add the following text:

Forms to comply with the reporting requirements of the Authority and the operator.

Justification:

Necessary for compliance with EU OPS contents.

(c) '…OPS-GEN.600(a)(1)-(6) …'

Add:

(a)(2) and (3) CoA and CoR always to be carried

Reason:

due to possible diversion for evidence purpose

comment *1000* comment by: *British Gliding Association*

Sailplane flights, unlike most aeroplane flights, are planned so that the sailplane lands back at its take-off site. A very small percentage of the total

land away from the take-off site. In addition, as sailplanes are designed for optimal aerodynamic efficiency and minimum cross section, there is little space for storage.

Original documents can become worn and damaged in use. Replacements are very expensive in member states where NAA's recover a financial surplus on their regulatory activities (eg the UK CAA).

The BGA offers the following observations relating to the carriage of those documents in sailplanes in general;

(1) the Aircraft Flight Manual or equivalent documents;

This important pre-flight reference document cannot be referred to in flight. There is no safety or operational need to carry this document in a sailplane.

(2) the Certificate of Airworthiness;

It is assumed here that the agency is referring to the Airworthiness Review Certificate, which can only be held where a Certificate of Airworthiness exists. Pilots of club sailplanes in particular need to be aware of validity of the airworthiness certificate. Unfortunately Part M rules require that this can only be assured through the ARC format described within Part M. The BGA agrees therefore that until Part M is modified appropriately, an exact copy or the original ARC should be carried in the sailplane. There is however no safety or operational need to carry the Certificate of Airworthiness in a sailplane.

(3) the Certificate of Registration;

The BGA believes that there is no safety or operational need to carry this document in a sailplane.

(4) the original or copy of the Noise Certificate, if applicable;

The BGA believes that there is no safety or operational need to carry this document in a sailplane.

(5) the original or copy of the third party liability Insurance Certificate;

As it is possible for a sailplane to make an out-landing where third party property can be affected, the BGA agrees that a copy of the aircraft insurance certificate carried in the sailplane will be of assistance.

(6) the journey log book for the aircraft;

The BGA believes that there is no safety or operational need to carry this document in a sailplane.

(7) current and suitable aeronautical charts for the route of the proposed flight and all routes along which it is reasonable to expect that the flight may be diverted;

The BGA agrees that these documents should be carried in a sailplane

(8) procedures and visual signals for use by intercepting and intercepted aircraft which shall be easily accessible to the flight crew;

As interception requirements are learnt during FCL theoretical knowledge training. There is no safety or operational need to carry this documentation in a sailplane.

and (9) any other documentation which may be pertinent to the flight or is required by the States concerned with the flight.

The BGA finds it difficult to comment on such an ambiguous statement.

The BGA finds no justification for the disproportional approach taken within this proposed IR.

The BGA therefore proposes the following wording change for OPS.GEN.600 Documents and information to be carried on all aircraft;

OPS.GEN.600 Documents and information to be carried on all aircraft

(a) On any aeroplane or helicopter, the following documents shall be carried on each flight:

(1) the Aircraft Flight Manual or equivalent documents;

(2) the original or copy of the Airworthiness Review Certificate;

(3) the original or copy of the Certificate of Registration;

(4) the original or copy of the Noise Certificate, if applicable;

(5) the original or copy of the third party liability Insurance Certificate;

(6) the journey log book for the aircraft;

(7) current and suitable aeronautical charts for the route of the proposed flight and all routes along which it is reasonable to expect that the flight may be diverted;

(8) procedures and visual signals for use by intercepting and intercepted aircraft which shall be easily accessible to the flight crew; and

(9) any other documentation which may be pertinent to the flight or is required by the States concerned with the flight.

(b) On any sailplane or powered sailplane, the following documents shall be carried on each flight:

(1) the original or copy of the Airworthiness Review Certificate;

(2) the original or copy of the third party liability Insurance Certificate;

(3) current and suitable aeronautical charts for the route of the proposed flight and all routes along which it is reasonable to expect that the flight may be diverted;

a 9: HEMS-Flights should be treated the same way as the description in article b. The Helicopter returns mostly to his point of departure. Especially the Flight-Log should remain on HEMS-Operating-Base.

comment *1036* comment by: *REGA*

OPS.GEN.600 (a): HEMS-Flights should be treated the same way as the description in article b. The Helicopter (complex or non-complex) returns to his point of departure (HEMS operating base).

OPS.GEN.600 (b): The distance shall not be defined by numbers. The operator has to define the specific local area according the requirements by the competent authority.

Proposal (OPS.GEN.600, b)

(…) taking off and landing at the same aerodrome/operating site and remaining within 50 nm of that aerodrome/operating site or in a specific operating area approved by the competent authority; *(…) of departure ~~on the same day~~ within the same 24 hours period;*

Proposal (OPS.GEN.605, 3)

(…) on commercial air transport flights ~~by day and~~ over routes navigated by reference to visual landmarks, with: (…)

(ii) ~~other than complex motor-powered helicopters~~ ~~and~~ helicopters having a maximum passenger seating configuration of 9 or less engaged in flight operations conducted within a local area specified in the operations manual approved by the competent authority;

comment *1044* comment by: *AECA helicopteros.*

The description of the required maps should be contained in Flight Planning rule

comment *1554* comment by: *Luftfahrt-Bundesamt*

Under (a) (5) as a further document the **„Third party liability insurance certificate“** should be added.

comment *1753* comment by: *Swedish Soaring Federation*

Para (b) shall also apply to sailplanes flying cross-country on closed circuits (i.e returning to the launch aerodrome). There is no possibility to carry all these documents in a cramped sailplane cockpit.

comment *1914* comment by: *Ingmar Hedblom*

The Aircraft Flight Manual or equivalent documents should be on-board also during local flights. There may be a need to consult these in an emergency situation, a flight safety issue.

Change the last part of the text to …” information referred to in

OPS.GEN.600**(a)(2)** - (6) may be retained at the aerodrome/operating site

comment *2008* comment by: *Klaus HARTMANN*

zu (c) :

Für non-commercial flights mit Ballonen ist es nicht gefordert das Flight Manual während der Fahrt mit an Bord zu haben. Die Mitnahme im Verfolgerfahrzeug ist danach ausreichend. Dies verhindert aber grundsätzlich das schnelle Auffinden wichtiger Informationen in besonderen Situationen oder z.B. für Piloten die weniger vertraut mit dem gerade verwendeten Ballon sind oder Checklisten für Notverfahren.

Auch wenn das Flughandbuches im Ballon während der Fahrt selten benutzt wird, sollte es dem Piloten grundsätzlich aus Sicherheitsgründen zur Verfügung stehen. Die Mitnahme im Ballonkorb stellt auch keinerlei Platz- oder Gewichtsprobleme dar.

Der Satz (c) sollte daher geändert werden nach :

On non-commercial flights with balloons, the documents referred to in OPS.GEN.600 (a)(2) - (6) may be carried in the retrieve vehicle.

comment *2384* comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

Replace "to be carried on all aircraft" by "to be available on all aircraft".

Delete "original or copy" from (4) and (5) as this implies the option is not available to the other documents.

Clarification is required for:

1. **AMC OPS.GEN.600.2** states the documents and information may be available in a form other than on printed paper; this implies also electronic documents and/or hard copies.Is this correct?

2.Please also clarify that the carriage of the Airworthiness review Certificate is also covered by the mandatory carriage of the C of A

comment *2787* comment by: *Southern Cross International*

To facilitate ferry flights and test flights OPS.GEN.600 (a) (2) shall be modified as follows:

(2) the Certificate of Airworthiness or Permit to Fly issued by the competent authority or organisations approved in accordance with Part-21, as appropriate;

comment *2788* comment by: *Southern Cross International*

It should be possible to have certain documents and information available in an electronic format such as an Electronic Flight Bag (EFB).

comment *3821* comment by: *IAOPA Europe*

For some documents it is explicitly stated that the document may be a copy or an original, for other documents this distinction is not made.

There should no requirement to carry originals since these are often best stored safely on the ground. An copy of the original document should be sufficient as onboard documentation.

comment *3881* comment by: *M Wilson-NetJets*

Original text:

(a) On any aircraft, the following documents shall be carried on each flight:

(1) the Aircraft Flight Manual or equivalent documents;

(2) the Certificate of Airworthiness;

(3) the Certificate of Registration;

(4) the original or copy of the Noise Certificate, if applicable;

(5) the original or copy of the third party liability Insurance Certificate;

(6) the journey log book for the aircraft;

(7) current and suitable aeronautical charts for the route of the proposed flight and all routes along which it is reasonable to expect that the flight may be diverted;

(8) procedures and visual signals for use by intercepting and intercepted aircraft which shall be easily accessible to the flight crew; and

(9) any other documentation which may be pertinent to the flight or is required by the States concerned with the flight.

(b) On non-commercial flights with sailplanes, other than complex motor-powered aeroplanes and helicopters taking off and landing at the same aerodrome/operating site and remaining within 50 nautical miles (nm) of that aerodrome/operating site, the documents and information referred to in OPS.GEN.600(a)(1) - (6) may be retained at the aerodrome/operating site.

(c) On non-commercial flights with balloons, the documents referred to in OPS.GEN.600(a)(1) - (6) may be carried in the retrieve vehicle.

Suggested new text:

(a) On any aircraft, the following documents shall be carried on each flight:

(1) the Aircraft Flight Manual or equivalent documents;

(2) the Certificate of Airworthiness;

(3) the Certificate of Registration;

(4) the original or copy of the Noise Certificate, if applicable;

(5) the original or copy of the third party liability Insurance Certificate;

(6) the journey log book for the aircraft;

(7) current and suitable aeronautical charts for the route of the proposed flight and all routes along which it is reasonable to expect that the flight may be diverted;

(8) procedures and visual signals for use by intercepting and intercepted aircraft which shall be easily accessible to the flight crew; and

(9) any other documentation which may be pertinent to the flight or is required by the States concerned with the flight.

(b) On non-commercial flights with sailplanes, other than complex motor-powered aeroplanes and helicopters taking off and landing at the same aerodrome/operating site and remaining within 50 nautical miles (nm) of that aerodrome/operating site, the documents and information referred to in OPS.GEN.600(a)(1) - (6) may be retained at the aerodrome/operating site.

(c) On non-commercial flights with balloons, the documents referred to in OPS.GEN.600(a)(1) - (6) may be carried in the retrieve vehicle.

(d) Documentation in OPS.GEN.600(a)(6) -(9) may be carried onboard the aircraft by other means than paper if so approved by the responsible authority.

Comment/suggestion:

To ensure compatibility with electronic carriage of documents and manuals, a clause should be added to provide for this opportunity.

comment *4073* comment by: *Ted Moore*

Surely the carriage of the documents mentioned in (C) can be carried in the retrieve vehicle in both commercial and non commercial flights. What is the difference?

comment *4222* comment by: *DGAC*

OPS.GEN.600 + OPS.GEN.610 + AMC OPS.GEN 610

Proposal :

Return to the wording of EU-OPS 1055(b)

(b) An operator may be permitted not to keep an aeroplane journey log, or parts thereof, by the Authority if the relevant information is available in other documentation.

Justification

As written OPS.GEN.600 + OPS.GEN.610 seem to imply that a journey log has to be established and carried on board, which is not consistant with the possibility provided in EU-OPS OPS 1.125 & 135 + OPS 1.1055b, which allowed to gather this information in other documentations.

(9) - the wording "or is required by the States concerned with the flight" is too vague in this context and could be misinterpreted by members states

Proposal

(9) "....or is required by the authority designated by the Member State where the operator has its principle place of business"

comment *5146* comment by: *Trevor Wilcock*

Para a - general: I question the wisdom of carrying original documents in an aircraft. In the event of accident, such important documents, which might relate to safety investigations, could be destroyed. I also see no operational reason to carry original documents. This appears to be recognised by OPS.GEN.615 which calls for such documentation to be provided to the

competent authority within a reasonable time. If so, why not store originals off-aircraft.

Para a (1): this seems to reflect "big aircraft" thinking. There is nothing in the aircraft flight manual for my sailplane or light aircraft that I need to refer to in the course of my flights. Loading, cg and airfield performance calculations are simple matters for which I do not need to refer to the flight manual; any data that I might need I have already prepared in appropriate form. In any case in a sailplane there is no room to store and access such a manual during flight.

Para a (2) - (5): I propose copies, not originals.

Para a (6): the practicalities of sailplane operations are not taken into account here. A training sailplane may in a day make several tens of short flights, with frequent changes of crew. The information on crew and flight duration is, in the case of my club, recorded at the launch point and retained. Transcribing it into a journey log giving crew and journeys (or even series of journeys) would be a substantial task which would make no safety or operational contribution.

Para b - the alleviation proposed here is still reflective of commercial aircraft thinking. I operate my light aircraft from a farmer's field. It does not make sense to keep significant documents at such an operating site; they are far better retained at home, to be produced on demand in a reasonable time in accordance with OPS.GEN.615.

comment *5265* comment by: *Graham HALLETT*

OPS.GEN.600 (c).

This implies that for commercial flights these documents must be carried on board, but in OPS.GEN.605(c), it says they can be carried in the retrieve vehicle. Would it not be simpler to say within this clause: 'For balloons, the documents…. May be carried in the retrieve vehicle'.

comment *5315* comment by: *Light Aircraft Association UK*

Paragraph b).

Since emergency documentation may be contained in the operating manual which may be required even on local flights, this paragraph should be reworded "… the documents and information referred to in OPS.GEN.600 a)2) – 6) may be retained at the aerodrome/operating site".

comment *5386* comment by: *Norwegian Air Sports Federation*

Carrying these documents in original version on board in every flight will destroy these documents. There should be an possibility to carry a copy on

board.

For most air sports the flight starts and ends at the home field. There is no need to carry the document s in (1)-(6) for these flights.

European Regions Airline Association Comment

(a) On any aircraft, the following documents shall be carried on each flight:

(8) procedures and visual signals for use by intercepting and intercepted aircraft which shall be easily accessible to the flight crew; and

(9) any other documentation which may be pertinent to the flight or is required by the States concerned with the flight.

First: Apart from some requirements are not justified there is no provision for Electronic Flight Bags [EFB]. Therefore, suggest the following changes to (a) (8) (9):

(8) ~~procedures and visual signals for use by intercepting and intercepted aircraft which shall be easily accessible to the flight crew; and (9)~~ any other documentation which may be pertinent to the flight or is required by the States concerned with the flight.

The Authority may permit the information detailed in subparagraph (a) above, or parts thereof, to be presented in a form other than on printed paper. An acceptable standard of accessibility, usability and reliability must be assured

Second: There is also a need for greater clarification regarding documents to be carried on board. Some places in IR state that an original or a copy is accepted. In other places in the IR there is incoherent information. There is a need to determine whether documents must be originals or if copies are possible. This is of special importance when it comes to C of A and certificate of registry

comment

5715 comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

(a) On any aircraft, the following documents shall be carried on each flight:

(1) the Aircraft Flight Manual or equivalent documents;

- - -

(b) On non-commercial flights with sailplanes, other than complex motor-powered aeroplanes and helicopters taking off and landing at the same aerodrome/operating site and remaining within 50 nautical miles (nm) of that aerodrome/operating site, the documents and information referred to in OPS.GEN.600(a)(1) - (6) may be retained at the aerodrome/operating site.

Comment:

Except for aerobatic flights, the AFM should be onboard for flights within 50 nm radius from the departure airport

Proposal (including ***new text***):

(b) On non-commercial flights with sailplanes, other than complex motor-powered aeroplanes and helicopters taking off and landing at the same aerodrome/operating site and remaining within 50 nautical miles (nm) of that aerodrome/operating site, the documents and information referred to in OPS.GEN.600(a)(~~1~~ ***2***) - (6) may be retained at the aerodrome/operating site.

comment

6042 comment by: *Fédération Française Aéronautique*

French FFA supports this requirement, including item (a), (4) and (5) which accept copy of original document.

