The take-off flight path shall be cleared of all obstacles by lateral distance and horizontal or vertical distances depending on the aeroplane size, type of engines and navigation accuracy.

Comment/suggestion:

Besides the wingspan and type of engine, the navigation accuracy is essential to the risk in determining the lateral distance to an obstacle or terrain. Future improvements in navigation accuracy, including autopilot and auto throttle capabilities may warrant a reduction in planned lateral distances from obstacles and terrain.

comment *3350* comment by: *UK CAA*

Page No: 68 of 464

Paragraph No:

OPS.CAT.A.327

Comment:

Take-off obstacle clearance is demonstrated by either a net or gross flight path, depending on the category (Class A, B or C) of aeroplane under consideration. Grouping all Classes together into one paragraph in this way has lost this detail and this needs to be corrected. This is another example of the significant problems resulting from moving away from the EU-JAR-OPS 1 structure.

Justification: The intent of EU/JAR-OPS 1 needs to be preserved.

Proposed Text (if applicable):

*The **net or gross** take-off flight path, **as applicable,** shall be cleared of all obstacles by lateral distance and horizontal or vertical distances depending on the aeroplane size and type of engines.*

B. I. Draft Opinion - Part-OPS - Subpart B - Section III - OPS.CAT.340.A p. 68-69

En-Route requirements - Aeroplanes

comment *75* comment by: *Air Southwest*

OPS.CAT.340.A(c) The first sentence defines the requirement for one engine inoperative. The second sentence is vaguely ambiguous in that it implies the definition of one engine inoperative (!). Suggest amending second sentence to read: "This requirement shall be met ....."

comment *519* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.340.A(d)(2): change as follows:

(d) Three or more engines aeroplanes, two engines inoperative.

(1) An aeroplane with three or more engines shall, at no point along the intended track, be more than 90 minutes away from an aerodrome at which the performance requirements applicable at the expected landing mass can be met. This shall be met at the all-engines long range cruising speed at standard temperature in still air.

(2) Notwithstanding (d)(1), the 90 minutes criteria may be exceeded, if, in the case of two engines inoperative en-route, the **~~flight path~~** **net flight path** with two engines inoperative permits the aeroplane to continue the flight to an aerodrome at which the performance requirements applicable at the expected landing mass are met. In this case, the diversion shall start from the point where two engines are assumed to fail simultaneously, to an aerodrome at which the performance requirements applicable at the expected landing mass are met.

Justification:

Editorial. Current text does not fit the intent.

comment *1231* ☐ comment by: *Loganair Limited*

Turbine Powered aircraft with 19 seats Currently Operating to United Kingdom AN(G)R Performance C for Lifeline and Public Service Obligations where no alternative exists

The regulations do not cater for for turbine propeller powered aircraft with up to 19 passenger seats designed for STOL operations, such as the DHC6 Twin Otter, currently operating on Public Service Obligation and Lifeline routes to United Kingdom AN(G)R Performance C (Broadly equivalent to EASA/EU-OPS Performance Class B.) The purpose for which the aircraft was designed (Commercial Air Transport Short Take-Off and Landing (STOL) operations) is not recognised, by omission rather than specifically stated, in either EU-OPS or the proposed implementing rules. **Both EU-OPS and the proposed implementing rules need to recognise that Commercial Air**

Transport STOL operations exist within Europe and are necessary to meet Public Service Obligation requirements.

Performance Class A requirements cannot be met because of the physical characteristics of the runways and obstacles. Typical examples are operations where no hard runway is available such as where Commercial Air Transport Operations are required to operate from a beach or where it would not be physically possible extend an existing runway. Example airfields are the beach airfield at Barra (EGPR) and Isles of Scilly (EGHE).

Performance Class A data is becoming available for aircraft such as the DHC6 Twin Otter, but the aircraft cannot be operated from certain airfields in Performance Class A. In the case of the Beach airfield at Barra no aircraft currently exists that can comply with the Public Service Obligation requirements and meets either Performance Class A, Performance Class B or Performance Class C.

Enforcing the performance Class A requirement on aircraft which have operated safely out of these airfields under United Kingdom AN(G)Rs for over 40 years would terminate air services which are operated purely for Public service Obligations and to provide lifeline services to remote and isolated Islands and Regions. During the Winter months these services are frequently the only method of transport available. It is clear that the imposition of Performance Class A requirements on STOL - type aircraft such as the DHC6 Otter has effectively removed the Short Take Off capability of the type as there is no provision for Short Take Off techniques in Performance Class A. Loganair believes that there is no case to answer in this respect and that the operating safety record of the type under AN(G)R has been exemplary. Loganair cannot overstress the importance of short field capability in Public Service Obligation Commercial Air Transport Operations.

The only alternatives are:

1. Continue to allow operations with current aircraft to United Kingdom AN(G)R Performance C or EASA Performance Class B at airfields where Performance Class A requirements cannot be met.

OR

2. Cease operations to remote and isolated regions or Islands.

Proposal

Amend AMC OPS.CAT.316.A(1) by making it an acceptable means of compliance for Turbine Propeller aircraft with a seating capacity of 19 seats or less to operate to Performance class B criteria at airfields where Performance A criteria cannot be met ie STOL operations.

AMC OPS.CAT.316.A(a)(1)1. would then read:

Performance Class A. Performance class A aeroplanes should be multi-engined aeroplanes powered by turbo-propeller engines with a maximum passenger seating configuration of more than 9 or a maximum take-off mass exceeding 5700 Kg, amd all multi-engined turbojet powered aeroplanes. ***Turbine propeller aircraft with a passenger seating configuration of 19 seats or less and a maximum take-off mass not exceeding 5700 Kg may be classified as a performance B aeroplane***

at airfields where Performance A criteria cannot be be met for reasons of airfield physical characteristics. In this case supplemental Performance B data must be incorporated in the Aeroplane Flight Manual in addition to the Performance A data.

This would cater for STOL operations*.*

Equivalent safety case

Operations would meet the current level of safety at the very few airfields where Performance A criteria could not be applied, but would meet the level of safety afforded by performance B. In effect the the level of safety of Performance A is met by the increased visibility requirements for take-off for Performance B, which will be the same for all aircraft with a maximum take-off mass of 5700Kg or less, irrespective of the number of passengers carried. The increased take-off visibility requirements will allow the pilot "to see and avoid" obstacles which is unlikely to be valid on aircraft with a maximum take-off mass greater than 5700Kg due the increased speed, energy, inertia and consequently radius of turn. This technique has served DHC6 operations well and has resulted in an exemplary safety record.

In summary provided operations are restricted to operating in Visual Meteorological Conditions (VMC) to 300ft above aerodrome level and the aircraft Maximum Take-Off Mass is limited to 5700Kg, regardless of the number of passengers, the level of safety will be equivalent to that of a Performance A aircraft operating in Instrument Meteorological Conditions (IMC) from Take-Off to 300ft. The Shortfield Landing case is already covered by the regulations and in the Rejected Take-off case level of safety is improved because the Take-off has to be made in VMC instead of visibilities down to 500 metres or less as the regulations permit.

comment *1549* comment by: *ECA - European Cockpit Association*

Comment: add the following text to (a):

(a) Single-engined aeroplanes. In the event of an engine failure, single-engined aeroplanes shall be capable of reaching a place at which a safe forced landing can be made. **For landplanes a place on land is required unless otherwise approved by the Authority**

Justification:

Forced landings on places other than land should be limited to exceptional cases approved by the authority as reflected in EU-OPS 1.542(a)

comment *1553* comment by: *ECA - European Cockpit Association*

Comment: change (b)(2)(i) as follows:

[..] (2) aeroplanes powered by reciprocating engines with a maximum take-off mass exceeding 5 700 kg or a maximum passenger seating configuration of more than 9

shall at any point on the route or on any planned diversion there from, be capable of a rate of climb of at least 300 ft per minute with all engines operating within the maximum continuous power conditions specified:

i. **at the minimum safe altitude for a safe flight** ~~**at the minimum altitudes for a safe flight on each stage of the route to be flown; and**~~

Justification:

Any point on the route or any planned diversion there from is mentioned in the text preceding (i). The current wording could lead to the interpretation that the climb gradient requirement is only intended for the route and not any diversion there from. To clarify that the requirement is applicable to diversion from the planned route as well the text should be amended as proposed.

comment *1626* comment by: *Luftfahrt-Bundesamt*

The LBA cannot agree to the move of major parts of the performance requirements into the AMC – material. We request to re-establish the performance requirements currently in place in JAR-OPS 3 and EU-OP in order to provide legal clarity.

Justification Justification: see LBA - General Comment, reasons 1 and 2.

comment *1689* comment by: *Dassault Aviation*

Technical comment.

Page 69 OPS.CAT.340.A(d): En-route requirements aeroplanes / three or more engines aeroplane with two engines inoperative. Considering the regulatory difference between an Implementing Rule (which is at the level of Safety Objectives) and an AMC/GM (which are at the level of Technical Details), we suggest that OPS.CAT.340.A(d) does not quote any specific flight time duration away from an adequate aerodrome with two engines inoperative. The corresponding AMC OPS.CAT.340.A(d) is commented in a comment below. Our proposed modification to paragraph OPS.CAT.340.A(d) is:

(d) Three or more engines aeroplanes, two engines inoperative.

(1) An aeroplane with three or more engines shall, at no point along the intended track, be more than a determined flight time away from an aerodrome at which the performance requirements applicable at the expected landing mass can be met. This shall be met at the all-engines long range cruising speed at standard temperature in still air.

(2) Notwithstanding (d)(1), the determined flight time may be exceeded, if, in the case of two engines inoperative en-route, the flight path with two engines inoperative permits the aeroplane to continue the flight to an aerodrome at which the performance requirements applicable at the

expected landing mass are met. In this case, the diversion shall start from the point where two engines are assumed to fail simultaneously, to an aerodrome at which the performance requirements applicable at the expected landing mass are met.

comment *1837* comment by: *claire.amos*

Point C

Doesn't specify 1500 ft abover diversion airfield.

comment *2862* comment by: *M Wilson-NetJets*

Original text:

(d) Three or more engines aeroplanes, two engines inoperative.

(1) An aeroplane with three or more engines shall, at no point along the intended track, be more than 90 minutes away from an aerodrome at which the performance requirements applicable at the expected landing mass can be met. This shall be met at the all-engines long range cruising speed at standard temperature in still air.

(2) Notwithstanding (d)(1), the 90 minutes criteria may be exceeded, if, in the case of two engines inoperative en-route, the flight path with two engines inoperative permits the aeroplane to continue the flight to an aerodrome at which the performance requirements applicable at the expected landing mass are met. In this case, the diversion shall start from the point where two engines are assumed to fail simultaneously, to an aerodrome at which the performance requirements applicable at the expected landing mass are met.

Suggested new text:

(d) Three or more engines aeroplanes, two engines inoperative (MPSC of 20 or more or a MTOM of 45360 Kg or more).

(1) An aeroplane with three or more engines shall, at no point along the intended track, be more than 90 minutes away from an aerodrome at which the performance requirements applicable at the expected landing mass can be met. This shall be met at the all-engines long range cruising speed at standard temperature in still air.

(2) Notwithstanding (d)(1), the 90 minutes criteria may be exceeded, if, in the case of two engines inoperative en-route, the flight path with two engines inoperative permits the aeroplane to continue the flight to an aerodrome at which the performance requirements applicable at the expected landing mass are met. In this case, the diversion shall start from the point where two engines are assumed to fail simultaneously, to an aerodrome at which the performance requirements applicable at the expected landing mass are met.

(e) Three or more engines aeroplanes, two engines inoperative (MPSC of 19

or less and a MTOM of less than 45360 Kg).

(1) An aeroplane with three or more engines shall, at no point along the intended track, be more than 90 minutes away from an aerodrome at which the performance requirements applicable at the expected landing mass can be met. This shall be met at the all-engines long range cruising speed at standard temperature in still air.

(2) Notwithstanding (e)(1), the 90 minutes criteria may be exceeded, if, in the case of

(i) one engine inoperative en-route, the flight path with one engine inoperative permits the aeroplane to continue the flight to an aerodrome at which the performance requirements applicable at the expected landing mass are met, not to exceed 240 minutes at one engine inoperative cruise speed an altitude; or

(ii) two engines inoperative en-route, the flight path with two engines inoperative permits the aeroplane to continue the flight to an aerodrome at which the performance requirements applicable at the expected landing mass are met. In this case, the diversion shall start from the point where two engines are assumed to fail simultaneously, to an aerodrome at which the performance requirements applicable at the expected landing mass are met.

Comment/suggestion:

This paragraph is much more penalizing for three engined aeroplanes than four engined aeroplanes. Four engined business aeroplanes are often not an option due to their size and layout and therefore manufacturers are only left with the choice of only three engines and not four. Therefore, the performance gradient is not in favor of business aeroplanes. As with OPS.CAT.225.A (IR and AMC material), a difference should be made between aeroplanes with an MPSC of 19 or less and a MTOM of less than 45360 Kg. This allows business aeroplane manufacturers and operators to build/use business aeroplanes that are more environmentally friendly due to less demand for high engine thrust performance and additional fuel to be carried to adhere to this paragraph.

comment *3247* comment by: *Eurocontrol CND*

OPS.CAT.340A En-route requirements – Aeroplanes

Regarding (a), this is a requirement which in many (or most) cases is not possible to achieve (see ICAO Annex 2, paragraph 3.1.2 regarding minimum heights).

comment *3351* comment by: *UK CAA*

Page No: 69 of 464

Paragraph No:

OPS.CAT.340.A (c)

Comment:

Another consequence of the amendment of the JAR-OPS/EU-OPS structure has resulted in this paragraph not specifying whether obstacle clearance needs to be based on a net or gross flight path.

Justification:

Proposed Text (if applicable):

Preferably, reintroduce the separate en-route paragraphs for Class A, B and C aeroplanes as rule material, or, less satisfactorily, amend paragraph (c) as follows:-

One engine inoperative. Multi-engined aeroplanes shall, in the event of one engine becoming inoperative at any point on the route or on any planned diversion there from, be capable of continuing the flight to an altitude above an aerodrome where a landing can be made in accordance with OPS.CAT.345.A. This shall be met with ***the net or gross one-engine inoperative flight path, as applicable, and*** *with the other engine or engines operating within the maximum continuous power conditions specified.*

comment *3352* comment by: *UK CAA*

Page No: 69 of 464

Paragraph No:

OPS.CAT.340.A (d)

Comment:

Clarification text developed and agreed by the JAA Performance Sub-Committee for this paragraph should be considered for inclusion here.

Justification:

Provides clarification of the requirement, i.e. that the aerodrome from which the 90-minute distance is measured is that at which the landing distance requirements of OPS.CAT 345 are satisfied.

Proposed Text (if applicable):

(d) Three or more engines aeroplanes, two engines inoperative.

(1) An aeroplane with three or more engines shall, at no point along the intended track, be more than 90 minutes away from an aerodrome at which the ~~performance~~ requirements of ***OPS.CAT.345*** *~~applicable~~ at the expected landing mass can be met. This shall be met at the all-engines long range cruising speed at standard temperature in still air.*

(2) Notwithstanding (d)(1), the 90 minutes criteria may be exceeded, if, in the case of two engines inoperative en-route, the flight path with two engines inoperative permits the aeroplane to continue the flight to ~~an~~ ***the aerodrome specified in (d)(1)*** *~~at which the performance requirements~~*

~~applicable at the expected landing mass are met~~. In this case, the diversion shall start from the point where two engines are assumed to fail simultaneously, to an aerodrome at which the performance requirements applicable at the expected landing mass are met.

comment *3522* comment by: *Heliswiss AG, Belp*

The aim is to maintain the possibility to operate in PC3 without an assured SFL en route in the particular cases of mountain or remote operations.By consistency with OPS.SPA.005.SFL(d)(3) it should be indicated that Performance Class 3 operations may be conducted without an assured safe forced landing capability en-route. Moreover the requirement number to be referenced should be OPS.SPA.005.SFL instead of OPS.SPA.SFL. Proposed wording modifications: (e) Helicopters operated in performance class 2 or 3 may be operated without an assured safe forced landing capability during the landing and take-off phase under the conditions contained in OPS.SPA.SFL Subpart D Section VI (SFL). (f) Helicopters operated in performance class 3 may be operated without an assured safe forced landing capability under the conditions contained in Subpart D Section VI (SFL).

comment *5175* comment by: *DGAC*

(d) 'Three or more engines aeroplanes, two engines inoperative'

Proposal:

add a (d)(3) as follows :

"(3) For turbojet aeroplanes with a maximum take-off mass of 45 360 kg or less and a maximum passenger seating configuration (MPSC) of 19 or less, if approved by the Authority, the threshold of 90 minutes can be extended up to 180 minute one-engine inoperative (OEI) provided engine reliability and systems redundancy are sufficient."

Justification: There is no reason to be more restrictive for small three-turbojets than for small twin-turbojets which are allowed to be operated up to 120Nm without authorisation and up to 180Nm provided authority approval.

comment *7147* comment by: *ECA - European Cockpit Association*

Comment: change (b)(2)(i) as follows:

(b) [...] (2) [...]

(i) at the minimum **safe** altitudes for a safe flight ~~**on each stage of the route to be flown**~~; and

Justification:

Any point on the route or any planned diversion there from is mentioned in the text preceding (2). The current wording could lead to the interpretation that the climb gradient requirement is only intended for the route and not any diversion there from. To clarify that the requirement is applicable to diversion from the planned route as well the text should be amended as proposed.

B. I. Draft Opinion - Part-OPS - Subpart B - Section III - OPS.CAT.345.A Landing requirements - Aeroplanes p. 69

comment *76* comment by: *Air Southwest*

OPS.CAT.345.A(b) Suggest amending paragraph to read: " ..... provided that applicable criteria can be met."

OPS.CAT.345.A(c) Suggest amending paragraph to read: " .....aeroplanes provided that applicable criteria can be met."

comment *521* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.345.A(a)(2):

Paragraph (a)(2) should be rewritten to reflect the intent of EU OPS 1.520.

Justification:

The proposed text under (i) refers to any data provided in the AFM for wet and contaminated runways without providing a quality standard and removes the 15% margin contained in the original EU-OPS 1.520 requirement. Wet runway data should be certified according to the certifications specifications whereas contaminated runway data should be approved by the Authority.

The 1.15 factor under (ii) should not be applied to the landing distance available but to the landing distance required. Furthermore the current proposal would allow operation to contaminated runways based on wet performance data when no AFM data is available for contaminated runways which clearly is unsafe. The original requirement from EU-OPS 1.515 required a 15% margin on approved contaminated runway data with a minimum of the wet runway performance which in turn is 15% of the dry runway data.

comment *523* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.345.A(c): change as follows: remove

~~**(c) The operator may use short landing operations for the operation of turbojet-engined or propeller-driven aeroplanes provided that suitable criteria are met.**~~

Justification:

In order to ensure an acceptable safety level short landing operations should only be approved in exceptional cases by the Authority. As such it seems inappropriate to include short landing operations in the rule. Instead it should be referenced as an exceptional case in the AMC.

comment *530* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.345.A(a): Rephrase in such way that "may be" is not reflecting the dry runway situation, but only the wet/contaminated runway:

(a) When the weather information available to the pilot-in-command indicates that the runway at the estimated time of arrival ~~**may be**~~:

(1) **is** dry, the landing mass of the aeroplane shall allow a full stop landing from 50 ft above the threshold within a safe margin of the landing distance available at the destination aerodrome and at any alternate aerodrome which is appropriate to the performance class of the aeroplane; and

(2) **may be** wet or contaminated, the landing distance available in (a)(1) shall be:

(i) calculated in accordance with any data provided in the AFM for wet and contaminated runways; or

(ii) multiplied by a factor of 1.15, in the case that no data is provided in the AFM.

Justification:

"may be dry" is not strict. Eg. a wet runway can also be interpreted as "may be" dry.

comment *1627* comment by: *Luftfahrt-Bundesamt*

The LBA cannot agree to the move of major parts of the performance requirements into the AMC – material. We request to re-establish the performance requirements currently in place in JAR-OPS 3 and EU-OP in order to provide legal clarity.

Justification Justification: see LBA - General Comment, reasons 1 and 2.

comment *1780* comment by: *Dassault Aviation*

Pages 27, 69 and 311 (resp. OPS.GEN.010 §67, OPS.CAT.345.A §(b) and AMC OPS.CAT.345.A(b)) (same comment as #1704) - Steep Approach and

Screen Heights: these operational paragraphs consider that the landing distances data are based on a screen height of less than 50 feet but not less than 35 feet. It is to be noted that this 35-50 feet interval may be inadequate versus some airworthiness certification requirements. For example, NPA 25B-267 dealing with Steep Approach, allows screen heights from 35 feet up to 60 feet for the determination of landing distances data. Although it is a NPA, it is taken as it is through a Certification Review Item (CRI) therefore becoming an airworthiness certification bases on certain programs. The proposal is - if a maximum screen height needs to be mentioned - to increase the 50 feet proposed in the NPA 2009-02 to the value of 60 feet.

comment *1836* comment by: *claire.amos*

(a) (1) SAFE MARGIN

Safe margin?

(b)

Limit still 4.5 deg for performance benefit.

comment *1843* comment by: *Airbus SAS*

For short landing operations in OPS.CAT.345.A(c), the regulation requires to meet "suitable" criteria, while in subpara (b) for steep approaches "applicable" criteria are mentioned.

For both operations, there are defined conditions in applicable documents (AFM, OPS-Manual, airport regulations, minimum weather conditions, etc.). The explanatory note does not provide reasons for using terms of different stringency for these operations.

==> Airbus proposes to replace in subpara (b) "applicable criteria" by "suitable criteria" because these criteria are defined in the AMC and not in the rule.

comment *3079* comment by: *M Wilson-NetJets*

Original text:

LANDING DISTANCE
(a) When the weather information available to the pilot-in-command indicates that the runway at the estimated time of arrival may be: (1) dry, the landing mass of the aeroplane shall allow a full stop landing from 50 ft above the threshold within a safe margin of the landing distance available at the destination aerodrome and at any alternate aerodrome which is appropriate to the performance class of the aeroplane; and (2) wet or contaminated, the landing distance available in (a)(1) shall be:

(i) calculated in accordance with any data provided in the AFM for wet and contaminated runways; or
(ii) multiplied by a factor of 1.15, in the case that no data is provided in the AFM.

Suggested new text:

LANDING DISTANCE

(a) When commencing a flight, the weather information available to the pilot-in-command indicates that the runway at the estimated time of landing may be:

(1) dry, the landing mass of the aeroplane shall allow a full stop landing from 50 ft above the threshold within a safe margin of the landing distance available at the destination aerodrome and at any alternate aerodrome which is appropriate to the performance class of the aeroplane; and

(2) wet or contaminated, the landing distance available in (a)(1) shall be:
(i) calculated in accordance with any data provided in the AFM for wet and contaminated runways; or

(ii) multiplied by a factor of 1.15, in the case that no data is provided in the AFM.

Comment / suggestion:

The definition of "Estimated Time of Arrival" according ICAO (Doc 9713 Part 1) is:

"For IFR flights, the time at which it is estimated that the aircraft will arrive over that designated point, defined by reference to navigation aids, from which it is intended that an instrument approach procedure will be commenced, or, if no navigation aid is associated with the aerodrome, the time at which the aircraft will arrive over the aerodrome. For VFR flights, the time at which it is estimated that the aircraft will arrive over the aerodrome."

Therefore, the ETA does not coincide with the time the aeroplane is estimated to touchdown, which should the defining moment for the runway condition.

Furthermore, the paragraph does not clearly indicate that the requirement is only valid for dispatch phase. Half way into a flight the landing time is still estimated, but this paragraph should not be applicable.

comment *3354* comment by: *UK CAA*

Page No: 69 of 464

Paragraph No:

OPS.CAT.345.A

Comment:

It is recommended that it is clarified, by adding a new paragraph (d) (see below), that the special steep approach and short landing provisions must

not be used together.

Justification:

The steep approach and short landing criteria may not be compatible. It is generally understood that they must not be used together.

Proposed Text (if applicable):

(d) The steep approach and short landing provisions of paragraphs (b) and (c) above must not be used for the same landing.

comment *3355* comment by: *UK CAA*

Page No: 69 of 464

Paragraph No:

OPS.CAT.345.A & AMC OPS.CAT.345.A(a)(1) et seq.

Comment:

It is not sufficient in the rule just to specify that the landing can be completed "within a safe margin". The specific margins (i.e. the landing distance factors), for all Classes of aeroplane, must be specified in the rule and not left to AMC.

Justification:

To achieve the objectives of EC Regulation 216/2008 and the intended level of safety of JAR-OPS/EU-OPS 1, the specific factors must be contained in rule material. By being relegated to AMC/GM they will become open to local negotiation with the Member States oversight system, which will inevitably result in uneven implementation between operators and MS.

Proposed Text (if applicable): Reassign AMC material as rule text.

comment *3356* comment by: *UK CAA*

Page No: 69 of 464

Paragraph No:

OPS.CAT.345.A(c)

Comment:

An error in the JAR-OPS 1/EU-OPS 1 text needs to be corrected. The existing text is only applicable to steep approaches with screen heights less than 50ft, which is wrong. A suitable correction, proposed below, was developed and agreed by the JAA Performance Sub-Committee.

Justification:

Steep approaches are defined as 4.5º or more, regardless of the screen height being used .

Proposed Text (if applicable):

"*(b) The operator may apply Steep Approach procedures for the operation of turbojet-engined or propeller-driven aeroplanes using glide slope angles of 4.5° or more and with screen heights of* ***~~less than 50 ft but~~*** *not less than 35 ft, provided applicable criteria are met."*

comment *5178* comment by: *DGAC*

This paragraph is not worded consistently with the rest of section III of OPS.CAT. It contains quantitative requirements while other paragraphs contain general safety objectives as explained in the explanatory note (paragraph 59 p. 35).

(a)(2) :

Proposal : Amend the beginning of (2) as follows :

"(2) wet or contaminated, the landing distance **required** ~~available~~ in (a)(1) shall be:"

Justification : As written the provision does not make any sense.

- **(a)(2)(ii)** allows operations of aeroplanes on contaminated runways without any manufacturer data in the AFM, which contradicts the objectives of the AMC section (AMC OPS.CAT.345(a)(2)).

comment *6423* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Comment

"Suitable criteria" should be defined regarding short landing operations.

Proposal

Add a paragraph defining those criteria.

Justification

This is not clear for operators.

comment *7409* comment by: *Axel Schwarz*

(2) should read: "wet or conaminated, the landing distance REQUIRED in (a)(1) shall be: ...".

B. I. Draft Opinion - Part-OPS - Subpart B - Section III - OPS.CAT.355.H Performance applicability - Helicopters p. 69-70

comment *543* comment by: *EUROCOPTER*

Performance Class 2 operations without an assured SFL capability are only allowed during take-off and landing phases, while, by consistency with OPS.SPA.005.SFL(d)(3), Performance Class 3 operations may be conducted without an assured safe forced landing capability not only during take-off and landing phases but also en-route. Consequently the case of PC 3 operations is different from the case of PC 2 operations. Moreover the reference should be Subpart D Section VI instead of OPS.SPA.SFL.

Proposed wording modifications:

(e) Helicopters operated in performance class 2 ***~~or 3~~*** *may be operated without an assured safe forced landing capability during the landing and take-off phase under the conditions contained in* ***~~OPS.SPA.SFL~~ Subpart D Section VI (SFL)***.

(e) Helicopters operated in performance class 3 may be operated without an assured safe forced landing capability under the conditions contained in Subpart D Section VI (SFL).

Author : von Boletzky, Swiss Air Ambulance SAA Ltd. Switzerland

Considerations PC 1:

- operations according PC 1 criteria does not have any major implications for REGA operations when operating

from or to an aerodrome

- most of the HEMS-Missions flown by REGA have at least one movement to/from a congested and hostile environment !! special emphasis regarding hostile environment is to be put on the **absence of a safe forced landing possibility** and the **risks involved for persons and objects on ground not involved in operation !!**

As stated in (a)(3) operations on HEMS operating and public interest sites may be executed respecting PC 2.

With regards to the

comment *927* comment by: *REGA*

Attachments #9 #10

(a) (1) Following the EASA's definitions of "congested" and "hostile" area: most of the HEMS operations begin at and end at an aerodrome/operating site located in a congested hostile environment.

Considerations

Definition: *'Congested area' means in relation to a city, town or settlement, any area which is substantially used for residential, commercial or recreational purposes.* (...)

As commented on page 23, this definition covers quite every area in Europe. An unchanged definition of "congested area" will seriously curtail a number of existing HEMS-operations.

HEMS-Base: Even with modern twin helicopters (e.g. EC135; EC145; BK117), due to variable operational conditions (e.g. weight; temperature; altitude), operations on HEMS-bases/-aerodromes meeting the requirements of ICAO Annex 14 are not able to guarantee the operation within Performance Class 1 at any time.

HEMS-bases not meeting the requirements of ICAO Annex 14: Like the situation of hospital sites, the problems are historical as well related to geographical aspects (e.g. mountainous terrain providing small places for constructions; obstacles). If EASA or national authorities or used at such a low weight that critical power unit failure performance is assured, it would seriously curtail a number of existing HEMS-operations.

The HEMS Operating Bases, builded before 1 July 2002, should treated like the public interest sites

HEMS-Operating Sites: Meeting the Performance Class 2 requirement at HEMS-operating sites is even with modern twin helicopters (e.g. EC145; EC135) not possible at all time: Due to the "character" of HEMS-missions and their operating sites (e.g. within a forest or a mountainous terrain; wind, temperature) twin helicopters (CAT A certified) are operating within all three performance classes; even for short period in Performance Class 3 without the assurance of a safe forced landing (see examples below).

Aerodrome, landings sites at hospital according ICAO annex 14

EASA itself has mentioned in the GM (P.436) the performance problem. Even at hospital sites, compliant with ICAO annex 14, most of the modern twin helicopter are not able to be operated within Performance Class 1 (PC1) at all time (see examples below).

Proposal 1:

(a) (3) *operations to/from a HEMS-aerodrome/-base or a Public Interest Site in a congested hostile environment; or operations to/from a helideck conducted with a helicopter having a MPSC of more than 19, may be operated in performance class 2.*

(a) (4) *HEMS-operations to/from an HEMS Operating Site may be operated in performance class 2 or 3.*

(f) *Helicopters HEMS-missions operated in:*

Performance class 1, 2 or 3 shall be certificated in Category A.

or

Proposal 2:

(a) Except as specified in (f) below, helicopters shall be operated in performance class 1 when:

(...)

~~*(a) (3)*~~

(f) *HEMS-operations: If it is not possible to comply with the requirement of performance class 1 due to performance or operational reasons, HEMS operations may be carried out with multi-engine helicopters (Category A certified), in performance class 2 or 3 providing that these deviations are described in the operations manual and have been approved by the competent authority.*

(g) *Helicopters operated in performance class 1 or 2 not meeting entirely the Category A certification standards should not be operated beyond 2015.*

Examples (CAT A - Limitation VTOL - elevated helipad)

BK117 B-2 (Lycoming)

Mission weight (without patient) = 2'910 kg

Max. CAT A weight at 1'000ft/30° = 2'860 kg

Max. CAT A weight at 2'200ft/20° = 2'870kg

Max. CAT A weight at 3'500ft/20° = 2'740 kg

Max. CAT A weight at 8'500/10° = 2'360 kg

BK117 C-1 (Arriel)

Mission weight (without patient) = 2'910 kg

Max. CAT A weight at 1'000ft/30° = 3'100 kg

Max. CAT A weight at 2'200ft/20° = 3'070 kg

Max. CAT A weight at 3'500ft/20° = 2'960 kg

Max. CAT A weight at 8'500/10° = 2'525 kg

BK117 C-2 (EC145)

Mission weight (without patient) = 3'150 kg

Max. CAT A weight at 1'000ft/30° = 3'150 kg

Max. CAT A weight at 2'200ft/20° = 3'130 kg

Max. CAT A weight at 3'500ft/20° = 3'000 kg

Max. CAT A weight at 8'500/10° = 2'550 kg

EC135 P2+

Mission weight (without patient) = 2'768 kg

Max. CAT A weight at 1'000ft/30° = 2'825 kg

Max. CAT A weight at 2'200ft/20° = 2'800 kg

Max. CAT A weight at 3'500ft/20° = 2'630 kg

Max. CAT A weight at 8'500/10° = - kg

comment *1152* comment by: *AgustaWestland*

Attachment #11

A) CAT Operations to/from a helideck conducted with helicopters having a MPSC of more than 19 should not be permitted in Performance Class 2.

The type of operations for which OPS.CAT.355.H (a)(3) gives alleviation (HEMS at Operating Site, HEMS at a Public Interest Site or Ops to/from Helideck) with respect to OPS.CAT.355.H (a)(2), are significantly different and it is improper to group them together.

In fact in the HEMS ops at the Operating Site or at a Public Interest Site the alleviation is reasonable as the rescued person is not transported for compensation, but because is life is at serious risk.

The HEMS operating site can not be predicted and, therefore, it might not satisfy PC1 requirements in terms of size, obstacle clearance, lighting system.

Instead flights to/from helideck are CAT Ops. People are transported for compensation. They are passengers at all effects. The departure and landing site are defined and should be adequate, in term of size and strength, for PC1 operations for the specific type of helicopter being used.

In this case they, the passengers, must be protected adopting the highest level of

safety only granted by helicopters whose design and performance comply with CS/FAR

29 Category A and hence, from a performance stand point, with PC1 requirements.

B) It should be noted that, according to CS/FAR 29.1, the number of passenger seats that allow a large helicopter to be certificated Category B is 9. Above 9 passenger seats the helicopter may be certificated in Cat B provided the maximum certificated mass is less than 9072 Kg .

C) In addition OPS.CAT.355.H(e) allows helicopters with more than 19 MPSC to be operated PC2 without an assured safe forced landing capability(see OPS.SPA.005.SFL (b)). It means that, following an engine failure during Landing or during Take-off to/from a helideck, the resulting ditching could be uncontrolled and then potentially catastrophic.

D) The alleviations mentioned above for the helicopters with more than 19 MPSC are not consistent with the Performance requirements for HHO Operations (see OPS.SPA.025.HHO).

This rules prescribes that those HHO ops performed as CAT (typically the Harbour Pilot Transfer) must be conducted at a mass that allows OEI HOGE performance therefore at a mass that comply with engine failure accountability. And this limitation constitutes a severe mass penalty for every helicopter models, limiting the operational mass to the mass that allows Hover Out of Ground Effect with One Engine Inoperative (HOGE OEI).

Therefore while for this HHO CAT Ops the full stay up capability is required,

the same requirement is not applied for CAT Ops on helidecks.

E) It is worth to note that the above alleviation was never present in JAR.OPS 3 and that it was introduced with Amdt 5 (see attached file from NPA OPS 38 (JAR-OPS 3) " Helicopter Performance & Miscellaneous Items").