Additionally, FFA proposes to extend the possibility to carry a complete copy of the following documents :

- (1) Airplane Flight Manual,
- (2) Certificate of Airworthiness
- (3) Certificate of Registration

Justification : Doing so, those importants documents will be preserved from destruction in case of accident. FFA does not see any difference with documents (4) and (5) for which a copy of the original is accepted.

FFA supports also item (b) which alleviate the requirement to carry all documents during "local flights"

comment

6166 comment by: *EUROPEAN GLIDING UNION*

Para (b) shall also apply to sailplanes flying cross-country on closed circuits (i.e returning to the launch aerodrome). There is no possibility to carry all these documents in a cramped sailplane cockpit.

comment *6274* comment by: *DAeC LV NRW e.V.*

(b) On non-commercial flights with sailplanes, other than complex motor-powered aeroplanes and helicopters taking off and landing at the same aerodrome/operating site and remaining within 50 nautical miles (nm) of that aerodrome/operating site, the documents and information referred to in OPS.GEN.600(a)(1) - (6) may be retained at the aerodrome/operating site.

OPS.GEN.600(b)

Wording in the NPA

(b) On non-commercial flights with sailplanes, other than complex motor-powered aeroplanes and helicopters taking off and landing at the same aerodrome/operating site and remaining within 50 nautical miles (nm) of that aerodrome/operating site, the documents and information referred to in OPS.GEN.600(a)(1) - (6) may be retained at the aerodrome/operating site.

Our proposal

(b) On < delete: non-commercial> flights with sailplanes, other than complex motor-powered aeroplanes and helicopters taking off and landing at the same aerodrome/operating site and remaining within 50 nautical miles (nm) of that aerodrome/operating site, the documents and information referred to in OPS.GEN.600(a)(1) - (6) may be retained at the aerodrome/operating site.

Issue with current wording

This rule should also be applicable to commercial flights on non complex airplanes and sailplanes

Rationale

Passenger rides with non complex aircraft e.g. sailplanes usually occur unexpectedly during otherwise non commercial operation when interested passengers show up on the airfield. It is not appropriate to require documents to be on the airplane just for these occasional rides. Often they are not available directly at the takeoff location.

comment *6417* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Comment

In EU-OPS, journey logbook did not have to be carried on board.

Proposal

Remove the requirement for journey logbook on board.

Justification

Nothing proves that this would clearly improve safety.

comment *6419* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

There is no consistency with NPA 2008-22 as nothing mentions Part-OR certificate here. Anyways , we re-new our comment previsouly made in NPA 2008-22 : This appendix gives the template for a new Part OR certificate. It seems not be stated anywhere such a certificate is required.

Where is such a certificate defined in the IRs ? in part-OR? in part-AR? in part-OPS ? in part FCL ?

Moreover, it is not clear :

• If an organization needs an OR certificate and an operational certificate (eg: ATO, AOC, FSTD…)?

• If any operational certificate (eg: ATO, AOC, FSTD…) is considered as a an annex or supplement to this OR certificate?

• If the delivery of any operational certificate (eg: ATO, AOC, FSTD…) implies that the organization is compliant with OR requirements, and thus if such an operational certificates de facto includes the OR compliance ? (in this case, a specific OR certificate would be useless)

PROPOSAL

Re-write, precise and homogenize requirements between different parts according to their activity .

Clarify it in the IRs :

• If there is really a need for a new OR certificate?

• If any operational certificate is to be considered as an appendix to such a possible OR certificate ?

• if any operational certificate is to be considered as an independent document ?

or

• if there is no need for such a supplementary OR-certificate which would be complexifying the regulation in a contrary manner to Basic Regulation aims.

comment *6537* comment by: *TG WHITING*

Once again this proposal does not seem to have taken into account the operational use and technical specification of a sailplane. Sailplane flights are generally designed to return back to the take off site. Sailplanes are designed for maximum efficiency and have little storage space/weight allowances for storage of extensive paperwork (or indeed anything else).

In the typical glider there is no provision for carrying paperwork where it will

not risk damage or loss.

THe flight manual is of no use during the duration of a glider flight and thus there seems no safety reason as to why it should be carried in flight. The Airworthiness Review Certificate is not awarded (Part M rules) unless a valid Certificate of Ariworthiness exists. There therefore seems to be no need to carry the Certificate of Airworthiness in the sailplane. The ARC document is amended over the course of 3 years and thus cannot be laminated as protection. There is a real risk of loss or damage in carrying the original and I would propose that it be mandatory only to carry an exact copy. There also seems to be no safety or operational benefit to carrying the Certificate of Registration and the log book of the sailplane in each flight.

It would seem very appropriate to carry a copy of the third party liabilty Insurance certificate for the sailplane in case of damage incurred to a third party in an outlanding. Similarly aeronautical charts as required for the legal operation of the planned flight should always be carried.

I would propose amending the OPS GEN 600 with a separate option for sailplanes specifying only the copy of the ARC review, a copy of the third party liability insurance document and the current appropriate aeronautical charts.

comment *6571* comment by: *Baden-Württembergischer Luftfahrtverband*

OPS.GEN.600(b)

Wording in the NPA

(b) On non-commercial flights with sailplanes, other than complex motor-powered aeroplanes and helicopters taking off and landing at the same aerodrome/operating site and remaining within 50 nautical miles (nm) of that aerodrome/operating site, the documents and information referred to in OPS.GEN.600(a)(1) - (6) may be retained at the aerodrome/operating site.

Our proposal

As discussed on Comment 6273 certain flights of non commercial organizations and persons should not be considered as commercial operation although payments for cost sharing are exchanged. So this requirement should apply. Never the less it should be further extended:

(b) On < delete: non-commercial> flights with sailplanes, other than complex motor-powered aeroplanes and helicopters taking off and landing at the same aerodrome/operating site and remaining within 50 nautical miles (nm) of that aerodrome/operating site, the documents and information referred to in OPS.GEN.600(a)(1) - (6) may be retained at the aerodrome/operating site.

Issue with current wording

This rule should also be applicable to commercial flights on non complex airplanes and sailplanes

Rationale

Passenger rides with non complex aircraft e.g. sailplanes usually occur unexpectedly during otherwise non commercial operation when interested passengers show up on the airfield. It is not appropriate to require documents to be on the airplane just for these occasional rides. Often they are not available directly at the takeoff location.

comment *6710* comment by: *Finnish Aeronautical Association - Kai Mönkkönen*

Sailplane activity in clearly most cases is made from a certain aerodrome or gliding site despite of a length of a cross-country flight route. We consider it is essential that the required documentation as in OPS.GEN.600 for sailplanes is required to be available for a pilot making daily inspection before sailplane flight operation of the day. Quite limited space available in a sailplane cockpit restricts practical storage of the required documentation also during a flight. We do not see any other documents than perhaps flight manual such that even in principle would be needed by the pilot during the flight.

We suggest that in case of sailplanes and powered sailplanes the documentation shall be made available at least for daily inspection.

(8) any other documentation which may be pertinent to the flight or is required by the States concerned with the flight.

Add:

The Authority may permit the information detailed in subparagraph (a) above, or parts thereof, to be presented in a form other than on printed paper. An acceptable standard of accessibility, usability and reliability must be assured

Second: There is also a need for greater clarification regarding documents to be carried on board. Some places in IR state that an original or a copy is accepted. In other places in the IR there is incoherent information. There is a need to determine whether documents must be originals or if copies are possible. This is of special importance when it comes to C of A and certificate of registry

comment

7387 comment by: *Europe Air Sports, VP*

These requirements with the exception of (7) contribute in no case to flight safety. It only enables ground authorities to police the operation of that

aircraft.

Second, the original documents should be kept in a safe place while it is sufficient to carry copies. We recommend to discuss the need for carrying which copies of documents during the CRD process.

comment *7396* comment by: *Comercial Operators in Sweden*

OPS.GEN.600 Ducuments and Information to be carried on all aircrafts

When flying a balloon you do not have a cocpit, you are outside and I whant to suggest that balloons are allowed to carry copies of the documents.

This to be shure that the original documents will not be damage or lost.

comment *7400* comment by: *Comercial Operators in Sweden*

I suggest that all docoments will be allowed to have in the retrive vehicle.

comment *7458* comment by: *European Sailplane Manufacturers*

Sailplane flights, unlike most aeroplane flights, are planned so that the sailplane lands back at its take-off site. A very small percentage of the total land away from the take-off site. In addition, as sailplanes are designed for optimal aerodynamic efficiency and minimum cross section, there is little space for storage.

Original documents can become worn and damaged in use. Replacements are very expensive in member states where NAA's recover a financial surplus on their regulatory activities (eg the UK CAA). The BGA (and also the sailplane manufacturers) offers the following observations relating to the carriage of those documents in sailplanes in general;

(1) the Aircraft Flight Manual or equivalent documents;

This important pre-flight reference document cannot be referred to in flight. There is no safety or operational need to carry this document in a sailplane.

(2) the Certificate of Airworthiness;It is assumed here that the agency is referring to the Airworthiness Review Certificate, which can only be held where a Certificate of Airworthiness exists. Pilots of club sailplanes in particular need to be aware of validity of the airworthiness certificate.

Unfortunately Part M rules require that this can only be assured through the ARC format described within Part M. The BGA agrees therefore that until Part M is modified appropriately, an exact copy or the original ARC should be carried in the sailplane. There is however no safety or operational need to carry the Certificate of Airworthiness in a sailplane.

(3) the Certificate of Registration;

The BGA believes that there is no safety or operational need to carry this document in a sailplane.

(4) the original or copy of the Noise Certificate, if applicable;

The BGA believes that there is no safety or operational need to carry this document in a sailplane.

(5) the original or copy of the third party liability Insurance Certificate;

As it is possible for a sailplane to make an out-landing where third party property can be affected, the BGA agrees that a copy of the aircraft insurance certificate carried in the sailplane will be of assistance.

(6) the journey log book for the aircraft;

The BGA believes that there is no safety or operational need to carry this document in a sailplane.

(7) current and suitable aeronautical charts for the route of the proposed flight and all routes along which it is reasonable to expect that the flight may be diverted;

The BGA agrees that these documents should be carried in a sailplane

(8) procedures and visual signals for use by intercepting and intercepted aircraft which shall be easily accessible to the flight crew;

As interception requirements are learnt during FCL theoretical knowledge training. There is no safety or operational need to carry this documentation in a sailplane.and (9) any other documentation which may be pertinent to the flight or is required by the States concerned with the flight. The BGA finds it difficult to comment on such an ambiguous statement. The BGA finds no justification for the disproportional approach taken within this proposed IR.

The BGA and the sailplane manufacturers therefore propose the following wording change for OPS.GEN.600 Documents and information to be carried on all aircraft;

OPS.GEN.600 Documents and information to be carried on all aircraft

(a) On any aircraft, the following documents shall be carried on each flight:

(1) the Aircraft Flight Manual or equivalent

documents;

(2) the original or copy of the Certificate of Airworthiness;

(3) the original or copy of the Certificate of Registration;

(4) the original or copy of the Noise Certificate, if applicable;

(5) the original or copy of the third party liability Insurance Certificate;

(6) the journey log book for the aircraft;

(7) current and suitable aeronautical charts for the route of the proposed flight and all routes along which it is reasonable to expect that the flight may be diverted;

(8) procedures and visual signals for use by intercepting and intercepted aircraft which shall be easily accessible to the flight crew;

and

(9) any other documentation which may be pertinent to the flight or is required by the States concerned with the flight.

(b) On non-commercial flights with sailplanes, other than complex motor-powered aeroplanes and helicopters, the documents and information referred to in OPS.GEN.600(a)(1),(3),(4) & (6) may be retained at the aerodrome/operating site.

comment *7475* comment by: *David ROBERTS*

This is the set of proposed rules that I have explained previously, during the drafting phase, is (a) impractical (b) unnecessary (c) bureaucratic (d) without a safety case for sailplanes in particular.

1. Having originals of some of the documents on board can lead to them being lost / destroyed / degraded through frequent handling. Therefore copies should be adequate when documents are justified in carriage. Original documents cost money to replace. Copies do not.

2. In a sailplane, no pilot in his right mind is going to look at the flight manual in flight. All the necessary information he / she needs is on a placard or in his / her head.

3. There is just simply not room in most sailplanes to carry all these documents

4. There are alternative means of ascertaining compliance, when necessary, for the state of the aircraft. It carries registration markings, therefore can be checked 'online' on the ground as to its CofA status without carrying the actual CofA document on board.

5. These requirements appear to be borne out of certain member States' local rules (France? and maybe some former eastern block countries?). Please rethink this for a modern western democracy!

6. The distinction in sub para (b) for flights < 50 NM radius from the take off aerodrome is arbitary and adds nothing. Why should not all documents be held on the ground for any flight planned to return to the base aerodrome?

7. It is far from convenient for the owners of privately owned aircraft to keep the documents at the aerodome. Most will keep them at home or in their office.

I regard this set of proposals as cometely disproportionate and lends credence to those who criticise the 'European system' for ultimate bureaucracy.

Proposal: re-think this whole section PLEASE on review and take notice of what the real experts think!

comment | *7515* | comment by: *John Castle*

To carry other than a copy of the ARC and insurance documents is impractical and unnecessary in a sailplane. No reference can be made to manuals etc in flight. It is possible that an out landing could damage a 3rd party property and therefore proof of insurance may be required. Whilst most cross country flights are navigated with GPS based equipment it is sensible that the appropriate Aeronautical charts are carried for reference in the event of a system failure.

B. I. Draft Opinion - Part-OPS - Subpart A - Section V - OPS.GEN.605 Documents and information to be carried on non-commercial flights with complex motor-powered aircraft and aircraft used in commercial operations p. 56-57

comment | *434* | comment by: *EHOC*

Paragraph (a)(6)

Editorial; not sure that portions (which is usually associated with allocation) is the correct word; it might be better as:"Those parts of the operations manual..."

Paragraph (b)(3)

Whilst this is not an issue for A to A operations; for operations in a local area (which for example in some States are all operations within the State borders), some of these elements are considerably beyond those envisaged in the original rule - which considered flights only in a single day.

As far as the OPS.GEN.605 is concerned, the alleviation from carriage (under the conditions above) of:

The Flight Manual;

The CofA;

The CofR

The liability insurance certificate;

The journey log book

appears to be too liberal.

The CofA;

The CofR

The liability insurance certificate;

The jouney log book

appears to be too liberal.

comment *1162* comment by: *CAA-NL*

Comment regarding:

OPS.GEN.605(a)(8)

Comment: no mention is made of the requirement for a Dangerous Goods Transport Document to accompany a consignment of dangerous goods to final destination; this form is completed by the shipper and is different to the notification to the Captain of any dangerous goods on board (see OPS.GEN.605(a)(8)(iv).

Justification: Part 7;1.2.2 of the Technical Instructions requires one of the two copies of the Dangerous Goods Transport Document, which must be presented to the operator before the dangerous goods can be accepted for air transport, to accompany the consignment to final destination.

Proposed Text (if applicable):

Add a new OPS.GEN.605(a)(8)(v) as follows:

"(v) a copy of the Dangerous Goods Transport Document(s) accompanying any dangerous goods carried as cargo."

(note this will result in the consequential re-numbering of the existing (v))

comment *1380* comment by: *International Air Transport Association*

OPS.GEN.605(a)(8). Subparagaph (iv) makes reference to written information for dangerous goods, commonly referred to as the Notification to Captain (NOTOC). However, in addition to the NOTOC information there is also a requirement that one of the copies of the dangerous goods transport document must also accompany the consignment of dangerous goods to destination, unless the information has been provided to the operator in electronic form.

This provision is set out in part 7;1.2.2 and 7;1.2.3 of the ICAO Technical Instructions.

On this basis, a new subparagraph (v) should be inserted below the current OPS.GEN.605(a)(8)(iv), which would then make reference to the carriage of copies of the dangerous goods transport document, if applicable, unless the operator has the information contained on the dangerous goods transport document(s) available in electronic form.

The current subparagraph (v) would then be renumbered as (vi).

comment *1410* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

No mention is made of the requirement for a Dangerous Goods Transport Document to accompany a consignment of dangerous goods to final destination; this form is completed by the shipper and is different to the notification to the Captain of any dangerous goods on board (see OPS.GEN.605(a)(8)(iv).

Comment:

Part 7;1.2.2 of the Technical Instructions requires one of the two copies of the Dangerous Goods Transport Document, which must be presented to the operator before the dangerous goods can be accepted for air transport, to accompany the consignment to final destination.

Proposal:

Add a new OPS.GEN.605(a)(8)(v) as follows:

"(v) a copy of the Dangerous Goods Transport Document(s) accompanying any dangerous goods carried as cargo."

Note:

This will result in the consequential re-numbering of the existing (v).

comment *1555* comment by: *Luftfahrt-Bundesamt*

– Referring to (a)(5), the **Operation Specification** should also be required to be carried on board.

B. Under (a) (8) as another document the „Dangerous Goods Transport Document" should be added:

„(v) a copy of the Dangerous Goods Transport Document."

The current No. (v) should be renamed to (vi) accordingly.

comment *1604* comment by: *British Parachute Association*

We suggest that in (a) (8) (iv) after the words "...dangerous goods," be added (in parentheses) the following..

"(excepting smoke trail devices carried by parachutists who intend to exit the aircraft)"

This is in order to enable the use of smoke trail devices by parachutists engaged on parachute displays and will ensure consistency with our comments 1412, 1632 and 1657.

comment *1754* comment by: *Swedish Soaring Federation*

para (b) (2) shall also apply to sailplanes flying cross-country on closed circuits (i.e returning to the launch aerodrome). There is no possibility to carry all these documents in a cramped sailplane cockpit.

comment *2009* comment by: *Klaus HARTMANN*

zu (c) :

Hier werden Dokumente aufgeführt, die an Bord eines kommerziell genutzten Luftfahrzeugs (auch Ballone) während des Fluges mitzuführen sind, und unter (c) welche Dokumente bei Ballonfahrten stattdessen auch im Verfolgerfahrzeug mitgeführt werden können.

Auch hier wird wie in OPS.GEN.600 für non-commercial flights mit Ballonen nicht die Mitnahme vom Flughandbuch gefordert. Die Mitnahme im Verfolgerfahrzeug ist danach ausreichend. Dies verhindert aber grundsätzlich das schnelle Auffinden wichtiger Informationen in besonderen Situationen oder z.B. für Piloten die weniger vertraut mit dem gerade verwendeten Ballon sind oder Checklisten für Notverfahren.

Auch wenn das Flughandbuches im Ballon während der Fahrt selten benutzt wird, sollte es dem Piloten grundsätzlich aus Sicherheitsgründen zur Verfügung stehen. Die Mitnahme im Ballonkorb stellt auch keinerlei Platz- oder Gewichtsprobleme dar.

Zusätzlich werden unter anderem als nicht erforderlich im Ballon die meteorologischen Informationen und die AIS Informationen für die Ballonfahrt genannt. Dies sind jedoch wichtige Informationen die während der Fahrt jederzeit vom Piloten benötigt werden könnten. Daher gehören diese Sicherheitsinformationen unbedingt mit an Bord und nicht ins Verfolgerfahrzeug.

Der Satz (c) sollte daher geändert werden nach :

On commercial flights with balloons, the documents referred to in OPS.GEN.600 (a)(2) - (6) and OPS.GEN.605 (a)(1) and (5) may be carried in the retrieve vehicle.

Replace: "Certified true copy of the operator certificate" by "copy of the operator certificate and extend the application of AMC OPS.600 to OPS GEN 605

comment *2764* comment by: *Pietro Barbagallo ENAC*

OPS.GEN.605(a)(5) Comment:The statement "True Certified Copy" should be defined. Also it should be clarified who is responsible for the issue of such statement.

Justification: Proposed actions: 1) add the definition of "True Certified Copy"

in OPS.GEN.010; 2) add a new AMC OPS.GEN.605(a)(5) specifying that the statement "True Certified Copy" should be issued by the Quality Manager of the Commercial Air Operator or by a person He has delegated for such duty.

OPS.GEN.605(a)(8) Comment: No mention is made of the requirement for a Dangerous Goods Transport Document to accompany a consignment of dangerous goods to final destination; this form is completed by the shipper and is different to the notification to the Captain of any dangerous goods on board (see OPS.GEN.605(a)(8)(iv)).

Justiifcation: Part 7;1.2.2 of the ICAO Technical Instructions requires one of the two copies of the Dangerous Goods Transport Document, which must be presented to the operator before the dangerous goods can be accepted for air transport, to accompany the consignment to final destination.

Proposal: Add a new OPS.GEN.605 (a) (8) (v) as follows: "(v) a copy of the Dangerous Goods Transport Document(s) accompanying any dangerous goods carried as cargo." (note this will result in the consequential re-numbering of the existing (v))

comment *2789* comment by: *Southern Cross International*

It should be possible to have certain documents and information available in an electronic format such as an Electronic Flight Bag (EFB).

comment *2958* comment by: *Austro Control GmbH*

(5): certified true copy

Comment:

for a uniform understanding in the Member States and for legal certainty it is recommended to define what "Certified True Copy" means: is it a certification according to national law (e.g. certification by competent authority, by court, by public notary etc) or is it understood as a self certification by the operator?

It is recommended to allow both possibilities and to define that in the respective AMC.

Proposed Text for AMC, OPS. GEN.605 (a) (5), Page 256:

Certified true copy should mean a certification by the issuing authority, by court, by public notary, by any other national authorised organisation or by the operator based on a suitable procedure.

comment *2972* comment by: *REGA*

Rmk: the requirement for a certified copy is overdone for operators that perform CAT operations in the member state of registration only.

comment *2982* comment by: *CAA-NL*

comment *2983* comment by: *AOPA Switzerland*

The carriage of the Aircraft Technical Log does not increase flight safety. Therefore this point is to be withdrawn.

comment *3181* comment by: *Peter SCHMAUTZER*

In OPS GEN.605a 5 is stipulated that as document a certified true copy of the operator certificate has to be carried in the aircraft.

Until now a non-certified copy of the AOC was sufficient. If the copies have to be notarised, there will be costs to perform notarisations, which can be avoided. If somebody has the intention to use a false documents, a certification can also be forged. The consequences of faking documents are the same.

If at taxi operation flight plans are filed electronically and NOTAMS and Met Info is received in the same way, this documentation can not be carried in paper. There should be a possibility to have these documentations on a laptop.

comment *3188* comment by: *Austro Control GmbH*

(a)

(1) ~~the Aircraft Radio Licence;~~

Justification:

Transferred to OPS.GEN.600 (a), because it is required when a radio station is on board.

comment *3212* comment by: *Austro Control GmbH*

(7) the Minimum Equipment List (MEL) **or equivalent document;**

The definiton of the term "equivalent document" is not clear and must be defined. Explanation in AMC OPS.GEN.605 is not sufficient.

comment *3337* comment by: *UK CAA*

Page No: 56

Paragraph No:

OPS.GEN.605 (a)(5)

Comment: Paragraph (a)(5) does not cover the possibilities that an aircraft used in commercial operations may be subject to a declaration rather than certification nor that an aircraft used in non-commercial operations may be subject to some kind of certification. In addition, the reference to "the operator certificate" may be ambiguous.

Justification: UK CAA considers that the IRs should provide for conditions under which a certificate shall be replaced by a declaration and conditions under which a declaration shall be replaced by a certification process, in accordance with Article 8.5 (b) and (d) of Regulation 216/2008. Such IRs would need to provide for different kinds of certification, so that the use of the phrase "the operator certificate" would not be appropriate.

In any case the UK CAA considers that one kind of "operator certificate" is not appropriate due to the specific international requirements/obligations regarding an Air Operator Certificate". The UK proposes that two kinds of certificate be provided for commercial operations, one for CAT and one for commercial operations other than CAT (see also comment 595 to NPA 2008-22).

Proposed Text (if applicable):

(5) a certified true copy of a certificate issued to the operator in accordance with AR.GEN.310 or a declaration verified in accordance with AR.GEN.340, whichever is required.

European Regions Airline Association Comment

(a) In addition to OPS.GEN.600(a), on flights with complex motor-powered aircraft used in non-commercial operations and aircraft used in commercial operations, the following documents and information shall be carried on each flight:

(5) a certified true copy of the operator certificate if the aircraft is used in commercial operations and a copy of the declaration if the aircraft is used in non-commercial operations;

The ERA Directorate has the same concern as with OPS.GEN.600. In addition when the authorities can request originals directly from the airline HQ is not a "certified true copy" unjustified? In addition more information is required on the definition of a certified true copy. In the case of the AOC would the following be acceptable?:

- A copy stamped by the operator, or
- A copy stamped by an authority.

In many cases it is currently simply acceptable to carry a simple copy.

Therefore ERA would like to see the following changes to paragraph (a) (5):

(5) a ~~certified true~~ copy of the operator certificate if the aircraft is used in commercial operations and a copy of the declaration if the aircraft is used in non-commercial operations;

The Authority may permit the information detailed in subparagraph (a) above, or parts thereof, to be presented in a form other than on printed

paper. An acceptable standard of accessibility, usability and reliability must be assured.

comment *5777* comment by: *Norsk Luftambulanse*

(a)(5) Rmk: the requirement for a certified copy is overdone for operators that perform CAT operations in the member state of registration only.

comment *5778* comment by: *Norsk Luftambulanse*

For HEMS operations in the specified geographical area the carriage of NOTAM and Weather information in paper form should not be required.

605(a)(5): the requirement for a true certified copy is overdone for operators that perform CAT-operations in the member state of registration only.

comment *5975* comment by: *HSD Hubschrauber Sonder Dienst*

605(b)(3):

For HEMS-operations in a specified geographical area the carriage of NOTAM and weather information in paper form should not be required.

comment *6145* comment by: *Finnish CAA*

Paragraph No: OPS.GEN.605(a)(8)

Comment: Missing mention of the requirement for a Dangerous Goods Transport Document to accompany a consignment of dangerous goods to final destination; this form is completed by the shipper and is different to the notification to the Captain of any dangerous goods on board (see OPS.GEN.605(a)(8)(iv)).

Justification:

Part 7;1.2.2 of the Technical Instructions requires one of the two copies of the Dangerous Goods Transport Document, which must be presented to the operator before the dangerous goods can be accepted for air transport, to accompany the consignment to final destination.

Proposed text (if applicable):

Add a new OPS.GEN.605(a)(8)(v) as follows:

"(v) a copy of the Dangerous Goods Transport Document(s) accompanying any dangerous goods carried as cargo."

(note this will result in the consequential re-numbering of the existing (v))

comment *6168* comment by: *EUROPEAN GLIDING UNION*

para (b) (2) shall also apply to sailplanes flying cross-country on closed circuits (i.e returning to the launch aerodrome). There is no possibility to carry all these documents in a cramped sailplane cockpit.

comment *6275* comment by: *DAeC LV NRW e.V.*

OPS.GEN.605 Documents and information to be carried on non-commercial flights with complex motor-powered aircraft and aircraft used in commercial operations

(a) In addition to OPS.GEN.600(a), on flights with complex motor-powered aircraft used in non-commercial operations and aircraft used in commercial operations, the following documents and information shall be carried on each flight:

OPS.GEN.605

Wording in the NPA

OPS.GEN.605 Documents and information to be carried on non-commercial flights with complex motor-powered aircraft and aircraft used in commercial operations

(a) In addition to OPS.GEN.600(a), on flights with complex motor-powered aircraft used in non-commercial operations and aircraft used in commercial operations, the following documents and information shall be carried on each flight:

Our proposal

OPS.GEN.605 Documents and information to be carried on non-commercial flights with complex motor-powered aircraft and aircraft used in commercial operations except on sailplanes and non complex airplanes

(a) In addition to OPS.GEN.600(a), on flights with complex motor-powered aircraft used in non-commercial operations and aircraft used in commercial operations except on sailplanes and non complex airplanes, the following documents and information shall be carried on each flight:

Issue with current wording

These requirements should not apply to non complex aircraft only occasionally used for commercial operations.

Rationale

Most of these documents are not available for non complex airplanes and sailplanes. Also these aircraft are usually only occasionally used in commercial operations. These additional requirements are just not appropriate in this case.

comment *6284* comment by: *Lufthansa CityLine GmbH*

More information is required on the definition of a certified true copy. In the case of the AOC would the following be acceptable?:

A copy stamped by the operator, or

A copy stamped by an authority.

In many cases it is currently simply acceptable to carry a simple copy.

Therefore Lufthansa CityLine would like to see the following changes to paragraph

a): in addition to OPS.GEN.600(a), on flights with complex motor-powered aircraft used in non-commercial operations and aircraft used in commercial operations, the following documents and information shall be carried on each flight:

(5) a ~~certified true~~ copy of the operator certificate if the aircraft is used in commercial operations and a copy of the declaration if the aircraft is used in non-commercial operations;

….

The Authority may permit the information detailed in subparagraph (a) above, or parts thereof, to be presented in a form other than on printed paper. An acceptable standard of accessibility, usability and reliability must be assured.

comment *6344* comment by: *Konrad Polreich*

OPS.GEN.605 (b) (3)

There is an alleviation for certain CAT flights, but not for non-commercial operations. I see no reason for this, therefore I suggest to amend the paragraph by adding non-commercial flights.

Suggestion:

(b)(3) on non-commercial flights and commercial air transport flights by day and over routes …….

comment *6573* comment by: *Baden-Württembergischer Luftfahrtverband*

OPS.GEN.605

Wording in the NPA

OPS.GEN.605 Documents and information to be carried on non-commercial flights with complex motor-powered aircraft and aircraft used in commercial operations

(a) In addition to OPS.GEN.600(a), on flights with complex motor-powered aircraft used in non-commercial operations and aircraft used in commercial operations, the following documents and information shall be carried on each flight:

Our proposal

As discussed on Comment 6273 certain flights of non commercial organizations and persons should not be considered as commercial operation although payments for cost sharing are exchanged. So this requirement should not apply. Never the less exemptions should be made:

OPS.GEN.605 Documents and information to be carried on non-commercial flights with complex motor-powered aircraft and aircraft used in commercial operations except on sailplanes and non complex airplanes

(a) In addition to OPS.GEN.600(a), on flights with complex motor-powered aircraft used in non-commercial operations and aircraft used in commercial operations except on sailplanes and non complex airplanes, the following documents and information shall be carried on each flight:

Issue with current wording

These requirements should not apply to non complex aircraft only occasionally used for commercial operations.

- A copy stamped by the operator, or
- A copy stamped by an authority.

In many cases it is currently simply acceptable to carry a simple copy.

Therefore we would like to see the following changes to paragraph (a) (5) use a copy instead a certified true copy:

(5) **a copy of the** operator certificate if the aircraft is used in commercial operations and a copy of the declaration if the aircraft is used in non-commercial operations;

And add the following paragraph:

The Authority may permit the information detailed in subparagraph (a) above, or parts thereof, to be presented in a form other than on printed paper. An acceptable standard of accessibility, usability and reliability must be assured.

comment *7406* comment by: *Comercial Operators in Sweden*

Let all documents be allowed to be carried in the retrive vehicle and prefferebly copies.

This is because a bolloon pilot is always outside an storege are verry much limited.

B. I. Draft Opinion - Part-OPS - Subpart A - Section V - OPS.GEN.610 Journey log book p. 57

comment *46* comment by: *George Knight*

AMC states that, -

The aircraft journey log book should contain the following items:

a. aircraft registration;

b. date;

c. crew member names and duty assignments;

d. departure and arrival points and times;

e. purpose/nature of the flight;

f. incidents, observations (if any); and

g. signature of the pilot-in-command.

Whilst this may be appropriate for commercial flying and aerial work it has no relevance to light general aviation and gliding.