The argument that none helicopter is operated, to day, to/from helideck with more than 19 passenger is not a sound argument. There are several helicopter models, certificated with a MAPSC above 19 and MTOM above 9072 Kg, that may be operated in PC2 to/from helideck.

Page No: 70

Paragraph No:

OPS.CAT.355.H (a)(3)

Comment:

The performance conditions of the operations described in the paragraph have not been correctly transposed from JAR-OPS 3.470. The operations to/from a helideck for a MPSC of more than 19 are only approved if conducted in accordance with the conditions contained in OPS.SPA.SFL and the text of paragraph (a)(3) needs to be linked to (e). Additionally, the text would be better associated with paragraph (a)(2) for clarity.

A separate change has been proposed for the AMC.

Justification:

Correction of performance conditions and clarification of purpose.

Proposed Text (if applicable):

(2) having a maximum passenger seating configuration (MPSC) of more than 19, ***except that when such helicopters are operated to/from a helideck they may be operated in performance class 2 but are subject to the requirements of paragraph (e)***.

(3) ~~operations~~ ***operating*** to a HEMS Operating Site or a Public Interest Site in a congested hostile environment~~.; or operations to/from a helideck conducted with a helicopter having a MPSC of more than 19, may be~~

~~operated in performance class 2.~~

OPS.CAT.365.H (c)(1,2)

Für was steht die Abkürzung "R"? Unter OPS.GEN.010 Definitionen ist "R" nicht beschrieben. Im Text findet sich auch kein Bezug dazu.

B. I. Draft Opinion - Part-OPS - Subpart B - Section III - OPS.CAT.370.H Flight hours reporting - Helicopters p. 71

comment *454* comment by: *EHOC*

General

Although this reporting will be used to ascertain the rates for reliability of engines, it is not only for that purpose; it will also be used to assess the accident rates in all areas of operation.

This is an operational procedure and should therefore be contained in General requirements or Operational procedures.

The ACJ that accompanied this rule appears to be missing!

[ACJ OPS 3.426

Flight hours reporting

(See JAR-OPS 3.426)

The requirement of JAR-OPS 3.426 may be achieved by making available either:

- the flight hours flown by each helicopter – identified by its serial number and registration mark -

during the elapsed calendar year; or

- the total flight hours of each helicopter – identified by its serial number and registration mark – on

the 31s t of December of the elapsed calendar year.

Where possible, the operator should have available, for each helicopter, the breakdown of hours for CAT,

aerial work, general aviation. If the exact hours for the functional activity cannot be established, the

estimated proportion will be sufficient.

comment *3360* comment by: *UK CAA*

Page No: 71

Paragraph No: OPS.CAT.370.H

Comment:

Although this reporting will be used to ascertain the rates for reliability of engines, it is not only for that purpose; it will also be used to assess the accident rates in all areas of operation.

This is an operational procedure and should therefore be contained in General Requirements (Section I) or Operational Procedures (Section II).

The JAR-OPS ACJ that accompanied this rule appears to be missing and would be suitable, as modified, for a new associated AMC.

(ACJ OPS 3.426, Flight hours reporting, (See JAR-OPS 3.426))

Justification:

Clarification of purpose and improvement in compliance.

Proposed Text (if applicable):

AMC OPS.CAT.370.H Flight Hours Reporting - Helicopters

(a) The requirement of OPS.CAT.370.H may be achieved by making available either:

(1) the flight hours flown by each helicopter, identified by its serial number and registration mark, during the elapsed calendar year; or

(2) the total flight hours of each helicopter, identified by its serial number and registration mark, on the 31st of December of the elapsed calendar year.

(b) Where possible, the operator should have available, for each helicopter, the breakdown of hours for CAT, commercial and non-commercial flying. If the exact hours for the functional activity cannot be established, the estimated proportion will be sufficient.

comment *3574* comment by: *Walter Gessky*

OPS.CAT.370.H Flight hours reporting - Helicopters

Delete OPS.CAT.370.H here and transfer to **OPS.GEN.370**

New OPS **OPS.GEN.370**

An operator shall make available to the competent authority the hours flown for each aircraft operated during the previous calendar year.

Justification

This point shall be transferred to OPS.GEN.370 and required for all operators. Reporting of flight hours is important for the state safety program for a quantitative analysis.

comment *3797* comment by: *Civil Aviation Authority of Norway*

Comment:

Although this reporting will be used to ascertain the rates for reliability of engines, it is not only for that purpose; it will also be used to assess the accident rates in all areas of operation.

Justification:

Clarification of purpose and improvement in compliance.

Proposed Text

(if applicable):

AMC OPS.370.H Flight Hours Reporting - Helicopters

(a) The requirement of OPS.CAT.370.H may be achieved by making available either:

(1) the flight hours flown by each helicopter, identified by its serial number and registration mark, during the elapsed calendar year; or

(2) the total flight hours of each helicopter, identified by its serial number and registration mark, on the 31st of December of the

elapsed calendar year.

(b) Where possible, the operator should have available, for each helicopter, the breakdown of hours for CAT, commercial and non-commercial flying. If the exact hours for the functional activity cannot be established, the estimated proportion will be sufficient.

comment *5186* comment by: *DGAC*

We wonder why the requirement for the flight hours reporting is in the sub-part dealing with performance of CAT. It should rather be in the operational procedures. There could be an AMC explaining the reason for this requirement and giving some more details: it could be interesting to have the number of flight hours flown in aerial work (COM) and in CAT for example.

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.406.A Safety harness - Aeroplanes p. 72

comment *77* comment by: *Air Southwest*

The requirement refers to aeroplanes with a max certificated TOM <5700kg. This is inconsistent with other requirements. The usual cases are MTOM =<5700kg, or MTOM >5700kg. Suggest amending to read ".... take off

mass equal to or less than 5700kg ....."

On the subject of consistency, in the SI system of numbering the thousands separator is applied for all cases where more than 4 digits are present either side of the decimal point. So the correct number format could be either 5 700kg or 5700kg. Whichever is used I suggest a consistent approach is adopted. Note OPS.CAT.406.A compared to OPS.CAT.410 (b,c and d). There are numerous other examples of number inconsistency throughout the publication.

comment *3227* comment by: *Austro Control GmbH*

Safety harness for each passenger seat seems to be an "overkill" and has a big economical impact for operators.

Belts are suggested to be sufficient for passengers.

Proposal is to change wording *".... with **belts** on each...."*

comment *3575* comment by: *Walter Gessky*

OPS.CAT.406.A Safety harness - Aeroplanes

Aeroplanes with a maximum certificated take-off mass of less than 5 700 kg and with a maximum passenger seating configuration of less than 9 **the front row seats** shall be fitted with a safety harness for each passenger seat.

Comment:

Safety belt for each passenger seat seems to be an "overkill" and has a big economic impact for small operators. Only for front row seats safety harnesses shall be required.

comment *4231* comment by: *Airlec Air Espace / Paul Tiba*

This point is impossible to implement. For example, on our Swearingen Merlins, there are no compatible passenger seats with such a harness. Also, it will be very difficult or impossible to have passengers understood that they take an aircraft with harness. For them, it would represent a lack of safety of that class of aircraft. I really think that this paragraph should only refer to the recommendation letter but could not be compulsory. Thanks for taking in consideration my comment.

comment *5745* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment:

1. The term 'safety harness' should be replaced by 'shoulder harness'.

2. The referenced aeroplanes could only with a huge cost be modified with shoulder harness instead of only safety belts.The paragraph should be changed to require safety belt only.

Proposal (including ***new text***):

Aeroplanes with a maximum certificated take-off mass of less than 5 700 kg and with a maximum passenger seating configuration of less than 9 shall be fitted with a safety ~~harness~~ ***belt*** for each passenger seat.

comment *5994* comment by: *DGAC*

Proposal : insert the following § : "A safety belt with a diagonal shoulder strap for aeroplanes with a maximum certificated take-off mass not exceeding 5700 kg or a safety belt for aeroplanes with a maximum certificated take-off mass not exceeding 2730 kg may be permitted in place of a safety belt with shoulder harness if it is not reasonably practicable to fit the latter".

Justification : it is simply not possible for some "small" aircraft to meet the certification requirement for harnesses that require any harness to be able to bear 9 G force.

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.410 Flight instruments and equipment for VFR flights – Motor powered aircraft p. 72-73

comment *455* comment by: *EHOC*

Paragraph (b)

The text in GEN and CAT are two ways of doing similar things; the discriminant in GEN is objective and superior to CAT (which contains a prescriptive requirement). No further text is required for helicopters in CAT as GEN covers the requirement. Because accuracy is required it may be necessary only to provide a GM for CAT helicopters stating that:

"GM OPS.GEN.410(b)

REDUCED VISUAL CUE ENVIRONMNENT - HELICOPTERS

1. Environmental condition where the risk of loss of control is high and reference to one or more flight instruments may be necessary occurs when:

a. operating over land or water with a visibility of less than 1500m; and/or

b. operating over water and out of sight of land.

2. Because instruments cannot be fitted or removed temporarily, the net effect of not having the specified instruments is an operational limitation."

However, that does leave aeroplanes and helicopters with MCTOM > 3175 kg; this can be accommodated with an abbreviated rule text:

"(b) Helicopters with a maximum certificated take-off mass exceeding 3175 kg and aeroplanes shall, in addition to (a), be equipped with a means of measuring and displaying:"

This text appears to call for double compliance as it appears both in OPS.GEN.410(b) and OPS.CAT.410(b). To avoid this, it may be necessary to have a statement somewhere in the rule to avoid the necessity for double compliance.

Paragraph (c)

A second outside air temperature gauge is not required for helicopters or even aeroplanes (one has always been the requirement). It is usually located in the centre of the windscreen.

The text should be revised to:

"(a) In addition to OPS.GEN.410(a) ***and (b)***, aeroplanes and helicopters operating under Visual Flight Rules (VFR) shall be equipped with: (...)"

Otherwise, for VFR flights under OPS.CAT, aeroplanes would not be required to be equipped with means of measuring and displaying attitude and stabilised heading (as per OPS.GEN.410(b)(3) and (4)).

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.415 Flight instrument and equipment for VFR night flights and IFR flights – Motor powered aircraft p. 73-74

comment *78* comment by: *Air Southwest*

OPS.CAT.415(a)(2) - what does this mean! I assume it means that the aircraft must have a light or caption that illuminates (or an audio warning that sounds) when the ice/condensation detection system has failed.

comment *102* comment by: *EUROCOPTER*

Comment on OPS.CAT.415 (a)(2)(iii) and (iv):

The requirement of a 'pitot heater failure annunciation system' included in JAR-OPS 3.652 (d) says that this requirement does not apply for:

- helicopters with a MAPSC of 9 or less, or with a MCTOM of 3175 kg or less

- and issued with an individual Certificate of Airworthiness prior to 1 August 1999

The negative form of this requirement says that a 'pitot heater failure annunciation system' applies only for:

- helicopters with a MCTOM exceeding 3175 kg and with a MPSC of more than 9

- or first issued with an individual Certificate of Airworthiness on or after 1 August 1999

Wording modification proposal:

(iii) aeroplanes first issued with an individual Certificate of Airworthiness on or after 1 August 1999; ***~~and~~ or***

(*iv) helicopters with a maximum certificated take-off mass exceeding 3175 kg* ***~~or~~ and*** *a maximum passenger seating configuration of more than 9;* ***~~and issued with an individual Certificate of Airworthiness before 1 August 1999;~~***

comment *103* comment by: *EUROCOPTER*

Comment on OPS.CAT.415 (a)(4):

By consistency with aeroplanes, only helicopters with a MCTOM exceeding 3175 kg or with a MPSC of more than 9 should be under the scope of OPS.CAT.415 (a)(4)

Wording modification proposal:

(4) In the cases of aeroplanes ***and helicopters*** *with a maximum certificated take-off mass exceeding* ***respectively*** *5700 kg* ***and 3175 kg*** *or* ***with*** *a maximum passenger seat configuration of more than 9* ***~~and helicopters~~****:*

(ii) ...

(iii) ...

comment *456* comment by: *EHOC*

Paragraph (a)(1)

No method of compliance is present; a suggested text is:

"AMC OPS.CAT.415(a)(1)

MEANS OF INDICATING ALTITUDE

For single pilot operations with helicopters, the additional means of

indicating altitude may be a radio altimeter."

Paragraph (d)

The text of (d) appears to be a method of compliance of (a)(3); modern helicopters are now beginning to introduce more imaginative landing light systems using LEDs - these use less power, reduce the amount of heat and last longer. They can also provide alternative ways of achieving lighting to "illuminate the ground in front of and below the helicopter and the ground on either side of the helicopters" - other than being "adjustable in flight".

It is suggested either that paragraph (d) be removed and placed into AMC OPS.CAT.415.H(a)(3). (If there is subsequently a method of compliance which can meet the same objective it can be quickly added.)

Or:

Paragraph (d) is amended to provide an objective -thus allowing for alternative method of compliance:

" (d) In the case of helicopters the second landing light required shall be ~~adjustable in flight so as to~~ **capable of** illuminate**ing** the ground in front of and below the helicopter and the ground on either side of the helicopter.

comment *828* comment by: *Reto Ruesch*

For single pilot operations with helicopters, the additional means of indicating altitude may be a radio altimeter.

comment *7635* comment by: *Cirrus Design Corporation*

This requirement limits landing light technology to filaments and fails to include other light technologies such as LED or HID. Instead of requiring a specific quantity of landing lights or filaments, this requirement should focus on the reliability of maintaining a specific luminosity since luminosity is already addressed by the Certification Specifications. For instance, a landing light could be powered by multiple LED, which could provide any level of redundancy depending on the number of diodes used. Failure of one or more diodes could be acceptable as long as the minimum luminosity is maintained. The rule, as written, could not be adequately applied to LED technology. The use of HID technology also does not use filaments and not literally allowed by this rule as written.

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.416 Airborne weather equipment p. 74

comment *79* comment by: *Air Southwest*

OPS.CAT.416 is cumbersome and not particularly descriptive. The wording of EU-OPS 1.670 is clear and unambiguous. I suggest replacing the paragraph with the verbatim transcript of EU-OPS 1.670.

Ops cat 415 Means of indicating altitude

For single pilot operations with helicopters, the additional means of indicating altitude may be a radio altimeter.

Ops Cat 415 Night VFR landing light adjustable

Landing light at least adjustable on vertical axis AMC CAT 415 page 202.

comment *1844* comment by: *Airbus SAS*

The title of the regulation "Airborne weather equipment" is misleading. In particular because the text specifies the function to detect "... hazardous weather conditions regarded as detectable with airborne radar equipment".

It is understood and supported that EASA has made all efforts to comply with the objective to avoid technical specifications in regulations.

Consequently, as it was obviously impossible to keep the proven title "Airborne Weather Radar" from EU-OPS-1.760, and to clearly define the safety objective in OPS.CAT.416,

==> Airbus proposes to revise the regulation title to read: "Airborne weather detecting equipment".

comment *2454* comment by: *Catherine Nussbaumer*

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.417.A Equipment to wipe windshield - Aeroplanes p. 74

comment *1846* comment by: *Airbus SAS*

If the performance-based–requirement approach prevents requiring explicetly a windshield wiper (instead requiring "means to maintain a clear portion of the windshield), the requirement title should be consistent, and not reading "equipment to wipe windshield"

==> Airbus proposes to revise the requirement title to read: "Equipment to

clear windshield".

comment *2327* comment by: *heliswiss ag, belp*

Landing light at least adjustable on vertical axis AMC CAT 415 page 202.

comment *3081* comment by: *M Wilson-NetJets*

Original text:

OPS.CAT.417.A Equipment to wipe windshield - Aeroplanes

Aeroplanes with a maximum certificated take-off mass of more than 5700 kg shall be equipped at each pilot station with a means to maintain a clear portion of the windshield during precipitation.

Suggested new text:

OPS.CAT.417.A Equipment to **clear the** windshield - Aeroplanes

Aeroplanes with a maximum certificated take-off mass of more than 5700 kg shall be equipped at each pilot station with a means to maintain a clear portion of the windshield during precipitation.

Comment/suggestion:

Wipe insinuates a moving motion while there are other means available to clear the windscreen of rain or other contaminants.

comment *4623* comment by: *Bristow Helicopters*

This should be applied to all aircraft and so A should be removed

comment *7411* comment by: *Axel Schwarz*

The requirement should be restricted to operations under IFR (this would exclude e.g. commercial operations of Performance Class C aeroplanes for scenic flights...).

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.418.H Radio altimeters - Helicopters p. 75

comment *97* comment by: *EUROCOPTER*

In order to:

a) ensure a similar level of IR/AMC balance than the one applied with many other requirements as the radio altimeter requirements in OPS.SPA.010.NVIS and AMC OPS.SPA.010.NVIS (a), as well as for all Flight Performance requirements, where the detailed technical requirements have been transferred into AMCs. We also remind that it is written in Explanatory Note, item n° 35, page 31, that the general approach developed by the Agency was to put the safety objectives in the Implementing Rules and to include the technical specifications of the different instrument, data or equipment in AMC and GM.

b) take into account the fact that the rulemaking task OPS.054(b) (*'Helicopter radio-altimeters. Review of the AMC/GM due to implementing/interpretation problems'*) is included in the EASA '4-year Rulemaking Programme 2009-2012' (document dated 10 February 2009),

the proposal is to transfer into AMC OPS.CAT.418.H the detailed technical part of the radio altimeter warning function. The advantage of this proposal will be to allow in the future an easier and quicker modification of the detailed technical requirement in accordance with the outcome of the OPS.054(b) rulemaking task.

In addition 'or' as been omitted in the first two conditions (a) and (b).

Wording modification proposal:

'OPS.CAT.418.H: Helicopters on flights over water shall be equipped with a radio altimeter capable of emitting ***an audio and a visual warning*** ~~***below a preset height and a visual warning at a height selectable by the pilot,***~~ *when operating:*

- out of sight of the land; ***or***

- in a visibility of less than 1500 m; ***or***

- ...'

comment *942* comment by: *Aersud*

Comment

The requirement asks for CAT operations the "emergency exit illumination" which means "the exit should be illuminated".

Comparing CS29 and CS27 concerning this requirement there is a big difference.

The CS 29.811 Emergency exit marking and CS 29.812 Emergency lighting reports specific requirements as requested by this paragraph of EU.OPS. In case of CS27 we do not have any requirements about Emergency Illumination neither in "CS 27.807 Emergency exits".

So it is an inconsistency that in the Operative requirements foresees to add the exit illumination not requested in the CS.

For light helicopter the exit it's very close to the passengers, so it's not necessary an illumination of the exit, but it's maybe enough an emergency exit marking. A different and acceptable proposal could be a fluorescent sticker.

Consider also that this topic was discussed also in a JAA HSST meeting held between Monday 14th June - Wednesday 16th June 2004. It emerged the same problems and Authorities agreed that this requirement could be applied only for helicopters with Maximum Certified Take-off Mass greater than 3.175 kg.

Proposal

Change: (c) In addition to complying with OPS.GEN.420(e) and OPS.GEN.420(f), helicopters *with a Maximum Certified Take-off Mass greater than 3.175 kilograms (kg) and up to 7.000 kilograms (kg), shall be equipped with emergency exit illumination marking. Helicopter over 7.000 kilograms (kg)* shall be equipped with emergency exit illumination when operated on a flight over water.

Note

Priority **H**

comment *1232* comment by: *EUROCOPTER*

Wording modification proposal:

(c) In addition to complying with OPS.GEN.420(e) and OPS.GEN.420(f),

helicopters shall be equipped with emergency exit ***~~illumination~~ markings visible in daylight or in the dark*** *when operating on a flight over water*

Rationale:

This requirement raises the following questions:

- does it refer to the illumination of the exterior of the emergency exit (JAR.29 812(b) or to the illumination of the internal exit signs?

This question was raised by ENAC in 2004 and the answer of the JAA HSST was as follows:

Extract from the JAA HSST 2004-02 meeting minutes:

"3. JAR-OPS 3.830(a)(4) emergency exit illumination: ENAC requested clarification if this JAR-OPS 3 requirement refers to the illumination of the external area in front of the emergency exit (JAR 29.812(b)), or to the illumination of the internal exit signs (JAR 29.811(a)). After comparing all rule and airworthiness material the following was concluded:

• JAR-OPS 3.830(a)(4) refers to the internal lighting, however;

• JAR 29.812(d) gives the requirement for CAT. B certified JAR 29 helicopters

• JAR 29.812 (a) gives the requirement for CAT. A certified JAR 29 helicopters

• The airworthiness requirements in JAR 29 helicopters, contains sufficient rule material for 3.830(a)(4).

• JAR 27 does not contain airworthiness requirements for internal emergency exit lighting. should there be a requirement FOR jar 27. If not, deletion of 3.830(a)(4) is appropriate."

Advantages of the wording modification proposal:

- clarifies that the requirement refers to the (internal) markings and not to the external part of the emergency exit

- ensures consistency with the wording ("remain visible' and 'daylight or in the dark') used in OPS.CAT.427.H (d) (Helidecks in hostile seas)

- ensures consistency with CS 27.807 (b)(3) ('marked so as to be operated even in darkness')

- specifies the function to be achieved (visibility in darkness) instead of the means to ensure the function (illumination)

comment *1761* comment by: *claygate*

There really has not been much thought regarding the private helicopter Pilot on this one, this is totally unreasonable and would mean i would not be able to fly to France in a Private Jetranger ! The cost of adding floats for a private pilot is too expensive for us to retro fit and would curtail my European flying and British Isles flying for that matter !

Also, to carry a life raft on what is already a heavy helicopter is again

unreasonable, life vests, yes without a doubt we all use, but to make the carrying of a life raft mandatory for a private pilot is taking the safety issue too far !

come on guy's , be reasonable and sensible about these changes !

This requirement raises the following questations :

- does it refer to the illumination of th exterior of the emergency exit (JAR.29.812 (b) or to the illumination of the internal exit signs ?

This question was raised by ENAC in 2004 and the answer of the JAA HSST was as follows :

Extract from the JAA HSST 2004-02 meeting minutes :

"3.JAR OPS 3.830 (a) (4) emergency exit illumination : ENAC requested clarification if this JAR OPS 3 requirement refers to the illumination of the external area in front of the emergency exit (JAR 29.811 (a)). After comparing all rule and airworthiness material the following was concluded :

-jAR OPS 3.830 (a) (4) refers to the internal lighting, however;

- JAR 29.812 (d) gives the requirement for CAT.B certified JAR 29 helicopters

- JAR 29.812 (a) gives the requirement for CAT.A certified JAR 29 helicopters

- The airworthiness requirements in JAR 29 helicoptres, contains sufficient rule materiel for 3.830 (a) (4)

- JAR 27 does not contain airworthiness requirements for internal emergency exit lighting should there be a requirement FOR JAR 27. If not, deletion of

3.830 (a) (4) is appropriate"

Advantages of the wordin modification proposal :

-clarifies that the requirement refers to the (internal) marking and not to the external part of the emergency exit

- ensure consistency with the wordin ("remain visible and daylight or in the dark") used in OPS.CAT.427.H (d)

- ensure consistency with CS 27.807 (b) (3) (marked so as to be operated even in darkness)

- specifies the function to be achieved (visibility in darkness) instead of the means to ensure the function (illumination)

Regarding to the fact that non complex motor powered helicopters have small passenger cabins volumes, we don't think that the emergency exit illumination is necessary. We propose to request this equipment for complex motor powered helicopter only.

Proposed Text

(if applicable):

AMC OPS.370.H Flight Hours Reporting - Helicopters

(a) The requirement of OPS.CAT.370.H may be achieved by making available either:

(1) the flight hours flown by each helicopter, identified by its serial number and registration mark, during the elapsed calendar year; or

(2) the total flight hours of each helicopter, identified by its serial number and registration mark, on the 31st of December of the elapsed calendar year.

(b) Where possible, the operator should have available, for each helicopter, the breakdown of hours for CAT, commercial and non-commercial flying. If the exact hours for the functional activity cannot be established, the estimated proportion will be sufficient.

Justification:

Reformatting of requirement required.

Proposed Text

(if applicable):

(b) Helicopters certificated for operating on water, when so doing, shall, in addition to complying with OPS.GEN.420(e) and OPS.GEN.420(f), be equipped with:

(1) a sea anchor and other equipment necessary to facilitate mooring, anchoring, or manoeuvring the aircraft on water, appropriate to its size, weight and handling characteristics; and

(2) equipment for making the sound signals prescribed in the International Regulations for the prevention of collisions at sea; and

~~*(c) In addition to complying with OPS.GEN.420(e) and OPS.GEN.420(f), helicopters shall be equipped with*~~

(3) *emergency exit illumination ~~when operated on a flight over water~~:*

(i) *in Performance Class 1 or 2, at a distance corresponding to more than 10 minutes flying time at normal cruising speed; or*

(ii) *in Performance Class 3, at a distance corresponding to more than 3 minutes flying time at normal cruising speed.*

comment *4318* comment by: *Civil Aviation Authority of Norway*

Comment:

Specific Norwegian requirements for surveillance and alarm equipment.

Justification:

Safety enhancing equipment

Proposed Text

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.426.H Crew survival suits - Helicopters p. 76

comment *7516* comment by: *Civil Aviation Authority of Norway*

OPS.CAT426.H Crew survival suits – Helicopters

(a) This section states that each member of the crew of a helicopter shall wear a survival suit when the sea temperature will be less than plus 10 ºC during the flight, or the estimated rescue time exceeds the estimated survival time;

Recommendation:

Increasing the sea temperature level from +10ºC to +15ºC.

A higher temperature requirement will harmonize design survival time through the sea water temperature range. An individual passenger on a flight over +15ºC sea water should not be less protected than an individual wearing an immersion suit at +2 ºC. A Class B suit system is verified to support 4 hours survival in calm water at 0 to +2 ºC. An individual not wearing an immersion suit need a sea water temperature of near +20 ºC to obtain an equal survival time.

This is also supported by the IMO in MSC/Circ. 1046 which shows that the survival time by 10ºC is 0.8h and by 20 ºC is 1.7h wearing un-insulated suit. EASA ETSO 2C-502 and 2C-503 requires Class B isolated suit which by 15 ºC has a survival time of 7h (EN ISO 15027-1:2002 Table A.1).

The consequences of cold shock, which can occur up to 20 ºC, is eliminated by wearing an immersion suit.

Recommendation:

Delete the text:" ..*or the estimated rescue time exceeds the estimated*

survival time".

Estimating survival time is explained in GM OPS.CAT.426.H Crew Survival Suits – Helicopters.

Delete GM OPS.CAT.426.H Crew Survival Suits – Helicopters.

EASA has issued European Technical Standard Orders for survival suit that satisfies the test requirements of paragraph 3.8 of EN ISO 15027-3:2002 as a class B suit system. The information given in GM OPS.CAT.426.H Crew Survival Suits – Helicopters is not relevant for Class B certified survival suits.

comment *7517* comment by: *Civil Aviation Authority of Norway*

OPS.CAT426.H Crew survival suits – Helicopters

(b) .. temperature will be less than plus 10 ºC.

Recommendation:

Increasing the temperature level from 10 ºC to 15 ºC.

Higher temperature requirement will increase survival time and give time to be rescued. This is also supported on MSC/Circ. 1046 which shows that the survival time by 10ºC is 0.8h and by 20 ºC is 1.7h wearing un-insulated suit. EASA ETSO 2C-502 and 2C-503 requires Class B isolated suit which by 15 ºC has a survival time of 7h (EN ISO 15027-1:2002 Table A.1). The risk of cold shock, which can occur up to 20 ºC, will be reduced by wearing an immersion suit.

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.430 Emergency Locator Transmitter (ELT) – Motor-powered aircraft p. 77

comment *943* comment by: *Aersud*

Comment

The regulation asks for the installation of a Automatic Deployable ELT (ELT(AD)), In that case the ELT requested by OPS.GEN.430 (c) is no more necessary. The article should be modified adding that one ELT, independently of the type, it's enough.

Proposal

Add: [omissis] shall be equipped with an Automatic Deployable Emergency Locator Transmitter (ELT(AD))*; in this case the automatic ELT requested in OPS.GEN.430 (c) is no more required.*

Note

Priority: **L**

comment *1631* comment by: *Luftfahrt-Bundesamt*

The ELT rule does not include the frequency requirement, asking for 121,5 and 406 MHz capability. This, however, is included in AMC OPS.GEN.430 No.2, which is not acceoptable.

Applicability date 1 July 2008 needs to be adjusted.

comment *1690* comment by: *Dassault Aviation*

Technical comment.

Page 77 OPS.CAT.430 §(a)(2) ELT motor-powered aircraft: paragraph (a)(1) requires 2 ELTs on aeroplanes first issued with an individual certificate of airworthiness after 04-jul-2008, whereas paragraph (a)(2) requires 1 ELT(A) or 2 ELT of any type *in other cases*. Our comment is replace the term "other cases" by "before and including 01-jul-2008", so as to improve the text in clarity, and to keep wording consistency with OPS.GEN.430.

comment *3600* comment by: *jim reeve*

i do not see any safety benefit in everyone corrying elt.false alarms and inadvertant activation already tie up precious emergency services,and this will increase by several orders of magnitude. em. servicies will ignore them unless backed by second opinion due to too many false alarms.this will actually reduce service for those that wisely carry elt for flight in inhospitable areas.there is always a farmer around for 99.99% of forced landings

comment *3944* comment by: *SNEH Organisation representing all french commercial helicopters operators*

(b) OPS 3 allows the use of an equivalent system. The text should be either:

Notwithstanding OPS.GEN.430 (c), helicopters operated in performance Class 1 or 2 used in offshore operations on a flight over water, in a hostile environment and at a distance corresponding to more than 10 minutes flying time at normal cruising speed shall be equipped with an Automatically Deployable Emergency Locator Transmitter (ELT(AD)) or equivalent system.

Or : mandatory only for aircraft with the first airworthiness certificate delivered after 2012

comment *5890* comment by: *ERA*

European Regions Airline Association Comment

The requirement of carriage of a second ELT of any type, provided the first one is automatic has been in question since the introduction of the requirement in July 2008. There is a recognised need is to have one automatic ELT. The second one be it portable or fixed could be considered obsolete. EASA should review the need as this was a compromise not based on performance based requirements but based on an original flawed assumption that the original requirements that were changed in July 2008 would not be used as bargaining chips by ICAO member states to offset other equipment requirements. Therefore EASA need to consider the following:

- File an ICAO difference with the July 2008 requirement
- Change wording of (a)(1) to the following:

(1) one automatic ELT in the case of aeroplanes first issued with an individual Certificate of Airworthiness after 1 January 2002; or

comment *5941* comment by: *DGAC*

Proposal: At the end of (b) add: "or an equivalent means acceptable to the competent authority"

Justification: Already accepted in french version of JAR-OPS3

comment *6287* comment by: *Lufthansa CityLine GmbH*

1) one automatic ELT in the case of aeroplanes first issued with an individual Certificate of Airworthiness after 1 January 2002; or

2) one automatic Emergency Locator Transmitter (ELT), or two ELTs of any type , in other cases.

2) one automatic Emergency Locator Transmitter (ELT), or two ELTs of any type , in other cases.

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.432 Megaphones – Motor-powered aircraft p. 77

comment *367* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.432:

The term "sufficient number" is ambiguous: the exact number shall be defined in the rule.

comment *1633* comment by: *Luftfahrt-Bundesamt*

The LBA cannot agree to the move of major parts of the former megaphone

requirements into the AMC – material. We request to re-establish the requirements on the required number of megaphones which are currently in place in JAR-OPS 3 and EU-OPS in order to provide legal clarity.

Justification: see LBA - General Comment, reasons 1 and 2.

comment *1729* comment by: *claire.amos*

EU-OPS states the required number of megaphones dependant on seats fitted. This only states a sufficient number. What will be considered a sufficient number by each individual NAA? Clarity is required to ensure consistency across all European operators.

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.440 High altitude flights – Oxygen requirements for motor powered aircraft p. 77-79

comment *80* comment by: *Air Southwest*

OPS.CAT.440 inconsistency. This paragraph (and others) use the word 'cockpit' to refer to the pilot station area. Other sections refer to the flight deck (OPS.GEN.485.A for instance). One dictionary definition of 'flight deck' is "the part at the front of an aircraft, larger than a cockpit, where the pilot and other crew sit." I suggest standardisation in CAT to 'flight deck.'

comment *878* comment by: *Condor Flugdienst GmbH - FRA HO/R*

Regarding OPS.CAT.440 Table 1 (4):

Please clarify by using the following wording:

- 30% of passengers: "… when the cabin pressure altitude exceeds 14.000 ft, but does not exceed

15.000 ft"

Regarding OPS.CAT.440 Table 1 (5):

Please clarify by using the following wording:

- 10% of passengers: "…when the cabin pressure altitude exceeds 10.000 ft, but does not exceed

14.000 ft..."

comment *977* comment by: *REGA*

The originally JAR (JAR-OPS 3.385) rules for high altitude helicopter (e.g. hems) operations take into account the performance decline due to the increased weight of oxygen equipment (=less power available) at higher altitudes.

Experience did not show any incident or accident during HEMS operations in relation to oxygen supply. Many ski, hiking and climbing areas within the Alps are situated above 10'000 ft. To be able to continue HEMS operations - guarantee rescue service - in the mountains, duration of maximum 30 minutes between 10'000 ft and 13'000 ft without supplemental oxygen shall be allowed.

Proposal (a) (1) (ii) (12)

Use of supplemental oxygen. With prior approval of the authority, HEMS operations between 10 000 ft and 13 000 ft for a duration of maximum 30 minutes may be undertaken without the use of supplemental oxygen in accordance with procedures contained in the Operations Manual. (In such circumstances, the HEMS operator must ensure that the passengers are informed before departure that supplemental oxygen will not be provided).

comment *1849* comment by: *Airbus SAS*

The following comment on OPS.CAT.440 focuses on inconsistencies with the requirement GM1 OPS.CAT.440. It is also introduce there as comment no.1848 :

The allocation of GM sentences to OPS.CAT.440 Table 1 seem to be incorrect, or table 1 points may at least be insufficiently clarified:

- With reference to Table 1 point 5., GM sentence 1 specifies a quantity of necessary oxygen for a period of 10 min descent from max certified operating altitude to 10000 ft, followed by 20 min at 10000ft.

- OPS.CAT.440 table 1 point 5 specifies oxygen required for 10 % of the passengers for the remainder of the flight between 10000 and 14000 ft , after the initial 30 min at these altitudes.

=> There is a need to better clarify the time/altitude relations.

- With reference to Table 1 point 4., GM sentence 4 specifies the minimum necessary quantity of oxygen for a constant rate of descent from max certified operating altitude to 15000 ft in 10 minutes.