For aircraft with 4 or fewer seats (including crew) the requirement should be waived. Sufficient data will exist in the pilots' log books, existing design aircraft log books and airfield flight records to meet all conceivable requirements. This additional bureaucracy is over-regulation for private, recreational and sporting aviation – especially gliding.

comment *71* comment by: *Air Southwest*

OPS.GEN.610 Do you really mean 'Journey Log Book'. We haven't had journey log books for years. JAR-OPS 1.415 referred to the "Journey Log." Suggest maintaining the same title and drop the word 'book'.

comment *713* comment by: *ECA - European Cockpit Association*

Comment on OPS.GEN.610: NIL

The change from EU OPS has been noted, but it is accepted.

comment *813* comment by: *CAA-NL*

Comment regarding:

1. d. departure and arrival points and times;

CAA-NL proposes to add:

….'actual' times of departure and arrival

Reason:

In compliance with 1.1055/3.1055 a7 / a8

and add:

Hours of flight

Reason:

Missing in text; In compliance with 1.1055/3.1055 a9

comment *814* comment by: *CAA-NL*

Comment regarding:

2. The journey log may be combined with the aircraft log book as required in M.A.305.

CAA-NL suggests to EASA to add:

Text suggests that content of the journey log may only be combined with the log book instead of the Aircraft Technical Log. Reference to MA 305 is to "Aircraft continuing airworthiness record system' which does requires the ATL system as required by MA 306.

EU-OPS and JAR-OPS 1.1055 (b)/3.1055 (b) and relevant IEM makes it possible to include the content of a journey log in the ATL system.

Reason:

Present text is not clear in the option of ATL

comment *5147* comment by: *Trevor Wilcock*

The practicalities of sailplane operations are not taken into account here. A training sailplane may in a day make several tens of short flights, with frequent changes of crew. The information on crew and flight duration is, in the case of my club, recorded at the launch point and retained. Transcribing it into a journey log giving crew and journeys (or even series of journeys) would be a substantial task which would make no safety or operational contribution.

comment *5387* comment by: *Norwegian Air Sports Federation*

Electronic journey log book should be allowed.

comment *7595* comment by: *AOPA UK*

It should be added that documents, need for the flight shall only be available until the aircraft comes to a stop after a flight, so the cockpit can be cleaned as fast as possible.

B. I. Draft Opinion - Part-OPS - Subpart A - Section VI p. 58

comment *779* comment by: *ECA - European Cockpit Association*

The whole section on security should be deleted.

Justification:

The Security provisions in this NPA overlap with the requirements in Regulation 300/2008 of 11 March 2008 on common rules in the field of civil aviation security. The proposed text contains conflicting or divergent concepts and definitions. This could create confusion and legal uncertainty. The nature of the rules are also different as part of the security rules in OPS are AMC or Guidance Material while in the Regulation the same would be either part of a Regulation or a Recommendation to the Member States.

ECA believes that the use of AMC is not adequate for this section. Any operator could propose another AMC, and if the level of safety is the same, the Authority or the Agency would not have any reason to deny it.

Finally, some of the proposed rules deviate from ICAO Annexes and would oblige the Member States to file differences creating potential risks of non recognition from other ICAO signatory parties.

B. I. Draft Opinion - Part-OPS - Subpart A - Section VI - OPS.GEN.700 Disruptive Passenger Behaviour p. 58

comment *780* comment by: *ECA - European Cockpit Association*

This paragraph should be deleted. ECA believes the provisions of the security section should be deleted as they overlap with Regulation 300/2008 (see comment n° 779). If, however it is decided to keep this section within OPS, the following changes are needed:

OPS.GEN.700 Disruptive Passenger**s** Behaviour

~~**When deemed necessary, t**~~**T**he pilot-in-command shall take appropriate measures to reduce the risk to flight safety emanating from ~~**potentially**~~ disruptive passengers hindering crew members from performing their duties or not complying with crew member instructions.

comment *2046* comment by: *claire.amos*

Conflict between heading and text - disruptive passenger and potentially disruptive passenger are different definitions under EU Regulations

delete the word "potentially" from text

Potentially disruptive passengers have a different definition under EU Regulation EC300 - means a passenger who is either a deportee, a person deemed to be inadmissable for immigration reasons or a person in lawful custody. This is security risk and not the same as a normal passenger who becomes disruptive causing a safety problem.

comment *4916* comment by: *Virgin Atlantic Airways*

Relevant Text:

GM OPS.GEN.700 Disruptive Passenger Behaviour

GENERAL

1. Operators engaged in the transportation of passengers should take into account that their passengers could obstruct the safe operation of the aircraft. Passenger behaviour may be affected by a variety of factors, including:

a. limitations on personal 'freedom', such as restrictions on smoking or on the use of mobile phones;

b. physical effects, such as from consummation of alcohol, illness, or taking of medication, possibly increased from effects of higher altitude and less available oxygen;

c. social or psychological effects, such as from fear of flying, claustrophobia, or reluctance to follow instructions.

2. The pilot-in-command should consider preventive measures when the possibility of disruptive passenger behaviour is anticipated. Such measures could include, but are not

limited to:

a. communication with the potentially disruptive passenger in an effort to reduce the likelihood of disruptive behaviour;

b. reseating a potentially disruptive passenger to an area where there is less risk of passenger interference;

c. deny boarding to the potentially disruptive passenger or cancel the flight.

Comment: Delete 'or cancel the flight'.

It is unlikely a scenario would ever arise where a flight would be cancelled because of a disruptive passenger(s) and suggest therefore this option in the formal legislation be removed.

6190 comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment:

Regulation (EC) No 300/2008 provides the basis for a common interpretation of ICAO Annex 17.

According to Regulation (EC) No 300/2008 article 10 all Member States shall draw up, apply and maintain a National Civil Aviation Security Programme. This programme shall be made available in appropriate parts to operators and entities concerned. The programme shall define responsibilities for the implementation of the common basic standards and describe the measures required by operators. The common basic standards consists of a large variety of security measures and includes both inflight security measures and training. The detailed implementing legislation are at present being prepared by the Commission in cooperation with Member States. Regulation (EC) No 300/2008 also requires air carriers to draw up, apply and maintain an air carrier security program.

Considering the above we find it inappropriate and unpractical to single out a few security related issues and regulate them in the flight safety context. We have absolutely no objections of regulating the issues per se, but they should be dealt with in the same context as all other security issues. We believe that this view is also shared by most stake holders.

Proposal:

All security issues related to ICAO Annex 17 should be left to be dealt with in the implementing legislation of Regulation (EC) No 300/2008.

comment

6461 comment by: *BDF - German Airline Association*

The EASA NPA 2009-02 reflects only safety issues. Since "Disruptive passenger behaviour" is already covered in Regulation (EC) 300/2008, Chpt 4.3 of the annex, and the forthcoming Commission Regulation (Commission Regulation laying down detailed measures for the implementation of the common basic standards on aviation security), it is already regulated what

the pilot-in-command's responsibilities are and what action must therefore be taken. Regulation 300/2008 also reflects that security is not only an issue during a flight but already starts on the ground.

Additionally the EASA NPA mixes safety and security related subjects. Security must stay in the Commissions's and the Committee for Civil Avation Security's sole authority.

B. I. Draft Opinion - Part-OPS - Subpart A - Section VI - OPS.GEN.705 Reporting acts of unlawful interference p. 58

comment *783* comment by: *ECA - European Cockpit Association*

The paragraph should be deleted. ECA believes the provisions of the security section should be deleted as they overlap with Regulation 300/2008 (see comment n° 779). If, however it is decided to keep this section within OPS, the following changes are needed:

OPS.GEN.705 Reporting acts of unlawful interference.

Following an act of unlawful interference on board an aircraft, the pilot-in-command or, if unable, **the operator shall inform the competent authority either at the point of departure or the next place of landing. ~~submit, w~~W**ithout delay, **the operator shall submit** a report to the competent authority in the State of the operator in compliance with its national civil aviation security programme**~~, and shall inform the designated local authority~~**.

comment *3053* comment by: *AEA*

Relevant Text:

Following an act of unlawful interference on board the aircraft, the pilot-in-command or, if unable, the operator shall submit,, without delay a report to the Competent Authority,

Comment:

This wording is not line with EU-OPS. We suggest to stick to EU-OPS and replace 'unable' with 'in his/her absence'

Proposal:

Realign with EU-OPS: replace '***unable'*** with '***in his/her absence'***

comment *6194* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment:

Regulation (EC) No 300/2008 provides the basis for a common interpretation of ICAO Annex 17.

According to Regulation (EC) No 300/2008 article 10 all Member States shall draw up, apply and maintain a National Civil Aviation Security Programme. This programme shall be made available in appropriate parts to operators and entities concerned. The programme shall define responsibilities for the

implementation of the common basic standards and describe the measures required by operators. The common basic standards consists of a large variety of security measures and includes both inflight security measures and training. The detailed implementing legislation are at present being prepared by the Commission in cooperation with Member States. Regulation (EC) No 300/2008 also requires air carriers to draw up, apply and maintain an air carrier security program.

Considering the above we find it inappropriate and unpractical to single out a few security related issues and regulate them in the flight safety context. We have absolutely no objections of regulating the issues per se, but they should be dealt with in the same context as all other security issues. We believe that this view is also shared by most stake holders.

Proposal:

All security issues related to ICAO Annex 17 should be left to be dealt with in the implementing legislation of Regulation (EC) No 300/2008.

comment *6465* comment by: *BDF - German Airline Association*

Reflecting on BDF's comment on OPS.GEN.700 aviation security measures are within the remit of the Commission.

B. I. Draft Opinion - Part-OPS - Subpart B p. 59

comment *916* comment by: *CAA-NL*

Text does not provide a clear definition for CAT.

comment *949* comment by: *KLM*

Very confusing that helicopters and fixed wing are all put together and very unclear what is applicable to which category.

Helicopters have to be mentioned seperately, even if it means duplication, but this is unclear and too much mixed up.

comment *1353* comment by: *AECA helicopteros.*

An additional rule to provide a requirement for radios for VFR is required:

OPS.CAT.524 Radio equipment for operations under VFR over routes navigated by reference to visual landmarks

(a) motor powered aircraft shall be provided with radio equipment that permits:

(1) communication with appropriate ground stations;

(2) communication with appropriate air traffic control facilities; and

(3) reception of meteorological information.

comment *2297* comment by: *Austro Control GmbH*

general comment:

for a uniforme understanding a definition of "Commercial Air transport" is necessary and therefore requested (see OPS.GEN.001).

comment *7074* comment by: *IACA International Air Carrier Association*

Contrary to small aircraft, ETOPS will not be included in Part-OPS. ETOPS for large aircraft used in Commercial Air Transport (CAT) will remain separate as AMC 20-6. Hereto CRD 2008-01, including training requirements, will be published within one month.

p.57 AMC5 OR.OPS.015.MLR Operations Manual

8.5 ETOPS for two-engine aeroplanes. A description of the ETOPS operational procedures. (Refer to EASA AMC 206)

B. I. Draft Opinion - Part-OPS - Subpart B - Section I p. 59

comment *6058* comment by: *DGAC*

We do not understand the rationale for mentioning R 216/2008 in the scope of part OPS subparts GEN, CAT & COM and not mentioning it in the scope of both part OR subpart OPS and part OPS subpart SPA?

If, as explained by EASA, the mere application of those subparts is not enough to ensure compliance with the BR, then mentioning the BR in the scope should be avoided as it is confusing and misleading.

"OPS.CAT.001 Scope

This subpart establishes additional and specific requirements to be met by an operator undertaking commercial air transport operations, to ensure compliance with Annex IV to Regulation (EC) No 216/2008 (Essential requirements for air operations)".

B. I. Draft Opinion - Part-OPS - Subpart B - Section I - OPS.CAT.001 Scope p. 59

comment *673* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.001: change as follows:

OPS.CAT.~~**001**~~**005** Scope

Justification:

Should read "OPS.CAT.005"

comment *674* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.001: change as follows:

This subpart establishes additional and specific requirements to be met by an operator undertaking commercial air transport operations~~**, to ensure compliance with Annex IV to Regulation (EC) No 216/2008 (Essential requirements for air operations)**~~

Not acceptable - Justification:

Everything necessary to comply with the BR must be found in the IR/AMC/GM. Reference to BR 216/2008 is inappropriate.

comment *677* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.001: add the following text:

"An operator shall comply with the applicable retroactive airworthiness requirements for aeroplanes operated for the purpose of commercial air transportation."

Justification:

Missing requirements from EU OPS 1.005 (b).

comment *3570* comment by: *Walter Gessky*

OPS.CAT.001 Scope

Comment:

For a uniform understanding a definition of "Commercial Operation" is required and therefore shall be added (see OPS.GEN.001).

comment *4225* comment by: *DGAC*

Renumber this paragraph into "**OPS.CAT.005 Scope",** as the same paragraph in OPS.GEN is numbered "OPS.GEN.005 Scope"

comment *4226* comment by: *DGAC*

There should be a general statement allowing for an operator, when operating a non commercial flight, to keep the same rules than it uses when undertaking commercial air transport, that is to say allowing replacing GEN provisions by the similarly numbered CAT provisions when those provisions start with "notwithstanding OPS.GENxxx". By applying those "notwithstanding OPS.GENxxx" provisions, operators should be "deemed to be compliant with the corresponding OPS.GEN xxx provisions"

comment *4227* comment by: *DGAC*

There should be a provision (*at least in the Cover Regulation*) equivalent to (3) EU/JAR-OPS 1/3.001, stating that subpart CAT does not apply "to flights immediately before, during, or immediately after an aerial work activity provided these flights are connected with that aerial work activity and in which, excluding crew members, no more than 6 persons indispensable to the aerial work activity are carried."

comment *5965* comment by: *Irish Aviation Authority*

Comment:

The paragraph needs to be re-numbered to OPS.CAT.005 Scope.

Justification:

For regulation consistency all other references to "Scope" are .005.

OPS.GEN.005 Scope; OPS.COM.005 Scope; OPS.SPA.005.GEN Scope.

Proposed text:

OPS.CAT.005 Scope

B. I. Draft Opinion - Part-OPS - Subpart B - Section I - OPS.CAT.040 Carriage of sporting weapons and ammunition p. 59

comment *686* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.040(a): change as follows:

(a) inaccessible to passengers during flight, or if the aircraft does not have a separate compartment in which weapons can be stowed, appropriate procedures shall be applied to ensure that they are not ~~**immediately**~~ accessible to the passengers; and

Justification:

Safety and security relevant

comment *1411* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

Carriage of weapons in other than separate compartment should only be permitted if the approval of all states concerned has been granted, as required by EU-OPS 1.065 (b).

Comment:

The current wording is vague and the wording "as far as possible" may provide for the operator not implementing adequate measures.

Proposal:

Amend AMC OPS.CAT.040 1. as follows:

"If the aircraft does not have a separate compartment in which weapons and ammunition can be stowed, carriage of such items is subject to approval by all States concerned. In such instances, procedures should take into account the nature of the flight, its origin and destination, and the possibility of unlawful interference. ~~As far as possible,~~ The weapons should be stowed so they are not immediately accessible to the passengers (e.g. in locked boxes, in checked/personal baggage which is stowed under other baggage or under fixed netting). The pilot-in-command should be notified accordingly."

comment *1413* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

The conditions of AMC OPS.CAT.040 are equally relevant to weapons of war and munitions of war.

Comment:

Weapons of war and munitions of war will often be firearms and so need to be inaccessible to passengers and unloaded.

Proposal:

Amend AMC OPS.CAT.040 as follows:

"OPS.CAT.040 Carriage of sporting weapons, weapons of war, munitions of war and ammunition

Sporting weapons, weapons of war, munitions of war and ammunition carried in an aircraft shall be: ...

comment *2765* comment by: *Pietro Barbagallo ENAC*

Comment: The requirements of this paragraph are equally relevant to weapons of war and munitions of war (see also the conditions of AMC OPS.CAT.040).