- OPS.CAT.440 table 1 point 4 requires minimum oxygen supply for 30 % of passenger for the entire flight between 14000 and 15000 ft.

=> Also for these details of regulation and GM, the relation is difficult to understand.

==> Airbus proposes to re-investigate OPS.CAT.440 and related GM1 for consistency and clarity of wording.

comment *2271* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern detail:

High altitude flights – Oxygen requirements for motor powered aircraft

Comment / Proposal:

Modify text:

Insert the following possibility into table 2:

With prior approval of the authority, excursions between 10 000 ft and 16 000 ft for a short duration may be undertaken without the use of supplemental oxygen in accordance with procedures contained in the Operations Manual. (In such circumstances, the operator must ensure that the passengers are informed before departure that supplemental oxygen will not be provided.)

comment

2389 comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

Comment:

There is an Untidiness and lack of clarity in the wording and tables in this IR. These need to be clarified and corrected.

e.g The wording is not clear where the 14000 ft belongs to, whereas **Appendix 1 to EU-OPS 1.770:**

4. 30% of passengers (note 5) Entire flight time when the cabin pressure altitude exceeds 14000 ft but does not exceed 15000 ft

5. 10% of passengers (note 5). Entire flight time when the cabin pressure altitude exceeds 10000 ft but does not exceed 14000 ft after the first 30 minutes at these altitudes.

Proposal:

The EU-OPS [Appendix 1 to EU-OPS 1.770] wording is clearer and the EASA wording should be changed to this to provide clarity.

comment

2510 comment by: *Royal Aeronautical Society*

The reason for having oxygen supplied in the manner described is to *supplement* oxygen that is naturally available, and is distinct from oxygen that may be required for *emergency* or *therapeutic* reasons. It is suggested that the heading be amended to read, **'High altitude flights – Supplemental oxygen requirements for motor-powered aircraft'**.' so that this distinction is clear. See also and contrast with OPS.CAT.447 A 'First aid oxygen – Aeroplanes', and GM CAT.447 A General, paragraph 2 where this description is used: 'supplemental oxygen as calculated in accordance with Table 1 OPS.CAT 440 and Table 2 OPS CAT 440 … etc'.

For the same reason, it is suggested that the headings to both Tables on pages 78 and 79 should also be amended to read, **'Supplemental oxygen**

minimum requirements …etc'.

comment *3003* comment by: *AOPA Switzerland*

Again, all flights consisting of parachute operation shall be exempted from OPS.CAT.440

comment *3070* comment by: *AEA*

Comment:

The wording is different from the EU-OPS 1.770 wording in particular in relation to the **cabin pressure altitudes** (for example 'exceeds 10000 feet but does not exceed 13000 feet' (EU-OPS) is less restrictive than between 10000 feet and 13000 feet). This change which would have huge impact on flight operations is therefore not acceptable to AEA.

Proposal:

Realign with EU-OPS 1.770 with no changes in wording

comment *3371* comment by: *UK CAA*

Page: 78/79

Paragraph No:

OPS.CAT.440 Tables 1 & 2

Comment:

The notes to Tables 1 & 2 of the Regulation are an integral part of the methodology in calculating the oxygen requirements from the OPS.CAT.440 Tables 1 & 2. It is inappropriate to relegate them to the status of GM.

In addition the notes provided by GM1 OPS.CAT.440 are incorrect.

The corrected text in GM1 OPS.CAT.440 should be included as notes to Tables 1 & 2 OPS.CAT.440 and GM1 OPS.CAT.440 deleted.

Justification:

Insufficient information provided in the Rule.

Proposed Text (if applicable):

Oxygen – Minimum Requirements for Supplemental Oxygen for Pressurised Aeroplanes During and Following Emergency Descent

Table 1 OPS.CAT.440 Oxygen minimum requirements for pressurised aeroplanes

Supply for:	Duration and cabin pressure altitude

1. Occupants of cockpit seats on cockpit duty	(a) The entire flight time when the cabin pressure altitude exceeds 13 000 ft (b) The remainder of the flight time when the cabin pressure altitude is between 10 000 ft and 13 000 ft, after the initial 30 minutes at these altitudes, but in no case less than: (i) 30 minutes supply for aeroplanes certificated to fly at altitudes below 25 000 ft ***(Note 1)***; and (ii) 2 hours supply for aeroplanes certificated to fly at altitudes more than 25 000 ft ***(Note 2)***.
2. Required cabin crew members	(a) The entire flight time when cabin pressure altitude is above 13 000 ft but not less than 30 minutes. ***(Note 1)***, (b) The remainder of the flight time when the cabin pressure altitude is between 10 000 ft and 13 000 ft, after the initial 30 minutes at these altitudes.
3. 100% of passengers (Note 4)	The entire flight time when the cabin pressure altitude exceeds 15 000 ft but in no case less then 10 minutes supply. ***(Note 3)***.
4. 30% of passengers (Note 4)	The entire flight time when the cabin pressure altitude is between 14 000 ft and 15 000 ft.
5. 10% of passengers (Note 4).	The remainder of the flight time when the cabin pressure altitude is between 10 000 ft and 13 000 ft, after the initial 30 minutes at these altitudes

Note 1: The required minimum supply is that quantity of oxygen necessary for a constant rate of descent from the aeroplane's maximum certificated operating altitude to 10 000 ft in 10 minutes and followed by 20 minutes at 10 000 ft.

Note 2: The required minimum supply is that quantity of oxygen necessary for a constant rate of descent from the aeroplane's maximum certificated operating altitude to 10 000 ft in 10 minutes and followed by 110 minutes at 10 000 ft.

Note 3: The required minimum supply is that quantity of oxygen necessary for a constant rate of descent from the aeroplane's maximum certificated operating altitude to 15 000 ft in 10 minutes.

Note 4: For the purpose of this table "passengers" means passengers actually carried and includes infants.

Table 2 OPS.CAT.440 Oxygen minimum requirements for non-pressurised aeroplanes

Add at bottom of table:

For the purpose of this table "passengers" means passengers actually carried and includes infants.

Delete: GM1 OPS.CAT.440 in total

comment *3653* comment by: *AUSTRIAN Airlines*

Comment:

The wording is different from the EU-OPS 1.770 wording in particular in relation to the **cabin pressure altitudes** (for example 'exceeds 10000 feet but does not exceed 13000 feet' (EU-OPS) is less restrictive than between 10000 feet and 13000 feet). This change which would have huge impact on flight operations is therefore not acceptable to AUSTRIAN.

Proposal:

Realign with EU-OPS 1.770 with no changes in wording

comment *3947* comment by: *SNEH Organisation representing all french commercial helicopters operators*

There was alleviation in JAR OPS 3.005 (e) allowing the incursion between 13 000 ft and 16 000 ft for short period without oxygen. We propose to keep this alleviation.

The wording is different from the EU-OPS 1.770 wording in particular in relation to the **cabin pressure altitudes** (for example 'exceeds 10000 feet but does not exceed 13000 feet' (EU-OPS) is less restrictive than between 10000 feet and 13000 feet).

Proposal:

Realign with EU-OPS 1.770 with no changes in wording

comment *7419* comment by: *Axel Schwarz*

The requirements should be the same for all operations. OPS.GEN.440 should therefore be sufficient.

Furthermore, Table 1 is not in compliance with ICAO Annex 6 Part I (14000ft and 15000ft - requirements for passengers).

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.442.A Crew protective breathing equipment - Aeroplanes p. 79

comment *1691* comment by: *Dassault Aviation*

Technical comment.

Page 79 OPS.CAT.442.A §(b) Protective Breathing Equipment aeroplanes: §(b) requires an additional portable PBE to be located near the hand fire extinguishers required in OPS.CAT.405 (b) and (c). Although the additional portable PBE associated to the hand fire extinguisher required by OPS.CAT.405(c) - near cargo/baggage compartment - may be useful on "large" aeroplanes, it is useless on aeroplanes with "small" cabin where the flight crew can instead use the portable PBE associated to the hand fire extinguisher required by OPS.CAT.405(b) - near each galley - to fight a fire in the cargo/baggage compartment. We propose to reword §(b) of OPS.CAT.442.A as follows: "*In addition, the aeroplanes in (a) shall be equipped with an additional portable PBE located near the hand fire extinguishers required in OPS.CAT.405 (b) and (c)****, except that aeroplanes with a MPSC < 20 and MTOM < 45,360 kg need not to comply with the additional portable PBE located near the hand fire extinguisher required in OPS.CAT.405(c)***".

comment *2391* comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

Comment:

EU-OPS 1.780 Crew protective breathing equipment

(a)2. States: it has sufficient portable PBE to protect the eyes, nose and mouth of all required cabin crew members and to provide breathing gas for a period of not less than 15 minutes.

Proposal:

OPS.CAT.442.A (a)(2) Replace "oxygen" by "breathable air".

comment *6890* comment by: *Flybe*

This requirement is for PBE to be provided for all flight crew members at their assigned duty station and is an addition to the existing requirement for at least one PBE to be provided to flight crew.

Flight crew are already provided with personal oxygen supplies and smoke goggles. It is suggested that provided that each flight crew member has access to a dedicated oxygen supply and smoke protection for the eyes, then the requirement for a separate PBE should be limited to at least one PBE for

the flight crew.

"Note to (1)

Provided that each flight crew member has access to a dedicated oxygen supply and smoke protection for the eyes, either as a separate or combined mask, the number of required PBE can be changed to at least one"

comment *7094* comment by: *IACA International Air Carrier Association*

(a)(2)

Provide "oxygen" or provide "breathing gas" ?

EU-OPS 1.780 Crew protective breathing equipment

(a)2. it has sufficient portable PBE to protect the eyes, nose and mouth of all required cabin crew members and to provide breathing gas for a period of not less than 15 minutes.

Replace "oxygen" by "breathable air".

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.447.A First aid oxygen - Aeroplanes p. 79

comment *1634* comment by: *Luftfahrt-Bundesamt*

LBA cannot agree to the move of major parts of the former requirements into the AMC – material. We request to re-establish the first aid oxygen requirements currently in place in JAR-OPS 3 and EU-OP in order to provide legal clarity.

Justification: see LBA - General Comment, reasons 1 and 2.

comment *7100* comment by: *IACA International Air Carrier Association*

(b)

"Personnel" implies an employment relationship; doctors and nurses on-board are passengers and not employed by the operator. Better is to write "…by qualified individuals."

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.462.A Altitude alerting system – Aeroplanes p. 80

comment *777* comment by: *ECA - European Cockpit Association*

Comment on the following text:

"…an altitude alerting system capable of alerting the flight crew when approaching…"

"…the warning shall be made by an aural signal"

The Airbus family presently does not comply with this requirement, as there is not an aural signal alerting of the approach to the cleared altitude under normal operation with AutoPilot on.

comment *3375* comment by: *UK CAA*

Page No: 80

Paragraph No: OPS.CAT.462.A

Comment:

The condition specified in sub-paragraph (b) applies to all of sub-paragraph (a) and not just (a)(3).

Justification:

Incorrect condition applied to Regulation.

Proposed Text (if applicable):

OPS.CAT.462.A Altitude alerting system – Aeroplanes

The following aeroplanes shall be equipped with an altitude alerting system capable of alerting the flight crew when approaching, or deviating from, a pre-selected altitude:

turbine-powered aeroplanes with a maximum certificated take-off mass exceeding 5 700 kg; or

aeroplanes with a maximum passenger seating configuration of more than 9; or

aeroplanes powered by turbo-jet engines.

(b) ~~In the case of (a)(3),~~ The warning shall be made by *at least* an aural signal.

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.482 Seat belts and harnesses for the observer seat in the cockpit p. 80

comment *460* comment by: *EHOC*

General

The provision of this requirement is understood and supported. However, it must be pointed out that some legacy helicopters do not provide such harnesses; this will inevitably hinder the move towards LOFT.

comment *3205* comment by: *Austro Control GmbH*

Any observer seat in the cockpit of aircraft, except balloons, shall be equipped with a safety belt with shoulder harness ***or diagonal belt*** *incorporating a device which will automatically restrain the occupant's upper torso in the event of rapid deceleration.*

Justification:

The exemptions and derogations accordig to Art. 8 (2) and (3) show that there is an urgent practical need for this change!

comment *3576* comment by: *Walter Gessky*

OPS.CAT.482 Seat belts and harnesses for the observer seat in the cockpit

Any observer seat in the cockpit of aircraft, except balloons, shall be equipped with a safety belt with shoulder harness **or when adequately justified with a diagonal belt** incorporating a device which will automatically restrain the occupant's upper torso in the event of rapid deceleration.

Justification:

Several exemptions and derogations are filed according Art 8(2) and (3). There is a need for this change. A shoulder harness will provide on certain installation an adequately level of safety equal to a shoulder harness.

comment *5747* comment by: *Swedish Transport Agency, Civil Aviation Department*

(Transportstyrelsen, Luftfartsavdelningen)

Comment:

There is a problem with some aeroplane types which have a safety belt but no shoulder harness for the observer seat in the cockpit. Until EASA has completed a rule-making task for this subject the requirements for shoulder harness should be in line with the ICAO Annex 6, Part I standard that only requires shoulder harness for cabin crew jump seats in the cabin compartment. (Ref. OPS.CAT.406.A)

Proposal (including ***new text***):

Any observer seat in the cockpit of aircraft, except balloons, shall be equipped with a safety belt. ~~with shoulder harness incorporating a device which will automatically restrain the occupant's upper torso in the event of rapid deceleration~~

comment *6884* comment by: *Flybe*

This section does not include a definition of the required shoulder harness. Some aircraft (Dash 8 series) are equipped with a 3 point hrness on the jump seat for crew members and this is approved within the aircraft certification.

An additional definition of the type of harness should be include.

"Safety belts with shoulder harnesses shall have a single point release. The harness shall be a four point harness for operatring crew; however, flight deck jump seats may be equipped with a three point diagonal shoulder strap"

comment *7657* comment by: *Asociación Española de Pilotos de Aerostación (AEPA)*

OPS. CAT 482: Although the procedure is accurate typing CAT is not adequate. It would be better GEN

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.490 Flight data recorder – Motor powered aircraft p. 80-81

comment *1635* comment by: *Luftfahrt-Bundesamt*

The LBA cannot agree to the move of FDR – parameter tables into the AMC – material. JAA especially prepared an NPA to move these tables in Section 1 of JAR-OPS in order to provide legal clarity.

Justification: see LBA - General Comment, reasons 1 and 2.

comment *1676* comment by: *Dassault Aviation*

Editorial comment.

Page 80 OPS.CAT.490 (FDR) §(a): requirement (a)(1) shall be dissociated from (a)(2), therefore, the word "and" at the end of (a)(1) shall be replaced by "or".

comment *3008* comment by: *AOPA Switzerland*

For aeroplane: Flight data recorder equipment shall only be mandatory in those aircraft mentioned in OPS.GEN.495 "Cockpit voice recorder", as flight data recorder are not in direct relation with flight safety.

However, should no FDR available on the market (especially for older aircraft) the national authority may allow exeptions.

comment *3377* comment by: *UK CAA*

Page No: 81

Paragraph No:

OPS.CAT.490(d)(3)

Comment:

The requirement for data to be recorded by OPS.CAT.490(d)(3) relates to an OPS.GEN.490 requirement and should be deleted from this requirement.

Justification:

Misplaced recording requirement.

Proposed Text (if applicable):

HELICOPTERS

(c) Notwithstanding OPS.GEN.490(c):

(1) helicopters with a maximum certificated take-off mass exceeding 3 175 kg and first issued with an individual Certificate of Airworthiness after 31 July 1999; and

(2) helicopters having a maximum certificated take-off mass exceeding 7 000 kg, or a maximum certificated seating configuration of more than 9, and first issued with an individual Certificate of Airworthiness between 1 January 1989 and 31 July 1999, inclusive, shall be equipped with a flight data recorder that uses a digital method of recording and storing data and a method of retrieving that data from the storage medium available.

(d) Notwithstanding OPS.GEN.490(d), the flight data recorder shall be capable of retaining the data recorded during at least:

(1) the last 8 hours, for helicopters referred to in (c)(1); or

(2) the last 5 hours, for helicopters referred to in (c)(2); ~~or~~

~~the last 10 hours for helicopter with a maximum certificated take-off mass exceeding 3 175 kg, and first issued with an individual certificate of airworthiness after 31 December 2009.~~

comment *3708* comment by: *Civil Aviation Authority of Norway*

Comment:

The requirement for data to be recorded by OPS.CAT.490(d)(3) relates to an OPS.GEN.490 requirement and should be deleted from this requirement.

Justification:

Misplaced recording requirement.

Proposed Text

(if applicable):

HELICOPTERS

(c) Notwithstanding OPS.GEN.490(c):

(1) helicopters with a maximum certificated take-off mass exceeding 3 175 kg and first issued with an individual Certificate of Airworthiness after 31 July 1999; and

(2) helicopters having a maximum certificated take-off mass exceeding 7 000 kg, or a maximum certificated seating configuration of more than 9, and first issued with an individual Certificate of Airworthiness between 1 January 1989 and 31 July 1999, inclusive, shall be equipped with a flight data recorder that uses a digital method of recording and storing data and a method of retrieving that data from the storage medium available.

(d) Notwithstanding OPS.GEN.490(d), the flight data recorder shall be capable of retaining the data recorded during at least:

~~(3) the last 10 hours for helicopter with a maximum certificated take-off mass exceeding 3 175 kg, and first issued with an individual certificate of airworthiness after 31 December 2009.~~

comment *4906* comment by: *BEA*

OPS.CAT.490 (a)

The wording « FDR which uses a digital method of recording and storing data and has a method of retrieving that data from the storage medium available" is not precise enough:

- Does digital storing of the data implies that a non magnetic FDR is referred to ? ICAO is planning to issue shortly a new version of Annex 6 which deals with discontinuing the use of magnetic tape FDR after 2016, but until this date some airplanes will still be using magnetic tape FDR.
- The FDR does not usually contain a method to fully retrieve data from its storage medium, some additional information is needed, in particular the parameters frame layout.

comment *5983* ☐ comment by: *DGAC*

Proposal:

For GEN: apply dates and weights according to ICAO Annex 6 (2nd part for aeroplanes and 3rd part for helicopters)

For CAT: apply dates and weights from EU-OPS / JAR-OPS3

Justification:

Avoid costly retrofit.

comment *7063* comment by: *Embraer - Indústria Brasileira de Aeronáutica - S.A.*

Embraer believes that there is an editorial error in paragraph (a)(2) that where it should say ". . .multi-engine turbine powered aeroplanes with a maximum certificated take-off mass of 5 700 kg or less, ***and*** with a maximum passenger seating configuration of more than 9, and first issued with an individual Certificate of Airworthiness after 31 March 1998, . . ." As written this is a change to the existing requirements of EU OPS which should be addressed in the Regulatory Impact Assessment unless the requirement is changed to match the existing EU OPS.

comment *3009* comment by: *AOPA Switzerland*

Cockpit voice recorder equipment shall only be mandatory in those aircraft mentioned in OPS.GEN.495 "Cockpit voice recorder", as cockpit voice recorders are not in direct relation with flight safety.

comment *4908* comment by: *BEA*

OPS.CAT.495 (b)

The duration of CVR is not covered in the paragraph for aeroplanes with a maximum certificated take-off mass exceeding 5700 kg and issued before march 1998. It is suggested to include them in the (b) (2).

comment *5983* ☐ comment by: *DGAC*

Proposal:

For GEN: apply dates and weights according to ICAO Annex 6 (2nd part for aeroplanes and 3rd part for helicopters)

For CAT: apply dates and weights from EU-OPS / JAR-OPS3

Justification:

Avoid costly retrofit.

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.515.A Microphones - Aeroplanes p. 81-82

comment *82* comment by: *Air Southwest*

OPS.CAT.515.A (a) states "...shall wear the headset with boom....." I suggest this should read "...shall wear a headset with boom....."

comment *115* comment by: *tbone aviation a/s*

Propose new wording for section (a):

Each flight crew member required to be on duty shall wear the headset with boom, throat or equivalent microphone and use it as the primary device to listen to the voice communication with Air Traffic Services:

This new proposed wording include the "equivalent" phrase to allow the use of other and newer technologies compared to the boom microphone.

comment *1835* comment by: *claire.amos*

easyJet compliant under OM-A 8.3.20.2

comment *3011* comment by: *AOPA Switzerland*

Airplane certified with an overhead loudspeaker system shall not be required to use headsets.

comment *3382* comment by: *UK CAA*

Page No: 81/82

Paragraph No: OPS.CAT.515.A

Comment:

The regulation is not clear due to incorrect formatting. Sub-paragraph (2) contains a heading plus a condition. Sub-paragraph (3) is a condition of sub-paragraph (2).

Justification:

Incorrect formatting.

Proposed Text (if applicable):

OPS.CAT.515.A Microphones - Aeroplanes

(a) Each flight crew member required to be on duty shall wear the headset with boom or throat microphones and use it as the primary device to listen to the voice communications with Air Traffic Services:

(1) on the ground:

(i) when receiving the ATC departure clearance via voice communication; and

(ii) when engines are running;

~~(2) in flight below transition altitude or 10000ft, which ever is higher; and~~

~~(3) whenever deemed necessary by the pilot-in-command.~~

(2) in flight:

(i) below transition altitude or 10000ft, which ever is higher; and

(ii) whenever deemed necessary by the pilot-in-command.

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.516 Crew member interphone system – Motor-powered aircraft p. 82

comment *1677* comment by: *Dassault Aviation*

Editorial comment.

Page 82 : OPS.CAT.516 §(b): word "already" is missing to read "… with an individual Certificate of Airworthiness before 1 April 1965 and *already* register in a Member State on 1 April 1995 …".

comment *1692* comment by: *Dassault Aviation*

Technical comment.

Page 82 OPS.CAT.516 Crew Member interphone system: Although this proposed text is compliant with JAR/EU-OPS1.690, it is Dassault proposal to exclude aeroplanes with a MPSC less than 20 and with a MTOM less than 45,360 kg from a crew member interphone system. The rationale is that for that category of airplanes, the cabin is small enough to orally communicate without the need of an assisted device.

comment *3089* comment by: *M Wilson-NetJets*

Original text:

OPS.CAT.516 Crew member interphone system – Motor-powered aircraft AEROPLANES

(a) Aeroplanes with a maximum certificated take-off mass exceeding 15 000 kg, or with a maximum passenger seating configuration of more than 19 shall be equipped with a crew member interphone system.
(b) Notwithstanding (a), those aeroplanes first issued with an individual Certificate of Airworthiness before 1 April 1965 and registered in a Member State on 1 April 1995 are not required to be equipped with a crew member interphone system.

Suggested new text:

OPS.CAT.516 Crew member interphone system – Motor-powered aircraft AEROPLANES

(a) Aeroplanes with a maximum certificated take-off mass exceeding 15 000 kg, **and** with a maximum passenger seating configuration of more than 19 shall be equipped with a crew member interphone system.
(b) Notwithstanding (a), those aeroplanes first issued with an individual Certificate of Airworthiness before 1 April 1965 and registered in a Member State on 1 April 1995 are not required to be equipped with a crew member interphone system.

Comment/suggestion:

The communication in small cabin (MPSC of 19 or less) is more easily accomplished by directly talking between crewmembers or passengers.

Therefore this clause should be only applicable to aeroplane types with a MPSC of 20 or more.

comment *3403* comment by: *UK CAA*

Page No: 82

Paragraph No: OPS.CAT.516

Comment:

Although this reflects the requirement in EU-OPS, the UK CAA has consistently argued that this is not a reasonable requirement.

The Rule assumes that aeroplanes with a maximum certificated take-off mass exceeding 15,000 kg will carry a cabin crew member. Where the maximum passenger seating configuration is less than 19, a cabin crew member is not required. Therefore, the Regulation should not require an interphone to be fitted where cabin crew are not required.

Justification:

Inappropriate Regulation.

Proposed Text (if applicable):

AEROPLANES

(a) Aeroplanes with a maximum certificated take-off mass exceeding 15 000 kg, ~~or~~ ***and*** with a maximum passenger seating configuration of more than 19 shall be equipped with a crew member interphone system.

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.517 Public address system – Motor-powered aircraft p. 82

comment *461* comment by: *EHOC*

Paragraph (a)

Perhaps a better construct might be:

(a) Except as provided in (b) below, the following aircraft shall..."

This could distinguish between a construct that overrules a rule in GEN (using 'notwithstanding'), and a local variation (using 'except as...').

comment *3383* comment by: *UK CAA*

Page No: 82

Paragraph No: OPS.CAT.517

Comment:

The paragraph construction is confusing by having two separate conditions for Helicopters. Separating the two aircraft types will provide clarity. In addition, the requirement is confusing by stating an upper limit (less than 19 passengers) without including a lower limit (9 Passengers)

Justification:

Clarity

Proposed Text (if applicable):

OPS.CAT.517 Public address system – Motor-powered aircraft

~~AEROPLANES AND HELICOPTERS~~

~~(a)~~ ***The following aircraft shall be equipped with a public address system:***

AEROPLANES

~~(1) aeroplanes~~ ***(a)*** With a maximum passenger seating configuration of more than 19; ~~and (2) helicopters with a maximum passenger seating configuration of more than 9.~~

HELICOPTERS

(b) ~~Notwithstanding (a),~~ ***With a maximum passenger seating configuration of more than 9.***

(c) The public address system may not be required for helicopters with a maximum passenger seating configuration ***of more than 9 but*** less than 19 if:

(1) the helicopter is designed without a bulkhead between the cockpit and passenger compartment; and

the operator can demonstrate to the competent authority that, in flight the pilot's voice is audible at all passengers seats.

comment *3794* comment by: *Civil Aviation Authority of Norway*

comment *83* comment by: *Air Southwest*

OPS.CAT.519.A(a) - missing word. "...between the passenger and the

cockpit..." Amend to read " .....between the passenger compartment and the flight deck ...."

B. I. Draft Opinion - Part-OPS - Subpart B - Section IV - OPS.CAT.525 Communication and navigation equipment for VFR as controlled flights, night flights and IFR flights – Motor-powered aircraft p. 83

comment *463* comment by: *EHOC*

General

It is not clear why the separation of the rules in Subpart GEN – 525 for Communications; and 535 for Navigation - has not been followed in Subpart CAT. Having two rules in GEN and then combining them in CAT has no logic. Perhaps when the rules are once again separated, the requirement for a radio for VFR could be added.

An additional rule to provide a requirement for radios for VFR is required:

"OPS.CAT.524 Radio equipment for operations under VFR over routes navigated by reference to visual landmarks

(a) motor powered aircraft shall be provided with radio equipment that permits:

(1) communication with appropriate ground stations;

(2) communication with appropriate air traffic control facilities; and

(3) reception of meteorological information."

There is no rule for communication equipment for VFR - i.e. OPS.CAT.525 is not compliant with ICAO Annex 6 Part III Section II Chapter 5.1 - for which the Standard is unconditional.

comment *1637* comment by: *Luftfahrt-Bundesamt*

The LBA requests to stay away from the performance base rule making here. If this system shall be used, OPS.GEN 405 should be phrased in a similar way. However, this does not make much sense at all. Same with this paragraph.

Justification: see LBA - General Comment, reason 3.

comment *3092* comment by: *M Wilson-NetJets*

Original text:

(a) Motor powered aircraft shall be equipped with:

(1) two independent radio communication means;

(2) two independent navigation equipment appropriate for each phase of flight and appropriate to the route/area.

Suggested new text:

(a) Motor powered aircraft shall be equipped with:

(1) two independent **or redundant** radio communication means;

(2) two independent **or redundant** navigation equipment appropriate for each phase of flight and appropriate to the route/area. **Aeroplanes with a MPSC of less than 10 may have only one area navigation equipment if this equipment is capable of incorporating current positions from more than one navigation source and has sufficient warning capabilities to advise the flight crew of loss of either navigation source, unless required differently by airspace requirements for the route to be flown.**

Comment/suggestion:

Although the AMC specifies one are navigation for the route flown this IR clearly specifies two independent navigation equipment. This would imply also two independent area navigation equipment. Smaller business jets do not always have two completely independent area navigation equipment. Often it is just one FMS with one CDU and two GPS receivers. Technically this could not be considered fully independent. There should be an exclusion clause already in the IR to allow for single area navigation equipment to be used. Secondly, the terminology of "independent" might raise question with modern systems that use parts of equipment simultaneously or in back-up mode (like display units, avionics busses, graphics modules etc.). These systems have complete redundancy but cannot be considered fully independent.

comment *3384* comment by: *UK CAA*

Page No: 83

Paragraph No: OPS.CAT.525

Comment:

There is no rule for communication equipment for VFR - i.e. this rule is not compliant with ICAO Annex 6 Part I Chapter 7.1 or Part III Section II Chapter 5.1 - for which the Standard is unconditional.

A new section should be added as indicated.

Justification:

Compliance with ICAO Annex 6.

Proposed Text (if applicable):

OPS.CAT.524 Communication equipment for operations under VFR over routes navigated by reference to visual landmarks

(a) motor powered aircraft operated under VFR over routes navigated by reference to visual landmarks shall be provided with radio communication equipment that permits:

(1) communication with appropriate ground stations;

(2) communication with appropriate air traffic control facilities from any point in controlled airspace within which flights are intended; and

(3) reception of meteorological information.

(b) The radio communication equipment required in (a) shall provide communications on the aeronautical emergency frequency.

comment *400* comment by: *ECA - European Cockpit Association*

Comment on OPS.CAT.526:

ECA requests clarification:

Is this requirement binding for CAT only, therefore not for COM?

B. I. Draft Opinion - Part-OPS - Subpart C p. 84

comment *5192* comment by: *DGAC*

There should be a provision (*at least in the Cover Regulation*) equivalent to (3) EU/JAR-OPS 1/3.001, stating that subpart CAT does not apply "to flights immediately before, during, or immediately after an aerial work activity provided these flights are connected with that aerial work activity and in which, excluding crew members, no more than 6 persons indispensable to the aerial work activity are carried."

B. I. Draft Opinion - Part-OPS - Subpart C - Section I p. 84

comment *3296* comment by: *Austro Control GmbH*

This subpart establishes additional and specific requirements to be met by an operator undertaking commercial operations other than CAT, to ensure compliance with Annex IV of Basic Regulation.

Comment:

a detailled definition for commercial operation is required in the rule or shall be at least explained in detail in AMC by examples (no definition in AMC for reasons of legal certainty!). The definition in the Basic Regulation seems not to be sufficient (e.g. training within clubs is unclear).

comment *6060* comment by: *DGAC*

We do not understand the rationale for mentioning R 216/2008 in the scope of part OPS subparts GEN, CAT & COM and not mentioning it in the scope of both part OR subpart OPS and part OPS subpart SPA?

If, as explained by EASA, the mere application of those subparts is not enough to ensure compliance with the BR, then mentioning the BR in the scope should be avoided as it is confusing and misleading.

"OPS.COM.005 Scope

This subpart establishes additional and specific requirements to be met by an operator undertaking commercial operations other than Commercial Air

Transport, to ensure compliance with Annex IV to Regulation (EC) No 216/2008 (Essential requirements for air operations)."

B. I. Draft Opinion - Part-OPS - Subpart C - Section I - OPS.COM.005 Scope p. 84

comment *675* comment by: *ECA - European Cockpit Association*

Comment on OPS.COM.005: change as follows:

This subpart establishes additional and specific requirements to be met by an operator undertaking commercial operations other than Commercial Air Transport~~**, to ensure compliance with Annex IV to Regulation (EC) No 216/2008 (Essential requirements for air operations)**~~.

Justification:

Everything necessary to comply with the BR must be found in the IR/AMC/GM. Reference to BR 216/2008 is inappropriate.

comment *1532* comment by: *Luftfahrt-Bundesamt*

Regarding the operation of sailplanes and powered sailplanes and the possible economic gain with such type of operation, we seriously doubt that the proposed regulations will improve the safety in any detectable way, but lead to a significant decrease of the activities and consequently to a decline in this kind of aviation.

We propose to exempt sailplanes and powered sailpanes from the scope of this NPA and add the following wording:

"The operation of sailplanes and powered sailpanes is exempted from the scope of this subpart."

comment *3577* comment by: *Walter Gessky*

OPS.COM.005 Scope

This subpart establishes additional and specific requirements to be met by an operator undertaking commercial operations other than Commercial Air Transport, to ensure compliance with Annex IV to Regulation (EC) No 216/2008 (Essential requirements for air operations).

Comment:

Clear definition for commercial operation is required in the rule or at least in the AMC. The definition in the basic regulation is not sufficient (flight training in clubs etc) Based on that, additional requirements might be added.

comment *5194* comment by: *DGAC*

COM is not restricted to aerial work (as specified in §79 of appendix I Explanatory memorandum to Part OPS in NPA 2009-02 A in the explanatory note). Some of the paragraphs of Subpart COM refer to "specialized tasks". It is not clear however whether all COM operations are considered as specialized tasks. If specialized task are only a fraction of COM operations, a definition of "specialized task" should be added somewhere. If specialized task and COM operations are the same concept, then the use of the terms "specialized tasks" should be avoided to remove confusion.

Furthermore their might be some specialized tasks that are not COM.

comment *7422* comment by: *Axel Schwarz*

According to the definition of "Commercial Operations" in the Basic Regulation, this subpart would include operations under commercial hire.

Since for commercial hire of aircraft the owner/operator has only very limited control over the pilot hiring the aircraft, most provisions of this Subpart should not be applicable to commercial hire either by amending the scope or revising the definition in the Basic Regulation to exclude the hiring out of aircraft against remuneration by an operator to pilots.

B. I. Draft Opinion - Part-OPS - Subpart C - Section I - OPS.COM.035 Application and use of dangerous goods in specialised tasks p. 84

comment *919* comment by: *CAA-NL*

Comment CAa-NL:

Clarification required for 'specialised tasks'.

comment *953* comment by: *CAA-NL*

Comment CAA-NL:

The Agency should clarify what it means by 'specialised task'

comment *1165* comment by: *CAA-NL*

OPS.COM.035

Comment: The text states that an aircraft must not fly over cities, towns etc when using dangerous goods for the purposes of a specialised task. It is

suggested this text should be amended.

Justification: Elsewhere in the IRs (OPS.GEN.030 (b)) states that dangerous goods for "specialised purposes" are those specified in Part 1 of the Technical Instructions, which in turn refer to "specialized use"; in the Technical Instructions this term includes tasks (e.g. aeromedical operations, provision of veterinary aid) which could quite reasonably be allowed over cities, towns etc. It is suggested that the text need only apply to the application of dangerous goods.

Proposed Text (if applicable):

Amend OS.COM.035 as follows:

"OS.COM.035 Application ~~and use~~ of dangerous goods in specialised tasks

The operator shall not fly over congested areas of cities, towns or settlements or over an open-air assembly of persons when applying ~~or using~~ dangerous goods for the purpose of a specialised task."

comment *1414* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

The text states that an aircraft must not fly over cities, towns etc when using dangerous goods for the purposes of a specialised task. It is suggested this text should be amended.

Comment:

Amend OS.COM.035 as follows:

"OS.COM.035 Application and use of dangerous goods in specialised tasks

The operator shall not fly over congested areas of cities, towns or settlements or over an open-air assembly of persons when applying or using dangerous goods for the purpose of a specialised task."

comment *1424* comment by: *International Air Transport Association*

OPS.COM.035 Application and use of dangerous goods in specialised tasks.

The text in this paragraph is rather vague in setting out just what constitutes "using dangerous goods for the purposes of a specialised task". Previously in

OPS.GEN.030(b) there was text regarding "dangerous goods on board for specialised purposes". Here it was commented that this was addressed by Part 1;1.1.3 of the ICAO Technical Instructions. This part of the ICAO TI addresses such operations as search and rescue, provision of medical aid to a patient during flight, etc. For these types of "specialised uses" there should be no impediment on flight over inhabited areas.

The text of OPS.COM.035 should perhaps clearly state that it is the release of dangerous goods from the aircraft over cities, towns, etc. that is prohibited.

comment *1632* comment by: *British Parachute Association*

We suggest that the following wording is added to the end of this paragraph.

"(except when carrying smoke trail devices to be used by parachute display jumpers after exiting the aircraft)."

We are not sure at this stage whether parachute operations are likely to be classsified as a specialised task, but in that event this rule could otherwise prohibit the use of smoke trails on many parachute displays. Smoke trails have long been an important visual feature of parachute displays.

This will also ensure consistency with our comments no. 1412, 1604 and 1657.

comment *2766* comment by: *Pietro Barbagallo ENAC*

Defintion of "specialised task" required

B. I. Draft Opinion - Part-OPS - Subpart C - Section I - OPS.COM.040 Carriage and use of weapons in specialised tasks p. 84

comment *920* comment by: *CAA-NL*

Suggestion CAA-NL I:

Clarification required for 'specialised tasks'.

Suggestion CAA-NL II:

The Agency should clarify what it means by ' when the weapons are used'. When the Agency means the use by air marshals than this statement is unrealistic.

comment *1166* comment by: *CAA-NL*

Comment 1

OPS.COM.040(a)

Comment: It is not clear what "specialised tasks" are envisaged by OPS.COM.040.

Justification: Without an appropriate definition it is suggested the text is too vague and open to abuse.

Proposed Text (if applicable):

It is suggested a definition of "specialized tasks" should be developed.

Comment 2

OPS.COM.040(a)

Comment: Text needs expanding

Justification: "Securing" is only one measure which should be ensured in respect of weapons. Prevention from accidental discharge (in the case of guns) or activation (in the case of pyrotechnics, tear gas devices etc) should also be required.

Proposed Text (if applicable):

Amend OPS.COM.040(a) as follows:

"An operator may carry weapons on a flight for the purposes of a specialised task provided that the weapons are secured and protected against accidental discharge or activation when carried."

Comment 3

OPS.COM.040(b)

Comment: Text is unrealistic

Justification: It is queried how an operator could possibly ensure that, for example, if a policeman discharges his weapon this will not endanger the aircraft or persons. Also, the text could be interpreted as allowing the discharge of a weapon from an aircraft (e.g. to a target on the ground) which is not something allowed currently in the UK (without an exemption) because of the risk of structural damage (e.g. to main or tail rotors) by bullets, including ricochets.

Text is unrealistic

Justification:

It is queried how an operator could possibly ensure that, for example, if a policeman discharges his weapon this will not endanger the aircraft or persons. Also, the text could be interpreted as allowing the discharge of a weapon from an aircraft (e.g. to a target on the ground) which is not

something allowed currently in the UK (without an exemption) because of the risk of structural damage (e.g. to main or tail rotors) by bullets, including ricochets.

Proposed Text (if applicable):

Delete OPS.COM.040(b)

comment *5198* comment by: *DGAC*

Paragraph (a) precludes aerial work operations such as those operations where a weapon onboard the aircraft is used to shoot vaccine or anaesthetic darts at wild animals.

Proposed Text:

Amend text as follows: "(a) An operator may carry weapons on a flight for the purpose of a specialised task provided that the weapons are secured when carried, **except when necessary for the specialized task"**"

comment *5318* comment by: *Department for Transport UK*

It is not clear what sort of specialised tasks are envisaged but it appears that the weapons may be used for the specialised task while the aircraft is in flight. If this is the case the weapons cannot be secured when being used for the specialised task. The text should therefore amended to reflect that the weapons will not be secured while in use.

Proposed text: OPS.COM.040(a) An operator may carry weapons on a fight for the purpose of a specialised task provided that the weapons are secured when not in use for that task.

comment *5731* comment by: *Ryanair*

Definition of "specialised task" required

comment *6185* comment by: *Finnish CAA*

Paragraph: OPS.COM.040(a)

Comment: It is not clear what "specialised tasks" are envisaged by OPS.COM.040.

Justification: Without an appropriate definition it is suggested the text is too vague and open to abuse.

Proposed text (if applicable): It is suggested a definition of "specialized tasks" should be developed.

comment *6211* comment by: *Finnish CAA*

Paragraph: OPS.COM.040(a)

Comment: Text needs expanding

Justification: "Securing" is only one measure which should be ensured in respect of weapons. Prevention from accidental discharge (in the case of guns) or activation (in the case of pyrotechnics, tear gas devices etc) should also be required.

Proposed text (if applicable):

Amend OPS.COM.040(a) as follows:

"An operator may carry weapons on a flight for the purposes of a specialised task provided that the weapons are secured and protected against accidental discharge or activation when carried."

B. I. Draft Opinion - Part-OPS - Subpart C - Section II p. 85

comment *5200* comment by: *DGAC*

Paragraph 81 of chapter IV of the Explanatory (NPA 2009-02 A, page 38) specifies the following concerning section II :

"Secondly, it requires the mitigating procedures to be applied when flying below the minimum flight altitudes."

However there is no such provision in the text of Section II

B. I. Draft Opinion - Part-OPS - Subpart C - Section II - OPS.COM.115 Briefing of operational personnel p. 85

comment *978* comment by: *REGA*

For HEMS purposes like evacuation and rescue flight within the mountains, specialists (e.g. mountain guides) has to be added to the already available and well trained operational personal.

Proposal (OPS.COM.115)

For HEMS missions, where exceptional situations require additional specialists for specific tasks, the pilot in command is exceptionally allowed to involve personnel without a standard briefing. The pilot has to proceed according the operators Standard Operating Procedure (SOP), described in the operational manual. Those operational personnel should be supervised

by the flight crew or technical crew member.

comment *2272* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern detail:

Briefing of operational personnel

Comment / Proposal:

Modify text:

Operational personnel [...] except for mission which are described by Special Operating Procedures (SOP) in the manual of the operator.

comment *3680* comment by: *Austro Control GmbH*

Modification suggested:

Operational personnel [...] except for mission which are described by Special Operating Procedures (SOP) in the manual of the operator.

Justification:

SOPs are binding for crew members, therefore a duplication is not necessary.

comment *5733* comment by: *Ryanair*

Definition of "specialised task" required

comment *5750* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment:

Operational personnel is not defined. Is this meant to be personnel carried for the operation, i.e photographer, power line inspector and others?

Proposal:

Define Operational personnel as personnel with work tasks on board during the mission/operation

B. I. Draft Opinion - Part-OPS - Subpart C - Section II - OPS.COM.270 Standard operating procedures - specialised operations other than the transport of persons, cargo or mail p. 85

comment *979* comment by: *REGA*

(b) HEMS-missions usually carry out special operations (e.g. evacuations) in accordance to standard operations procedures (SOP), described in the operational manual. For those specialized standard operations a generic risk assessment according AMC 1 OPS.COM.270, described in the operational manual and authorized by the competent authority, shall be acceptable.

Proposal (b)

For HEMS-missions carrying out special operations in accordance to standard operations procedures (SOP), described in the operational manual and authorized by the competent authority, shall be allowed to use generic risk assessment template according to AMC 1 OPS.COM.270. The generic risk assessment template shall be described in the operational manual and authorized by the competent authority.

comment *1655* comment by: *British Parachute Association*

At the end of (a) we suggest adding the words.....

"...or operations manuals that are approved by Competent Authorities or National Governing Bodies as being appropriate for specialised tasks."

We have in mind here the British Parachute Association Operations Manual which is approved by the UK Civil Aviation Authority. This comment may, of course, be disregarded if parachute operations are not regarded as a specialised task.

comment *2273* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern detail:

Standard operating procedures - specialized operations other than the transport …

Comment / Proposal:

Modify text:

(b) Before commencing operations, the operator shall carry out a risk assessment and shall develop appropriate SOPs. A generic risk assessment template according to can be used by the operator.

comment *5202* comment by: *DGAC*

Proposal : If (a) is really meant to stay in subpart COM, then delete "other than the transport of persons, cargo or mail"

Justification : commercial operations involving "transport of persons, cargo or mail" are addressed in subpart B (CAT) , therefore commercial operations other than CAT (subpart C - COM) are obviously operations "other than the transport of persons, cargo or mail" !

Proposal : If (c) is really meant to stay in subpart COM, then amend the beginning of (c) as follows :

> "(c) ~~Applicants for an Air Operator Certificate~~ **Operators** shall demonstrate
>
> **Justification :** COM is dedicated to commercial operations other than CAT. All commercial operations are subject to an AOC. Then all operators under COM shall do make demonstration.

Proposal : Move OPS.COM.270 towards Subpart GEN and define "specialized operations"

Justification: It is not clear whether SOP are to be developed for all COM operations or only for specialized activities (as it is not clear what "specialized operations" are - *See also our comment to OPS.COM.005 Scope*). One EASA answered during a forum was that we would have the answer once the cover regulation is published. The problem is that, by that time, we will not have the opportunity to comment anymore…

Besides, the surprising wording of OPS.COM.270 (see comments on (a) and (c)) and diagram 1 of AMC OPS.COM.270 (see related comment as well), seem to mean that OPS.COM.270 was first tailored to be inserted into OPS.GEN, that for any specialized activities (commercial or not commercial) SOP have to be developed, and that in the case of COM those SOP require Ahthority approval as shcwn below :

This explanation would make sense.

We suggest further development of other SOP that could be used from the shelves for aerobatics flights, parachutes droppings, and other specialized activities to be defined.

comment *5734* comment by: *Ryanair*

Defintion of "specialised operations" required

comment *5751* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment: It is unclear what is meant with "specialised operations". The explanation that is given is that the proposal concerns private aerial work. If this is the case it doesn´t fit in to the context of COM "commercial operations other than commercial air transport". By putting rules concerning private flying in a context with commercial operations creates confusion.

Proposal: Restructure the text and put rules as concerns private aerial work

in another section.

comment *6347* comment by: *Heliswiss International*

Points b and c shall be the same as for loads below 1500 kg. 10 h flight experience on type and 30 hours performing load types 1 and 2 before acting as PIC in loads 3 and 4.

comment *6348* comment by: *Heliswiss International*

Where is this document page 372 ?

comment *7300* comment by: *DHV*

Standard operating procedures - specialised operations other than the transport of persons, cargo or mail HELICOPTER EXTERNAL LOAD OPERATIONS (HELO)

3. b.For the four load types, the experience acquired on other helicopter types is not taken in consideration. We consider that a pilot having experience on a load type don't need so much experience when changing of helicopter type. Proposal : We suggest to divide by 2 the experience needed on the helicopter type, for pilots having more than 50 hours of flight as pilot-in-command for a load type.

Performance

b) this is not acceptable and not fulfillable. The modification shall be a reserve of power of at least 5% of the MTOM or at least 10% of the maximum sling load capacity.

B. I. Draft Opinion - Part-OPS - Subpart C - Section III p. 86

comment *5204* comment by: *DGAC*

What is the rational for the numbering of the paragraphs related to performance criteria (316.A for aeroplanes, 350.H for helicopters) ?

Some provisions are repeated in both paragraphs, where they could be mutualized.

comment *6238* comment by: *DGAC*

Clarify the use of occupants versus persons

comment *6933* comment by: *Christian Hölzle*

From 1968 the Swiss AIB reports 18 flame out occurrences (6 on SP and 12 on SE)(10 CAT - 5 AW - 3GA). Out of these 18, 3 were due to HFACS (ice ingestion and fuel contamination). Concerning the SE, on the remaining 9, five happends on Bell 204,205,206, three on SA315B and one on AS350. Considering 390 occurences and a total of 4 engine failure on the type in use for AW-HEMS-SAR, that represent only 1% of the total occurences.

From 1968 the Swiss AIB reports 58 occurrences related to technical or maintenance. 25 cases for SP, 28 cases for SE and 5 cases for ME. If we compare to the number of announced occurrences the figures shows : 25 occurrences for SP over a total of 121 representing 21%. 28 occurences for SE over a total of 240 representing 12%. 5 occurences for ME over a total of 29 representing 17%. Single Engine is according to this database the safest type.

comment *6934* comment by: *Christian Hölzle*

More, both IHST and EHEST in their respective analysis and research have not come to a result or any recommendations about the performance class type of helicopters. Therefore the choice of the performance class shall be left to the operator, provided he obtain the National Authority AOC required.There is no justification not allowing Performance Class 2 and 3 helicopter operating in SAR-HEMS-AW-CAT over hostile environement.

B. I. Draft Opinion - Part-OPS - Subpart C - Section III - OPS.COM.316.A Performance criteria aeroplanes p. 86

comment *3389* comment by: *UK CAA*

Page No: 86

Paragraph No:

OPS.COM.316.A

Comment:

For non-passenger commercial operations, the performance requirements should be the same as passenger-carrying operations.

Justification:

For all commercial operations, whether carrying passengers or not, the same

level of safety should be required.

Proposed Text (if applicable): The OPS.CAT requirements should apply to OPS.COM activities.

Reason: consistency with OPS.COM.488 title

comment *1355* comment by: *AECA helicopteros.*

Proposal to change from category concept to performance concept assoicated with helicopter operation (as in OPS CAT 355)

comment *1580* comment by: *EUROCOPTER*

This requirement, with the associated requirements OPS.COM.487 and AMC OPS.COM.487, request that the helicopter is fitted with crash mitigation equipment such as crash-absorbing seats and self-sealing fuel tanks. Comments are:

- This requirement is disproportionate and, if maintained as such, will forbid Aerial Work operations to many helicopter types in Europe because of the dramatic induced development costs for operators to retrofit crash mitigation equipment. As a matter of fact, only a few helicopter types would be

compliant to this requirement thanks to having been certificated in accordance with recent certification bases.

- In addition we do not see the benefit of self-sealing fuel tanks in terms of crash mitigation.

Proposal: to delete OPS.COM.350.H § (c)(4), as well as the corresponding OPS.COM.487 and AMC OPS.COM.487:

~~(4) ensure that the helicopter is equipped with appropriate crash mitigation equipment pertinent to the operation~~;

If we compare to the number of announced occurrences the figures shows : 25 occurrences for SP over a total of 121 representing 21%. 28 occurences for SE over a total of 240 representing 12%. 5 occurences for ME over a total of 29 representing 17%. Single Engine is according to this database the safest type.

More, both IHST and EHEST in their respective analysis and research have not come to a result or any recommendations about the performance class type of helicopters. Therefore the choice of the performance class shall be left to the operator, provided he obtain the National Authority AOC required.There is no justification not allowing Performance Class 2 and 3 helicopter operating in SAR-HEMS-AW-CAT over hostile environement.

From 1968 the Swiss AIB reports 18 flame out occurrences (6 on SP and 12 on SE)(10 CAT - 5 AW - 3GA). Out of these 18, 3 were due to HFACS (ice ingestion and fuel contamination). Concerning the SE, on the remaining 9, five happends on Bell 204,205,206, three on SA315B and one on AS350. Considering 390 occurences and a total of 4 engine failure on the type in use for AW-HEMS-SAR, that represent only 1% of the total occurences.

From 1968 the Swiss AIB reports 58 occurrences related to technical or maintenance. 25 cases for SP, 28 cases for SE and 5 cases for ME. If we compare to the number of announced occurrences the figures shows : 25 occurrences for SP over a total of 121 representing 21%. 28 occurences for SE over a total of 240 representing 12%. 5 occurences for ME over a total of 29 representing 17%. Single Engine is according to this database the safest type.

(c) (6) Who are the "persons" ? The pilots, other workers necessary to the mission, passengers ? Proposal is to delete OPS.COM.350.H (c)(6). Reason: Workers carried during aerial work operations are aware of the risks encountered and should not have the same level of protection as in CAT. Requesting compliance to OPS.SFL would forbid aerial work operations over forests with single engine helicopters and persons on board. Moreover, it is a heavy burden on operators to ask them to implement a Usage Monitoring System for example.

Page No: 86

Paragraph No:

OPS.COM.350.H (c)

Comment:

The requirements at sub-paragraphs (4) and (5) are repeated at OPS.COM.487 and 488 respectively and therefore should be deleted.

Sub-paragraph (6) requires amendment to correct the reference and to

clarify the intent to require additional performance measures when persons other than crew are carried. This is in line with the original JAR-OPS 4.495(c)(6) intention.

Justification:

Deletion of duplication and clarification of the text and requirement.

Proposed Text (if applicable):

(~~6~~***4***) ensure compliance with OPS.***SPA.***SFL when persons ***other than crew members*** are carried.

(a) (1)

Proposal : "(a) Helicopter operating in a congested hostile environment shall be :

(1) certificated in category A **or considered to satisfy the Category A criteria;** and"

Justification : AMC OPS.GEN.010 (a)(9) & (10) defines, in its §2, additional requirements for certain helicopter types to be eligible for Performance Class 1 or 2 operations, but omits to say that, when it has been demonstrated that these additional requirements are fulfilled, these helicopter types are considered to satisfy the Category A criteria. It is so proposed to amend OPS.COM.350.H §(a) (1) and AMC OPS.GEN.010 (a) (9) & (10) in this purpose.

comment *5206* comment by: *DGAC*

(a)(1) and (b) :

We still have reservations on the requirement about cat A and B for COM as it could prevent operators from performing some aerial works which can be done by only big Russians helicopters.

(a)(2) :

Proposed Text:

Amend text as follows:

"(2) operated at a mass and in conditions **such** that, in the event of a critical power unit failure, the helicopter is capable of sustaining level flight. Measures shall be taken to prevent risk to persons on the ~~**ground**~~ **surface** and to alleviate risk to property on the surface.

Justification :

To improve the wording and to take into account the fact that the surface under the fight path may not be limited to ground.

(c)(6) :

We propose do delete paragraph (6) of (c) of OPS.COM.350.H. We do not really know who these persons are. We still have some reservations concerning the feasibility for operators of aerial work to implement some of SFL provisions, for instance those related to Usage Monitoring System.

(c) (6) Who are the "persons" ? The pilots, other workers necessary to the mission, passengers ? Proposal is to delete OPS.COM.350.H (c)(6). Reason: Workers carried during aerial work operations are aware of the risks encountered and should not have the same level of protection as in CAT. Requesting compliance to OPS.SFL would forbid aerial work operations over forests with single engine helicopters and persons on board. Moreover, it is a heavy burden on operators to ask them to implement a Usage Monitoring System for example

B. I. Draft Opinion - Part-OPS - Subpart C - Section IV - OPS.COM.426.H Survival suits - Helicopters p. 87

comment *1229* comment by: *EUROCOPTER*

Wording modification proposal:

Each crew member shall wear a survival suit during a flight when operating on water or over water ***~~beyond auto-rotational/gliding distance from land~~ from more than 3 minutes*** *where, in the event of a mishap, there would be a likelihood of ditching, and when the weather reports or forecasts available to the pilot-in-command indicates that the* ***~~sea~~ water*** *temperature will be less than plus 10°C during the flight,* ***or when the estimated rescue time exceeds the estimated survival time.***

Reasons:

- this requirement should only apply when the aerial work mission over water exceeds a definite time (proposal is 3 minutes), in order to avoid to wear the survival suits as soon as a river is crossed for example.

- the words 'in th eevent of a mishap' do not bring anything useful; moreover the word 'mishap' is not adapted to regulatory wording

- replacing 'sea temperature' by 'water temperature' is for consistency with the title, and in order to cover operations on lakes or rivers.

- for consistency with other requirements such as OPS.CAT.426.H and OPS.CAT.427.H it is proposed to add the condition "or when the estimated time exceeds the estimated survival time".

comment *1596*

comment by: *Réseau de Transport d'Electricité - Services et Travaux Héliportés*

Wording modification proposal:

Each crew member shall wear a survival suit during a flight when operating on water or over water **~~beyond auto-rotational/gliding distance from land~~ from more than 3 minutes** where, **in the event of a mishap**, there would be a likelihood of ditching, and when the weather reports or forecasts available to the pilot-in-command indicates that the **~~sea~~ water** temperature will be less than plus 10°C during the flight, **or when the estimated rescue time exceeds the estimated survival time.**

comment *3393*

comment by: *UK CAA*

Page No: 87

Paragraph No:

OPS.COM.426.H

Comment:

The requirement for the wearing of survival suits should be extended to cover all persons on board for flights over water in the detailed conditions. The text would benefit from reflecting that at OPS.CAT.426.H and part of OPS.CAT.427.H to make this clear and proportionate to the type of helicopter performance class equivalence being used.

A new GM OPS.COM.426H with text directing readers to GM OPS.CAT.426H Crew Survival Suits would be prudent.

Justification:

Clarification of the text and requirement and better use of guidance material.

Proposed Text (if applicable):

OPS.COM.426.H Survival suits - Helicopters

~~Each crew member~~ ***All persons onboard*** shall wear a survival suit when operating***:*** ~~on a flight on water or over water beyond auto-rotational/gliding distance from land where, in the event of a mishap, there would be a likelihood of ditching, and when the weather reports or forecasts available to the pilot-in-command indicate that the sea temperature will be less than plus 10°C during the flight.~~

(a) in Performance Class 1 or 2 on a flight over water at a distance from the land corresponding to more than 10 minutes flying time at normal cruising speed, when the weather reports or forecasts available to the pilot-in-command indicate that the sea temperature will be less than plus 10°C during the flight, or the estimated rescue time exceeds the estimated survival time; or

(b) in Performance Class 3 on a flight over water beyond autorotational or safe forced landing distance from land, when the weather reports or forecasts available to the pilot-in-command indicate that the sea temperature will be less than plus 10°C during the flight.

New associated GM.

GM OPS.COM.426.H Survival Suits - Helicopters

Refer to GM OPS.CAT.426.H for information regarding Estimating Survival Times.

comment *3966* comment by: *SNEH Organisation representing all french commercial helicopters operators*

Wording modification proposal :

Each crew member shall wear a survival suit during a flight when operating

on water or over water ~~**beyond auto-rotational/gliding distance from land**~~ **from more than 3 minutes** where, **in the event of a mishap,** there would be a likelihood of ditching, and when the weather reports or forecasts available to the pilot-in-command indicates that the ~~**sea**~~ water temperature will be less than 10°C during the flight, **or when the estimated rescue time exceeds the estimated survival time.**

Reasons :

- This requirements should only apply when the aerial work mission over water exceeds a definite time (proposal is 3 minutes), in order to avoid to wear the survival suits as soon as a river is crossed for example.

- The words 'in the event of a mishap' do not bring anything useful ; moreover the word 'mishap' is not adapted to regulatory wording

- Replacing 'sea temperature' by 'water temperature' is for consistency with the title, and inorder to cover operations on lakes or rivers.

- For consistency with other requirements such as OPS.CAT.426.H and OPS.CAT.427.H it is proposed to add the condition "or when the estimated time exceeds the estimated survival time".

comment *5211* comment by: *DGAC*

Proposal: Replace "beyond auto-rotational/gliding distance" by "for more than 3 minutes"

Justification: this requirement should only apply when the aerial work mission over water exceeds a definite time (proposal is 3 minutes), in order to avoid wearing the survival suits as soon as a river is crossed.

comment *6053* comment by: *Irish Aviation Authority*

Comment:

The requirements as set out in OPS.CAT.426 H should apply equally to flights carried out under commercial operations.

Justification:

Standardisation with already accepted aviation normal practice.

Proposed text:

Amend text to reflect requirements set out in OPS.CAT.426 H

comment *6252* comment by: *DGAC*

Proposal:

Replace "sea" by "water" to read:

"... indicate that the ~~sea~~ **water** temperature will be less ..."

Justification:

Consistency with the rest of the paragraph and to cover operations on lakes or rivers.

comment *6472* comment by: *DGAC*

Proposal:

Delete "in the event of a mishap"

Justification:

These words don't bring anything useful; moreover the word 'mishap' is not adapted to regulatory wording.

comment *6474* comment by: *DGAC*

Proposal:

Add "...will be less than plus 10°C during the flight, **or when the estimated rescue time exceeds the estimated survival time**."

Justification:

Consistency with other requirements such as OPS.CAT.426.H and OPS.CAT.427.H

B. I. Draft Opinion - Part-OPS - Subpart C - Section IV - OPS.COM.486 Emergency egress from the cockpit p. 87

comment *2918* comment by: *Pietro Barbagallo ENAC*

Comment: this requirement may have impact on existing fleet. Please consider a proper implementation date

comment *3394* comment by: *UK CAA*

Page No: 87

Paragraph No:

OPS.COM.486

Comment:

The requirements for effective means of breaking out of the cockpit are best

dealt with by OPS.GEN.485.A and its AMC. As written the requirement would also be addressed at helicopters which is incorrect.

Delete this paragraph and AMC OPS.COM.486.

Justification:

Clarity.

comment *6349* comment by: *Heliswiss International*

Emergency egress : In smaller helicopters without a lot of available space in the cabin, the decision shall be left to the manufacturer to find an acceptable site. Today the regulations are imposing so many requirements that it will be very difficult to fullfil them all without redefining cabin size. In this particular case, a crash axe is useless in most of the small helicopters because of the construction of the cabins (windows).

B. I. Draft Opinion - Part-OPS - Subpart C - Section IV -OPS.COM.487 Crash mitigation equipment p. 87

comment *1351* comment by: *EUROCOPTER*

OPS.COM.487 and AMC OPS.COM.487, request that the helicopter is fitted with crash mitigation equipment such as crash-absorbing seats and self-sealing fuel tanks. Comments are:

- This requirement is disproportionate and, if maintained as such, will forbid Aerial Work operations to many helicopter types in Europe because of the dramatic induced development costs for operators to retrofit crash mitigation equipment. As a matter of fact, only a few helicopter types would be compliant to this requirement thanks to having been certificated in accordance with recent certification bases.

- In addition we do not see the befefit of self-sealing fuel tanks in terms of crash mitigation.

Proposal: to delete OPS.COM.487 and AMC OPS.COM.487:

~~***OPS.COM.487 Crash mitigation equipment***~~

~~***Aircraft shall be equipped with crash mitigation equipment which is adequate for the type of operation.***~~

comment *3395* comment by: *UK CAA*

Page No: 87

Paragraph No:

OPS.COM.487

Comment:

The expression "crash mitigation equipment" is vague and could be taken to mean either equipment that helped prevent an aircraft crash or equipment that helped to prevent injury to aircraft occupants from the effects of a crash.

Justification:

Clarification of the Rule is required.

B. I. Draft Opinion - Part-OPS - Subpart C - Section IV - OPS.COM.488 Individual protective equipment p. 87

comment *1349* comment by: *EUROCOPTER*

Wording modification proposal:

"***When operating under OPS.COM.350.H § (c)****, persons on board shall wear* ***individual*** ~~***personal***~~ *protective equipment which is adequate for the type of operation."*

Reason: individual protective equipment should not be requested for in the conditions of OPS.COM.350 (a) (operations in a congested hostile environment).

B. I. Draft Opinion - Part-OPS - Subpart D p. 88

comment *1076* comment by: *Alexander Fitz/AUA*

The Subpart D (SPA) does not contain all operations requiring special approval. The Operations Specification of an Air Operator Certificate usually contains ETOPS together with an authorized maximum diversion time which should be a dedicated part of SPA. Other specific approvals could also be stated, e.g. FANS, ADS-B or other e.g. defined in AMC-20.

comment *5242* comment by: *Civil Aviation Authority of Norway*

Comment:

The Civil Aviation Authority of Norway (CAA-N) feels that Part OPS is incomplete as long as there is no Specific Approval for offshore operations conducted more than 10 minutes away from shore at normal cruising speed.

Norway – among with Great Britain, Ireland, Denmark and the Netherlands – has extensive operations of helicopters between the mainland and oil- and gas-installations. Each of these countries have national regulations aimed especially at these operations. The regulations are designed to minimise the extra risks affiliated with the operation.

Among the subjects that need to be regulated are

- supplementing operating procedures
- performance requirements
- operating minima
- crew training and experience requirements
- crew composition requirements
- equipment requirements

Regarding equipment requirements CAA-N feels it is of the utmost importance that helicopters are equipped with some extra form of Flight Following-system that can inform national FlightServices about its exact position (longitude, latitude and altitude) in real-time. This is the best way for SAR to find an aircraft after an accident and gives the best chance of survival for crew and pax.

CAA-N notes that EASA, when writing Part OPS, has tried to incorporate all the rules in JAR-OPS 3. From what we can understand, EASA has not proposed any regulation on Offshore Helicopteroperations due to the fact that no such rules were to be found in JAR-OPS 3. This is only partly correct.

The JIP for JAR-OPS 3, Section four, Part 2; Operations, describes how the AOC and Operations Spesification is to be compiled. In pages 51 and 55, under the label E) Special Authorisations/Approvals, it is assumed that any operator wanting to perform Offshore Helicopter Operations needs such a Special Authorisation/Approval. The basis for this Authorisation/Approval has been national legislation.

We therefore feel that the Part OPS does not truly reflect the necessary levels of safety from JAR-OPS 3 unless an SPA for Offshore Helicopter Operations is included in the rules.

This could lead to unintentional mistakes and leads to further confusion potentially even leading to decreased flight safety and extra costs.

Proposal:

Ensure a complete realignment with existing AMC20 material/EU-OPS for specific approvals.

B. I. Draft Opinion - Part-OPS - Subpart D - Section I p. 88

comment *6061* comment by: *DGAC*

We do not understand the rationale for mentioning R 216/2008 in the scope of part OPS subparts GEN, CAT & COM and not mentioning it in the scope of both part OR subpart OPS and part OPS subpart SPA?

If, as explained by EASA, the mere application of those subparts is not enough to ensure compliance with the BR, then mentioning the BR in the scope should be avoided as it is confusing and misleading.

"OPS.SPA.005.GEN Scope

This part establishes the requirements to be met by an operator to qualify for the issue or continuation of specific operational approvals."

B. I. Draft Opinion - Part-OPS - Subpart D - Section I - OPS.SPA.001.GEN Competent authority p. 88

comment *349* comment by: *ECA - European Cockpit Association*

Comment: change text as follows:

Notwithstanding **OPS.GEN.001** ~~**OPS.GEN.005**~~, for the purpose of this Subpart, the competent authority for non-commercial operators conducting operations in PBN/MNPS and RVSM airspace shall be the State of registry.

comment *1638* comment by: *Luftfahrt-Bundesamt*

The LBA cannot agree to the wording, including reference to OPS.GEN 005, describing the scope. In our view, the reference should be OPS.GEN 001 Competent Aurthoiry. In addition, in OPS.SPA.001.GEN, only RVSM, MNPS, PBN are addressed. In our view, AWO, DG and all other disciplines need to be addressed, or even replaced or removed in order to avoid confusion.

comment *3396* comment by: *UK CAA*

Page No: 88

Paragraph No:

OPS.SPA.001.GEN

Comment:

The reference to OPS.GEN.005 is not understood. It may be that OPS.GEN.001 is meant but, if so, there is no distinction between non-commercial operators of complex and those of non-complex aircraft as in that requirement. Moreover, by referring only to the State of Registry there can be no Member State competent authority for cases of the operation of aircraft covered by Article 4(1)(c) of Regulation 216/2008. Finally, the terms "PBN/MNPS" and "RVSM" do not seem to be defined anywhere in these requirements.

Justification:

The Agency needs to make its intentions clear. See also UK CAA comments on OPS.GEN.001 and OPS.GEN.005.

comment *5213* comment by: *DGAC*

The wording « PBN/MNPS and RVSM » is confusing

SPN is not an ICAO definition but an EASA invention. Domestic terminology should be avoided because it does not help understanding and can create confusion.

comment *6057* comment by: *DGAC*

Proposal:

Replace OPS.GEN.005 by OPS.GEN.001

Justification:

OPS.GEN.005 deals with scope, not competent authority

comment *6394* comment by: *Konrad Polreich*

OPS.SPA.001.GEN

The reference should probably be OPS.GEN.001 instead of the mentioned .005.

comment *6426* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Comment

"Competent authority" is not consistently defined. "Competent authority" is defined in OPS-SPA.001.GEN, but the definition is restricted to "the purpose of this sub part (Operations requiring specific approvals).

Proposal

We suggest a specific part or the EASA regulation framework may contain a comprehensive and exhaustive list of definitions, applicable to the whole EASA regulation, which is the best way to have consistent definitions.

Justification

This might be a legal issue regarding the scope of understanding and cause problems of reading.

B. I. Draft Opinion - Part-OPS - Subpart D - Section I - OPS.SPA.005.GEN Scope p. 88

comment *3975* comment by: *HDM Luftrettung gGmbH*

OPS SPA 005 SFL

Ops without safe force landing. En route with max 6 pax / no more 119/B4

Mpsc : This is also required for COM (and may also be required for GEN complex aircraft). The provision of this in Part SPA might add a burden to the Authorities that might be unnecessary/unwelcome. Shall be at least 7 pax due to already existing helicopter models with 7 seating capacity like

AW119, EC130B4.

comment *4960* comment by: *easyjet safety*

Alternative Training & Qualification Program (ATQP)

The NPA 2009-02b omits any reference to the above, as currently outlined in EU-OPS 1.978 Appendix 1 to OPS 1.978 and TGL 44, which requires specific approval by the Competent Authority.

The availability of such progressive flight training regimes based on performance data and organisational learning are core elements of Safety Management and are now being used effectively at easyJet to ensure that recurrent training is focussed on identifiable safety and performance issues.

An ATQP ensures a higher level of civil aviation safety by utilising improved training and evaluation over the current system. An ATQP is a company specific alternative to traditional training. Ongoing data collection can be developed into a responsive program that can adapt to an operator's changing requirements such as new equipment, new technology or a differing route structure. Focusing on specific needs of fleets and groups of pilots, targeted training can enhance performance while reducing costs.

This approach also reflects the principles identified in the Implementing Rules (Article 8) that they should:

- take into account worldwide aircraft experience in service, and scientific and technical progress

- be based on a risk assessment and shall be proportional to the scale and scope of the operation

It is essential that this omission in the NPA proposals is rectified in the pursuit of overall safety improvements in the industry

comment *5138* comment by: *Tim Glasspool*

There should be a specific approval for Offshore Helicopter Operations. This will allow the current high standards in the North Sea to be maintained.