Justiifcation: Weapons of war and munitions of war will often be firearms and so need to be inaccessible to passengers and unloaded, as required by EU-OPS 1.065.

Proposal: Amend OPS.CAT.040 as follows: "Carriage of sporting weapons, weapons of war, munitions of war and ammunition sporting weapons, weapons of war, munitions of war and ammunition carried in an aircraft shall be: (…)"

comment *3054* comment by: *AEA*

comment *7368* comment by: *ETF*

Comment to (a)

Further guidance on special categories of passengers is needed. It would in particular be useful with limitations on special categories of passengers. Secondly how the cabin crew can protect themselves when helping this category of passengers in an emergency.

The reason being that there is no way a carrier or pilots or cabin crew can guarantee for example the same possibility for survival in a crash of this category of passengers in particular when they are numerous on board. To justify this the NTSB report on survivability of accidents from 1983 to 2001 outlines that in selected survivable accidents from 1970 to 1995 as many as 68 % of the occupants involved in aircraft accidents died as a result of injuries sustained during postcrash fires.

It has been argued by manufacturers that the 90 second evacuation test for certification is only a template. Nevertheless The ATSB report on evacuation commands for optimal passenger management of 2006 states: "If a fire enters the cabin, there is typically less than two minutes before conditions

deteriorate to the extent that human life cannot be supported. Hence, it is essential that the surviving occupants can be evacuated efficiently and expeditiously."

B. I. Draft Opinion - Part-OPS - Subpart B - Section II - OPS.CAT.111 Persons under the influence of alcohol or drugs p. 60

comment *643* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.111: change as follows:

Persons under the influence of alcohol or drugs ~~**to such an extent that they may endanger the safety of the aircraft or its occupants**~~ shall not be allowed on the aircraft.

Justification:

The effects of alcohol and drugs cannot be underestimated in any case. The reactions of a person under the influence of alcohol/drugs are unexpected. The best measure shall be the preventive one.

B. I. Draft Opinion - Part-OPS - Subpart B - Section II - OPS.CAT.115 Passenger briefing p. 60

comment *2298* comment by: *Austro Control GmbH*

Passenger briefing cards shall be free from other informations (e.g. advertising matters or commercials)

Proposal to change the text:

*".....pictorial instructions indicate **exclusively** the operation of emergency equipment and exits.... "*

Justification:

Experience has shown that some operators have put advertising text or commercials on the briefing cards, which may put the seriosity of the cards in question.

comment *2817* comment by: *M Wilson-NetJets*

Original text:

Passengers of motor-powered aircraft shall be provided with a safety briefing card on which pictorial instructions indicate the operation of emergency equipment and exits likely to be used by passengers in the case of an emergency.

Suggested new text:

Passengers of motor power aircraft shall be made aware of the safety features and their operation of the aircraft required and/or likely to be used by a passenger during any type of emergency in such a fashion that the information is easily retained and reproduced during an emergency.

AMC1: Passenger shall be provided with a briefing card

AMC2: Passengers shall be briefed on the items as described in OPS.GEN.115

Comment/suggestion:

There are many ways to make passengers/owners aware of the safety features of an aeroplane. Although safety cards at the moment are a good tool to acquaint passengers/owners with these safety features it might be surpassed in the future by better means. By this instruction being in an IR it will not as easily be amended if an operator wants to progress to a more efficient or safer means of making the passengers/owners familiar with the safety features. Therefore the requirement for a safety card should be moved to an AMC.

comment *5156* comment by: *DGAC*

Rename the paragraph "OPS.CAT.115 Passenger briefing - **motor-powered aircraft**" (or add "MOTOR-POWERED AIRCRAFT" at the beginning of the paragraph), as the provisions it contains deal with motor-powered aircraft only.

B. I. Draft Opinion - Part-OPS - Subpart B - Section II - OPS.CAT.116 Embarking and disembarking of passengers p. 60

comment *644* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.116: add the following:

OPS.CAT.116 Embarking and disembarking of passengers

(a) Embarking and disembarking of passengers shall be done under the responsibility of a person designated by the operator. **This person shall receive the authorisation of the pilot-in-command before initiating the embarking.**

Justification:

Previous to the embarking process it is necessary to confirm the aircraft and the crew is ready for the process.

comment *2278* comment by: *Austro Control GmbH*

(b)

Disembarking has necessarily to be undertaken during the deflation of the ballon; otherwise the ballon will even take off again because of weight loss. Therefore clarification is necessary and the requirement has to be adapted.

OPS CAT 116 (b): Although the procedure is accurate typing CAT is not adequate. It would be better GEN

B. I. Draft Opinion - Part-OPS - Subpart B - Section II - OPS.CAT.120 Stowage of baggage and cargo p. 60

comment *951* comment by: *CAA-NL*

Comment CAA-NL:

The Agency should make clear that if aircraft have no stowage facility within the cabin the hand baggage and cargo must be weight at the check in.

comment *1430* comment by: *International Air Transport Association*

OPS.CAT.120(a).

There should be a requirement at this point to identify that any cargo carried in the passenger compartment must not contain items of dangerous goods, except as described in Part 7;2.1.1 of the ICAO Technical Instructions.

comment *5300* comment by: *Department for Transport UK*

Sub paragraph (a) requires that only hand baggage and cargo which can be adequately and securely stowed shall be taken into the passenger compartment. However, the requirement in subparagraph (b) to adequately stow the baggage is conditional and therefore implies that not all baggage need be stowed. This is not consistent with paragraph 4.8 to Annex 6 Pt 1 which requires that "the operator shall ensure that all baggage carried onto an aeroplane and taken into the passenger cabin is adequately and securely stowed.

The text should be amended to ensure full implementation of paragraph 4.8 of Annex 6 Pt 1.

Proposed text: OPS.CAT.120(b) All baggage and cargo taken on board shall

be stowed so as to prevent its movement.

B. I. Draft Opinion - Part-OPS - Subpart B - Section II - OPS.CAT.130 Smoking on board p. 60

comment *630* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.130: change as follows:

Smoking is not permitted on board of any commercial flight, unless it is a designated smoking flight, in this case, the non-smoking areas shall include the aisles and toilets**, as well as any other area designated by the manufacturer or operator**.

Justification:

We believe that this paragraph does not show most of the European national legislations about smoking in public spaces and working positions. Therefore, it would be recommended to simply ban smoking on commercial flights unless it is a designated smoking flight, i.e. a smoking charter flight.

comment *952* comment by: *CAA-NL*

Comment CAA-NL:

The Agency should make clear that in most EU countries it is forbidden to smoke on a working place, which is also valid for an aircraft

comment *5286* comment by: *Department for Transport UK*

OPS.GEN.130 states that no one shall be allowed to smoke outside of those areas that the operator has designated a smoking area and OPS.CAT.130 states that non-smoking areas shall include the aisles and toilets. However, there appears to be no rule which specifically requires operators to designate smoking and non smoking areas.

B. I. Draft Opinion - Part-OPS - Subpart B - Section II - OPS.CAT.150.H Operating minima - Helicopter Airborne Radar Approaches (ARAs) for overwater operations p. 60-61

comment *442* comment by: *EHOC*

Paragraph (a)(2)

This does not work well because it confuses the establishment of minima

with the method of indicating it. It might be better to purify the text as shown.

"(i) the minimum Descent Height (MDH) is determined with a radio altimeter; or

(ii) the Minimum Descent Altitude (MDA) is determined with a barometric altimeter at the appropriate setting."

The AMC already provides the method of establishing the minimum height/altitude and includes the provision of an adequate margin for the MDA.

Paragraph (d)

This should be turned into a recognised imperative - a recent accident in the North Sea has highlighted that the text for visual reference is not quite as good as it might be (and is very difficult to establish); in view of this, it might be better if the word 'adequate' is put into the text. The operator will then be able to establish what adequate is for each type that is flown taking into consideration that some have highly sophisticated control augmentation (thus offloading the pilot for visual flying) but others do not.

"(d) An approach shall not be continued beyond decision range, or below MDH/A, unless adequate visual reference with the destination has been established."

comment *6047* comment by: *Irish Aviation Authority*

Comment:

(d) The text needs to be expanded to include the use of the term "adequate visual reference".

Justification:

Standardisation with already accepted aviation normal practice.

Proposed text:

Amend text to "adequate visual reference".

B. I. Draft Opinion - Part-OPS - Subpart B - Section II - OPS.CAT.155.A Selection of alternate aerodromes - Aeroplanes p. 61

comment *310* comment by: *CAA-NL*

Attachment #8

Sent the attached file as EASA RPF december 2006.

comment | *645* | comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.155.A(d): change as follows:

(d) A destination alternate aerodrome, an isolated aerodrome, a 3% en-route alternate aerodrome or an en-route alternate aerodrome required at the planning stage shall only be selected when **the rescue and fire-fighting service available is appropriate to the aircraft category and** the available current meteorological information indicates that during a period commencing one hour before and ending one hour after the estimated time of arrival, the weather conditions will be at or above the applicable landing minima in Table 1A of OPS.CAT.155.A.

Justification:

Rescue and fire-fighting services must be taken into account in the selection of alternate aerodromes.

comment | *791* | comment by: *KLM*

(b) change the one 3% en-route alternate into "fuel en -route alternate".

This enroute alternate is used with statistical fuel policies as well with the lower coverage and will not necessarily be 3%. In order to make clear the purpose of this enroute alternate it has to be called "Fuel en-route alternate".

comment | *792* | comment by: *KLM*

The requirement to have the weather available one hour before the stimated arrival is irrealistic and too limiting. It should be the estimated time of arrival untill one hour after the estimated arrival time.

comment | *793* | comment by: *KLM*

Table 1A planning minima.

Difficult to put into flightplanning systems and time consuming for dispatcher and pilot to determine which minima are applicable.

The table used for ETOPS with an increment to the usable facility is easier and more approriate. The intention is to create a margin in weather not to depend on facilities.

comment | *875* | comment by: *Condor Flugdienst GmbH - FRA HO/R*

Refering to OPS.CAT.155.A(c):Term “landing minima” incorrect. It shall be renamed by the term “alternate minima”.

comment *887* comment by: *Condor Flugdienst GmbH - FRA HO/R*

In detail OPS.CAT.155.A (d): This paragraph shall be corrected with the following wording:

A destination alternate aerodrome, an isolated aerodrome, a 3% en-route alternate aerodrome

or an en-route alternate aerodrome required at the planning stage shall only be selected when

the available current meteorological information indicates that during a period commencing one

hour before and ending one hour after the estimated time of arrival, the weather conditions will be at or above the applicable **planning minima** in Table 1A of OPS.CAT.155.A.

comment *1372* comment by: *KLM*

Not included are APV/LPV and those developments are available already. More reason to change the methodology and determine the required minima and add and increment for use as an alternate.

comment *2299* comment by: *Austro Control GmbH*

It is recommended to insert a point (e):

Considering that alternate aerodrome selection shall take into account also extreme meteorogical conditions. (e.g. -50° C outside air temperatur on aerodroms along polar routes) a requirement appears necessary.

comment *2396* comment by: *Dassault Aviation*

Technical comment

Page 61 Table 1A of OPS.CAT.155.A : Line 3 "Cat I", Column 2 "Non precision". For the purpose of harmonization, we would like to add this clear-cut statement : "a localizer approach is a non-precision approach procedure" as per GM OPS.CAT.155.A(d). Indeed, when checking the planning minimums at the destination alternate, if CAT 1 ILS equipped, some pilots take into account the LOC approach procedure (considering only a glide failure) and some others take into account another non-precision approach procedure (considering a total ILS failure).

comment *2508* comment by: *Royal Aeronautical Society*

Paragraph (a) (3) contains the terms 'separate runways' but does not define what this should mean. **It is suggested that 'separate runways' should**

be defined as currently specified in EU-OPS (OPS 1.192 (j)) thus:

Separate runways. Runways at the same aerodrome that are separate landing surfaces. These runways may overlay or cross in such a way that if one of the runways is blocked, it will not prevent the planned type of operations on the other runway. Each runway shall have a separate approach procedure based on a separate aid.

comment *2818* comment by: *M Wilson-NetJets*

Original text:

PLANNING MINIMA

'Non-precision minima' in Table 1A of OPS.CAT.A.155 means the next highest minimum that is available in the prevailing wind and serviceability conditions; Localizer only approaches, if published, are considered to be 'non precision' in this context. It is recommended that operators wishing to publish tables of planning minima choose values that are likely to be appropriate on the majority of occasions (e.g. regardless of wind direction). Unserviceabilities should, however, be fully taken into account.

Suggested new text:

No suggested text

Comment/suggestion:

"localizer only approaches" does that include ILS approaches for which the Glide Slope is temporarily unserviceable?

comment *2819* comment by: *M Wilson-NetJets*

Original text:

Table 1A

Suggested new text:

The forecasted/expected weather at the alternate aerodrome shall be at or above the weather minima applicable to that approach increased by 500m for the visibility and a cloud ceiling of 100' above the DA/H or MDA/H as applicable.

Comment/suggestion:

Alternate weather minima should be based on a risk assessment of the unforecasted deterioration of the weather. Separately a risk mitigation factor should be included based on unforeseen failure of approach equipment. The current table is an inconsistent hybrid of both. Analogue to the requirements for helicopters (OPS.CAT.155.A) the weather deterioration mitigation measures should be solely based on an increase in the weather requirements above the weather requirements of the expected and planned approach at the alternate aerodrome. This increase should also be applicable to circling or visual approaches.

Another option is to move these values to the AMC.

(b) allows for operators to select one destination alternate and one 3% en-

route alternate (ERA) aerodrome. This choice doesn't mean that the reduced contingency fuel (RCF) procedure will be applied.

However the definition of a 3%ERA of OPS.GEN.010 is only: "an ERA aerodrome selected for the purpose of reducing contingency fuel to 3%".

Therefore, it is necessary to amend the definition of "3% ERA" in (1) of OPS.GEN.010 to reflect the use of these terms in the present OPS.CAT.155.A(b).

This paragraph is an illustration of the limits of the new structure. We are not convinced to have fully understood what provision shall be applicable to whom and what provision of OPS.GEN.155 is deemed to be applicable in addition to those laid-down in OPS.CAT.155A, especially in the case of isolated aerodrome

B. I. Draft Opinion - Part-OPS - Subpart B - Section II - OPS.CAT.155.H Selection of alternate aerodromes - Helicopters p. 62

comment *443* comment by: *EHOC*

Paragraph (a)

It is not clear what the construct 'notwithstanding' is intended to mean in this paragraph. A close reading of the text of OPS.GEN.155 would suggest (as stated in OPS.GEN.155(d)) that paragraphs (a) and (c) are applicable to CAT. It would appear that the text of OPS.CAT.H.155 complements the text of OPS.GEN.155 and does not replace it.

In fact it would appear that the text of the CAT rule is only intended to replace the text of OPS.GEN.155(e). Specifying only this clause would have made the intent much clearer:

"Notwithstanding OPS.GEN.155(e)..."

(See also the comment in OPS.CAT.H.156).

Paragraph (c)(4)

This needs to be brought into line with Annex 6 which states "to the extent possible, deck availability shall be guaranteed" – to the extent possible is explained and qualified in the AMC.

Paragraph (d)

The contraction of the original text has led to a change in requirements.

The previous requirement prescribed minima for the three cases: those for the destination; those for an offshore destination alternate; and those for all other destination alternates. The proposal puts all into one clause and points to 'Table 1H'. The end result is a increased requirement for the destination

and an inappropriate set of conditions for the offshore alternates (subject to their own specific rules).

This can be rectified by applying the following text:

"(d) A destination or destination alternate aerodrome required at the planning stage shall only be selected when the available current meteorological information indicates that during a period commencing one hour before and ending one hour after the estimated time of arrival, the weather conditions will be at or above the applicable planning minima as follows:

(1) *For a destination*, the applicable landing minima as specified in accordance with OPS.GEN.150; and

(2) *For an offshore alternate*, the applicable landing minima as specified in accordance with (c)(4) above; or

(3) *For a destination alternate*, the applicable landing minima as specified in Table 1H of OPS.CAT.155.H."

comment *871* comment by: *Robert R McGregor*

comment *872* comment by: *Robert R McGregor*

It is misleading to simply state, that an IFR flight to a coastal aerodrome does not require an alternate, when, in reality, there must be an alternative means available of guaranteeing a safe arrival at the destination other than by completion of an IFR approach procedure.