This should include the fitting IHUMS on all aircraft, large company SMS (regardless of the actual size of the company), Flight Data Monitoring and specific offshore pilot training programmes (night approach and landing recency etc.)

In addition, the use of offshore helideck certification and turbulent sector mapping could be mandated.

This would allow simplification of the safe forced landing SPA and possibly be a better place to put items such as Airborne Radar Approaches, and Coastal Heliport alleviations.

comment *5215* comment by: *DGAC*

« This **sub**part establishes » : subpart SPA, not part OPS

B. I. Draft Opinion - Part-OPS - Subpart D - Section I - OPS.SPA.020.GEN Application for a specific approval p. 88

comment *1339* comment by: *Southern Cross International*

OPS.SPA.020.GEN (b)

Due to the type of operations of our company (test and ferry flights) and taking into consideration the wide variety of aircraft operated by our company, the different equipment fits for each of those aircraft, the extreme short period of time those aircraft are operated, and the fact that the majority of our crews are employed on a contract per flight basis, requiring an operator training program is not practicable as these crew members will be compliant with the training programme established by their regular employer for the subject type of aircraft. See also OR.OPS.060.FC

comment *2685* comment by: *AOPA-Sweden*

(a) (1): It has to be open for a private pilot/owner to apply too.

comment *2686* comment by: *AOPA-Sweden*

(b): A GA pilot can be flying several aircraft from different owners, and the owner shall not be responsible if a pilot is violating his/hers privileges.

comment *2688* comment by: *Pietro Barbagallo ENAC*

General Comment: some special authorisations allowed according to JAR-OPS 3005 (f) i.e. "Operations for small helicopters; (g) "Local area operations; (i) "Pubblic interest sites", have not be included in OPS SPA.

Justification: See App.1 to JAR-OPS 3.175, Contents and conditions of the Air Operator Certificate, para. (h) Special authorisations /approvals e.g.: CAT II/CAT III; Offshore Operations;HEMS, etc,etc.

comment *3417* comment by: *EHOC*

Paragraph (b)

It is not clear what the reference to OR.GEN.015 is intended to achieve.

Paragraph (c)

There is no specific text in OR.OPS.220.MLR that is applicable to the documentation of this application. Referring back to OR.GEN.220 or OR.GEN.200 produces no specific period for which the records must be retained.

comment *5073* comment by: *IAOPA Europe*

There should be no requirement to specify a business name. A private operator should be able to apply for a specific approval as well.

comment *5224* comment by: *DGAC*

- (b)(2) : "requirements/approvals » is confusiong. Avoid "/" and specify clearly if it is "and" or "or". Rewrite : "comply with the applicable airworthiness requirements **and are approved when required by the relevant section** ~~/approvals~~
- (b)(4) : "the applicable ~~subpart~~ **section** »
- (b)(4) : the case of operators who are not required to have an Ops Manual should be adressed in the IR, not in the AMC. Therefore the content of AMC OPS.SPA.020.GEN (b)(4) should be transfered to this paragraphe : Add at the end of (b)(4) : "**when required by Annex IV to Regulation (EC) No 216/2008 (Essential requirements for air operations), or in a procedures manual**".
- OR.OPS.220.MLR is not the good reference :
- 1/ OR OPS is not applicable to non commercial with non complex powered aircraft
- 2/ OR.OPS.220.MLR deals with management system & information used for the preparation of flights & crew records. It is preferable to write directly the requirement : "(c) Records relating to the requirements of (a) and (b) above shall be retained by the operator ~~in accordance with OR.OPS.220.MLR~~ **at least for the duration of the SPA operation**.

comment *5735* comment by: *Ryanair*

To avoid ambiguity the "competent authority" must be further defined

Proposal

the competent authority *designated by the Member State where the operator has its principle place of business*

Proposal

(b)(3) a training programme *if required* has been established.....

B. I. Draft Opinion - Part-OPS - Subpart D - Section I - OPS.SPA.035.GEN Continued validity of a specific approval p. 89

comment *3397* comment by: *UK CAA*

Page No: 89

Paragraph No:

OPS.SPA.035.GEN

Comment:

This states that, "Specific approvals shall be issued for an unlimited duration. " They shall remain valid subject to the operator remaining in compliance with this subpart, etc.

Current UK policy being implemented is that all special approvals are currently time limited: 5 years for an AOC and 3 Years for non-AOC (CAT) operators who have less routine oversight. Routine changes to AOC (CAT) fleets provide a means for this oversight of special approvals. In the case of non-CAT special approvals oversight is provided by a requirement for a 3-year check. Making the specific approvals open-ended for both CAT and non-CAT would result in a drop in oversight of non-CAT complex aircraft operating in areas requiring special approvals. If this amendment to current policy is adopted an oversight mechanism needs to be built in.

Justification:

Special approvals require regular oversight as the equipment requirements, procedures and areas are dynamically developing world-wide particularly in

Performance Based Navigation areas. Oversight is built-in for AOC operators (CAT), but this is not the case for other non-AOC operators and leaving approvals open ended could reduce safety margins.

Proposed Text (if applicable):

CAT operators ~~S~~specific approvals shall be issued for an unlimited duration**,** ***subject to periodic review by the competent authority. Non-CAT operators specific approvals shall be renewed at least every 3-years by the competent authority.*** They shall remain valid subject to the operator remaining in compliance with this subpart, OR.GEN.030, OR.GEN.035 (a)(1),(b) and (c).

comment *3416* comment by: *EHOC*

General

Editorial - there is no OR.GEN.035(a)(1).

The referencing of OR.GEN.030 and 035 does not make too much sense, perhaps a clear statement about 'changes to the organisation' or 'continued validity' would be better.

comment *3681* comment by: *Civil Aviation Authority of Norway*

Comment:

This states that, "Specific approvals shall be issued for an unlimited duration. " They shall remain valid subject to the operator remaining in compliance with this subpart, etc.

Current policy being implemented is that all special approvals are currently time limited 5 years for an AOC and 3 Years for non-AOC (CAT) operators who have less routine oversight. Routine changes to AOC (COM) fleets provide a means for this oversight of special approvals. In the case of non-commercial (COM) special approvals oversight is provided by a requirement for a 3-year check. A light touch. Making the specific approvals open-ended for both CAT and COM may well result in a drop in oversight of COM complex aircraft operating in areas requiring special approvals. If this change in current implemented policy is to be changed an oversight mechanism needs to be built in.

Justification:

Special approvals require regular oversight as the equipment requirements, procedures and areas are dynamically developing world-wide particularly in Performance Based Navigation areas. Oversight is built- in for AOC operators, but this is not the case for other non-AOC operators and leaving approvals open ended could reduce safety margins.

Proposed Text

B. I. Draft Opinion - Part-OPS - Subpart D - Section II p. 90

comment *2687* comment by: *AOPA-Sweden*

How is this coordinated with EASA NPA 2008-14? Why about the same regulation in two different documents?

comment *3398* comment by: *UK CAA*

Page No: 90

Paragraph No:

Subpart D, Section II

Comment:

Under current regulations Offshore Operations (helicopter operations in support of the oil and gas industry and other over water specific operations) are conducted under an approval contained within the Operations Specification of the Air Operators Certificate documentation. This procedure was covered by JAR-OPS Joint Implementation Procedures (JIPS) but has not been reflected in NPA 2008-22b at Appendix I to Annex 1 Part Authority Requirements - EASA Standard Organisation Approval Certificate or NPA OPS 2009-02b.

It is considered that a special authorisation for an 'Offshore Operations' specific approval (SPA) be developed and included in Part OPS.SPA with direct inclusion in the Operations Specifications section of the AOC at Part AR.

It is recommended that the SPA framework be modelled and developed from the HEMS SPA and limited to helicopter commercial operators.

An amendment to the definition of 'Offshore Operations' has been made separately

Justification:

To retain the equivalent level of helicopter aviation safety and control achieved under current JAR-OPS procedures. The specific procedure contained within JIPS has not been transferred into the proposed IRs. The extension to cover Commercial (former 'aerial work') activity is considered appropriate.

comment *7598* comment by: *AOPA UK*

How is this coordinated with EASA NPA 2008-14? Why about the same regulation in two different documents?

comment *3087* comment by: *AEA*

Relevant Text:

C 3 (vii) navigation database integrity, in case of PBN

Comment:

Navigation Database Integrity is not a matter of operating procedures but will be defined (where required) in the corresponding AMC 20 material

Proposal:

Delete the reference to navigation database integrity

comment *3399* comment by: *UK CAA*

Page: 90

Paragraph No: OPS.SPA.001.SPN

Comment:

This mixes up two different types of airspace: that which comes under "Performance Based Navigation" (PBN) as defined in ICAO DOC 9613 and "Minimum Navigation Performance Specification Airspace" (MNPS), which is not PBN and applies just to the North Atlantic. The requirements are different and each requires its own AMC.

In addition, within PBN there are multiple approval type requirements to support en-route continental, en-route oceanic and remote, arrivals and departures, and approaches that will each need their own AMCs. It is necessary to break out the approval requirement for PBN into paragraph A, and MNPS into paragraph B.

Change Title to read: ***Operations in Areas with Specified Navigation Performance.***

Para (a). Replace "navigation specifications" with "***Performance Based Navigation specifications"***

Para (b). Is not clear as written. Change to read, "An aircraft shall only be operated in designated Minimum Navigation Performance Specification (MNPS) airspace, based on ICAO Regional Air Navigation Agreement, if the

operator has been approved by the competent authority."

Para (c). Standardise with OPS.SPA.001.RVSM

Include: Flight Planning, Pre-flight procedures, Procedures prior to entry, post flight procedures, Maintenance and training requirements.

Existing para (c)3(vi) Change to read just "specific regional operating procedures." (*It applies to MNPS and a range of RNAV/RNP areas of operation).*

Existing para (c)(3)(vii) Amend to read " navigation database integrity, as applicable." (*It does not apply to all PBN just some aspects*).

Justification:

MNPS airspace is not PBN airspace. Using the words Performance Based Navigation in the title is misleading as it has a definitive meaning, and does not apply to MNPS airspace.

Proposed Text (if applicable):

OPS.SPA.001.SPN Operations in areas with ***Specified Navigation Performance.***

(a) An aircraft shall only be operated in designated airspace, on routes or in accordance with procedures where ***Performance Based Navigation (PBN) specifications*** are established, if the operator has been approved by the competent authority.

(b) An aircraft shall only be operated in designated ***Minimum Navigation Performance Specification (MNPS) airspace***, ***based on ICAO Regional Air Navigation Agreement***, if the operator has been approved by the competent authority.

(c) To obtain such approval by the competent authority, the operator shall:

(1) demonstrate that the navigation equipment meets the required performance in terms of navigation functionality, accuracy, integrity, availability and continuity;

(2) establish and maintain a training programme for the flight crew involved in these operations; and

(3) establish operating procedures specifying:

(i) the equipment to be carried, including its operating limitations and appropriate entries in the Minimum Equipment List (MEL);

(ii) flight crew composition and experience requirements;

(iii) ***flight planning;***

(iv) ***pre-flight procedures;***

(v) ***procedures prior to entry;***

(vi) normal procedures;

(vii) contingency procedures;

(viii) incident reporting;

(ix) ***specific regional operating procedures,***

(x) ***navigation database integrity, as applicable;***

(xi) ***post flight procedures; and***

maintenance and training requirements.

comment *3605* comment by: *PPL/IR Europe*

The wording of this section (and related AMCs) does not permit, where appropriate, self-declared compliance for private operations based on meeting installation, database, operational and pilot training criteria. We believe it should. This has been the case successfully for B-RNAV in Europe and RNP-1 in the USA.

The example of JAA TGL 10 for P-RNAV is that it causes unnecessary complexity for private operators by leaving National Authorities highly unclear about how to implement regulations for private operators which were, in reality, only worded for commercial air transport.

It is essential the GA in Europe continues to have full access to the IFR system with proportionate and reasonable requirements. Europe has some of the lowest standards currently in GA IFR, because the complexity of RNAV regulation overall means that many operations at smaller airports depend on obsolete radio-based non-precision approaches, rather than modern RNAV methods.

In IFR historically, Commerical operators have needed specific approval for procedures, equipment, crew training programmes etc, whilst private operators have needed only to carry the required equipment and hold appropriate pilot qualifications and currency. There is no reason to move away from this principle in the realm of RNP/RNAV, and such a move should not be dictated by the inevitable nature of RNP/RNAV regulations being written, in the early stages of drafting, primarily for jet transport applications. There should be no misunderstanding that the 3rd party risk is any greater in, for example, P-RNAV operations than traditional radio-based IFR. In fact, we believe that modern avionics and RNAV methods make single-pilot private IFR safer than traditional radio IFR, and the regulations should encourage, rather than hinder, the transition to RNAV/RNP for light aircraft and private operators.

C 3 (vii) navigation database integrity, in case of PBN

Comment:

Navigation Database Integrity is not a matter of operating procedures but will be defined (where required) in the corresponding AMC 20 material

Proposal:

Delete the reference to navigation database integrity

comment *3884* comment by: *M Wilson-NetJets*

Original text:

(c) To obtain such approval by the competent authority, the operator shall:

(1) demonstrate that the navigation equipment meets the required performance in terms of navigation functionality, accuracy, integrity, availability and continuity;

(2) establish and maintain a training programme for the flight crew involved in these operations; and

(3) establish operating procedures specifying:

(i) the equipment to be carried, including its operating limitations and appropriate entries in the Minimum Equipment List (MEL);

(ii) flight crew composition and experience requirements;

(iii) normal procedures;

(iv) contingency procedures;

(v) incident reporting;

(vi) specific regional operating procedures, in case

Suggested new text:

(c) To obtain such approval by the competent authority, the operator shall **(where required):**

(1) demonstrate that the navigation equipment meets the required performance in terms of navigation functionality, accuracy, integrity, availability and continuity;

(2) establish and maintain a training programme for the flight crew involved in these operations; and

(3) establish operating procedures specifying:

(i) the equipment to be carried, including its operating limitations and appropriate entries in the Minimum Equipment List (MEL);

(ii) flight crew composition and experience requirements;

(iii) normal procedures;

(iv) contingency procedures;

(v) incident reporting

(vi) specific regional operating procedures, in case

Comment/suggestion:

Not all operations in areas where special navigation performance is applicable requires all the items listed under (c). Therefore, it is suggested to add (where required) to item (c)

SPN = MNPS + RVSM (+ PBN) ?

- MNPS and PBN should not be mixed, and new definitions like SPN should be avoided. MNPS and PBN are not at the same level.
- Purpose of PBN is to define different NAV specs at ICAO level and avoid new definitions and special nav specs proliferation. MNPS could be in the future replaced by a Nav specs defined in PBN. It would be better to put PBN and MNPS in separate requirements.

(a) « where a reduced vertical separation minimum of 300 m (1 000 ft) applies above flight level (FL) 290 » should be specified in airspace requirements (ex. Future NPA ATM, in the meantime in appropriate national airspace requirements), not in ops requirements. Replace by "in RVSM airspace"

(a) and (b) : specify "**(PBN)"** in (a) and "(**MNPS)"** in (b)

replace "if the operator has been approved by the competent authority "… by the following :

"**if :**

(1) the aircraft has been issued with the relevant airworthiness approval by the Agency in accordance with Part-21; and

(2) the operator has been approved by the competent authority.

Justification : In the case of PBN, not only the operator has to be approved but the aircraft and its equipment must be certified.

(c)(3) : operating procedures should be as detailed as in OPS.SPA.001.RVSM (b)(2)

OPS.SPA.001.SPN

Since IFR-operations with at least B-RNAV and RNAV-Approach capability is virtually standard today as P-RNAV (RNP 1) probably is at least tomorrow, it should be treated as it is -a standard. A kind of operation, which needs accordingly capable and certified equipment, which must be operated correctly, just like basic navigation via VOR or NDB and has to be trained thoroughly, like it is done in any flight school or operator training nowadays. An RNAV (GPS) approach and enroute navigation with LNAV (BRNAV) is less complex/critical compared to flying a VOR/NDB approach and navigating along an airway established by VOR/NDB's. It does not justifiy the additional administrative burden for a special approval?

In today/tomorrows airspace with more and more disappearing radio nav facilities and routes increasingly based soley on RNAV intersections, it would not be possible to operate IFR at all, without a SPA!

Suggestion:

Limit the requirement for a SPA for more specified and complex operations, like MNPS, Advanced-RNP 1 and RNP AR APCH (RNP SAAAR) and transfer special requirements for the less demanding operations into the general ops subpart. With the required certification for commercial and the declaration for non-commercial operators (of complex-motor-powered aircraft) there is sufficient possibility for the competent authorities to oversee the standards.

Alternatively define, which navigation specifications and type of approaches are possible without any SPA.

comment *6577* comment by: *Southern Cross International*

Due to the type of operations of our company (test and ferry flights) and taking into consideration the wide variety of aircraft operated by our company, the different equipment fits for each of those aircraft, the extreme short period of time those aircraft are operated, and the fact that the majority of our crews are employed on a contract per flight basis, requiring an operator training program is not practicable as these crew members will be compliant with the training programme established by their regular employer for the subject type of aircraft.

comment *6677* comment by: *AIR FRANCE*

(a) In EU OPS 1.243 the Authority approval is " if required". We think that this flexibility should remain.

comment *6678* comment by: *AIR FRANCE*

(b) An aircraft shall only be operated in designated airspace, based on ICAO Regional Air Navigation Agreement, minimum navigation performance

specifications are established, if the operator has been approved by the competent authority.

There is an editorial mistake in the sentence ("where" is probably missing). But more important it really looks like a duplication of (a) and should be deleted.

NPA 2009-02b, Part Ops

Section II and III

Paragraphs OPS.SPA.030.SPN and OPS.SPA.030.RVSM

Page 90 and 91 of 464

BOEING COMMENT:

Flight crew requirements for these special operations should all include the requirements that appear in paragraph OPS.SPA.030.LVO(b), as shown on page 93, which state that the flight crew members shall be "*properly*

qualified prior to commencing" special operations.

JUSTIFICATION: Our suggested change will ensure consistency of rulemaking requirements/standards.

comment *5236* comment by: *DGAC*

In contradiction with OR.OPS.115.FC "Composition of Flight Crew" which enables reduction of flight crew from 2 to 1 providing certain conditions are met.

Where does this requirement come from? Not addressed in NPA 2009-02(a)

RNAV (GNSS) approaches (also known as RNP(APCH) with PBN terminology) are authorized even with single pilot. Single pilot operations will just introduce some limitations in RVR as it is mentioned in point 10 of AMC6 OPS GEN 150.A.

comment *5729* comment by: *Peter Moeller*

What if a HEMS helicopter is certified for SP IFR? This rule would stop the introduction of IFR in HEMS operation.

comment *5787* comment by: *Norsk Luftambulanse*

This does not support the fact that HEMS operators in Europe and elsewhere consider and perform IFR as an integrated part of their HEMS operations and has done so for many years. It also hinder further introduction of IFR to increase safety in HEMS operations

We suggest that for single pilot HEMS IFR operations, when the Aircraft is certificated for Single Pilot IFR, the technical crew member shall be qualified to perform the duties requiring two pilots. This qualification then replaces the requirement for two pilots described in OPS.SPA.030 SPN and LVO.

comment *6681* comment by: *AIR FRANCE*

What is a "PBN area" ? OPS.SPA.001.SPN Operations in areas with specified performance based navigation (SPN) speaks about "SPN". A world wide harmonized phraseology is a basic requirement in matters of Navigation. We suggest to avoid any new wording that is not used in the PBN Manual. (PBN Area is not defined in the PBN manual)

comment *3250* comment by: *Eurocontrol CND*

OPS.SPA.001.RVSM Operations in airspace with reduced vertical separation minimum

It is stated that RVSM is applied "above FL290" which is incorrect. RVSM can be applied between FL290 and FL410 inclusive in accordance with ICAO. Why not use the ICAO wordings instead of paraphrasing?

comment *3400* comment by: *UK CAA*

Page No: 91

Paragraph No: OPS.SPA.001.RVSM (a) and (b)(2)

Comment:

Para (a). RVSM airspace applies to aircraft flying at Flight Levels between FL290 and FL410 inclusive, not above FL290. TGL 6, in places, does mention above FL290, but it should read at and above FL290. RVSM airspace itself exists from FL285 to FL420 and utilises FL290 through to FL410.

In Para (b)(2). The list of operating procedures to be specified omits importantly Contingency Procedures together with TCAS/ACAS Alerts, R/T phraseology and Height Monitoring requirements.

Justification:

Definition of RVSM airspace as applied to aircraft operation is incorrect.

Complete list of operating procedures required.

Proposed Text (if applicable):

(a) An aircraft shall only be operated in designated airspace where a reduced vertical separation minimum of 300 m (1 000 ft) applies ~~above~~ ***between*** flight level (FL) 290 ***and FL 410 inclusive,*** if:

(1) the aircraft has been issued with an RVSM airworthiness approval by the Agency in accordance with Part-21; and

(2) the operator has been approved by the competent authority.

(b) To obtain such approval by the competent authority, the operator shall:

(1) establish and maintain a training programme for the flight crew involved in these operations; and

(2) establish operating procedures specifying:

(i) the equipment to be carried, including its operating limitations and appropriate entries in the Minimum Equipment List (MEL);

(ii) flight crew composition and experience requirements;

(iii) flight planning;

(iV) pre-flight procedures;

(v) procedures prior to RVSM airspace entry;

(vi) in-flight procedures;

(vii) post flight procedures;

(viii) maintenance programme;

(ix) incident reporting;

(x) specific regional operating procedures;

(xi) contingency procedures;

(xii) TCAS/ACAS alerts;

(xiii) R/T phraseology; and

height monitoring requirements.

comment *5237* comment by: *DGAC*

In contradiction with OR.OPS.115.FC "Composition of Flight Crew" which enables reduction of flight crew from 2 to 1 providing certain conditions are met.

Where does this requirement come from. Not addressed in NPA 2009-02(a)

B. I. Draft Opinion - Part-OPS - Subpart D - Section IV p. 92

comment *5239* comment by: *DGAC*

The definitions of "Category I operations", "Lower than Standard Category I", "Other than Standard Category II", "Category II operations" and "Category III operations" should be somewhere in the IR (not just in the

AMC) for instance in OPS.GEN.010 Definitions (where you already find the definition of LVO and LVP)

The purpose of NPA OPS 41 was to have harmonized minima between EU-OPS/JAR-OPS and FAA rules (TERPS). There is no rationale for transferring those minima to AMC. The result could be deharmonization.

Huge contradiction between what is stated in NPA 2009-02(a) when explaining the approach for SPA.SPN ("As an AMC does not create any obligation on an operator, the provisions in this section have been included to address the obligation for an operational approval to conduct these type of operations."). Why is the approach totally different with LVO, transferring almost everything in AMC ? Does not answer the international demand for harmonization of LVO requirements!!!

Through EU OPS, European states agreed on a common regulation for minima determination, there is no benefit to introduce them now as an AMC. Minima in US are introduced in TERPS which is a not an AC. Furthermore, FAA publishes its minima whereas in Europe, most of the states do not publish their minima so that European operator can determine themselves their minima.

B. I. Draft Opinion - Part-OPS - Subpart D - Section IV - OPS.SPA.001.LVO Low visibility operations (LVO) p. 92

comment *1693* comment by: *Dassault Aviation*

Technical comment.

Page 92 OPS.SPA.001.LVO Low Visibility Operations: §OPS.SPA.001.LVO(a) and §GM1 OPS.SPA.001.LVO(c) defines EFVS operations as "Low Visibility Operations LVO". Furthermore, §OPS.SPA.010.LVO requires, for LVO operations, the two following points:

- - one radio-altimeter, and
- - an "aircraft" certification for DH < 200 feet (strictly).

As far as the radio altimeter is concerned for EVS operations, §3.1 to GM OPS.SPA.001.LVO(b)(2) comes in contradiction with the requirement to have a radio-altimeter on board - see above. Indeed, this GM says "*if the aircraft is equipped with a radio altimeter, it should be used only as enhanced terrain awareness during approach using EVS and should not be taken into account for the operational procedure development.*"

As far as the "aircraft" certification for DH < 200 feet is concerned, §2 to AMC OPS.SPA.001.LVO(b)(2) clearly states that an EFVS approach is an approach where DH is ≥ 200 feet. There is therefore a contradiction.

We understand therefore, from the AMC and GM quoted above, that an EFVS approach is classified as a Cat1 approach, which does not require a radio-altimeter to determine the DH, nor to determine the 100 feet EVS.

We therefore propose to not classify EFVS operations as Low Visibility Operations (LVO) since these are Cat1 operations which are not themselves classified as LVO.

comment *2512* comment by: *Royal Aeronautical Society*

Paragraph (b)(3) needs the insertion of 'so as' between 'failure' and 'to monitor' if it is to be read correctly. **It is suggested that paragraph (b)(3) be amended to read, 'establish a system for recording approach and/or automatic landing success and failure so as to monitor the overall safety of the operation'.**

comment *2691* comment by: *AOPA-Sweden*

If the definition of an "operator" is the same as a single private non-commercial aircraft-owner or a small air-club, AOPA-S thinks these requirements are unfeasible impracticable to achieve. It has to be the single pilot's responsibility to keep currency.

comment *3091* comment by: *AEA*

Relevant Text:

a) An aircraft shall only be operated in conditions lower than standard Category I, take off in less than 400 m RVR or with the aid of EVS, if the operator has been approved by the Competent Authority.

Comment:

The requirement for approval for take-off in less than 400m RVR (between 200/150/125m and 400m) is new and does not seem to be driven by safety considerations. The EASA proposal seems to be driven by administrative

requirements rather than safety without having assessed the impact.

Proposal:

Realign with EU-OPS

comment *3254* comment by: *Eurocontrol CND*

Section IV - Low visibility Operations:

LTS and OTS are not ICAO procedures

GM1 OPS.SPA.001.LVO - Terminology:

This section introduces LTS and OTS, but there is no mentioning of CAT I, CAT II, or CAT III.

Not clear why the terminology does not encompass all LVO terms.

GM2 OPS.SPA.001.LVO – Low visibility operations

As this document is a European standard and refers to LVPs we would recommend adding the ICAO EUR Doc 013: EUROPEAN GUIDANCE MATERIAL ON AERODROME OPERATIONS UNDER LIMITED VISIBILITY CONDITIONS which provides detailed information about low visibility procedures.

OPS.SPA.001.LVO and OPS.SPA.010.LVO would essentially prohibit t/o operations of CAT-I a/c below 400m RVR. However, especially in multiengine aircraft, takeoffs with less RVR or corresponding visibility have been safely and regulary performed in the past (under JAR and LuftVO (germany)) and are an essential option in private IFR-operations.

These aircraft (e.g. PA34, C340, C414, BE90 etc) are not capable of CAT II ops or higher and the crews in private operations can not be certified to the prescribes standards. As a result, the wording as given here will prohibit them from RVR<400 takeoffs and severely reduce the usablility of these aircraft.

comment *7269* comment by: *AIR FRANCE*

Relevant Text:

a) An aircraft shall only be operated in conditions lower than standard Category I, take off in less than 400 m RVR or with the aid of EVS, if the operator has been approved by the Competent Authority.

Comment:

The requirement for approval for take-off in less than 400m RVR is new.

EU-OPS appendix 1. to OPS 1.430 requires approval for reduced RVR 125 or 150m.

Proposal:

Realign with EU-OPS.

comment *7601* comment by: *AOPA UK*

If the definition of an "operator" is the same as a private non-commercial aircraft-owner or a small aero-c1ub, these requirements are not feasible impracticable to achieve. It has to be the pilot's responsibility to keep currency.

B. I. Draft Opinion - Part-OPS - Subpart D - Section IV -OPS.SPA.010.LVO Aircraft requirements for LVO p. 92

comment *84* comment by: *Air Southwest*

OPS.SPA.010.LVO (b) reads as if it is mandatory for all aircraft to be certificated for operations with decision heights below 200ft or no decision height. Suggest that this paragraph is re-written: "Only aircraft certificated for operations with decision heights below 200ft or no decision height, are to be used in such operations."

comment *590* comment by: *ECA - European Cockpit Association*

Comment on OPS.SPA.010.LVO(b): change as follows:

(b) **Each aircraft** ~~**Aircraft**~~ shall be certificated for operations with decision heights below 200 ft or no decision height.

comment *922* comment by: *CAA-NL*

Comment regarding:

(a) In addition to the equipment required by OPS.GEN, aircraft involved in LVO shall be equipped with a radio altimeter. (b) Aircraft shall be certificated

for operations with decision heights below 200 ft or no decision height.

Suggestion CAA-NL:

For Low vis. Take-off there is no need for a Radio Altimeter.

Text should be changed, to excluded ta Radio Alt. For Low Vis. Take-off

comment *2301* comment by: *Austro Control GmbH*

Recommendation:

The requirement should mention that for a LVO take-off a radio altimeter is not necessary.

comment *3886* comment by: *M Wilson-NetJets*

Original text:

OPS.SPA.010.LVO Aircraft requirements for LVO

(a) In addition to the equipment required by OPS.GEN, aircraft involved in LVO shall be equipped with a radio altimeter.

(b) Aircraft shall be certificated for operations with decision heights below 200 ft or no decision height.

Suggested new text:

OPS.SPA.010.LVO Aircraft requirements for LVO **(Except LVTO)**

(a) In addition to the equipment required by OPS.GEN, aircraft involved in LVO shall be equipped with a radio altimeter.

(b) Aircraft shall be certificated for operations with decision heights below 200 ft or no decision height.

Comment/suggestion:

This paragraph should only be applicable to LVO landing operations. LVO also contains LVTO, which does not need these requirements.

comment *5244* comment by: *DGAC*

OPS.SPA.010.LVO may not be consistent with CS AWO which determines the airworthiness level for Cat II or Cat III operations. Delete (a) or make reference to CS-AWO if needed at this level.

comment *5752* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

(a) In addition to the equipment required by OPS.GEN, aircraft involved in LVO shall be equipped with a radio altimeter.

Comment:

The requirement for a radio altimeter should be restricted to landing or approach but not for take-off.

Proposal (including ***new text***):

(a) In addition to the equipment required by OPS.GEN, aircraft involved in LVO ***approach and landing*** shall be equipped with a radio altimeter.

comment *6420* comment by: *Konrad Polreich*

OPS.SPA.010.LVO (b) and OPS.SPA.001.LVO

This sentence together with the statement in OPS.SPA.001.LVO excludes aircraft from doing LVTO, which are not certified and approved for CAT II or III approaches. I doubt the justification for this, since presently it can be done, even without the extensive training and checking required by this NPA. My experience on helicopters is, that take-offs can safely be done down to at least 150 m visibility, when the crew has a good operational concept (multi-pilot only) and is trained to do this. Our helicopter is not certified for DH < 200 ft.

I don't doubt there is safety data justifying this cancelling of present possibilities. There are a lot of operators safely doing LVTO with RVR > 150m without CAT II or III approvals for years. Anyway special training for LVTO would be beneficial, but this could be regulated in the OR. Only LVTO with RVR < 150/200m should require an SPA.

Suggestion:

Delete part (b) of OPS.SPA.010.LVO and alter OPS.SPA.001.LVO to exclude take-offs down to a minimum of 150 m visibility from the requirement of a special approval (SPA) at all (delete 400m and set 150 m).

OPS.SPA.030.LVO (b) does already demand properly trained FCM's.

Training and checking requirements could be detailed in an AMC to the OR.

comment *6511* comment by: *IATA*

b)(3)establish a system for recording approach and/or automatic landing success and failure to monitor the overall safety of the operation and

This is a new requirement and totally

impractical for a day to day operation.

Proposal: Delete

B. I. Draft Opinion - Part-OPS - Subpart D - Section IV -OPS.SPA.020.LVO LVO operating minima p. 92

comment *6* comment by: *KLM*

In (c) the pilot in commend shall ensure etc, while the aerodrome is authorised by the State and has established low vis procedures.

It is the responsibility of the aerodrome operator and ANSP that the correct procedures are followed. To put another burden onto a pilot is too much and may create confusion.

Moreover a simple airport with one taxiway and one apron may use normal procedures in low vis because there is no need to have special procedures with low vis. This is an unneccesary requirement and shall be deleted.

It is the pilots responsibility to complete the flight and the responsibility of the aerodrome operator to take care of the ground procedures.

The requirement is obsolete.

comment *631* comment by: *ECA - European Cockpit Association*

Comment on OPS.SPA.020.LVO(b): change as follows:

(a) The radio altimeter shall be used to determine the decision height.

(b) An operator shall not use an aerodrome for operations in accordance with this section, unless:

(1) the aerodrome has been approved for such operations by the State in which it is located;

(2) low visibility procedures (LVP) have been established at ~~**that**~~ **the** aerodrome ~~**where LVO are to be conducted.;**~~

add new text:

(3) the operator has been authorised by the State where the aerodrome is located.

Justification:

We consider that it has to be clear that the operator has to be authorised by the State of the aerodrome to perform LVO on its soil.

comment *646* comment by: *ECA - European Cockpit Association*

Comment on OPS.SPA.020.LVO(c): add the following proposed text:

(c) The pilot-in-command shall ensure that:

(1) appropriate LVPs are in force according to information received from Air

Traffic Services, before commencing a Low Visibility Take-off, a Lower than Standard Category I, an Other than Standard Category II, or a Category II or III approach, and

(2) the status of the visual and non-visual facilities are sufficient prior to commencing a Low Visibility Take-Off, an Approach utilising EVS, a Lower than Standard Category I, an Other than Standard Category II, or a Category II or III approach.

(3) that the status of the aeroplane and of the relevant airborne systems is appropriate for the specific operation to be conducted.

Justification:

The requirement of equipment "installed" for this kind of operations does not necessarily mean the equipment shall be in a full operational status.

comment *3093* comment by: *AEA*

Relevant Text:

*a) The radio altimeter shall be used **to determine** the decision height*

Comment:

This should not apply to the determination of minima which is subject to a calculation method.

Proposal:

comment *3888* comment by: *M Wilson-NetJets*

Original text:

(b) An operator shall not use an aerodrome for operations in accordance

with this section, unless:

(1) the aerodrome has been approved for such operations by the State in which it is located;

(2) low visibility procedures (LVP) have been established at that aerodrome where LVO are to be conducted.

(c) The pilot-in-command shall ensure that:

(1) appropriate LVPs are in force according to information received from Air Traffic Services, before commencing a Low Visibility Take-off, a Lower than Standard Category I, an Other than Standard Category II, or a Category II or III approach, and

(2) the status of the visual and non-visual facilities are sufficient prior to commencing a Low Visibility Take-Off, an Approach utilizing EVS, a Lower than Standard Category I, an Other than Standard Category II, or a Category II or III approach.

Suggested new text:

(b) An operator shall not use an aerodrome for operations in accordance with this section, unless:

(1) the aerodrome has been approved for such operations by the State in which it is located;

(2) low visibility procedures (LVP) have been established at that aerodrome where LVO are to be conducted.

(c) The pilot-in-command shall ensure that:

(1) appropriate LVPs are in force according to information received from Air Traffic Services, before commencing a Low Visibility Take-off, a Lower than Standard Category I, an Other than Standard Category II, or a Category II or III approach, and

(2) the status of the visual and non-visual facilities are sufficient prior to commencing a Low Visibility Take-Off, an Approach utilizing EVS, a Lower than Standard Category I, an Other than Standard Category II, or a Category II or III approach.

Note: at aerodromes where the term LVP or LVO are not used the operator shall ensure that equivelant procedures adhere to the requirements of LVP at the aerodrome. This situation shall be clearly noted in the appropriate route manual including guidance to he flight crew on how to determine equivelant LVP is in effect.

Comment/suggestion:

Many airports outside the European region do not (yet) use the terminology of LVP or LVO but do have procedures and equipment in place that adhere to the requirements of LVP. Operators should be allowed to ascertain that these procedures and equipments adhere to the LVP requirements and after properly documenting this, use LVO/LVTO at that particular aerodrome.

1. OPS.SPA.020.LVO LVO operating minima para a.

Comment:

This regulation will require the use of a radio altimeter to determine DH. Depending on the underlying terrain, the radio altimeter may not represent the correct operational decision height. Radio altimeters are typically not used for decision heights of 200 ft or higher.

The radio altimeter should only be used for identifying the DH if the underlying terrain has been evaluated and a radio altimeter height adjusted for terrain irregularities is made available to the operator. A barometric altimeter can be used at 200 ft or higher.

Recommendation:

Modify the regulation and the guidance material to clarify and amplify the usage.

B. I. Draft Opinion - Part-OPS - Subpart D - Section IV -OPS.SPA.030.LVO Flight crew requirements for LVO p. 93

comment *818* comment by: *Lukas KISTLER*

(a) ... LVTO (low visibility take offs) with helicopters may be conducted in single pilot operation if the pilot is qualified to do so.

comment *924* comment by: *REGA*

LVTO (low visibility take offs) with helicopters may be conducted in single pilot operation <u>if the pilot is qualified and helicopter is certified to do so</u>. Helicop... Minimum IFR Approach Speed, e.g. AW109 55kts.

Proposal (a)

<u>Except for helicopters</u> the minimum flight crew for operations in meteorological conditions lower than standard Category I or with the aid of enhanced vision systems (EVS) shall consist of at least two pilots.

comment *2302* comment by: *Austro Control GmbH*

This requirement is linked to qualification of the pilots;it does not completely correspond with the Part- FCL requirements and therefore should be rechecked and adapted.

comment *2692* comment by: *AOPA-Sweden*

(a): AOPA-S does not see a need for two pilots using an EVS system in non-commercial operations.

comment *5247* comment by: *DGAC*

(a) : Replace "in meteorological conditions lower than ~~standard Category I~~" by "in meteorological conditions lower than **the minima used for standard Category I**" to avoid confusion with the "Lower than Standard Category I".

(a) Delete "or with the aid of enhanced vision systems (EVS)" as paragraph 4 of GM.OPS.SPA.001.LVO(b)(2) requires two pilots in EVS operations only for RVR below 550m, which is the Cat I Lowest RVR.

(b) add after "shall be properly qualified" the following : "**according to OPS.SPA.001.LVO (b)(1)"**

comment *5788* comment by: *Norsk Luftambulanse*

(a) This does not support the fact that HEMS operators in Europe and elsewhere consider and perform IFR as an integrated part of their HEMS operations and has done so for many years. It also hinder further introduction of IFR to increase safety in HEMS operations

We suggest that for single pilot HEMS IFR operations, when the Aircraft is certificated for Single Pilot IFR, the technical crew member shall be qualified to perform the duties requiring two pilots. This qualification then replaces the requirement for two pilots described in OPS.SPA.030 SPN and LVO.

comment *7602* comment by: *AOPA UK*

AOPA UK does not see a need for two pilots using an EVS system in non-commercial operations.

B. I. Draft Opinion - Part-OPS - Subpart D - Section V p. 94

comment *2693* comment by: *AOPA-Sweden*

It should be elucidated that this Section V is only for commercial operations, AOPA-S can not comprehend this is for a private pilot bring his hunting-rifle with ammunition or fuel for his cottage on a flight to a remote place without

any land communication.

comment *5248* comment by: *DGAC*

(a) delete "2007-2008 Edition of the" as the current edition of the Technical Instructions is already the 2009-2010 (since 01 jan 2009)". The reference to the edition should be made in the AMC rather than in the IR to keep some flexibility (easier to keep up to date).

comment *7603* comment by: *AOPA UK*

It should be made clear that Section V is only for commercial operations, AOPA UK cannot understand why a private pilot cannot bring his hunting-rifle with ammunition or fuel for his cottage on a flight to a remote place without any external communication.

B. I. Draft Opinion - Part-OPS - Subpart D - Section V - OPS.SPA.001.DG Approval to transport dangerous goods p. 94

comment *1180* comment by: *CAA-NL*

OPS.SPA.001.DG

Comment 1: Reference to OPS.GEN.035(b) is incorrect.

Justification: OPS.GEN.035(b) does not exist, reference should be to OPS.GEN.030(b)

Proposed Text:

Amend OPS.SPA.001.DG as follows:

"Except as provided for in OPS.GEN.030~~5~~(b), an operator….."

OPS.SPA.001.DG(b)(2)(ii)

Comment 2: OPS.SPA.001. DG(b)(2)(ii) states that an operator shall establish operating procedures containing information and instructions on the requirements for acceptance, *packing, marking*, handling, loading, stowage and segregation of dangerous goods.

Justification: Packing and marking are the responsibility of the shipper and so it is inappropriate to require an operator to have such procedures in place. An awareness of the packing, marking (and labelling which is equally relevant to a shipper but not stated in the text) requirements would be addressed by the requirement for procedures relating to acceptance.

Proposed Text:

"(ii) the requirements for acceptance, ~~packing, marking,~~ handling,

loading, stowage and segregation of dangerous goods."

OPS.SPA.001DG(b)(2)

Comment 3: No mention is made of the requirement for the operator to provide information in the event of a serious incident involving dangerous goods or an accident.

Justification: NPA 2009-02f suggests this is covered by OPS.SPA.001.DG(b)(2)(viii) but this relates to "incident reporting" which is quite different.

Proposed Text

Add a new (ix) to OPS.SPA.001DG(b)(2) as follows:

"(ix) provision of information in the event of an incident or accident as required by the Technical Instructions."

OPS.SPA.001.DG(c)

Comment 4: A dangerous goods approval is granted to enable an operator to carry any dangerous goods which are permitted in normal circumstances as provided for by the Technical Instructions and would not refer to specific classes.

Justification: It is impractical for an operator to specify what classes of dangerous goods he intends to carry because at the time of application he simply will not know what he will be asked to carry. Alternatively, an operator could state "all 9 classes" on his application, to cover any future eventuality, but this would be of no value.

Proposed Text:

Delete OPS.SPA.001.DG(c)

comment *1425* comment by: *International Air Transport Association*

OPS.SPA.001.DG(a).

The reference to OPS.GEN.035(b) is incorrect, there is no such reference, rather the reference should read OPS.GEN.030(b).

OPS.SPA.001.DG(b)(2)(ii).

The text of this subparagraph requires that operators have procedures for acceptance, **packing, marking**,... Packing and marking of packages containing dangerous goods is the responsibility of the shipper. The operator is required to validate, to the extent possible by way of an acceptance check list that the shipper has complied, but the operator should not be held accountable for the compliance.

The reference to "packing, marking" should be deleted.

OPS.SPA.001.DG(c).

It is not clear just what is expected that an operator wishing to carry all classes of dangerous goods should state in the approval to comply with this requirement. Would it be sufficient for the statement to be "all dangerous

goods in Classes 1 - 9", which really doesn't provide any information. The opinion of the commenter is that instead of the operator having to include information about the classes of dangerous goods intended to be carried, that instead the operator should at this point make a statement about any exclusions to the classes of dangerous goods that will not be carried.

comment *1657* comment by: *British Parachute Association*

We suggest that at the end of (a) the following words are added.

"Except in the case of parachute flights where smoke trail devices may be carried by display parachutists who are intending to exit the aircraft."

This would ensure consistency with our comments no. 1412, 1604 and 1632.

comment *1736* comment by: *Luftfahrt-Bundesamt*

- The reference „OPS.GEN.035(b)" mentioned under character (a) does not exist. The right reference would be „OPS.GEN.**030**(b)".

- Reference (b)(2)(ii): The packing and marking of Dangerous Goods has to be done by the shipper and is not a task of the operator. Therefore those two words should be deleted, leaving the bullet as follows:

(ii) the requirements for acceptance, handling, loading, stowage and segregation of dangerous goods;

- as further information, the announcement of a serious accident or incident involving Dangerous Goods should be required, as already specified in the ICAO Technical Instructions. Under (b)(2) should therefore be added:

„(ix) provision of information in the event of an incident or accident as required by the ICAO Technical Instructions"

- Paragraph (c): Operator get an approval for the transport of Dangerous Goods and commit theirselves to stick to the regulations of the ICAO Technical Instructions. Dividing the approval and, more precisely, the AOC would complicate the AOC unnecessarily.

Therefore paragraph (c) should be deleted.

comment *1989* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

OPS.SPA.001. DG(b)(2)(ii) states that an operator shall establish operating procedures containing information and instructions on the requirements for acceptance, packing, marking, handling, loading, stowage and segregation of dangerous goods.

Comment:

Packing and marking are the responsibility of the shipper and so it is inappropriate to require an operator to have such procedures in place. An awareness of the packing, marking (and labelling which is equally relevant to a shipper but not stated in the text) requirements would be addressed by the requirement for procedures relating to acceptance.

Proposal:

"(ii) the requirements for acceptance, ~~packing, marking,~~ handling, loading, stowage and segregation of dangerous goods."

comment *1990* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

A dangerous goods approval is granted to enable an operator to carry any dangerous goods which are permitted in normal circumstances as provided for by the Technical Instructions and would not refer to specific classes.

Comment:

It is impractical for an operator to specify what classes of dangerous goods he intends to carry because at the time of application he simply will not know what he will be asked to carry. Alternatively, an operator could state "all 9 classes" on his application, to cover any future eventuality, but this would be of no value.

Proposal:

Delete OPS.SPA.001.DG(c).

comment *1994* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

No mention is made of the requirement for the operator to provide information in the event of a serious incident involving dangerous goods or

an accident.

Comment:

NPA 2009-02f suggests this is covered by OPS.SPA.001.DG(b)(2)(viii) but this relates to "incident reporting" which is quite different.

Proposal:

Add a new (ix) to OPS.SPA.001DG(b)(2) as follows:

"(ix) provision of information in the event of an incident or accident as required by the Technical Instructions.

comment *2513* comment by: *Royal Aeronautical Society*

comment *1067* comment by: *Aero-Club of Switzerland*

Definition of "dangerous goods"? (ICAO SARP?)

comment *1182* comment by: *CAA-NL*

OPS.SPA.040.DG(g)

Comment: OPS.SPA.040.DG(g) is overly restrictive in that it requires an operator to ensure a copy of the information to the pilot in command is available (as opposed to the information contained in the form as an alternative) at the intended destination aerodrome.

Justification: Part 7;4.1.7of the Technical Instructions states:

"This copy (of the information to pilot in command), *or the information contained in it*, must be readily accessible to the aerodromes of last departure and next scheduled arrival point, until after the flight to which the information refers."

Proposed Text (if applicable):

"g) ensure that a copy of the information to the pilot-in-command, or the information contained in it, is available at the intended destination aerodrome;"

comment *1426* comment by: *International Air Transport Association*

OPS.SPA.040.DG(e).

As commented in OPS.GEN.605(a)(8), the ICAO Technical Instructions provides for operators to have available the information contained on the dangerous goods transport document(s) in electronic form in in lieu of physically transporting the documents with the dangerous goods on board the aircraft. The text of OPS.SPA.040.DG(e) should reflect that ability.

Suggested re-word of (e) as follows:

(e) unless the operator has been provided with the information applicable to a consignment(s) of dangerous goods in electronic form, the operator shall ensure that the dangerous goods are accompanied by the required dangerous goods transport document(s);"

OPS.SPA.040.DG(f) & (g).

The provisions in these two subparagraphs do not reflect the requirements of the ICAO TI Part 7;4.1.7, which provides that either a copy provided to the pilot-in-command or the "information" contained on it must be available at the points of departure and scheduled arrival until after the arrival of the flight.

It is proposed that the two subparagraphs be combined into a single subparagraph (e) in accoradnce with the wording of ICAO TI Part 7;4.1.7. Note, this requirement does not include that the copies of the dangerous

goods transport document(s) be retained for the duration of the flight. The dangerous goods transport document(s) or the information contained in them must be retained for a minimum of 3 moths or such longer period as specified by the States concerned.

comment *1556* comment by: *Luftfahrt-Bundesamt*

In order to comply with the ICAO requirements (Technical Instructions, Part 7, 4.1.7), which do not necessarily demand an exact copy of the information, character (g) should be adjusted as follows:

(g) ensure that a copy of the information to the pilot-in-command ort he information contained in it, is available at the intended destination aerodrome;

comment *1992* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

OPS.SPA.040.DG(g) is overly restrictive in that it requires an operator to ensure a copy of the information to the pilot in command is available (as opposed to the information contained in the form as an alternative) at the intended destination aerodrome.

Comment:

Compare with the following statement of Part 7;4.1.7 of the Technical Instructions:

"This copy (of the information to pilot in command), or the information contained in it, must be readily accessible to the aerodromes of last departure and next scheduled arrival point, until after the flight to which the information refers."

Proposal:

"g) ensure that a copy of the information to the pilot-in-command, or the information contained in it, is available at the intended destination aerodrome;"

comment *2514* comment by: *Royal Aeronautical Society*

Paragraph (g) requires only that the operator shall ensure that a copy of the information to the pilot-in-command is available at the intended destination aerodrome. This does not make clear that, as is prescribed in EU-OPS (Ops 1.1215 (c) 3), the information must be made available to the 'next scheduled arrival point' which may not be the intended (final) destination where the goods are to be unloaded. **For the avoidance of doubt, it is suggested that paragraph (g) should be amended to read, 'ensure that a copy of the information to the pilot-in-command is available at**

the next scheduled arrival point'.

comment *2775* comment by: *Pietro Barbagallo ENAC*

OPS.SPA.040.DG (b)

Comment:This text should appear in OPS.GEN. In addition, it is inappropriate to refer to handling agents.

Justification:The carriage of dangerous goods in passenger baggage is not related to the holding of a dangerous goods approval, which is for the carriage of dangerous goods in cargo. The implementing rules do not apply to handling agents, only operators and they are required to "ensure" notices are provided (which may be delegated to a handling agent). If this comment is not accepted, reference to handling agent would have to be added everywhere in the text where a particular activity may be delegated to a handling agent.

Proposal:1. Delete OPS.SPA.040.DG (b) and consequentially renumber subsequent paragraphs; 2. Delete AMC.OPS.SPA.040.DG (b) and move its content in OPS.GEN.030 adding the following: "(e) The operator shall ensure that information is promulgated as required by the Technical Instructions so that passengers are warned as to the types of goods which they are forbidden from transporting aboard an aircraft. (f) The operator shall ensure that notices are provided at acceptance points for cargo giving information about the transport of dangerous goods."

comment *2777* comment by: *Pietro Barbagallo ENAC*

Comment:OPS.SPA.040.DG(g) is overly restrictive in that it requires an operator to ensure a copy of the information to the pilot in command is available (as opposed to the information contained in the form as an alternative) at the intended destination aerodrome.

B. I. Draft Opinion - Part-OPS - Subpart D - Section V I p. 96

comment *2459* comment by: *Catherine Nussbaumer*

Mpsc : This is also required for COM (and may also be required for GEN complex aircraft). The provision of this in Part SPA might add a burden to the Authorities that might be unnecessary/unwelcome.Shall be at least 7 pax due to already existing helicopter models with 7 seating capacity like AW119, EC130B4.

Applicability : This alleviation has been incorporated into Part OPS.SPA. Most of the clauses have been bound up into the requirement but the original guidance on when it might be applicable is missing. It might be clearer if there was guidance attached to OPS.SPA.005.SFL paragraph (d)(3).JAR guidance was as follows: IEM to Appendix 1 to JAR-OPS 3.005 Helicopter operations over a hostile environment located outside a congested area 1 The subject Appendix has been produced to allow a number of existing operations to continue.

It is expected that the alleviation will be used only in the following circumstances: 1.1 Mountain Operations; where present generation multi-engined aircraft cannot meet the requirement of Performance Class 1 or 2 at altitude. 1.2 Operations in Remote Areas; where existing operations are being conducted safely; and where alternative surface transportation will not provide the same level of safety as single-engined helicopters; 2 The State issuing the AOC and the State in which operations will be conducted should give prior approval .3 If both approvals have been given by a single State, it should not withhold, without justification, approval for aircraft of another State. See TGL 43 HEMS.Performance Class 2 and 3 shall have no restrictions provided the operator obtain the AOC validated by the National Authority.

comment *5251* comment by: *DGAC*

OPS SPA 001 SFL should be allowed only for operators holding a commercial certificate.

Firstly because we do not require private pilot to ensure a safe forced landing when above a non congested hostile environment.

Moreover, it is based on specific procedures, specific training, on the analysis of usage monitoring system and enhanced maintenance. It would be nonsense to require it for private pilot and will make the whole system fails**.**

We suggest transferring it into CAT. It has to be consistent with ETOPS

comment *6945* comment by: *Christian Hölzle*

Mpsc : This is also required for COM (and may also be required for GEN complex aircraft). The provision of this in Part SPA might add a burden to the Authorities that might be unnecessary/unwelcome.Shall be at least 7 pax due to already existing helicopter models with 7 seating capacity like AW119, EC130B4.

comment *7032* comment by: *Christian Hölzle*

Valair Maintenance AG is by EASA Part 145 authorized helicopter service centre. In the period of 1.11.2001 – 31.12.08 Valair Maintenance AG did the recurrent maintenance. of 50 piston helicopters. In this time frame of slightly more than 7 years these 50 piston helicopters made 27066 flight hours. Not one of the 50 helicopters had an engine failure or a sign of an engine malfunction. These figures show that a piston helicopter is an extremely reliable aircraft.(On request the mentioned figures may be reviewed anytime at Valair Maintenance AG)

The statement: "en-route in a specified, remote or mountain area with turbine powered helicopter" must be amended. The phrase "turbine powered" has to be deleted.

Reasons:

1. A discrimination of piston helicopters is not acceptable as they are similar in reliability or even better than turbine powered aircraft.

2. Over 80 % of Switzerland is Hostile Areas where no commercial air transport (CAT) would be allowed for piston helicopters.

3. The existence of commercial Helicopter Operations and Helicopter Service Centres focused on piston helicopters will be risked the due to this discrimination.

Page No: 96

Paragraph No:

OPS.SPA.001.SFL

Comment:

The operation of helicopters with accountability for engine failure and without an assured safe forced landing capability is only appropriate for all Commercial Operations. As drafted, the SPA.SFL would imply that it is suitable for other than commercial operations, which is not correct.

The applicability of this SPA should be restricted to helicopter commercial operations only.

Justification:

Engine failure accountability and the use operations without an assured safe landing is only applicable to helicopter commercial operations. All "Commercial Operations" is understood to include CAT.

Proposed Text (if applicable):

Section VI – Helicopter *Commercial* operations without an assured safe forced landing capability

OPS.SPA.001.SFL Operations without an assured safe forced landing capability

(a) A helicopter shall only be operated ***commercially*** without an assured safe forced landing capability if the operator has been approved by the competent authority, specifying the type of helicopter and operation.

comment *3431* comment by: *UK CAA*

Page No: 96

Paragraph No:

OPS.SPA.001.SFL

Comment:

Neither JAR OPS 3.005(i) [operations to a Public Interest Site] nor JAR OPS 3.005(e) [operations over hostile terrain] require operators to comply with the full requirements of Appendix 1 to 3.517(a): JAR OPS 3 required compliance with only sub para (a)(2)(i) & (ii).

The EASA rule requires full compliance with OPS.SPA.001.SFL See para (b)(1).

Justification:

This rule impacts disproportionately on smaller operators.

Proposed Text (if applicable):

OPS.SPA.001.SFL(b)(1) "except for operations to a public interest site or operations in Performance Class 3 when operating outside congested hostile environment, provide appropriate power unit....

OPS.SPA.001.SFL(b)(2) ") "except for operations for a HEMS operating site, a public interest site or operations in Performance Class 3 when operating outside a congested hostile environment, assess the risk involved for:"

An UMS only make sense if the helicopter is "on condition" maintenance. As long there are "hard times" as TBO it makes no sense. OEM´s also do not issue any limits for CS-27 helicopters.

comment

4433 comment by: *Benedikt SCHLEGEL*

Valair Maintenance AG is by EASA Part 145 authorized helicopter service centre. In the period of 1.11.2001 – 31.12.08 Valair Maintenance AG did the recurrent maintenance. of 50 piston helicopters. In this time frame of slightly more than 7 years these 50 piston helicopters made **27066 flight hours**. Not one of the 50 helicopters had an engine failure or a sign of an engine malfunction. These figures show that a piston helicopter is an extremely reliable aircraft.(On request the mentioned figures may be reviewed anytime at Valair Maintenance AG)

The statement: **"en-route in a specified, remote or mountain area with turbine powered helicopter"** must be amended. The phrase "turbine powered" has to be deleted.

Reasons:

1. A discrimination of piston helicopters is not acceptable as they are similar in reliability or even better than turbine powered aircraft.

2. Over 80 % of Switzerland is Hostile Areas where no commercial air transport (CAT) would be allowed for piston helicopters.

3. The existence of commercial Helicopter Operations and Helicopter Service Centres focused on piston helicopters will be risked the due to this discrimination.

comment

4642 comment by: *Bristow Helicopters*

To obtain such an approval the operator shall:

(b) provide appropriate power unit reliability statistics for the helicopter type and engine type.

This should be for the combination of helicopter and engine installed.

Due to commercial sensitivity, manufacturers are not prepared to issue primary reliability data to operators. It is proposed that the procedure used for JAR OPS 3.517(a) compliance is adopted. NPA OPS 38 to JAR OPS 3 states that the manufacturer must provide the State of Design, or State of First Certification in the case on non EU manufacturers, with the engine reliability data. When this data is verified by the competent authority, the manufacturer issues a Service Letter to all operators stating that the helicopter meets the reliability requirements. The operators then utilise this letter when seeking this approval.

2009-02b:

Subpart D, Section VI, OPS.SPA.001.SFL Operations without an assured safe forced landing capability (Seite 96):

unter (b)(3) wird verlangt *„ establish operating procedures specifying: (i) the take-off and landing techniques to be applied at the*

aerodrome/operating site; and (ii) site specific procedures in the case of public interest sites. ". Dies ist zumindest für HEMS vollkommen utopisch und praktisch nicht umsetzbar: Es liegt in der Natur des HEMS-Flugbetriebs, dass nicht vorher bestimmt werden kann, in welches Krankenhaus der Patient geflogen wird. Dies entscheidet sich je nach Art der Verletzung und Verfügbarkeit der medizinischen Leistungen erst während des konkreten Einsatzes. Um gewährleisten zu können, dass jeder transportierte Patient die entsprechende notwendige medizinische Indikation erhält, muss sichergestellt sein, dass jeder einzelne Hubschrauber unserer Flotte im konkreten Bedarfsfall auch jedes Krankenhaus anfliegen kann. Dazu müssten aber für alle vorhandenen Hubschrauberflugplätze an Krankenhäusern, an denen keine Möglichkeit zur Durchführung einer sicheren Notlandung während der Start- und Landephase besteht landeplatz-spezifische Verfahren entwickelt werden. Dies ist bereits allein aufgrund der Vielzahl der existierenden (häufig nicht zertifizierten) Krankenhauslandesstellen (allein in Deutschland insgesamt über **1.000**) praktisch nicht umsetzbar. Außerdem kann dies generell nicht Aufgabe jedes einzelnen Operators sein, sondern ist vielmehr originäre Aufgabe des jeweiligen Landeplatzbetreibers.

Denkbar und auch umsetzbar ist dagegen die Entwicklung und Beschreibung von einigen grundsätzlichen Standardverfahren für den An-/Abflug ohne Möglichkeit zur Durchführung einer sicheren Notlandung. Dies wäre unserer Erfahrung nach auch aus dem Gesichtspunkt der Sicherheit vollkommen ausreichend: die (mehrmotorigen) Hubschrauber der ADAC-Luftrettung GmbH haben seit 1970 bis Ende 2008 über 500.000 Rettungseinsätze durchgeführt. In der Regel sind pro Rettungseinsatz drei Starts und drei Landungen anzusetzen, die bedingt durch die orographischen Vorgaben und des Einsatzauftrages regelmäßig nicht auf einem flugplatzähnlichen Gelände durchgeführt werden können.

In der Summe der genannten Rettungseinsätze und der daraus resultierenden knapp **3 Millionen** Starts und Landungen hat innerhalb der ADAC Luftrettung GmbH nicht ein einziger Triebwerkausfall zu einem Flugunfall geführt. Insofern sind die derzeit gemäß JAR-OPS 3 deutsch (in der bis zum 31.12.2009 geltenden Fassung) geregelten Anforderungen zur Erreichung eines angemessenen Sicherheitsniveaus vollkommen ausreichend. Eine weitere Verschärfung ist nicht erforderlich. Mit Einführung der JAR-OPS 3 hat die ADAC Luftrettung GmbH mehr als **100.000.000,00 €** in die Modernisierung der Hubschrauberflotte investiert. Alle eingesetzten Hubschrauber sind gemäß Kategorie A zugelassen und nach JAR/CS 27/29 zertifiziert.

Wir beantragen daher, HEMS-Flüge auch zukünftig generell mit Hubschrauber zertifiziert nach Kategorie A in Übereinstimmung mit Flugleistungsklasse 2 (ohne Exposure Time und UMS) durchführen zu können und von den Anforderungen des Subpart D, Section VI auszunehmen.

Daneben beantragen wir höchstvorsorglich, OPS.SPA.001.SFL (b)(3) auf jeden Fall wie folgt zu ändern: *„establish standard operating procedures specifying general take-off and landing techniques to be applied at the aerodrome/operating/public interest sites"* .

Mpsc : This is also required for COM (and may also be required for GEN complex aircraft). The provision of this in Part SPA might add a burden to the Authorities that might be unnecessary/unwelcome.Shall be at least 7 pax due to already existing helicopter models with 7 seating capacity like AW119, EC130B4.

comment *6946* comment by: *Christian Hölzle*

Applicability : This alleviation has been incorporated into Part OPS.SPA. Most of the clauses have been bound up into the requirement but the original guidance on when it might be applicable is missing. It might be clearer if there was guidance attached to OPS.SPA.005.SFL paragraph (d)(3).JAR guidance was as follows: IEM to Appendix 1 to JAR-OPS 3.005 Helicopter operations over a hostile environment located outside a congested area 1 The subject Appendix has been produced to allow a number of existing operations to continue.

B. I. Draft Opinion - Part-OPS - Subpart D - Section VI - OPS.SPA.005.SFL Applicability p. 96-97

comment *465* comment by: *EHOC*

Paragraph (d)(3)

This alleviation has been incorporated into Part OPS.SPA. Most of the clauses have been bound up into the requirement but the original guidance on when it might be applicable is missing.

It might be clearer if there was guidance attached to OPS.SPA.005.SFL paragraph (d)(3). The JAR guidance was as follows:

"IEM to Appendix 1 to JAR-OPS 3.005(e)

Helicopter operations over a hostile environment located outside a congested area

See Appendix 1 to JAR-OPS 3.005(e)

1 The subject Appendix has been produced to allow a number of existing operations to continue. It is expected that the alleviation will be used only in the following circumstances:

1.1 Mountain Operations; where present generation multi-engined aircraft cannot meet the requirement of Performance Class 1 or 2 at altitude.

1.2 Operations in Remote Areas; where existing operations are being conducted safely; and where alternative surface transportation will not provide the same level of safety as single-engined helicopters;

2 The State issuing the AOC and the State in which operations will be

conducted should give prior approval.

3 If both approvals have been given by a single State, it should not withhold, without justification, approval for aircraft of another State.

4 Such approvals should only be given after both States have considered the technical and economic justification for the operation."

comment *546* comment by: *EUROCOPTER*

Wording modification proposal on OPS.SPA.005.SFL §(b):

(b) operations to/from helidecks ***~~with helicopters which have a MPSC of more than 19~~***;

Rationale:

Operations to/from helidecks without an assured safe forced landing capability must not be reserved to helicopters which have a MPSC of more than 19:

- the fact that OPS.CAT.355.H, §(a)(3) states that *'operations to/from a helideck conducted with a helicopter having a MPSC of more than 19, may be operated in performance class 2*' does not mean that these operations are only eligible for these types of helicopters

- JAR-OPS 3 allows operations to/from helidecks without an assured safe forced landing capability with helicopters having a MPSC of 19 or less (see Suppart H Performance Class 2; and particularly JAR-OPS 3.520(a)(3)(ii)(B) where it is mentionned 'any helicopter')

- most of the operations from/to helidecks in the North Sea are conducted with helicopters having a MPSC of 19 or less.

comment *833* comment by: *Reto Ruesch*

Applicability

This alleviation has been incorporated into Part OPS.SPA. Most of the clauses have been bound up into the requirement but the original guidance on when it might be applicable is missing. It might be clearer if there was guidance attached to OPS.SPA.005.SFL paragraph (d)(3).JAR guidance was as follows: IEM to Appendix 1 to JAR-OPS 3.005 Helicopter operations over a hostile environment located outside a congested area 1 The subject Appendix has been produced to allow a number of existing operations to continue. It is expected that the alleviation will be used only in the following circumstances: 1.1 Mountain Operations; where present generation multi-engined aircraft cannot meet the requirement of Performance Class 1 or 2 at altitude. 1.2 Operations in Remote Areas; where existing operations are being conducted safely; and where alternative surface transportation will not provide the same level of safety as single-engined helicopters; 2 The State issuing the AOC and the State in which operations will be conducted should give prior approval .3 If both approvals have been given by a single State, it

should not withhold, without justification, approval for aircraft of another State. See TGL 43 HEMS.

comment *1105* comment by: *EUROCOPTER*

Wording modification proposal on § (d)(3):

(3) en-route in a specified, remote or mountain, area with turbine powered helicopters with a MPSC of ~~***6***~~ ***7*** *or less****.***

Reason: JAR-OPS 3 introduced the requirement of "MPSC of 6 or less' without real substantiation of the number 6; the number 7 is proposed instead in order to allow the EC130B4 in its full seating capacity.

comment *1106* comment by: *EUROCOPTER*

Proposal to introduce the new (d)(4) condition:

(d)(4) en-route in a specified, other than remote or mountain, area with helicopters other than complex motor-powered, provided the flight time over hostile areas does not exceed 5-minutes periods and 50 % of the overall flight time.

Rationale**:**

- Reason for this proposal is that the current JAR-OPS 3 alleviation, which is only valid for remote or mountains areas, is too restrictive for single-engine helicopters, and would result, if maintained, in excluding single-engine helicopters from a lot of CAT operations in non-mountain areas, as soon as there is for example a small forest to cross. Maintaining unchanged the JAR-OPS 3 text would very likely condamn CAT with single-engine helicopters in countries filled with forests like Sweden of Finland.

- The proposal consists in transferring in Part OPS the French '5 minutes-50 %' condition which has been part of the French CAT Operational Regulation 'OPS 3' since April 2004, and used up to now by operators without any safety problem.

- It is also based on an Eurocopter analysis on the Ecureuil twin/single helicopters family which has shown that single-engine helicopters do not cause more accidents than twin-engine helicopters.

comment *1108* comment by: *EUROCOPTER*

Wording modification proposal on § (e)(2):

(2) established as public interest site ~~***before 1 July 2002***~~ ***at the date of entry into force of this Regulation.***

Reason: limiting the benefit of operating without a SFL capability to public interest sites (hospitals, lighthouses) established as such before 1 July 2002

is too restrictive.

The provision of this in Part SPA might add a burden to the Authorities that might be unnecessary/unwelcome.Shall be at least 7 pax due to already existing helicopter models with 7 seating capacity like AW119, EC130B4.

comment *2106* comment by: *Dirk Hatebur*

Applicability : This alleviation has been incorporated into Part OPS.SPA. Most of the clauses have been bound up into the requirement but the original guidance on when it might be applicable is missing. It might be clearer if there was guidance attached to OPS.SPA.005.SFL paragraph (d)(3).JAR guidance was as follows: IEM to Appendix 1 to JAR-OPS 3.005 Helicopter operations over a hostile environment located outside a congested area 1

The subject Appendix has been produced to allow a number of existing operations to continue.

It is expected that the alleviation will be used only in the following circumstances:

1.1 Mountain Operations; where present generation multi-engined aircraft cannot meet the requirement of Performance Class 1 or 2 at altitude.

1.2 Operations in Remote Areas; where existing operations are being conducted safely; and where alternative surface transportation will not provide the same level of safety as single-engined helicopters; 2 The State issuing the AOC and the State in which operations will be conducted should give prior approval .3 If both approvals have been given by a single State, it should not withhold, without justification, approval for aircraft of another State. See TGL 43 HEMS.Performance Class 2 and 3 shall have no restrictions provided the operator obtain the AOC validated by the National Authority.

Valair Maintenance AG is by EASA Part 145 authorized helicopter service centre. In the period of 1.11.2001 – 31.12.08 Valair Maintenance AG did the recurrent maintenance. of 50 piston helicopters. In this time frame of slightly more than 7 years these 50 piston helicopters made 27066 flight hours. Not one of the 50 helicopters had an engine failure or a sign of an engine malfunction. These figures show that a piston helicopter is an extremely reliable aircraft.(On request the mentioned figures may be reviewed anytime at Valair Maintenance AG)

The statement: "en-route in a specified, remote or mountain area with turbine powered helicopter" must be amended. The phrase "turbine powered" has to be deleted.

Reasons:

1. A discrimination of piston helicopters is not acceptable as they are similar in reliability or even better than turbine powered aircraft.

2. Over 80 % of Switzerland is Hostile Areas where no commercial air transport (CAT) would be allowed for piston helicopters.