30 years ago offshore flights on the North Sea were mostly conducted under VFR, for which a destination alternate was not required. But, on occasion, this led, to helicopters flying for hundreds of miles, at very low levels in conditions of low cloud and poor visibility to a coastal aerodrome destination where the weather had deteriorated to below arrival minima. To address this undesirable situation, the UK CAA set minima for en-route and destination weather for offshore VFR flights, of 600 ft cloud base and 4 km visibility (day) and 1000 ft cloud base and 5 km (night).

Although these new requirements brought about an improvement in operational safety, it was quickly realized that transit of areas of low cloud and poor visibility under IFR was intrinsically safer and that the normal requirement for a destination alternate under IFR could be dispensed with if the meteorological conditions at the coastal aerodrome were reliably forecast to be suitable for the alternative of a VFR arrival after an offshore descent to below cloud.

The rule that has worked exceedingly well for the past 26 years has been that, normally, a destination alternate is required, unless, the destination is a coastal aerodrome for which there is a valid Landing Forecast* of 600 ft

cloud base and 4 km visibility, by day or 1000 ft cloud base and 5 km, by night. This ensures that there is a high probability of the weather conditions being suitable for completion of, either an IFR approach, or a VFR arrival following an offshore descent to below cloud i.e. a VFR alternative to an IFR arrival.

*It is important that a destination Landing Forecast (with 90% reliability) is used for this purpose as opposed to an Aerodrome Forecast (TAF) which has only 70% reliability.

Consequently, the text in paragraph (a)(1) should be amended as follows:-

(a)"…unless:

(a)(1) the destination is a coastal aerodrome where the meteorological conditions forecast for the estimated time of arrival will be suitable for an arrival under VFR."

comment *3343* comment by: *UK CAA*

Page: 62

Paragraph No: OPS.CAT.155.H

Comment: Paragraph (a)

The text of OPS.GEN.155 would suggest (as stated in OPS.GEN.155(d)) that paragraphs (a) and (c) are applicable to CAT. It would appear that the text of OPS.CAT.H.155 complements the text of OPS.GEN.155 and specifically paragraph (e). Alluding to this by changing the text as indicated below would make the intent clearer.

Paragraph (c)(3)

This needs to be brought into line with Annex 6 which states "to the extent possible, deck availability shall be guaranteed" – to the extent possible is explained and qualified in the AMC.

Paragraph (d)

The original text has been contracted and lost its intent leading to a change in requirements for the destination and destination alternate. This should be rectified by applying the amended text below.

Justification:

Clarification and correction of text.

Proposed Text (if applicable):

(a) Notwithstanding OPS.GEN.155 ***(e)***, …….

(c)(3) ***To the extent possible,*** deck availability shall be ….

(d) A destination***, and when required at the planning stage a*** ~~or~~ destination alternate aerodrome***,*** ~~required at the planning stage~~ shall only be selected when the available current meteorological information indicates that during a period commencing one hour before and ending one hour after the estimated time of arrival, the weather conditions will be at or above the

applicable planning minima ~~in Table 1H of OPS.CAT.155.H~~ ***as follows:***

~~*(1) For a destination, the applicable landing minima as specified in accordance with OPS.GEN.150; and*~~

(2) For an offshore alternate, the applicable landing minima as specified in accordance with (c)(4) above; or

(3) For a destination alternate, the applicable landing minima as specified in Table 1H of OPS.CAT.155.H.

comment *5160* comment by: *DGAC*

This paragraph is an illustration of the limits of the new structure. We are not convinced to have fully understood what provision shall be applicable to whom and what provision of OPS.GEN.155 is deemed to be applicable in addition to those laid-down in OPS.CAT.155H, especially in the case of isolated aerodrome…

comment *5779* comment by: *Norsk Luftambulanse*

(b) There are good offshore and fixed wing solutions. To provide a similar safe and good solution for HEMS operators with IFR as an integrated part of their operations, a specification that 2 alternate approaches to same aerodrome is acceptable should be added;

"As helicopters can operate independent of the runway structure, and only require the approach aids, it should be specified that two destination alternates to the same aerodrome fulfill the requirement, provided two independent navaids are used, and the weather requirement for an alternate is applied for the approach with the highest minima."

comment *6054* comment by: *Irish Aviation Authority*

Comment:

(a)(i) - The term "Coastal Aerodrome" is not defined.

Justification:

Standardisation with already accepted aviation normal practice.

Proposed text:

Amend text in definitions to include Coastal Airfield.

comment *6915* comment by: *Konrad Polreich*

OPS.CAT.155.H (a)(2)

For helicopters acc. to this paragraph, it would be necessary to have VMC available, to plan without an alternate, compared to less restrictive conditions for aeroplanes. Although the flight time is normally considerably less than 6 hours and thus the available weather forecasts for the destination before take-off is more accurate. It should be possible to plan without an alternate, also for helicopters, when conditions at the destination are comparable to OPS.CAT.155.A (a)(3). The destination criteria (at ETA ± 1 hr) could be:

- VMC (ceiling above MRVA/MSA), or

- 2 separate instrument approach procedures, and

- weather: ceiling 400ft and visibility 1000m above the required planning minimum acc. Table 1H of OPS.CAT.155.H (The higher minimums of the 2 separate approach procedures have to be considered)

B. I. Draft Opinion - Part-OPS - Subpart B - Section II - OPS.CAT.156.A Selection of take-off alternate aerodromes - Aeroplanes p. 63

comment *72* comment by: *Air Southwest*

This paragraph is virtually a direct copy of OPS.GEN.155 (a-c) the only difference (excluding the ETOPS requirement) is that this paragraph mentions the operational flight plan not the ATS FPL. Suggest a directive pre-amble to OPS.GEN.155 to direct CAT Operators to OPS.CAT.156.A.

comment *558* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.156.A(a)(1): change as follows:

(a) A take-off alternate aerodrome shall be selected and specified in the operational flight plan, if:

(1) at the aerodrome of departure the weather conditions are ~~**at or**~~ below the applicable aerodrome operating minima; or

Justification:

Wrong transfer from JARs: a departure aerodrome with weather conditions at the applicable minima is still suitable for landing.

comment *559* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.156.A(b): consider adding:

(b) **Notwithstanding OPS.GEN.155** ~~**The**~~ **the** take-off alternate aerodrome

shall be located within the following distances from the aerodrome of departure:

Justification:

(b) (1) does not cater for a two hours ETOPS take-off alternate. This is specified in OPS.CAT.156.A so OPS.GEN.155 (b) should allow this as well. Another option is to add 'Notwithstanding OPS.GEN.155 to OPS.CAT.156.A (b).

comment *794* comment by: *KLM*

(c) one hour before the estimated time of arrival is too much and not useful. It is sufficient to require the weather to be at or above the required minima from ETA plus one hour.

comment *3063* comment by: *AEA*

Relevant Text:

b) The take off alternate aerodrome shall be located within the following distances from the aerodrome of departure

1) For aeroplanes having two engines

i) one hour flight time at the One-Engine-Inoperative cruise speed or

ii) The ETOPS diversion time subject to any MEL restrictions, up to a maximum of two hours at the OEI cruise speed

2) For aeroplanes having three or more engines, two hours flight time at OEI cruise speed.

Comment:

This definition is not consistent with EU-OPS due to the lack of reference to the '**in still air standard conditions'** (EU OPS 1.295). This would have a tremendous impact on flight operations which cannot be justified on safety grounds.

Proposal:

Realign with EU-OPS.

comment *5161* comment by: *DGAC*

The purpose of this paragraph, in order to select a take-off alternate, is to determine a distance threshold equivalent to flying during 60 minutes (or 120 minutes) in still air standard conditions (see EU-OPS 1.295). We should find in this paragraph (at IR level) the conditions for calculation of the distance threshold because the way it is written, it seems to be dependant on the actual conditions (temperature, wind, etc...) which is not feasible.

OPS.CAT.156.A
Selection of take-off alternate aerodromes - Aeroplanes

(a) …

(b) The take-off alternate aerodrome shall be located within the following distances from the aerodrome of departure:

(1) For aeroplanes having two engines:

(i) one hour flight time at One-Engine-Inoperative (OEI) cruise speed; or

(ii) the Extended Range Twin-Engine Operations (ETOPS) diversion time, subject to any MEL restrictions,
up to a maximum of two hours at the OEI cruise speed.

(2) …

Comment:

It is not clearly stated, if small jets, which basically do have a diversion time of 120 minutes, may also choose a take-off alternate aerodrome up to two hours distance.

From my point of view, this should be the case. At least they should be allowed to do so, if the competent authority approved an extension (up to 180 minutes) acc. to OPS:CAT.225A
??

B. I. Draft Opinion - Part-OPS - Subpart B - Section II - OPS.CAT.156.H Selection of take-off alternate aerodromes - Helicopters p. 63

comment *444* comment by: *EHOC*

General

This appears to be a repetition of the intent of the text that is contained in OPS.GEN.155(d).

B. I. Draft Opinion - Part-OPS - Subpart B - Section II - OPS.CAT.170 Minimum terrain clearance altitudes p. 63

comment *446* comment by: *EHOC*

General

The text does not capture the true intent of this rule.

The text in (b) is not understood because once the minimum altitudes have been specified, why would they not be used by all aircraft? A suggested text (and arrangement) might be:

"(a) An operator shall specify minimum flight altitudes, and the methods to determine those altitudes, for all route segments to be flown which provide the required terrain clearance taking into account the performance of the aircraft."

Then; delete (b) and renumber new (c) to (b)

Paragraph (b)

The meaning of this text is obscure; inserting the additional text into (a) would provide the same intent and make the rule simpler (see (a) above).

Paragraph (c)

It would be better if the meaning of this were made more precise; the following text is much clearer.

"Where minimum flight altitudes established by States overflown are higher than those established by the operator, the higher values shall apply."

comment *969* comment by: *REGA*

HEMS missions: It is unrealistic to establish minimum flight altitudes for all routes in mountainous terrain (Alps). Furthermore due the character of HEMS operations it is impossible to define routes to HEMS operating sites. A general minimum flight altitude of 500 ft/1000 ft as defined for example by the Swiss law is more realistic for a HEMS-operation.

Proposal (a)

An operator shall specify minimum flight altitudes for all route segments to be flown in airline operation, which provide the required terrain clearance, taking into account the performance of the aircraft.

comment *2266* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern detail:

Minimum terrain clearance altitudes

Comment / Proposal:

Modify text:

(a) An operator shall specify minimum flight altitudes for all route segments regularly flown in an airline operation,

comment *3344* comment by: *UK CAA*

Page No: 63

Paragraph No: OPS.CAT.170 (b)

Comment:

The proposed rule appears to be incomplete as it does not state what the "method specified in its operations Manual" is to be used for. Add the phrase "for the calculation of minimum terrain clearance altitudes".

Justification:

To clarify what the "method specified" is to be used for.

Proposed Text (if applicable):

An operator of complex motor-powered aircraft shall ***calculate minimum terrain clearance altitudes*** use***ing*** a method specified in its operations manual.

comment *4577* comment by: *Bristow Helicopters*

Paragraph b results in a circular argument. The operations manual is written to comply with the regulations, whilst this regulation requires the operator to comply with itself, i.e. the ops manual and not the regulations

comment *5780* comment by: *Norsk Luftambulanse*

For helicopters we suggest to allow for using criteria from arrival routes for the width of protected area also for en-route portions even outside of 30 NM of ARP/PRP in order to be able to keep IFR en-route altitudes as low as possible to avoid icing (and thus replacing VFR flight at low level). The en-route portion should then be considered to be arrival routes according to the above criteria, i.e. ±2.50 NM

A requirement should be that the operator ensures that the scaling on the GPS system is configured to maximum scaling ±1 NM (terminal) on a permanent base. The selected scale and any lower scale will be used during the various phases of flight. The default en-route scaling of ±5 NM (outside 30 NM) shall not be used. RAIM/HIL limits shall follow the selected scaling.

comment *6029* comment by: *Irish Aviation Authority*

Comment:

The Title of the paragraph uses the term "Minimum Terrain Clearance Altitude" which is not defined in the definitions. Additionally this is a term that is not in common use within the aviation world at present.

Justification:

Standardisation with already accepted aviation normal practice.

Proposed text:

Revert to use of "Minimum Safe Altitude" or "Minimum Obstacle Clearance Altitude".

Routes and areas of operation

comment *447* comment by: *EHOC*

General

It has been suggested that ERs 2.a.1, 2.a.4, 2.a.6 and 3.a.5 contain the original intent of this rule.

However, the original intent (in accordance with Annex 6 Part I Chapter 4.1 - Annex 6 Part I Chapter 2.1) was to ensure that, over-and-above general considerations for flight, specific elements that address the Area and Route of Operation are considered. This could include additional procedures, equipment, conditions - e.g. offshore, the met coverage for the area (offshore operations), performance in the case of mountains etc.

The ER is only general and requirement should be put into an IR and expanded out into its respective parts.

comment *5164* comment by: *DGAC*

Justification :

For operators located in islands (e.g : in the Caribbean region), water surfaces should also be accepted for single-engine aeroplanes, based on distance criteria, ditching certification, etc.

Proposed text : Amend the text as follows (or add this possibility in an AMC OPS.CAT.180) :

"When single-engine aircraft are used, surfaces which permit a safe landing to be executed shall be available along the route, except for helicopters when holding an approval in accordance with Part OPS.SPA.001.SFL. **For landplanes, a place on land is required, unless otherwise approved by the Authority**.

comment *5454* comment by: *ALFA-HELICOPTER*

Delete: Restrictions should be according to the RFM.

comment *5719* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment: Not all multi-engine aircraft have capability to sustain flight in the event of failure to one engine. Hence, the use of the term single-engine when considering safe forced landing is not correct. For helicopters the term should be category B helicopters

Proposal (including ***new text***):

Add following text:

HELICOPTERS

When ~~single-engine aircraft~~ ***category B helicopters*** are used, surfaces which permit a safe forced landing to be executed shall be available along the route, except for when holding an approval in accordance with Part OPS.SPA.001.SFL.

comment *6544* comment by: *SFR Sweden*

Section: OPS.CAT.180 Routes and areas of operation

Relevant Text: When single-engine aircraft are used, surfaces which permit a safe forced landing to be executed shall be available along the route, except for helicopters when holding an approval in accordance with Part OPS.SPA.001.SFL.

It might be reasonable to think that the propose of this requirement is to ensure safety for passengers, crew and third party in case of a forced landing. However, a forced landing might be necessary even for twin – engine helicopters during certain conditions. A reference to PC 3 might be better suited.

Proposal:

HELICOPTERS

When helicopters in Performance Class 3 are used, surfaces which permit a safe forced landing to be executed shall be available along the route, except for when holding an approval in accordance with Part OPS.SPA.001.SFL.

B. I. Draft Opinion - Part-OPS - Subpart B - Section II - OPS.CAT.205 Fuel and oil supply p. 64-65

comment *449* comment by: *EHOC*

Paragraph (c)

There is a lack of cohesion between this rule and AMC 3 OPS.CAT.205.H. Specifically the elements are not organised or ordered in the same way and text that is contained in the rule is repeated in the AMC. As the AMC follows the original method of planning, perhaps the rule should reflect this - i.e.:

(c) Notwithstanding OPS.GEN.205, fuel calculations shall be based upon the following:

(1) taxi fuel;

(2) trip fuel;

(3) Reserve fuel consisting of:

(i) contingency fuel;

(ii) alternate fuel, if an destination alternate is required;

(iii) final reserve fuel;

(4) additional fuel, if required by the type of operation (e.g. isolated aerodromes);

(5) extra fuel if requested by the pilot-in-command.