3. The existence of commercial Helicopter Operations and Helicopter Service Centres focused on piston helicopters will be risked the due to this discrimination.

comment *2245* comment by: *Valair AG Switzerland*

Page 96

OPS.SPA.005.SFL specifies that Performance Class 3 operations, outside a congested hostile environment, en-route in a specified, remote or mountain, area, is restricted to turbine powered helicopters with a MPSC of 6 or less, thereby excluding all piston powered helicopters.

As long as power unit reliability statistics demonstrate that piston powered helicopters meet the same minimum requirements applied to turbine engines, there is no change to operational safety by eliminating the turbine powered helicopter restriction. Furthermore, it is in the public interest to allow the use of piston powered helicopters for these types of operations as piston powered helicopters typically offer lower operating costs and reduced environmental impact compared to turbine powered helicopters.

Valair Maintenance AG is by EASA Part 145 authorized helicopter service centre. In the period of 1.11.2001 – 31.12.08 Valair Maintenance AG did the recurrent maintenance. of 50 piston helicopters. In this time frame of slightly more than 7 years these 50 piston helicopters made **27066 flight hours**. Not one of the 50 helicopters had an engine failure or a sign of an engine malfunction. comment *3434* comment by: *UK CAA*

Page No: 97

Paragraph No:

OPS.SPA.005.SFL

Comment:

The rule introduces a subtle change to the equivalent JAR OPS 3 code concerning Public Interest sites. At OPS.SPA.005.SFL para (e)(2) the text uses the term ""Public Interest Site", which changes the intent of the JAR that, for the same purpose, used the term "Heliport".

A hospital landing site may have been established for many years as a heliport, but may not necessarily have been established as a Public Interest site. Such a heliport might need to become a Public Interest site with the introduction of new aircraft with a helipad profile that can no longer achieve a Class 1 profile, for example. The rule now prevents categorisation of existing Heliports as Public Interest sites.

Justification:

Overly-restrictive rule.

Proposed Text (if applicable):

OPS.SPA.005.SFL(2)

"Established as ~~public interest site~~ *a heliport* before 1 July 2002; and"

comment *3435* comment by: *UK CAA*

Paragraph No:

AMC OPS.SPA.005.SFL(b) and (c)

Comment:

Minor editorial change to correct text to align with sense of the context of take-off conditions in 1(b) and landing conditions in 2(b).

Justification: Editorial.

Proposed Text (if applicable):

1b. for operations ~~to/~~from a helideck in a hostile environment …

2b. for operations to~~/from~~ a helideck in a hostile environment …

comment *3593* comment by: *Aero-Club of Switzerland*

(e) Please remove "with multi-turbine helicopters"!

Justification: There is no reason for such a restriction. Think of the catastrophic gear box failure of the recent brand new Bond Helicopters Super Puma, where the rotor separated. Leave the decision on the helicopter to be used to the operators.

comment *3607* comment by: *Austro Control GmbH*

UMS or HUMS are only regulated for turbine (d) (3).

It should be also regulated for reciprocating engines in the case of approval.

comment *3971* comment by: *SNEH Organisation representing all french commercial helicopters operators*

Proposed text modifications :

"operations **in accordance with OPS .CAT.355.H**, without an assured safe forced landing capability shall only be conducted in the following situations :"

comment *3976* comment by: *SNEH Organisation representing all french commercial helicopters operators*

(d) (3)

The aim is :

- to delete te '6 or less' limitation and to replace it by 'other than complex motor-powered'

-to partially allow CAT operations in PC3 without an assured SFL en-route above hostile areas different from mountains and remote area such a forest, by proposing to introduce the French DGAC specificity "50% - 5 minutes" (operations allowed by short periods, not exceeding 5 minutes, and provided that the total flight time above hostile areas does not exceed 50 % of the

total flight time.

Modification proposal :

(d) for PC3 operations, when operating outside a congested hostile environement :

(3) en-route in a specified, remote or mountain, area with turbine powered helicopters with a MPSC of 6 or less. Other than complex-motor-powered.

(4) en-route in a specified, other than remote or mountain, area with helicopters other than complex motor-powered, provided the flight time over hostile areas does not exceed 5-minutes periods and 50% of the overall flight time.

(b) :

Proposal: change the wording

"(b) ~~operations to/from helidecks~~ with helicopters which have a maximum passenger seating configuration (MPSC) of more than 19 **when operating to/from helidecks**;"

Justification : gain in clarity

(d) :

Proposal: add a fourth item as follows:

"(4) **en-route with turbine powered helicopters with a MPSC of 6 or less, provided the flight time over hostile areas does not exceed 5 minute periods and 50% of the overall flight time**"

Justification : It is very theoretical to operate in CAT single engine helicopters with an exposure time limited to take-off and landing.

Member States have to take their responsibilities: either CAT is forbidden with single or it is allowed but in this case we have to make it possible and their part of the responsibility that lays on the shoulder of the pilot and of the operator.

For example there is always a small forest to fly over.

Moreover, EHEST preliminary report does not show that the engine failure is a common cause of accident. Twin engine should be the standard over congested areas but small portions of flight over non congested hostile area should be allowed for single engine helicopters under certain conditions.

comment *5695* comment by: *Robinson Helicopter Company*

OPS.SPA.005.SFL specifies that Performance Class 3 operations, outside a congested hostile environment, en-route in a specified, remote or mountain, area, is restricted to turbine powered helicopters with a MPSC of 6 or less, thereby excluding all piston powered helicopters.

As long as power unit reliability statistics demonstrate that piston powered helicopters meet the same minimum requirements applied to turbine engines, there is no change to operational safety by eliminating the turbine powered helicopter restriction. Furthermore, it is in the public interest to allow the use of piston powered helicopters for these types of operations as piston powered helicopters typically offer lower operating costs and reduced environmental impact compared to turbine powered helicopters.

See also comments for AMC OPS.SPA.001.SFL(b)(4) and (b)(5).

Valair Maintenance AG is by EASA Part 145 authorized helicopter service centre. In the period of 1.11.2001 – 31.12.08 Valair Maintenance AG did the recurrent maintenance. of 50 piston helicopters. In this time frame of slightly more than 7 years these 50 piston helicopters made **27066 flight hours**. Not one of the 50 helicopters had an engine failure or a sign of an engine malfunction. These figures show that a piston helicopter is an extremely reliable aircraft.(On request the mentioned figures may be reviewed anytime at Valair Maintenance AG)

The statement: **"en-route in a specified, remote or mountain area with turbine powered helicopter"** must be amended. The phrase "turbine powered" has to be deleted.

Reasons:

1. A discrimination of piston helicopters is not acceptable as they are similar

in reliability or even better than turbine powered aircraft

2. Over 80 % of Switzerland is Hostile Areas where no commercial air transport (CAT) would be allowed for piston helicopters.

3. The existence of commercial Helicopter Operations and Helicopter Service Centres focused on piston helicopters will be risked the due to this discrimination.

OPS.SPA.025.HEMS sieht unter (b)(1) vor, dass "Helicopters conducting operations to/from an aerodrome at a hospital which is located in a hostile environment shall be operated in accordance with performance class 1; **except as provided for in OPS.SPA.005.SFL.**

Dieser Verweis **"except as provided for in OPS.SPA.005.SFL"** findet sich jedoch unter OPS.SPA.SFL - Applicability **nicht**.!!

Wie schon mehrfach geschrieben können in Deutschland über 1000 Krankenhauslandeplätze nicht in Übereinstimmung mit Leistungsklasse 1 angeflogen werden. Zum einen, weil unter ungünstigen Umgebungsbedingungen der Hubschrauber nicht in der Lage ist Leisungsklasse 1 zu erfüllen, zum anderen weil der angeflogene Landeplatz die Bedingungen für Leistungsklasse 1 nicht erfüllt.

So wie die OPS.SPA.SFL - Applicability jetzt geschrieben ist dürfen Krankenhauslandeplätze die innerhalb eines dichtbesiedelten Gebietes mit schwierigen Umgebungsbedingungen liegen auch unter HEMS nicht in Leistungsklasse 2 angeflogen werden. Das führt im Zusammenhang mit oben erwähnter Situation zu einer dramatischen Einschränkung der Luftrettung in ganz Europa!!

Vorschlag:

HEMS-Flüge auch zukünftig generell mit Hubschrauber, zertifiziert nach Kategorie A, in Übereinstimmung mit Flugleistungsklasse 2 (ohne Exposure Time und UMS) durchführen zu können und von den Anforderungen des Subpart D, Section VI auszunehmen.

Höchstvorsorglich, sollte diesem Antrag nicht entsprochen werden ist unter OPS.SPA.005.SFL unserer Ansicht folgendes mit aufzunehmen

(a) at a HEMS operating site or for operations to/from an aerodrome at a hospital which is located in a hostile environment

an, when operating under an approval in accordance with OPS.SPA.001.HEMS

additional:

Mpsc : This is also required for COM (and may also be required for GEN complex aircraft). The provision of this in Part SPA might add a burden to the Authorities that might be unnecessary/unwelcome.Shall be at least 7 pax due to already existing helicopter models with 7 seating capacity.

comment *6789* comment by: *Air Lloyd Deutsche Helicopter Service GmbH*

Dear Sirs,

AIR LLOYD established in 1963 operates a large fleet of single-engine and multi-engine helicopters and during the years we counted more than 250.000 flight hours. Over these 46 years we didn’t see any reliability differences between piston and turbine engines.

10 years ago we changed from Bell47 to R22 and R44. According our own reliability statistic we flew an average of 5.500 hours per year and didn’t have any engine trouble. If needed we can provide your with our statistic. But there are no reliability statistics from the TCH of the helicopter and engine available. And this will be the problem to get an approval for operations without an assured safe forced landing capability.

The definition of “Performance Class3 helicopters” doesn’t distinguish piston and turbine powered helicopters. From our point of view is this consideration correct and a distinction between piston and turbine powered helicopters later in this NPA is the wrong way to assure a safe air transport. We don’t see the need to use a turbine helicopter if a piston helicopter can do the task as well from the point of reliability. Only performance, seat, internal or

external load capacity will be the limiting factor and not the type of engine.

Yours faithfully

Helmut Appelfeller

Flight Operation Manager

AIR LLOYD GmbH

B. I. Draft Opinion - Part-OPS - Subpart D - Section VI - OPS.SPA.035.SFL Helicopter Flight Manual Limitations p. 97

comment *467* comment by: *EHOC*

General

Whilst this derogation is welcome, it only applies to those operators who have applied for a received an approval under Section VI of Subpart D of Part OPS.

Unless this derogation is applicable to all operations, all Part 29 helicopters (the position is unclear for those helicopters which have been approved under Appendix C to Part 27) will have to apply the limitation of the HV diagram. This will restrict the operations of complex helicopters to fly for Aerial Work.

comment *1016* comment by: *Michael Kroell*

Problem for CS-29 certified helicopters as H/V is in limitations section;

If H/V diagram is in the limitiation section this would be against the basic regulation.

Solution: H/V diagrams of the affected helicopter - into the performance section

comment *1388* comment by: *EUROCOPTER*

Wording modification proposal:

*"For helicopters certificated in Category A **or B**, a momentary flight through the height velocity (HV) diagram is allowed during the take-off and landing phases...*

Justification: consistency with GM OPS.SPA.OO5.SFL (d), § 4.c., which is recalled here after:

*'An elevated FATO or helideck: when operating to an elevated heliport/helideck in Performance Class 3, exposure is considered to be twofold: firstly, to a deck-edge strike if the engine fails after the decision to transition has been taken; **and secondly, to operations in the HV diagram due to the height of the heliport/helideck**. Once the take-off surface has been cleared and the helicopter has reached the knee of the HV diagram, the helicopter should be capable of making a safe forced landing.'*

comment *2312* comment by: *Austro Control GmbH*

This rule is no problem for CS 27 certified helicopters as the diagramm is in the performance section, but for CS 29 certified helicopters H/V it is in limitations sections and therefore a problem (see Basic Regulation).

It is suggested that this problem, which is obviously known by a EASA, is solved by a new formulation of this rule.

comment *2515* comment by: *Royal Aeronautical Society*

The text does not describe where, in the height velocity diagram, flight should not be permitted. It is suggested that the relevant text be amended to read, **'… a momentary flight through the unsafe area of the height velocity (HV) diagram …'**.

comment *3076* comment by: *AgustaWestland*

This rule is conceptually wrong. All the Cat A procedures must satisfy the requirements to allow a the safe OEI Rejected Take off or OEI landing. The

only way in which these conditions can be met is that Take-off and Landing path remain clear of the H-V diagram because this diagram define the H-V envelope inside which a safe landing can not be executed.

Additionally the Weight-Altitude-Temperature charts, that limit the maximum Take off and Landing weight for the various Cat A procedures, guarantee that, at WAT weight, the helicopter can be safely landed following an engine failure.But if an engine fail while crossing the H-V envelope the safe landing can not be executed by definition of the H-V. See also CS29.87 Height -Velocity envelope and CS29.59(a)(1) Take-off path: Category A.

comment *3436* comment by: *UK CAA*

Page No: 97

Paragraph No:

OPS.SPA.035.SFL

Comment:

The derogation to allow helicopters certificated in Category A to conduct momentary flight through the height velocity (HV) curve is welcomed, and the explanation for this at NPA 2009-2A page 42 is noted. However as it stands, it only applies to those operators who have applied for and received an approval under applicability of OPS.SPA.005.SFL. This derogation derives from the requirement in Appendix 1 to JAR-OPS 3.005(c).

The intention to initiate a rulemaking task on CS 29 is also noted but this will not assist current operations beyond OPS.SPA.001.SFL such as many Commercial (aerial work) activities. It is not clear how other operations under Commercial (aerial work), requiring similar clearance, will be able to do so in the future.

Unless this derogation is made applicable to all operations, all Part 29 helicopters (the position is unclear for those helicopters which have been approved under Appendix C to Part 27) will have to apply the limitation of the HV diagram in accordance with Annex IV 4.a of the Basic Regulation. This will severely restrict the operations of complex helicopters flying for Commercial (aerial work).

Justification:

Clarification of approval for momentary flight through the HV curve for operations other than in accordance with OPS.SPA.001.SFL.

comment *3747* comment by: *Civil Aviation Authority of Norway*

Comment:

The derogation to allow helicopters certificated in Category A to conduct momentary flight through the HV curve is welcomed, and the explanation for this at NPA 2009-2A page 42 is noted. However as it stands, it only applies

to those operators who have applied for a received an approval under applicability of OPS.SPA.005.SFL.

This derogation derives from the requirement in Appendix 1 to JAR-OPS 3.005(c) that required a specific approval for this type of operation. As JAR-OPS 3 was only applicable to CAT operations it is not clear how other operations under Com (aerial work), requiring similar clearance, will be able to do so in the future.

Unless this derogation is applicable to all operations, all Part 29 helicopters (the position is unclear for those helicopters which have been approved under Appendix C to Part 27) will have to apply the limitation of the HV diagram in accordance with Annex IV 4.a of the Basic Regulation. This will severely restrict the operations of complex helicopters flying for Com (aerial work).

comment *5255* comment by: *DGAC*

The alleviation on the H/V diagram limitation is also required for helicopters certificated in category A used for aerial work operations operated under OPS.COM.

Proposed Text:

Amend text as follows:

"For helicopters certificated in Category A, a momentary flight through the height velocity (HV) diagram is allowed during the take-off and landing phases, when the helicopter is operated under the approval in accordance with this section **or according to OPS.COM.005**"

However, this alleviation should also be written in OPS.COM as an aerial work operator does need to comply with SPA if there are no persons in the helicopter apart from the crew.

B. I. Draft Opinion - Part-OPS - Subpart D - Section VII p. 98

comment *6179* comment by: *DGAC*

We consider that NVG are very efficient and can provide an important safety benefit. However it is quite expensive to fly with NVIS (retrofit of the aircraft, NVG, crew training…) and there is no alleviation in IR OPS for the operators when flying NVIS. We think that no operators will fly NVIS if there is no advantage for them (reduction of minima?).

We suggest EASA to follow the work done by the new ICAO group regarding to HEMS flight to establish a policy for the use of NVIS for HEMS flight at night.

We consider that HEMS flights between two heliports (compliant with annex

14) could be done with NVIS (only for the cruise) with only one pilot

B. I. Draft Opinion - Part-OPS - Subpart D - Section VII - OPS.SPA.001.NVIS Night Vision Imaging System (NVIS) operations p. 98

comment *6870* comment by: *Luftfahrt-Bundesamt*

Why are NVIS requirements limited to helicopter operations only?

The foreword of the leaflet 34 says, that the content of TGL could be used for all aircraft for VFR Night flights.

"It has been suggested that it would be in the interest of safety if all night VFR operations were able to take advantage of a common NVIS regulation leading to harmonised qualification, procedures and equipment."

"1.3 NVIS, when first considered by the JAA, was felt suitable only for helicopters operating in Commercial Air Transport (CAT). Following consideration of the work of RTCA and EUROCAE, the proposed regulation (originally produced only for JAR-OPS 3) has been amended so that it could be used for 'aircraft' undertaking CAT and operations other than CAT. It has also been enhanced with text taken from the EUROCAE WG57 (and RTCA SC 196) recommendations.

In Subpart D Operations requiring specific approvals, regulations for **offshore operations** are missing.

Such approval is required in relation to Annex 1 to JAR-OPS 3.175 (h)

B. I. Draft Opinion - Part-OPS - Subpart D - Section VII - OPS.SPA.010.NVIS Equipment requirements for NVIS operations p. 98

comment *1111* comment by: *EUROCOPTER*

Wording modification proposal:

"In addition to the equipment required by OPS.GEN and, ***when applicable,*** *OPS.CAT or OPS.COM, …"*

Reason: the aim is to avoid that equipment required by OPS CAT or OPS COM, become mandatory as a basis for NVIS operations.

B. I. Draft Opinion - Part-OPS - Subpart D - Section VII - OPS.SPA.020.NVIS NVIS operating minima p. 98

comment *5498* comment by: *ADAC Luftrettung GmbH*

OPS.SPA.020.NVIS NVIS operating minima in Verbindung mit Table 1 OPS.SPA.020 - HEMS operating minima.

Unter OPS.SPA.020.NVIS NVIS operating minima wird verlangt: „**Operations shall not be conducted below the VFR weather minima for the type of night operations being conducted.**". Dies ist grundsätzlich richtig, um auch in den konventionellen Nachtflug wechseln zu können. Für das sichere Fliegen unter BIV ist jeodch eine gesonderte BIV-Flugwetterberatung notwendig, da hier andere Minima gelten.

Für den konventionellen Nachtflug wird die so genannte „Feuersicht", durch das Erkennen von Lampen, durch einen Beobachter ermittelt.

Für den BIV-Nachtflug wird die so genannte „BIV-Sichtweite" errechnet. In die Berechnung der „BIV-Sichtweite" fließen die Nachthelligkeit mit allen Korrekturen und die Normsichtweite ein. Die „BIV-Sichtweite" muss mindestens 1,5 km betragen und hat nichts mit der herkömmlichen „Feuersicht" gemeinsam. So können z.B. die Wetterminima, mit 2500m Sicht und 1200´ Wolkenuntergrenze, für den konventionellen Nachtflug ausreichend sein, bei gleichen Werten und einer Nachthelligkeit unter 25 mlx werden die 1,5 km BIV-Sichtweite nicht erreicht und somit ist ein BIV-Nachtflug nicht möglich.

Es ist durchaus auch möglich, dass die Wetterminima unterhalb der geforderten Werte für den konventionellen Nachtflug liegen und ein Fliegen unter BIV möglich ist, da der Wert 1,5 km „BIV-Sichtweite" erreicht wird.

Hier muss die „**Table 1 OPS.SPA.020 - HEMS operating minima**" um die Wetterminima für den BIV-Nachtflug ergänzt werden. NVIS visual range 1500 m, Ceiling 1200´

"OPS.SPA.020.NVIS NVIS operating minima" sollte folgenden Wortlaut haben.

Operations shall not be conducted below the VFR weather minima for the type of night operations being conducted. The NVIS visual range, of at least 1500m, must be reached.

B. I. Draft Opinion - Part-OPS - Subpart D - Section VII - OPS.SPA.030.NVIS Crew requirements for NVIS operations p. 98

comment *3080* comment by: *AgustaWestland*

This rule should be expanded considering the scenario in which the NVG operations are conducted.

When take-off and Landing are conducted from/to known site without using the NVG and the remaining portion of the flight is conducted above 300ft AGL or at a height proposed in the Operation Manual by the operator and accepted as safe by the competent authority, one pilot, qualified for NVG

ops, could be accepted provided the Helicopter Flight Manual allows Single Pilot Night VFR ops.

The second step, based on increased mission difficulties i.e using NVG also for take off and landing , could be one NVG qualified pilot and one NVG qualified crew member that can assist the pilot in obstacle identification during take off and Landing.

And, at the end, two NVG qualified pilots for the most difficult missions specified by the Operator in the Ops Manual.

comment *7340* comment by: *FAA*

1. OPS.SPA.030.NVIS

Comment:

The requirement for NVIS technical crewmember may not be applicable to all operations. The requirement would prevent single-crew helicopter operators from using NVIS, even if use would reduce overall risk. This may reduce widespread use of NVIS by single-crew operators, where having a technical crewmember is not necessary due to the type of operation being conducted.

Recommendation:

Justify the requirement for 'NVIS technical crew member' on ALL flights.

B. I. Draft Opinion - Part-OPS - Subpart D - Section VIII p. 99

comment *4451* comment by: *Helikopter Air Transport GmbH / Christophorus Flugrettungsverein*

There is no Section for HEC operation:

Section XXXXXXX – Human external cargo

OPS.SPA.001.HEC – Human external cargo (HEC)

(a) A helicopter shall only be operated for the purpose of human external cargo operations, if the operator has been approved by the competent authority.

(b) To obtain such approval by the competent authority, the operator shall:

(1) comply with the applicable requirements contained in OPS.GEN, OPS.CAT, OPS.COM and Part-OR, except for the variations contained in this Section;

(2) establish and maintain in addition to the requirements contained in Part OR.OPS a specific training and checking programme for the crew involved in these operations; and

(3) establish operating procedures specifying:

(i) performance criteria;

(ii) if applicable, the conditions under which offshore human external cargo transfer may be conducted including the relevant limitations on vessel movement and wind speed;

(iii) weather limitations for HEC;

(iv) criteria for determining the minimum size of the HEC site, appropriate to the task;

(v) crew composition and experience requirements.

OPS.SPA.010.HEC Equipment requirements for HEC

(a) The installation of helicopter double cargo hook with independend dual release function, mirrors for vissual contact to the HEC and an radio equipment to comply with OPS.SPA.015.HEC and any subsequent modifications and, where applicable, its operation shall have an airworthiness approval appropriate to the intended function.

Ancillary equipment must be designed and tested to the appropriate standard as required by the competent authority.

(b) Maintenance instructions for HEC equipment and systems shall be established by the operator, in liaison with the manufacturer and included in the operator's helicopter maintenance programme as required in Part-M.

OPS.SPA.015.HEC HEC communication

Two-way radio communication shall be established between the flight crew and a trained and from the operator nomminated person hanging on the HEC device and, where possible and applicable, communication with ground personnel for day and night onshore and offshore operations.

OPS.SPA.025.HEC Performance requirements for HEC operations

Except for HEC operations at a HEMS Operating Site, HEC operations shall be capable of sustaining a critical power unit failure with the remaining engine(s) at the appropriate power setting, without hazard to the suspended

person(s)/cargo, third parties, or property.

OPS.SPA.030.HEC Crew requirements for HEC operations

The minimum crew shall consist of at least one pilot and one HEC technical crew member hanging on the HEC device.

Section XXXXX – Human external cargo

AMC OPS.SPA.001.HEC(b)(3) Human external cargo (HEC)

TRAINING PROGRAMME

1. Flight Crew Members.

1.1 The specific HEC training programme for flight crew members should include the following subjects:

a. Fitting and use of the equipment;

b. Preparing the helicopter and equipment for HEC;

c. Normal and emergency procedures by day and, when required, by night;

d. Crew co-ordination concept specific to HEC;

e. Practice of HEC procedures; and

f. The dangers of static electricity discharge; and

g. HEC radio communication and defined standardized HEC commands between HEC and flight crew

h. HEC departures, landings and all procedures related to;

1.2 Flight crew member proficiency checks should include procedures likely to be used at HEC sites with special emphasis on:

a. Local area meteorology;

b. HEC flight planning;

c. HEC radio communication and defined standardized HEC commands between HEC and flight crew

d. HEC departures, landings and all procedures related to;

e. A transition to and from the hover at the HEC site;

f. Normal and simulated emergency HEC procedures; and

g. Crew co-ordination.

These checks should also be conducted by night if night HEC operations are undertaken by the operator.

2. HEC Technical Crew Member.

The specific HEC training programme for technical crew members who perform assigned duties relating to the operation should include the following additional items:

a. Duties in the HEC role;

b. Fitting and use of the equipment;

c. Operation of equipment;

d. Preparing specialist equipment for HEC;

e. Normal and emergency procedures;

f. Crew co-ordination concepts specific to HEC;

g. Operation of inter-communications and radio equipment;

h. Knowledge of emergency equipment;

i. Techniques for handling HEC passengers;

j. Effect of the movement of personnel on the centre of gravity and mass during HEC;

k. Effect of the movement of personnel on performance during normal and emergency flight conditions;

l. Techniques for guiding pilots over HEC sites;

m. Awareness of specific dangers relating to the operating environment; and

n. The dangers of static electricity discharge.

o. HEC radio communication and defined standardized HEC commands between HEC and flight crew

p. HEC departures, landings and all procedures related to;

AMC OPS.SPA.001.HEC(b)(4) Human external cargo (HEC)

OPERATING PROCEDURES

1. The Helicopter.

During HEC, the helicopter should be capable of sustaining a critical power unit failure with the remaining engine(s) at the appropriate power setting, without hazard to the suspended person(s)/cargo, third parties, or property.

2. The Crew.

2.1 Selection.

The operations manual should contain criteria for the selection of flight crew members for the HEC task, taking previous experience into account.

2.2 Experience.

2.2.1 The experience considered should take into account the geographical characteristics (sea, mountain, big cities with heavy traffic, etc.).

2.2.2 The minimum experience level for a pilot-in-command conducting HEC flights should not be less than:

a. Offshore:

i. 1 000 hours pilot-in-command of helicopters or 1 000 hours as co-pilot in HEC operations of which 200 hours is as pilot-in-command under supervision; and

ii. 50 HEC flights conducted offshore, of which 20 flights should be at night if night operations are being conducted.

b. Onshore:

i.500 hours pilot-in-command of helicopters or 500 hours as co-pilot in HEC operations of which 100 hours is as pilot-in-command under supervision;

ii. 100 hours operating experience in helicopters gained in an operational environment similar to the intended operation; and

iii. 30 HEC flights, of which 10 HEC flights should be at night if night operations are being conducted.

c. Successful completion of training in accordance with the procedures contained in the operations manual and relevant experience in the role and environment under which HEC is conducted.

2.3 Recency. All pilots and technical crew members conducting HEC should, in addition to the recency requirements in Part OR.OPS, have completed in one year periode:

a. When operating by day: Any combination of 6 day or night HEC flights, each of which should include a transition to and from the hover.

b. When operating by night: 6 night HEC flights, each of which should include a transition to and from the hover.

2.4 Crew Composition

2.4.1 The minimum crew for day or night operations should be as stated in the operations manual and will be dependent on the type of helicopter, the weather conditions, the type of task, and, in addition for offshore operations, the HEC site environment, the sea state and the movement of the vessel.

2.4.2 A crew of two pilots should be used during offshore operation when:

a. The weather conditions are below Visual Flight Rules (VFR) minima at the offshore vessel or structure.

b. There are adverse weather conditions at the HEC site (i.e. turbulence, vessel movement, visibility).

c. The type of helicopter requires a second pilot to be carried because of:

i. cockpit visibility;

ii. handling characteristics; or

iii lack of automatic flight control systems.

3. The Manual

When required in the interest of safety, relevant extracts from the operations manual should be made available to the organisation for which the HEC is being provided.

4. Passenger briefing

Passenger briefing prior to any HEC flight, or series of flights, except for HEMS operation, HEC passengers should be briefed and made aware of the dangers of static electricity discharge and other HEC considerations.

AMC OPS.SPA.010.HEC(a) Equipment requirements for HEC

AIRWORTHINESS APPROVAL FOR HUMAN EXTERNAL CARGO

1. Helicopter double cargo hook with independend dual release function and mirrors installations which have been certificated according to any of the following standards should be considered to satisfy the airworthiness criteria for Human External Cargo (HEC) operations:

a. CS 27 or CS 29;

b. JAR 27 Amendment 2 or JAR 29 Amendment 2 or later;

c. FAR 27 Amendment 36 or later - including compliance with CS 27;

d. FAR 29 Amendment 43 or later.

2. Helicopter double cargo hook with independend dual release function and mirrors installations which have been certificated prior to the issuance of the airworthiness criteria for HEC as defined in paragraph 1 may be considered as eligible for HEC operations provided that following a risk assessment either:

a. The service history of the double cargo hook with independend dual release function installation is found satisfactory to the competent authority; or

b. For hoist installations with an unsatisfactory service history, additional substantiation to allow acceptance by the competent authority should be provided by the Installation Certificate Holder (TC or STC) on the basis of the following requirements:

i. The double cargo hook with independend dual release function installation should withstand a force equal to a limit static load factor of 3.5, or some lower load factor, not less than 2.5, demonstrated to be the maximum load factor expected during hoist operations, multiplied by the maximum authorised external load.

ii. The reliability of the primary and back-up release systems at aircraft level should be established and Failure Mode and Effect Analysis at equipment level should be available. The assessment of the design of the primary and back-up quick release systems should consider any failure that could be induced by a failure mode of any other electrical or mechanical rotorcraft system.

iii. The operations or flight manual contains one-engine-inoperative hover performance data and procedures for the weights, altitudes, and temperatures throughout the flight envelope for which HEC operations are accepted.

iv. Information concerning the inspection intervals and retirement life of the HEC rope should be provided in the instructions for continued airworthiness.

v. Any airworthiness issue reported from incidents or accidents and not addressed by i., ii., iii. and iv. should be addressed.

Section VIII – HHO

OPS.SPA.001.(HHO)

(Page 99)

(b) (3) establish operating procedures specifying:

(iii) weather limitations for HHO:

Das macht keinen Sinn, es müssen vielmehr die jeweiligen Wetterminima für die Art des Einsatzes (z.B. HEMS) gelten. Beim Start zu einem Gebirgsrettungsflug kann z.B. oft noch nicht entschieden werden, ob es tatsächlich ein HHO Einsatz wird.

Im Gebirge sind ganz unterschiedliche lokale Wettersituationen möglich, eine Vorhersage für ein bestimmtes Einsatzgebiet daher oft unmöglich. Die Durchführbarkeit eines Einsatzes wird vor Ort entschieden. Hier können nur Ausbildungs- und Erfahrungstand der fliegerischen Crew die maßgebliche Rolle

spielen. Wir beantragen daher für HEMS-Einsätze eine entsprechende Ausnahme („...except for HEMS").

(iv) criteria for determining the minimum size…..

Das würde eine maßgebliche Einschränkung der Operationalität des HHO-Einsatzes bedeuten. Im Rahmen von HEMS-Einsätzen kommt es durchaus vor, dass z.B. auch in Waldgebieten (zwischen Bäumen) gewincht werden muss, um verletzte Personen retten zu können. Eine Bergung aus einer Bergwand lässt eine solche Definition per se nicht zu. Hier können nur Ausbildungs- und Erfahrungstand der fliegerischen Crew die maßgebliche Rolle spielen. Wir beantragen für HEMS-Einsätze daher eine entsprechende Ausnahme („...except for HEMS").

CAT=HHO class 1 : In Switzerland we are authorised to fly HHO-HCS operations for public interest site with class 3 Helicopters because of the high risk to the population if there is any delay. These sites are avalanche mining stations, rock fall alerting devices etc… An alleviation shall exist for this purpose to CAT B only after a risk analysis and approval of the National Authority.In first priority CAT A or equivalent Helicopter shall be operated for HHO. If the use of a CAT A helicopter is not appropriate for operational reasons, or if a CAT A helicopter is not available within an appropriate time frame, the HHO operation with a CAT B helicopter should be enabled. Performance Class 2 and 3 shall have no restrictions provided the operator obtain the AOC validated by the National Authority.

From 1968 the Swiss AIB reports 22 occurrence for SAR and HEMS over a total of 390 which represents only the 5.6%. 22 occurrences for more than 325'000 missions accomplished represents 0,0068%. Seven happened on ME and fifthteen on SE and only 2 are related to Technical or maintenance (vibrations and hoist failure both on ME). Considering this, Helicopter Class choice shall be left to the operator, provided he obtain the National Authority AOC required.

comment *3182* comment by: *Peter SCHMAUTZER*

In OPS.SPA.025 "Hems performance requirements for hems operation", is regulated, which performance class the helicopters should have to perform this operations. At the moment, BO 105 CBS 4 Helicopters perform HEMS operations in Carinthia, Austria.

HEMS Operation in Austria is under heavy cost pressure, because the transportations are mainly paid by the social security system. The social security system is trying to minimize the costs. The social security assurances decide after the transportation was performed about the necessity of the flight and pay the costs for the transport or not. The decision is made on the allegation, that the injury was not so serious, that the transportation with the helicopter was necessary. This was the reason, why all HEMS operators had financial losses.

According to AMC OPS Gen 010 it is not possible to decide in advance if the BO 105 CBS 4 can be used for HEMS operations in future. Therefore it is necessary to find a solution that HEMS operations to hospitals, which are considered, as hostile environment are possible in future. Therefore I find it necessary, that the criteria's are so, that HEMS operations with multi engine helicopters, so as BO 105 CBS 4, can be performed in future. In case this is not possible, it would be necessary to acquire new helicopters, which no operator can effort, because the higher costs will not be covered by the insurance companies and mainly by the state social security.

The Agency obviously wants to have a perfect system, however, no-one will be able to pay for it. As a consequence, no system at all will exist in the future.

So please leave all about HEMS to the NAA.

Justification: C.N. Parkinson wrote, years ago already, that perfect systems will only be available when no-one will be in position to make use of it.

Decision-making MUST be left to the operators AND to the PiC, they have the necessary experience.

Justification: Offshore operations and Alpine flying are very different from each other.

comment *7346* comment by: *ADAC Luftrettung GmbH*

Für HHO in HEMS gilt festzustellen, dass auch mit den modernsten, nach CAT A zugelassenen und gemäß CS 27/29 zertifizierten, HEMS-Hubschraubern, bei ungünstigen Umgebungsbedingungen (große Höhe, hohe Temperaturen) nicht immer Leistungsklasse 2 eingehalten werden kann. Solche Bedingungen sind des öfteren bei HEMS-Windeneinsätzen in großen Höhen gegeben. Um den

Piloten auch zukünftig die Chance zu geben, HEMS-Windeneinsätze innerhalb der Legalität durchführen zu können, muss hier eine Vorschrift geschaffen werden, die es erlaubt, in Ausnahmefällen HHO in PC 3 durchzuführen.