Paragraph (c)(3)

All of this is specified in AMC 3 OPS.CAT.205.H; it is not clear why other than the objective is being set in this rule. All that happens is the the objective

set in the rule and the method of compliance become confused.

The method of compliance should be removed and only the objective left.

Paragraph (c)(4)

All of this is specified in AMC 3 OPS.CAT.205.H; it is not clear why other than the objective is being set in this rule. All that happens is the the objective set in the rule and the method of compliance become confused.

The method of compliance should be removed and only the objective left.

Paragraph (c)(4)(iii)

This has been removed from ICAO because of the near impossibility of being able to carry an additional 2 hours fuel. It should be set as an objective and then left to the operator to specify.

Paragraph (5)

The reason that contingency fuel comes before alternate fuel (in the original) is that it is (with the exception of offshore operations) applied only to the trip fuel. The original order should be applied.

Addition of new Paragraph (d)

An objective text for the requirement for in-flight planning should be inserted here as (d) and AMC1 OPS.CAT.205 pointed to it.

"(d) An operator shall provide in-flight replanning procedures for calculating fuel required when a flight has to proceed along a route or to a destination other than originally planned."

comment *970* comment by: *REGA*

Beside trip fuel we have to carry 10% contingency fuel and a final reserve for 20 minutes at day or 30 minutes at night. This means that almost half of our fuel carried on board is a reserve! That also means that we may not start to a lot of standard missions, especially in summer, when we only carry 250kg of standard fuel on board because of the RSH (technical crew member). Such a fuel policy is more than unrealistic in Switzerland, where we have a narrow net of refueling possibilities.

Definition of aerodrome: Need to be clarified, if operating sites are included or not. Sometimes operating sites are mentioned separately.

An exception for HEMS should be added. Otherwise when Helicopters operated in mountainous terrain at high altitudes a reserve fuel for 30 minutes could result in performance problem. For those exceptionally cases, in specific areas described in the operational manual, where fuel is available within 20 minutes at cruise speed from the operational site, the HEMS mission should be alleviated from the final reserve fuel rule/ (4).

Proposal (3) and (4)

(3)

(ii) … or /operational site

(4)

(ii) …/operational site

Notwithstanding (4), for HEMS-operations in a specific areas, described in the operational manual and approved by the competent authority, where fuel is available within 20 minutes at cruise speed from the operational site.

comment *917* comment by: *CAA-NL*

Comment CAA-NL:

Add. in 'no wind' and ISA conditoins.

Reason:

Not in line with EU-OPS and ICAO

comment *1098* comment by: *Condor Flugdienst GmbH - FRA HO/R*

Condor comments: If EASA intends to permit extension of the 60 mins ETOPS threshold, the para should say so in plainer words.

comment *2064* comment by: *Airbus S.A.S.*

OPS.CAT.225.A (a)(1)(ii)(A) states:

"With a MPSC of 19 seats or less; *or*"

Replace "or", hereabove underlined, with "and".

In fact, if both conditions (A) and (B) of OPS.CAT.225.A(a)(1)(ii) are not satisfied, automatically provision OPS.CAT.225.A (a)(1)(i) applies.

comment *2357* comment by: *Dassault Aviation*

Technical comment:

Page 65 OPS.CAT.225.A §(a)(1)(ii) Maximum distance from an adequate aerodrome for two-engined aeroplanes. In this proposed requirement, there is no condition associated with the maximum distance flown from an adequate aerodrome, except the one-engine inoperative cruise speed. The additional criteria of EU-OPS1.245(a) "under standard condition in still air" should be added.

comment *2387* comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

Comment:

OPS .CAT.225.A is unclear in that it appears to refer to non-ETOPS and ETOPS aircraft.

Proposal:

1.A new AMC should be written and included in **AMC OPS.SPA.**

2. EU-OPS references 1.245(a) (b) and 1.246 (a) (b) are clearer and should be used instead.

comment *2824* comment by: *M Wilson-NetJets*

Original text:

(a) Two-engined aeroplanes shall not be operated over a route that contains a point further from an adequate aerodrome than: (1) for turbo-propeller or jet-powered aeroplanes: (i) the distance flown in 60 minutes at the One-Engine-Inoperative (OEI) cruise speed, for aeroplanes: (A) with a Maximum Passenger Seating Configuration (MPSC) of more than 19; or (B) a maximum take-off mass of 45 360 kg or more; (ii) the distance flown in 120 minutes at the OEI cruise speed, for aeroplanes: (A) with a MPSC of 19 seats or less; or

(B) a maximum take-off mass less than 45 360 kg. For jet aeroplanes, the competent authority may extend the distance referred to above by a maximum of 60 minutes, provided this extension is within the performance limits of the aeroplane and the operator has experience to ensure the safety of the operation; and (2) for other aeroplanes, the distance flown in 120 minutes at the OEI cruise speed, or 300 nautical miles, whichever is less.

(2) for other aeroplanes, the distance flown in 120 minutes at the OEI cruise speed, or 300 nautical miles, whichever is less.

Suggested new text:

(a) Two-engined aeroplanes shall not be operated over a route that contains a point further from an adequate aerodrome than: (1) for turbo-propeller or jet-powered aeroplanes: (i) the distance flown in 60 minutes at the One-Engine-Inoperative (OEI) cruise speed, for aeroplanes: (A) with a Maximum Passenger Seating Configuration (MPSC) of more than 19; or (B) a maximum take-off mass of 45 360 kg or more; (ii) the distance flown in 120 minutes at the OEI cruise speed, for aeroplanes: (A) with a MPSC of 19 seats or less; **AND**

(B) a maximum take-off mass less than 45 360 kg. For jet aeroplanes, the competent authority may extend the distance referred to above by a maximum of 60 minutes, provided this extension is within the performance limits of the aeroplane and the operator has experience to ensure the safety of the operation; and (2) for other aeroplanes, the distance flown in 120 minutes at the OEI cruise speed, or 300 nautical miles, whichever is less.

(2) for other aeroplanes, the distance flown in 120 minutes at the OEI cruise speed, or 300 nautical miles, whichever is less.

Comment/suggestion:

The "OR" at the end of the sentence in (a)(1) should be an "AND" so that the logic of the paragraph is correct.

comment *7313* comment by: *General Aviation Manufacturers Association / Hennig*

GAMA notes that OPS.CAT.225.A (a)(1)(ii) the definition of cruise speed (for determination of distance to adequate aerodromes) differs from the EU-OPS 1.245(a) language which includes "under standard conditions in still air" – a

statement which has not been retained in the NPA. This is of great concern as it indicates a change from the ETOPS requirements developed through the JAA Operational Sectorial Team (OST) over several years.

This is an important technical definition for the determination of ETOPS / Extended Operations and we feel it is important that the language be brought fully [emphasis added] in alignment with EU-OPS which was based on the much debated JAR-OPS definitions for ETOPS.

GAMA would especially note the hard work of the OST to develop the requirements for ETOPS for aircraft with a maximum take-off mass of less than 45,360kg.

GAMA recommends that EASA ensure that no intentional or unintentional changes are made to the ETOPS requirements as part of NPA 2009-02 as they are based on significant government and industry coordination on this important regulatory matter.

comment *7659* comment by: *Juergen Hauk*

Note: In this letter I will name a jet-powered airplane with 19 MPSC and MTOM<45.360 kg a "small jet"

OPS.CAT.225.A

Maximum distance from an adequate aerodrome for two-engined aeroplanes

(a) Two-engined aeroplanes shall not be operated over a route that contains a point further from an adequate aerodrome than:

(1) for turbo-propeller or jet-powered aeroplanes:

(i) the distance flown in 60 minutes at the OEI cruise speed, for aeroplanes:

(A) with a Maximum Passenger Seating Configuration (MPSC) of more than 19; or

(B) a maximum take-off mass of 45 360 kg or more;

(ii) the distance flown in 120 minutes at the OEI cruise speed, for aeroplanes:

(A) with a MPSC of 19 seats or less; or

(B) a maximum take-off mass less than 45 360 kg.

For jet aeroplanes, the competent authority may extend the distance referred to above by a maximum of 60 minutes, provided this extension is within the performance limits of the aeroplane and the operator has experience to ensure the safety of the operation; and

(2) …

EASA NPA 2009-02b - **AMC OPS.CAT.225.A(c)**

Maximum distance from an adequate aerodrome for twoengined aeroplanes

OPERATION OF TWIN TURBOJET AEROPLANES HAVING A MAXIMUM PASSENGER SEATING CONFIGURATION OF 19 OR LESS AND HAVING A MAXIMUM TAKE-OFF MASS OF LESS THAN 45 360 KG BETWEEN 120 AND 180 MINUTES FROM AN ADEQUATE AERODROME – OPERATIONAL CRITERIA FOR SMALL TWINS WITHOUT ETOPS CAPABILITY
1....

(Note: In this comment I will name a jet-powered airplane with 19 MPSC and MTOM<45.360 kg a "small jet")

Comments:

??

At (a)(1)(ii)(A) the text must be "and" (... with a MPSC of 19 or less;

and ...)

??
In EU-OPS, the extension, which a competent authority may approve up to 60 minutes, was only applicable for small jets. Now the text is applicable also for the "big" ones. I assume, this is by purpose.

??

It is not clearly stated, that this "extension" has nothing to do with an ETOPS approval.

Looking at AMC OPS.CAT.225.A(c), that paragraph seems to be the one which gives the basis for an extension up to 60 minutes, but it is applicable only for small jets ...

??

There are no questions when we talk about performance limits.
But how to define "experience", which is required "to ensure the safety of operation"?

??

Assuming, that for samll jets an ETOPS approval is relevant for "diversion times" of more than 180 minutes, (e.g. 240 minutes), we should have an official name for the extension up to 180 minutes: Most times I read "ER" operartion (Extended Range Operations), sometimes I find "EROPS". May be you will find a better wording.

??

B. I. Draft Opinion - Part-OPS - Subpart B - Section II - OPS.CAT.230.A Pushback and towing - Aeroplanes p. 66

comment *319* comment by: *Aero-Club of Switzerland*

We think that this paragraph ist not necessary.

Justification: A/C will always be towed and pushed back according to

aviation standards and procedures, at least within the EU area of jurisdiction.

comment *3415* comment by: *Peter SCHMAUTZER*

Every procedure has to be carried out according to this standards, why only pushback and towing.

comment *7036* comment by: *Christian Hölzle*

(c) That should only be for commercial flights as for AW the crews are always in direct contact with the operations center via mobile, company flight plan or radio.

B. I. Draft Opinion - Part-OPS - Subpart B - Section II - OPS.CAT.235 Air Traffic Services - Motor-powered aircraft p. 66

comment *452* comment by: *EHOC*

Paragraph (c)

This goes beyond that required by the original rule. (c) and (d) should be replace by a single (c):

(c) An operator shall ensure that a flight is not commenced unless an ATS flight plan has been submitted, or adequate information has been deposited or transmitted as soon as possible after take-off, in order to permit alerting services to be activated if required.

comment *976* comment by: *REGA*

HEMS missions are characterized by rapid changes in destinations and routes. To require submissions of flight plans for HEMS missions is not proportional. Hems missions are monitored (day and night) by the operational control center, e.g. Geographic Information System (GIS) and radio contact. A flight plane shall only submit, if required by the applicable air space requirement. Demanding e.g. the operational control center instead of the pilot to transmit the flight plan after the take off is often more adequate.

Proposal (b) (1)

Also by night….

Proposal (c)

A flight shall not be commenced unless a flight plan has been submitted to ATS, if required by the applicable air space requirement, or adequate information has been deposited in order to permit alerting services to be activated if required.

Proposal (d)

...or by the operator or an authorized person

(c) That should only be for commercial flights as for AW the crews are always in direct contact with the operations center via mobile, company flight plan or radio

comment *3236* comment by: *Eurocontrol CND*

OPS.CAT.235 Air Traffic Services – Motor-powered aircraft

As regards (a), this is a rather broad statement which is not possible to apply, considering that, in Class G airspace two-way communication is not required while, at the same time, at least flight information service and alerting service are available, which both form part of ATS.

Regarding (c), to require a flight plan for all VFR flights is a far-reaching extension of the ICAO requirements contained in Annex 2, paragraph 3.3.1.

OPS.CAT.316A(c) Performance General – Aeroplanes

(c) "Two propeller-driven aeroplanes. Two propeller-driven aeroplanes which do not meet the applicable climb criteria shall be treated as single propeller-driven aeroplanes and shall comply with (b)."

This is a discriminator for false twins, but excludes capable aircraft whose original airworthiness code omitted certain criteria (eg gradient of climb OEI with wing flaps in the take-off position(s)) yet are currently regarded as CS-23A aircraft. This cannot be the purpose of the Rules and an equivalent level of safety should be admitted for BCAR Section K aircraft whose Performance Group C WAT limit performance otherwise demonstrates their ability.

FAR 23 Normal Category aircraft should also be accommodated when they demonstrate similar UK Performance Group classification.

comment *5168* comment by: *DGAC*

Please consider that the comments we have made on Section III (and generally speaking on the entire NPA) are not comprehensive: we do not pretend having understood and discovered all the differences that have occurred compared to the present rules (made intentionally are not by the drafter) and their possible consequences on flight safety…

comment *5481* comment by: *Swiss International Airlines / Bruno Pfister*

comment *6683* comment by: *Ryanair*

The structure of the Performance Section is too complicated and confusing.

Aeroplane Performance Class A should be separated from Class B and C Aeroplane and Helicopters.

There is no clear distinction between certified/dispatch and in-flight landing performance requirements and factors which should be considered for each class.

The Performance proposal in its current format should be rejected. We should stick to current EU-OPS Requirements and should change only those rules which have been identified as needing change.

comment *6822* comment by: *Icelandair*

B. I. Draft Opinion - Part-OPS - Subpart B - Section III - OPS.CAT.316.A Performance General - Aeroplanes p. 68

comment *441* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.316.A(a): add the proposed text:

(5) take into account the effect of an engine failure in all flight phases

Justification:

EU-OPS 1.485 (a)(1) and (2) are not included in the current proposal. The content of (1) can be considered covered by the proposed (a)(3), the occurrence of an engine failure might be covered by (a)(3) as well, however this is not directly intuitive. One can argue whether an engine failure is to be considered the 'operation of systems which have an adverse effect on performance'. One can also argue whether ER 4.c.(vi) in Annex IV covers the situation as the ER only refer to 'deterioration' instead of complete failure. To explicitly make clear that the occurrence of an engine failure in all flight phases should be considered ECA proposes either a new paragraph (5) or rewriting of paragraph (3).

comment *1231* comment by: *Loganair Limited*

Turbine Powered aircraft with 19 seats Currently Operating to United Kingdom AN(G)R Performance C for Lifeline and Public Service Obligations where no alternative exists

The regulations do not cater for for turbine propeller powered aircraft with up to 19 passenger seats designed for STOL operations, such as the DHC6 Twin Otter, currently operating on Public Service Obligation and Lifeline

routes to United Kingdom AN(G)R Performance C (Broadly equivalent to EASA/EU-OPS Performance Class B.) The purpose for which the aircraft was designed (Commercial Air Transport Short Take-Off and Landing (STOL) operations) is not recognised, by omission rather than specifically stated, in either EU-OPS or the proposed implementing rules. **Both EU-OPS and the proposed implementing rules need to recognise that Commercial Air Transport STOL operations exist within Europe and are necessary to meet Public Service Obligation requirements.**

Performance Class A requirements cannot be met because of the physical characteristics of the runways and obstacles. Typical examples are operations where no hard runway is available such as where Commercial Air Transport Operations are required to operate from a beach or where it would not be physically possible extend an existing runway. Example airfields are the beach airfield at Barra (EGPR) and Isles of Scilly (EGHE).

Performance Class A data is becoming available for aircraft such as the DHC6 Twin Otter, but the aircraft cannot be operated from certain airfields in Performance Class A. In the case of the Beach airfield at Barra no aircraft currently exists that can comply with the Public Service Obligation requirements and meets either Performance Class A, Performance Class B or Performance Class C.

Enforcing the performance Class A requirement on aircraft which have operated safely out of these airfields under United Kingdom AN(G)Rs for over 40 years would terminate air services which are operated purely for Public service Obligations and to provide lifeline services to remote and isolated Islands and Regions. During the Winter months these services are frequently the only method of transport available. It is clear that the imposition of Performance Class A requirements on STOL - type aircraft such as the DHC6 Otter has effectively removed the Short Take Off capability of the type as there is no provision for Short Take Off techniques in Performance Class A. Loganair believes that there is no case to answer in this respect and that the operating safety record of the type under AN(G)R has been exemplary. Loganair cannot overstress the importance of short field capability in Public Service Obligation Commercial Air Transport Operations.

The only alternatives are:

1. Continue to allow operations with current aircraft to United Kingdom AN(G)R Performance C or EASA Performance Class B at airfields where Performance Class A requirements cannot be met.

OR

2. Cease operations to remote and isolated regions or Islands.

Proposal

Amend AMC OPS.CAT.316.A(1) by making it an acceptable means of compliance for Turbine Propeller aircraft with a seating capacity of 19 seats or less to operate to Performance class B criteria at airfields where Performance A criteria cannot be met ie STOL operations.

AMC OPS.CAT.316.A(a)(1)1. would then read:

Performance Class A. Performance class A aeroplanes should be multi-

engined aeroplanes powered by turbo-propeller engines with a maximum passenger seating configuration of more than 9 or a maximum take-off mass exceeding 5700 Kg, amd all multi-engined turbojet powered aeroplanes. ***Turbine propeller aircraft with a passenger seating configuration of 19 seats or less and a maximum take-off mass not exceeding 5700 Kg may be classified as a performance B aeroplane at airfields where Performance A criteria cannot be be met for reasons of airfield physical characteristics. In this case supplemental Performance B data must be incorporated in the Aeroplane Flight Manual in addition to the Performance A data.***

This would cater for STOL operations*.*

Equivalent safety case

Operations would meet the current level of safety at the very few airfields where Performance A criteria could not be applied, but would meet the level of safety afforded by performance B. In effect the the level of safety of Performance A is met by the increased visibility requirements for take-off for Performance B, which will be the same for all aircraft with a maximum take-off mass of 5700Kg or less, irrespective of the number of passengers carried. The increased take-off visibility requirements will allow the pilot "to see and avoid" obstacles which is unlikely to be valid on aircraft with a maximum take-off mass greater than 5700Kg due the increased speed, energy, inertia and consequently radius of turn. This technique has served DHC6 operations well and has resulted in an exemplary safety record.

In summary provided operations are restricted to operating in Visual Meteorological Conditions (VMC) to 300ft above aerodrome level and the aircraft Maximum Take-Off Mass is limited to 5700Kg, regardless of the number of passengers, the level of safety will be equivalent to that of a Performance A aircraft operating in Instrument Meteorological Conditions (IMC) from Take-Off to 300ft. The Shortfield Landing case is already covered by the regulations and in the Rejected Take-off case level of safety is improved because the Take-off has to be made in VMC instead of visibilities down to 500 metres or less as the regulations permit.

comment *1407* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

No commercial flights in IMC with single propeller driven aeroplanes allowed.

Comment / Proposal:

The criteria "single propeller driven" seems not to be adequat as it doesn't reflect correctly the critical element, which is suffiecient reliability of the power supply and transmission. It is to our knowledge not established that propellers are less reliable than jet-fans. However, there might be a slight difference between piston and turbine. If this is the reason for the regulation it should be reflected therein and, thus, read as follows: No commercial flights in IMC with single engine piston driven Aeroplanes.

comment *1623* comment by: *Luftfahrt-Bundesamt*

The LBA cannot agree to the move of major parts of the performance requirements into the AMC – material. We request to re-establish the performance requirements currently in place in JAR-OPS 3 and EU-OP in order to provide legal clarity.

Justification Justification: see LBA - General Comment, reasons 1 and 2.

In addition, reference is made only to contaminated runway performance but the reference to wet runway performance is missing.

comment *1838* comment by: *claire.amos*

(a)(1)

Cross reference material details applicability of retroactive airworthiness requirements that are not specifically dealt with here.

(a)(2)

Not as explicit regarding complementary material.

(a)(4)

No allowance for approved weight reduction i.e. fuel jettisoning.

comment *2509* comment by: *Royal Aeronautical Society*

Paragraphs (b) and (c) both proscribe certain operations made by 'propeller-driven aeroplanes', whilst EU-OPS (OPS 1.125) currently omits any such constraint, instead proscribing such operations by 'single-engine' and by 'two-engine aeroplanes which do not meet the climb requirements etc' regardless of engine type. **In the absence of any evidence that such prohibitions should not continue to apply to single-engine *turbojet* aeroplanes and to poor-performing two-engine *turbojet* aeroplanes, it is suggest that constraints such as are currently prescribed through EU-OPS should remain in the text of OPS.CAT.316.A.**

comment *2995* comment by: *AOPA Switzerland*

Single propeller-driven Aeroplane: (sentence to add) The national authority may allow exeptions for single propeller driven aeroplane to operate at night and/or under IFR.

The reliability of single engine turboprop and single engine jet airplane are nowadays as such that commercial operation at night and/or under IFR do not compromise safety. It is up to the national authorities to evaluate whether such flights will be allowed.

comment *3203* comment by: *Austro Control GmbH*

(b)

~~*Single*~~ *propeller-driven* ***single engine*** *aeroplanes.*

An operator of a ***single propeller driven engine aeroplane*** *shall not operate that aeroplane*:

Paragraph No:

OPS.CAT.316.A(a)(2)

Comment: EU-OPS 1 and JAR-OPS 1 paragraph 1.485(a) both require the supplemental data to the AFM to be acceptable to the operator's Authority. This aspect of approval has not been carried through to OPS.CAT.316.A(a)(2).

Justification: The performance data which is used to comply with the operating requirements must be seen to meet a minimum standard of derivation, and this standard needs to be applied uniformly to all operators.

Proposed Text (if applicable):

"*…use the performance data in the Aeroplane Flight Manual (AFM) and complement it, as necessary* ***with data acceptable to the Member State****;"*

comment *3347* comment by: *UK CAA*

Page No: 68 of 464

Paragraph No:

OPS.CAT.316.A(c)

Comment:

The term "Two propeller-driven aeroplanes" is confusing. Whilst the words "two-propeller-driven aeroplanes" would be clearer (as used in EU-OPS 1.525(b)), the optimum option would be to use the widely used term "multi-engined propeller-driven" aeroplanes.

Justification:

The current terminology is confusing, and also only applicable to aeroplanes with two engines, whereas it is equally applicable to multi-engined aeroplanes (i.e. all aeroplanes with more than one engine). In any case, OPS.CAT.340.A(b) already uses the term 'multi-engined'.

Proposed Text (if applicable):

~~***Two Multi-engined***~~ *propeller-driven aeroplanes.* ~~***Two Multi-engined***~~ *propeller-driven aeroplanes which do not meet the applicable climb criteria shall be treated as single propeller-driven aeroplanes and shall comply with (b).*

comment *3348* comment by: *UK CAA*

Page No: 68

Paragraph No:

OPS.CAT.316.A(c)

Comment:

This requirement need only apply to Class B aeroplanes (as in EU-OPS 1 and JAR-OPS 1.525(b)), as the climb requirements of Class A and C aeroplanes are covered elsewhere, predominantly by their certification bases.

Justification:

The climb requirements of Class A and C aeroplanes are covered elsewhere.

Proposed Text (if applicable):

~~***Two Multi-engined***~~ *propeller-driven* ***Class B*** *aeroplanes.* ~~***Two Multi-engined***~~ *propeller-driven* ***Class B*** *aeroplanes which do not meet the applicable climb criteria shall be treated as single propeller-driven aeroplanes and shall comply with (b).*

comment *3573* comment by: *Walter Gessky*

OPS.CAT.316.A Performance General - Aeroplanes

(b) ~~Single~~ propeller-driven **single engine** aeroplanes.

An operator of an aeroplane powered by one ~~propeller~~ **engine** shall not operate that aeroplane:

(a) ~~Two~~ propeller-driven **multi engine** aeroplanes. ~~Two propeller~~multi engine -driven aeroplanes which do not meet the applicable climb criteria shall be treated as single propeller-driven aeroplanes and shall comply with (b).

Justification:

Better wording an aeroplane is powered by an engine and not by a propeller.

comment *5170* comment by: *DGAC*

(b) Single propeller-driven aeroplanes :

Proposed text : Amend (b) and (c) as follows :

(b)Single ~~propeller-driven~~ **piston engine** aeroplanes **and single-engine turbine-powered aeroplanes which don't comply with "NPA JAA OPS 29"** . An operator of ~~an~~ **such** aeroplane**s** ~~powered by one propeller~~ shall not operate ~~that~~ **these** aeroplane**s**:

(1) at night; or

(2) in instrument meteorological conditions except under Special Visual Flight Rules.

(c)Two propeller-driven aeroplanes. Two ~~propeller-driven~~ **piston engines** aeroplanes which do not meet the applicable climb criteria shall be treated as ~~single propeller-driven~~ **single piston engine** aeroplanes and shall comply with (b).

Justification:

Many countries have developed SEIMC CAT operations with single-engine turbine-powered aeroplanes (SET) aeroplanes on the basis of NPA JAA OPS 29 in accordance with ICAO Annex 6 paragraph 5.4 Additional requirements for operations of single-engine turbine-powered aeroplanes at night and/or in IMC.

This paragraph seems to allow single turbo jets in IMC. Therefore there is no reason to forbid single turbo-propellers in IMC. Single turbo-propellers should be allowed, at least for cargo transportation.

In addition, only twin piston aeroplanes are concerned by the (c) restriction: indeed a difference should be made between piston engines and turbine engines which do not have the same reliability.

comment *5720* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

5743 comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

(c) Two propeller-driven aeroplanes. Two propeller-driven aeroplanes which do not meet the applicable climb criteria shall be treated as single propeller-driven aeroplanes and shall comply with (b).

Comment:

Two propeller-driven should be replaced by twin engine powered

Proposal (including ***new text***):

(c) ~~Two propeller-driven~~ ***Twin engine powered*** aeroplanes. ~~Two propeller-driven~~ ***Twin engine powered*** aeroplanes which do not meet the applicable climb criteria shall be treated as single ~~propeller-driven~~ ***engine powered*** aeroplanes and shall comply with (b).

Comment:

There are and will be also single engine JET aeroplanes, which have to do forced landing after the engine failure.

Proposal:

The requirements for single engine JET aeroplanes shall also be given as for single propeller-driven aeroplanes.

Comment on OPS.CAT.326.A: it is proposed to delete OPS.CAT.326.A and AMC1 OPS.CAT.326.A(1) and to revise OPS.GEN.320.A.:

~~**OPS.CAT.326.A Take-off requirements -Aeroplanes**~~
~~**The take-off distance shall not exceed the take-off distance available.**~~

Justification:

The current proposal only addresses take-off distance requirements. Take-off distance requirements however are not on a different level as e.g. accelerate-stop distance requirements or take-off run requirements. The requirements for TOD/TODA/ASD/ASDA/TOR/TORA are of equal level of importance and do not need the flexibility provided by the status of AMC material. Furthermore the current proposal includes a repetition for the take-off requirements in both OPS.GEN, OPS.CAT and the AMC and as such seems to be not in line with the directives for EU legislation.
Finally the requirement contained in EU-OPS 1.490(b)(5) is still valid and should be included. As such it is proposed to delete OPS.CAT.326.A and AMC1 OPS.CAT.326.A(1) and to revise OPS.GEN.320.A. See additional comments for that paragraph.

comment *1499* ☐ comment by: *Airbus*

Affected paragraphs:

- OPS.GEN.320.A(a)(1), p. 40
- OPS.CAT.326.A, p. 68
- AMC1 OPS.CAT.326.A § 1.b, p. 296

Comment:

These provisions as written are unclear. A consistency check is needed for provisions on take-off distance vs. TODA/clearway, in relation with categories of operations and aeroplane performance classes.

comment *1624* comment by: *Luftfahrt-Bundesamt*

The LBA cannot agree to the move of major parts of the performance requirements into the AMC – material. We request to re-establish the performance requirements currently in place in JAR-OPS 3 and EU-OP in order to provide legal clarity.

Justification Justification: see LBA - General Comment, reasons 1 and 2.

comment *3349* comment by: *UK CAA*

Page No: 68 of 464

Paragraph No:

OPS.CAT.326

Comment:

The take-off distance is only one aspect of the take-off field length parameters. This requirement does not cover the other, distinct, components that constitute take-off field lengths, and so is inadequate. The text from EU-OPS 1 and JAR-OPS 1 that addressed these distances has been relegated to AMC. Unless the rule specifically addresses these other components, operators might not take them into account.

Justification:

The take-off field lengths compromise, for most aeroplanes, the take-off run as well as the take-off distance together with, for some aeroplanes the accelerate-stop distance as well. These have to be assessed against the separate runway lengths available, i.e. TORA, TODA, and ASDA.

Proposed Text (if applicable):

Transfer AMC1 OPS.CAT.326.A to OPS.CAT.326.

comment *5171* comment by: *DGAC*

What is the difference between this provision and the one stated in (a)(1) of OPS.GEN.320.A ?

The term "take-off distance" is not defined in GEN.010. Is it an all-engine operating take-off distance, or a take-off distance taking into account an engine failure?

There should at least be a mention of Part 21 and CS airworthiness as was mentioned in (b) of EU-OPS 1.480 :

"(b) The terms "accelerate-stop distance", "take-off distance", "take-off run", "net take-off flight path", "one engine inoperative en-route net flight path" and "two engines inoperative en-route net flight path" as relating to the aeroplane have their meanings defined in the airworthiness requirements under which the aeroplane was certificated, or as specified by the Authority if it finds that definition inadequate for showing compliance with the performance operating limitations."

B. I. Draft Opinion - Part-OPS - Subpart B - Section III - OPS.CAT.327.A Take-off obstacle clearance - Aeroplanes p. 68

comment *74* comment by: *Air Southwest*

Typographical error/misused word: The paragraph reads as if it is a requirement to have all obstacles along the take off path removed. The

word 'cleared' needs to be replaced by 'clear.'

comment *472* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.327.A: change as follows:

~~**The take-off flight path shall be cleared of all obstacles by lateral distance and horizontal or vertical distances depending on the aeroplane size and type of engines.**~~

The net take-off flight path shall be cleared of all obstacles by adequate horizontal or vertical distances.

Justification:

It is essential that reference is made to the net take-off flight path to ensure that climb gradient reductions according to the certification specifications are taken into account. Furthermore it seems that lateral distance is the same as horizontal distance and as such it can be removed.

comment *474* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.327.A: Move to OPS.GEN

Justification:

Current proposal for OPS.GEN includes requirements for take-off in OPS.GEN.320.A, en-route in OPS.GEN.325.A and landing in OPS.GEN.330.A. As such there is no need for a repetition of the take-off requirements in OPS.CAT.326.A. Furthermore the requirements of OPS.CAT.327.A are of equal importance as the take-off requirements and are of equal general nature and as such should be included in OPS.GEN.

comment *1500* comment by: *Airbus*

Replace "type of engines" by "performance class".

Reason: "type of engines" refers to a specific make/model. The actual criteria to define the required clearance are the aeroplane size and performance class.

OPS 1 provisions have to be accurately transposed.

comment *1625* comment by: *Luftfahrt-Bundesamt*

The LBA cannot agree to the move of major parts of the performance requirements into the AMC – material. We request to re-establish the performance requirements currently in place in JAR-OPS 3 and EU-OP in

order to provide legal clarity.

Justification Justification: see LBA - General Comment, reasons 1 and 2.