B. I. Draft Opinion - Part-OPS - Subpart D - Section VIII - OPS.SPA.030.HHO Crew requirements for HHO operations p. 100

B. I. Draft Opinion - Part-OPS - Subpart D - Section IX p. 101

comment *1408* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

HEMS is part of the public health and police tasks of the state and, thus, not to be regulated by commercial civil aviation rules.

comment *2314* comment by: *Austro Control GmbH*

In conjunction with NPA 2009-02a (Page 43, Point 111) following **general commen**t is given:

The note to HEMS in Appendix 1 to JAR-OPS 3.005(d) states that the Authority is empowered to decide which operation is a HEMS operation in the sense of this Appendix.

This generates differences between the Member States as HEMS could be not the same in the sense of this regulation.

There is a problem for "Mountain HEMS and Primary HEMS missions" as well as performance requirements with altitude where for example Austria is seeking a higher standard due to the nature in HEMS operations (hot, high, humid) and where the AMC material p.104 generates problems, as some helicopter types can not maintain Performance Class 2 at the HEMS Operations site due to the lack of single engine performance. These helicopters may well show compliance at lower altitues e.g. example: operations in the Netherlands;

Just to transfer the responsibility to the pilot is not feasable as by the nature of HEMS he can not decide at the HEMS site if he is in Performance Class 2 or already operating in Performance Class 3. Performance Class 2 at the HEMS site must be assured. This can only be achieved by the use of Category A certified helicopters (fully compliance to JAR-27/FAR-27/CS27-Annex C/Cat A or JAR-29/FAR-29/CS29).

Human External Cargo Operations especially in the mountainous area are standard.

A further Problem in HEMS which generates unacceptable risks is if there is no authorization from the Member State in which the operations take place is

required. The rule should state: *Approval from the Agency issuing the AOC as well as an authorization from the Agency responsible for the operations area.*

The common playing ground is not influenced as this will be the same regulation for all memberstates.

Background: There ist a high accident rate in HEMS operations which is higher than in other helicopter operations and therefore provisions to reduce this risk for safety reasons are necessary.

According to the request in **NPA 02a, Page 43 (OPS.SPA.HEMS, post NPA38)** Austro Control pleads for Option 2(b), notwithstanding that only full **CAT A certificated helicopters** (JAR-27/FAR-27/CS27-Annex C/Cat A or JAR-29/FAR-29/CS29) shall be **used for HEMS** operations.

comment *5257* comment by: *DGAC*

HEMS is only CAT. This section should be transferred to CAT (as is ETOPS)

comment *6955* comment by: *Christian Hölzle*

Point iv : This again is not applicable to mountain operations as the sites are always different and because of weather changes, the routing will also be adapted to circumstances. Again alleviation shall be permitted for mountain ops after a risk analysis and approval by the national authority.See TGL 43 HEMS.

The original intent of the text was to require the operator to have an HEMS Supplement to the Operations Manual; the text might be: the Operations Manual includes an HEMS supplement specifying:

Operating minima : Visibility may be reduced to 500 m for short periods when in sight of land if the helicopter is manoeuvred at a speed that will give adequate opportunity to observe any obstacle and avoid a collision.

comment *7034* comment by: *Christian Hölzle*

The original intent of the text was to require the operator to have an HEMS Supplement to the Operations Manual; the text might be: the Operations Manual includes an HEMS supplement. Due to complex and different types of operations and different types of environement, HEMS definition shall be left to National AUthorities.

Comment / Proposal:

Modify text:

(a) The means/mounting of the installation [...].

comment *3904* comment by: *FOM ANWB MAA*

OPS.SPA.010.HEMS Equipment requirements for HEMS operations

(a) The ~~installation~~ fixture and fittings of all helicopter dedicated medical equipment and any subsequent modifications and, where appropriate, its operation shall be approved in accordance with Part-21.

Improve text as to make clear that certification is only required for the fixture and fittings, not for the medical equipment (like ventilators) itself.

Medical equipmeny cannot be approved by part 21 organisations, change text to read that all fixtures and fittings for medical equipment must be part 21 approved.

comment *3974* comment by: *DRF Stiftung Luftrettung gemeinnützige AG*

(a) Improve text as to make clear that certification is only required for the fixture and fittings, not for the medical equipment (like ventilators) itself

comment *4414* comment by: *Helikopter Air Transport GmbH / Christophorus Flugrettungsverein*

Medical devices must not comply with aviation requirements. The medical techchnical requirements are sufficient. medical equipmeny cannot be approved by part 21 organisations, change text to read that all fixtures and fittings for medical equipment must be part 21 approved

comment *5424* comment by: *ADAC Luftrettung GmbH*

OPS.SPA.010.HEMS (a)

Please improve text as to make clear that certification is only required for the fixture and fittings, not for the medical equipment (like ventilators) itself.

comment *5504* comment by: *ALFA-HELICOPTER*

Improve text as to make clear that certification is only required for the fixture and fittings, not for the medical equipment (like ventilators) itself.

comment *5791* comment by: *Norsk Luftambulanse*

(a) Improve text as to make clear that certification is only required for the fixture and fittings, not for the medical equipment (like ventilators) itself

comment *6018* comment by: *HSD Hubschrauber Sonder Dienst*

010.HEMS(a): improve text so as to make clear, that an approval from a PART-21 is only required for fixture and fittings for medical equipment, since PART-21 cannot approve medical equipment.

comment *6030* comment by: *Peter Moeller*

needs clarification:

only the provisions (fixations, connectors etc) for the medical equipment which are installed in a HEMS helicopter need an approval in accordance with Part-21 but not the medical instruments thenmselves like ventilators, pumps etc.

comment *6867* comment by: *ALFA-HELICOPTER, spol. s r.o.*

The agency should include rules or guidelines for the operation of non-certified medical equipment for voice and data transmission. This equipment should also be certified in accordance with PART-21 regulation as per the demands the agency.

comment *7187* comment by: *European HEMS & Air Ambulance Committee (EHAC)*

OPS.SPA.010.HEMS Equipment requirements for HEMS operations

(a) The ~~installation~~ fixture and fittings of all helicopter dedicated medical equipment and any subsequent modifications and, where appropriate, its operation shall be approved in accordance with Part-21.

Improve text as to make clear that certification is only required for the fixture and fittings, not for the medical equipment (like ventilators) itself.

Medical equipmeny cannot be approved by part 21 organisations. Change text to read that all fixtures and fittings for medical equipment must be part 21 approved.

comment *7325* comment by: *new European Helicopter Association*

The requirements under (a) need clarification: The part 21 approval can apply to the fixture and fittings of the medical equipment only. Medical equipment itself is not part 21 accepted but must meet CEN 13718-1/2 approval requirements.

B. I. Draft Opinion - Part-OPS - Subpart D - Section IX - OPS.SPA.020.HEMS HEMS operating minima p. 101-102

comment *473* comment by: *EHOC*

Paragraph (a)

The text would flow much better if the preamble was changed to read:

"HEMS flights **operating** in performance class 1 and 2 ~~operations~~ shall comply..."

Paragraph (b)

The original text has not been reproduced and is missing the alleviation on visibility that is contained in Annex 2; the following text should be appended to the existing rule:

"Visibility may be reduced to 800 m for short periods when in sight of land if the helicopter is manoeuvred at a speed that will give adequate opportunity to observe any obstacle and avoid a collision."

comment *838* comment by: *Reto Ruesch*

Helicopter Emergency medical service operations

HEMS Operating minima

Visibility may be reduced to 800 m for short periods when in sight of land if the helicopter is manoeuvred at a speed that will give adequate opportunity to observe any obstacle and avoid a collision.

comment *928* comment by: *REGA*

Rega / Swiss Air-Ambulance Ltd. is flying since 1988 with NVIS. We are flying single pilot NVIS OPS. The HCM also is NVIS trained and uses a hand held NVG.

Experience shows that even in single pilot HEMS NVIS operation with a NVIS trained HCM the night minima of 2500m visibility occurs no problem for safety.

Since the beginning of using NVIS designated experienced Rega pilots are allowed to fly down to 800m visibility ad night in well known regions and Rega never had problems in this low visibility conditions. Rega experience is based on more than 25’000 missions with almost around 100’000 landings with NVG since 1988.

There obviously is no reason to make a difference between 1 PILOT and 2 PILOTS (Table 1 OPS.SPA.020 - HEMS operating minima).

Proposal

*1 or 2 pilot/technical crew meber: *Visibility, ceiling and cloud base may be reduced for short periods within a specific area if the helicopter is equipment with RA, AP, TAWS, EVS and NVIS (night) when in sight of land and if the helicopter maneuvered at a speed that will give adequate opp… The procedure for hems missions below the minima according table 1 shall be described in the operation manual and be approved by the competent authority.*

FOCA statement regarding multi-engine helicopters / performance classes

It should be a requirement for a rulemaker to do a basic study on the requirement of multi-engine helicopters (required performance classes) before drafting rules that have a drastic impact on the industry. A very small percentage of all helicopter accidents are caused by engine failures. The operation of multi-engine helicopters causes a heavy increase of the costs for an operator and the customer or state, with a very minimal increase in safety. Most helicopter accidents are caused by human factors (pilot, see statistics). This is an issue which should be taken into consideration while drafting rules. Human aspects (e.g. decision making) and the training of pilots is the basic aspect for increasing the safety of helicopter operations. The FAA system shows that the requirement of multi-engine helicopters does not meet the needs of an increased safety (see text below).

A rulemaker should consider the basics of rulemaking. The principle of proportionality, public interest, economical and ecological feasibility should be the first priority. The need to operate multi-engine does not respect this

principles in most cases.

When JAR-OPS 3 introduced the requirement for operating multi-engine helicopters, it did not have to respect the above mentioned principles since it was not drafted by a recognized rulemaker. The countries that adopted the JAR-OPS 3 Regulations had the option to alleviate from the proposed rules. The EASA regulations now have a different impact on the whole aviation framework and should be tailored towards a safe operation in the public interest respecting the basic rulemaking principles.

FAA statement regarding the use of multi-engine helicopters for HEMS operations:

After a few email discussions regarding our experience in the helicopter emergency medical service (HEMS) industry, in your email of February 23, 2007, you asked us to summarize our findings in a letter regarding our experience with single versus multiengine helicopters in the HEMS industry.

We certainly welcome your inquiry and are pleased to provide that information. Also, we are very pleased to note that National Aviation Authority helicopter department in Switzerland uses our operational notices in the development of your policy, guidance, and rules.

You asked do we see any safety improvement "if there will be only twin engine helicopters for HEMS in the future." In response to your question, while preparing our efforts to reduce accidents in the HEMS industry, we examined 85 accidents of HEMS operators that occurred between the 1998 and 2004. The analysis of these accidents was the basis for our actions we took in the last 24 months regarding visual flight rules weather minimums, risk assessment, crew resource management, training, controlled flight into terrain, and operational control. Of the 85 HEMS accidents that occurred in that period, 49 were multiengine aircraft; 36 were singles. The ratio reflected here is the same as the ratio of single or multi-engine helicopters in the entire HEMS fleet.

In the United States, single engine helicopters make up approximately 42% of the operational HEMS fleet today; 58% are multi-engine. The operators make the business decision on the type of aircraft that best suits their operational requirements. Engine failure has not been a significant causal factor in HEMS accidents. Instead, the human factors causes of controlled flight into terrain, inadvertent flight into instrument meteorological conditions, and loss of control were the predominant causes. Thus, the FAA has no plans within the foreseeable future to mandate that HEMS operations be conducted in multiengine aircraft.

As you requested, we are enclosing a copy of the final draft report reflecting these statistics. It is the foundation of our specific efforts to decrease the accident numbers in HEMS. The total number of accidents mentioned in this report is 83; we included two additional in our analysis subsequent to the report.

In the table to OPS.SPA.020 HEMS it is suggested to modifiy the first line:

*2 Pilots **or** 1 Pilot and 1 HEMS crew member if approved*

Justification:

Due to the fact that in HEMS there is practially only one pilot and one HEMS crew member it seems necessary to reflect this option.

comment 840 comment by: Reto Ruesch

Perf class 3 not over hostile / How can we operate in mountain

According to the GM OPS SPA 020 HEMS page 464 the ability to reduce the visibility for short periods has been included. The pilot is allowed tpo asses the risk of flying temporarily into reduced visibility against the need to provide emergency medical service and according to the limitations of the AFM.

comment 905 comment by: CAA-NL

Comment regarding:

(a) Performance class 3 operations…

(b) The HEMS operating base shall not be located in a congested area or on a hospital roof if the HEMS operator provide a 24hour service and flights after UDP are expected.

(c) Take-off and landing

1. Helicopters conducting ……

CAA/NL Reasoning:

It is the opinion of the CAA/NL that helicopter night operations to and from locations in congested areas and / or hospital roofs results in unnecessary risks for the surroundings in case of an N-1 situation. Therefore the CAA/NL restricts their current HEMS operator from night operations to and from hospital roofs and / or congested areas and allows these flights only to pick up or deliver the medical passenger or emergency doctor. The HEMS operating base, in case of 24-hour operations, should therefore be located outside a congested areas and not being situated on a hospital roof.

comment 986 comment by: REGA

Attachment #12

(a) According the definition of Performance class 3, multi-engine helicopter may also be required to perform a forced landing. Even modern light twin helicopters, certified CAT A, may not be able to be operated according performance class 1 or 2 all the time. Especially when those missions are performed in confined areas like in the mountains (hostile environment) or at

operating sites within congested areas.

Proposal (a)

Performance class 3 operations with helicopters certified in CAT B shall not be conducted over a hostile environment.

HEMS-Operating Sites: Meeting the Performance Class 2 requirement at HEMS-operating sites is even with modern twin helicopters (e.g. EC145; EC135) not possible at all time: Due to the "character" of HEMS-missions and their operating sites (e.g. within a forest or a mountainous terrain; wind, temperature) twin helicopters (CAT A certified) are operating within all three performance classes; even for short period in Performance Class 3 without the assurance of a safe forced landing (see examples below).

Operations at hospitals

Throughout Europe HEMS operators used and use landingsites at hospitals that do not meet design criteria nor can be approached in the required PC. This issue was identified and adressed in JAR-OPS 3. A solution was provided by creating Public Interes Sites. Unfortunately many NAAs have neither implemented this regulation, nor have been willing to accept landingsites, existing prior to 1 July 2002, as Public Interes Sites as a consequence. Implementation of PIS regulation under present days conditions will result in a degradation of HEMS patient care because numerous Hospitals would no longer be available for doctor/patient pickup or delivery. Throughout Europe various National regulations exist. The common denominator in these regulations is the fact that unofficial landing sites at hospitals are treated as HEMS operating sites. This especially holds true for landing sites at smaller hospitals which are visited infrequently. In this respect reconsideration of the HEMS philosophy, and the related requirements, is necessary.

Proposal (b) (1)

Helicopters conducting…. To/from an aerodrome/hospital/operating base which is located…

On operating bases located in a hostile environment, CAT A certified helicopters shall be operated in accordance with performance class 1 or 2.

(3) In high altitudes/low density or confined areas, when CAT A certified helicopters is not able to sustain performance class 2 during,

Helicopters, certified CAT A, conducting operations to/from HEMS operating sites or hospital sites located in hostile environment where environmental conditions of altitude and high temperature - in excess of ISA – exists such that adequate reserves of performance are not available to meet the requirements for PC1 or PC2, provided AEO HOGE is available, the requirement for PC1 or PC2 may be disregarded (see. TGL No.43).

or

Proposal 2

(b) (1)/(2) HEMS-operations: If it is not possible to comply with the requirement of performance class 1 due to performance or operational reasons, HEMS operations may be carried out with multi-engine helicopters (Category A certified), in performance class 2 or 3 providing that these deviations are described in the operations manual and have been approved by the competent authority.

comment *1017* comment by: *Michael Kroell*

Performance requirements for HEMS operations should clearly state that the helicopter has to be a certified Category A helicopter to allow operations in accordance to Performance Class 1 where applicable.

Performance Class 3 operations should not be allowed at all in HEMS operations with one exemption - where high altitude rescue is necessary and the HEMS operation site is out of the altitude performance of the Category A certified helicopter. The operator has to determine these local areas based on the performance requirements and the operations need an approval by the competent authority.(OPS.SPA.001.SFL) Nevertheless - for the transport of the patient to the hospital a Category A certified helicopter to allow operations in Performance Class 1 shall be used. Designated mountainous areas could be established where these approvals could be effective.

comment *1136* comment by: *Heli Gotthard*

Perf class 3 : According to the GM OPS SPA 020 HEMS page 464 the ability to reduce the visibility for short periods has been included. The pilot is allowed tpo asses the risk of flying temporarily into reduced visibility against the need to provide emergency medical service and according to the limitations of the AFM.Mountain operations shall be considerated as SAR.In first priority CAT A or equivalent Helicopter shall be operated for HHO. If the use of a CAT A helicopter is not appropriate for operational reasons, or if a CAT A helicopter is not available within an appropriate time frame, the HHO operation with a CAT B helicopter should be enabled.

From 1968 the Swiss AIB reports 22 occurrences for SAR and HEMS over a total of 390 which represents only the 5.6%. 22 occurrences for more than 325'000 missions accomplished represents only 0,0068%. Seven happened on ME and fifthteen on SE and only 2 are related to Technical or maintenance (vibrations and hoist failure both on ME). Considering this, Helicopter Class choice shall be left to the operator, provided he obtain the National Authority AOC required.

Concern detail:

Performance requirements for HEMS operations

Comment / Proposal:

Modify text:

Performance Class 3 operations shall only be conducted over a hostile environment in mountain and remote areas and if there's is no multi-engine helicopter available within a reasonable time or due to operational reasons.

Remarks:

Mountain and remote areas as well as operational reasons (wind, altitude) justify the use of helicopters in Performance Class 3. Additional the lack of multi-engine helicopters justify the use of single engine helicopters operating in Performance Class 3 due to the need of an emergency case.

comment *2334* comment by: *Austro Control GmbH*

Performance requirements for HEMS operations should clearly state that the helicopter has to be a certificatedCategory A helicopter to allow operations in accordance to Performance Class 1 where applicable.

Suggested text: add a new point at the beginning of the parapraph:

(a 1) HEMS operations have to be conduced by helicopters certificated in category A.

(a) Performance Class 3 operations shall not be conducted in HEMS operations with the exemption that where high altitude rescue is necessary, the HEMS operation site is out of the altitude performance of the Category A certified helicopter and approval by the competent authority is granted.

Justification:

The operator must determine these local areas based on the performance requirements and the operations must need an approval by the competent authority.(OPS.SPA.001.SFL) Nevertheless - for the transport of the patient to the hospital a Category A certified helicopter to allow operations in Performance Class 1 shall be used for safety reasons.

comment *5259* comment by: *DGAC*

Justification:

Paragraph (a) could be removed once this section is moved back into subpart CAT, as it is general rule (cf OPS.CAT.180 allowing for an approval in accordance with Part OPS.SPA.001.SFL).

Besides we could have HEMS flights from one airport to another airport in Performance class 3. There is no reason for forbidding HEMS flights in Performance class 3. In general, it is not realistic but it could be possible.

The whole paragraph (b) has also to be reviewed.

Paragraph (2) is not true as a HEMS flight to/from a HEMS operating site located in a hostile environment could be operated in accordance with OPS.SPA.005.SFL (c).

Proposal:

Replace the entire text of OPS.SPA.025.HEMS by the following :

"~~(a) Performance class 3 operations shall not be conducted over a hostile environment.~~

~~(b)~~ Take-off and landing:

(1) Helicopters conducting operations to/from an ~~aerodrome~~ **heliport** at a hospital which is located in a hostile environment shall be operated in accordance with performance class 1; except as provided in OPS.SPA.005.SFL**(c) or (d) if it is not congested or in accordance with OPS.SPA.005.SFL(e) if it is congested**.

(2) Helicopters conducting operations to/from an operating site **which is** located in a hostile environment shall be operated in performance class ~~2~~ **1 except as provided in OPS.SPA.005.SFL(a) if it is congested or as provided in OPS.SPA.005.SFL(c) or (d) if it is not congested.**

(3) […] »

comment *5763* comment by: *Aero-Club of Switzerland*

(a) Why not? There are diffenent kinds of hostile environment: A town is not a glacier. We ask the Agency to take a look at all the different HEMS environment possible across Europe.

Justification: Sometimes performance class 3 helicopters perform better than species of the other performance classes.

Leistungsklasse 3 nicht über einem Gebiet mit schwierigen Umgebungsbedingungen. Wie sollen in zukünftig im Gebirge HEMS-Einsätze durchführen??

Für HHO in HEMS gilt festzustellen, dass auch mit den modernsten, nach CAT A zugelassenen und gemäß CS 27/29 zertifizierten, HEMS-Hubschraubern, bei ungünstigen Umgebungsbedingungen (große Höhe, hohe Temperaturen) nicht immer Leistungsklasse 2 eingehalten werden kann. Solche Bedingungen sind des öfteren bei HEMS-Windeneinsätzen in großen Höhen gegeben. Um den Piloten auch zukünftig die Chance zu geben, HEMS-Windeneinsätze innerhalb der Legalität durchführen zu können, muss hier eine Vorschrift geschaffen werden, die es erlaubt, in Ausnahmefällen HHO in PC 3 durchzuführen.

B. I. Draft Opinion - Part-OPS - Subpart D - Section IX - OPS.SPA.045.HEMS HEMS operating base facilities p. 102

comment *3603* comment by: *Austro Control GmbH*

For clarification reasons AMC to OPS.SPA.045 HEMS is requested to define HEMS operating base facilities:

Installations which allow each crew member to rest independently and undisturbed should be available.

Seperate lockable room for medical supply and desinfection as well as shelter for the aircraft are urgently recommended.

Most of the definitions contained in this GM should be in the IR

It is not very convenient to have definitions spread in so many places throughout the text of the NPA (OPS.GEN.010, GM OPS.GEN.010 Definitions, AMC 1 OPS.GEN.320A(a), …). Moreover, some terms are used early in an AMC and defined later on in another AMC (ex.: Class A&C used in AMC 1 OPS.GEN.320A(a) and only defined in AMC.OPS.CAT.316A(a)(1)).

Besides, is an AMC or a GM really the proper place for a definition, especially when the term is used in the IR ? The fact that a definition could be subject to interpretation and alternative means of compliance (as AMC or GM) is questionable actually. How can a standard be applied if there is no assurance on the meaning of the terms it is built upon.

(5) 'Maximum take-off mass for helicopters':

Proposal : Amend the definition as follows and move it to OPS.GEN.010 (or to a common documents with IR status that would gather all definitions…)

'Maximum take-off mass ~~for helicopters~~' means the maximum permissible **take-off mass** ~~total helicopter mass at take-off~~.

Justification : This definition should not be restricted to helicopters. It should be rewritten taking into account the definition of 'Take-off mass' laid-down in (74) of OPS.GEN.010, and generalized at least to aeroplanes as well.

(74) 'Take-off mass' means the mass, including everything and everyone carried at the commencement of the take-off for helicopters and take-off run for aeroplanes.

General Comment (Definitions)

Comment:

There should be a part common to all the other parts where definitions are listed and filtered according to type of aircraft (aeroplane, helicopter etc).

Proposal:

Introduce a common part for definitions

comment *6062* comment by: *Irish Aviation Authority*

Comment:

Definitions: There is a requirement for a common set of definitions that would apply throughout all of the rules. This must include all the relevant definitions from ICAO, EU OPS, JAR OPS 3, etc and any additional definitions created and used by EASA within the rules text.

Justification:

Standardisation with already accepted aviation normal practice.

comment *6429* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Comment

There is a need for a global part dedicated to definitions.

Proposal

We suggest a specific part or the EASA regulation framework may contain a comprehensive and exhaustive list of definitions, applicable to the whole EASA regulation, which is the best way to have consistent and non-redundant definitions.

Justification

This might be a legal issue regarding the scope of understanding and cause problems of reading.

B. II. Draft Decision - Part-OPS - Subpart A - Section I - AMC p. 104

OPS.GEN.010(a)(9)&(10) Definitions

comment *1008* comment by: *Michael Kroell*

Helicopters not fully certified to the first paragraph should not be eligible for performance class 1 operations in the HEMS helicopter role due to the nature of the operations. A Category A (certified to CS-27 in conjunction with Annex C or CS-29; JAR/FAR-27 and JAR/FAR-29 should be considered equivalent provided the certification standards are equivalent) certification shall be mandatory. For other operations, outside congested hostile areas, an alleviation depending on the operational environment may be accepted provided that the operator demonstrates an equivalent level of safety.

These mentioned helicopters do not fulfill the single engine performance requirements necessary for the successful termination of an approach in the case of a critical power failure after LDP or a critical power failure before reaching the TDP even when Category A take off and approach procedures are strictly followed.

The Type-Certificate Data Sheet proofs a full compliance to Category A.

comment *1065* comment by: *REGA*

Category A: Helicopters has to satisfy Category A criteria. The "new" separation between Category A and Performance Class 1 will open the possibility to operate "old" helicopters which are only Category A equivalent, e.g. the BO105.

To guarantee the safety targets the operation within Performance Class 1 should be limited in the future to helicopters fulfilling the whole Category A standards.

Comparing with JAR's (ACJ OPS 3.480): JAR OPS 3 set a time limit for operating Category A equivalent helicopters.

Proposal

Helicopters operated in performance class 1 or 2 not meeting the Category A certification standards should not be operated beyond 2015.

comment *1756* comment by: *EUROCOPTER*

§ 2.:

Modification proposal:

~~In addition to the above, certain~~ *Helicopters which have been certificated under FAR Part 27 and with compliance with FAR Part 29 engine isolation requirements as specified in FAA Advisory Circular AC 27-1****~~. These helicopters~~*** *may be* ***considered to satisfy the Category A criteria and therefore*** *may be accepted as eligible for Performance Class 1 or 2 operations provided ..."*

Justification: AMC OPS.GEN.010(a)(9) & (10) defines, in its § 2., additional requirements for certain helicopter types to be eligible for Performance Class 1

or 2 operations, but omits to say that, when it has been demonstrated that these additional requirements are fulfilled, these helicopter types are considered to satisfy the Category A criteria. It is so proposed to amend OPS.COM.350.H § (a)(1) and AMC OPS.GEN.010(a)(9)&(10) in this purpose.

comment *2068* comment by: *Réseau de Transport d'Electricité - Services et Travaux Héliportés*

§ 2.:

Justification: AMC OPS.GEN.010(a)(9) & (10) defines, in its § 2., additional requirements for certain helicopter types to be eligible for Performance Class 1 or 2 operations, but omits to say that, when it has been demonstrated that these additional requirements are fulfilled, these helicopter types are considered to satisfy the Category A criteria. It is so proposed to amend OPS.COM.350.H § (a)(1) and AMC OPS.GEN.010(a)(9)&(10) in this purpose.

comment *2337* comment by: *Austro Control GmbH*

2.

gives the rule a "second" meaning and was obviously historically introduced to allow operators to continue to operate non CAT-A certificated helicopters until manufacturers are able to serve the need on certified helicopters (see history of JAR-OPS 3 Amendments).

This requirement should be revised as this is now misleading and seems to open again the door for non-compliant (especially old) helicopters, which cannot be in the safety interest. (see also Comment to OPS.SPA.025.HEMS, page 102).

Solution suggested is to add at the end of the paragraph:

"Point 2 is not applicable for operations where Performance Class 1 is mandatory."

or delete Point 2.

comment *7388* comment by: *Heli Austria*

Just as per NPA 38 F.4.7 it is very important for the operators that CAT A paragraph 2 aircraft can be used for PC1 and PC2.

Currently a lot of CAT and COM operation is performed with PC3 helicopters and according to the NPA 2009-02b Category A helicopters will have to be used in the future. AS355 and B105 are aircraft with an exceptional good safety track and history.

Also the fact has been known since 1995 and it has always been clear that PC1 is mandatory by the end of 2009.

A lot of operators mixed up the requirement of PC1 versus the CAT A equivalence.

Don't let us down due to the big lobbies from ÖAMTC, ADAC and DRF to abbandon the CAT A equivalance because they never lernt reading English.

ECA requests clarification:

Who is responsible for the aircraft between boarding of crew and first movement of A/C? The GM leaves out exactly this timeframe - legal uncertainty.

comment *880* comment by: *Condor Flugdienst GmbH - FRA HO/R*

Refering to GM OPS.GEN.015 - Subparagr.1.:Assigns to the PIC the responsibility for safety of all persons

and cargo on board on entering the aircraft. However, the Tokyo Convention provides his means

of "imposing reasonable measures" only after closing of the doors.

comment *2330* comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

Comment:

Assigns to the PIC the responsibility for safety of all persons and cargo on board on entering the aircraft.However, the Tokyo Convention provides his/her means of "imposing reasonable measures" only after closing of the doors.

The Tokyo Convention gives him/her global police right, but only after having closed the doors.

Conclusion: There can be no obligations without empowerment.

comment *3445* comment by: *UK CAA*

Page No: 109

Paragraph No:

GM. OPS.GEN.015

Comment:

In para 2.a. there is a need for better clarification of: 'from the moment it is first ready to move for the purpose of flight'

Justification:

A captain cannot be held responsible for the safety of the aircraft when it is being pushed backwards by a ground handling vehicle.

EU-OPS 1.085 (f)(2) states: 'be responsible for the operation and safety of the aeroplane from the moment the aeroplane is first ready to move for the purpose of taxiing prior to take off'

Also who is responsible for the operation and safety of the aeroplane when taxiing not for the purpose of take off e.g. when repositioning the aircraft on an aerodrome?

Proposed Text (if applicable):

2. The operation and safety of the aircraft:
   a. from the moment it is first ready to move, ~~for the purpose of flight~~ ***under its own power, for the purpose of ground repositioning or taxiing prior to take off***, until the moment it comes to rest at the end of the flight and the engine(s) used as primary propulsion unit(s) is/are shut down, for aeroplanes;
   b. when the rotors are turning, for helicopters;
   c. from the moment the launch procedure is started until the aircraft comes to rest at the end of the flight, for sailplanes; and
   d. from the moment the inflating of the envelope is started until the envelope is deflated, for balloons.

(2)b. change to read

for helicopters from the moment the rotors start turning for the purpose of flight until the rotors come to a complete stop after flight.

comment *6169* comment by: *HSD Hubschrauber Sonder Dienst*

015 2.b:

change to: .."when rotors are turning under power"

comment *6948* comment by: *IACA International Air Carrier Association*

Assigns to the PIC the responsibility for safety of all persons and cargo on board on entering the aircraft. However, the Tokyo Convention provides his means of "imposing reasonable measures" only after closing of the doors.

The Tokyo Convention gives him/her global police rights, but only after having closed the doors. Conclusion, there can be no obligations without empowerment.

comment *7192* comment by: *European HEMS & Air Ambulance Committee (EHAC)*

GM OPS.GEN.015 Pilot-in-command responsibilities and authority

2. The operation and safety of the aircraft:

b. when the rotors are turning under power, for helicopters;

Windmilling of the rotor in absence of the PIC should not be included. Revise text to read: For helicopters, from the moment the rotor start turning for the purpose of flight until the rotor comes to a complete stop after the flight.

ADD that the final decision as to the admission to the cockpit always rests with the Pilot –in-command

comment *6446* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Comment

Wording "Pilot-in-command" needs a more precise definition as we can find other terms as : "commander" in GM OPS.GEN.180.H, "pilot flying/pilot non flying" in GM 2 OPS.GEN.460, "non-operating/non-handling pilot" in GM2 OPS.GEN.150.A which can be really confusing. Those terms are also in other parts of NPA 2009-02 B.

Proposal

We suggest specific definitions for those wordings so the text may be more clear and understandable for operators.

Justification

This might be a legal issue regarding the scope of understanding and cause problems of reading. All those wordings can lead to specific responsabilities that can be widely diffrerent.

comment *6950* comment by: *IACA International Air Carrier Association*

Add the following clarification: the final decision as to the admission to the cockpit rests with the Pilot-in-command.

comment *561* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.GEN.015(a)(5): change as follows:

AMC2 OPS.GEN.015(a)(5) Pilot-in-command responsibilities and authority

ADMISSION TO COCKPIT/PILOT COMPARTMENT – COMMERCIAL AIR TRANSPORT

1. Only the following persons may be admitted to or carried in the cockpit/pilot compartment:

a. An operating crew member;

b. A representative of the competent authority, if it is required for the performance of his/her official duties;

c. A person authorised by the operator;

d. Passengers, in the case of balloons with no separate pilot compartment.

2. In the case of other than complex motor-powered aircraft, persons admitted to or carried in the cockpit/pilot compartment may be carried in a pilot seat.

3. The final decision regarding admission to the cockpit/pilot compartment shall be the responsibility of the pilot-in-command.

Justification:

Compliance with JAR-OPS 1.100

comment *584* comment by: *Association of Dutch Aviation Technicians NVLT*

OPS.GEN.015(a)

Could you please clarify which person could be authorised by the operator, this can to our opinion be everybody! It is a common use by aviation companies to use the cockpit observer or crew rest seats for staff-travel or standby-passengers. To our opinion this is a unwanted and unsafe situation. Why in this case is there a closed reinforced cockpit door policy if any person authorised by the operator is allowed in the cockpit.

It is commonly used that Certifying staff is allowed in the cockpit for monitoring purposes for maintenance evaluations. The same feature will rise when certifying staff are performing a engine test run for maintenance activities when crew and passengers are on board. There should be a formal possibility to ad the certifying staff on the list of the following persons who may be admitted to or carried in the cockpit/pilot compartment,will this possibility formally acknowledged?

comment *881* comment by: *Condor Flugdienst GmbH - FRA HO/R*

Add the following clarification: the final decision as to the admission to the cockpit rests

with the Pilot-in-command.

comment *944* comment by: *Aersud*

Comment

In case of an helicopter with a maximum certificated seating configuration up to 9, imposing the non-possibility to carry passenger in the cabin is too much restrictive and expensive if we consider that this could reduce the transport capacity from 100% to 10% (example R22 100%, EC120 20%, AW119 14%, AS355 20%, AW109 14%). In that case it is better to impose that, in case of passenger transport in the cockpit, the co-pilot flight controls shall be removed or deactivated.

Consider that in the helicopter the dual controls is a simple task operation and could be done, accordingly to maintenance manuals, in less than 30 min. With dual controls removed or deactivated, accordingly to an approved configuration, the passenger cannot interfere with the flight safety.

Proposal

ADD:

1. Only the following persons may be admitted to or carried in the cockpit/pilot compartment:

a. An operating crew member;

b. A representative of the competent authority, if it is required for the performance of his/her official duties;

c. A person authorized by the operator;

d. Passengers, in the case of balloons with no separate pilot compartment;

e. Passengers, in the case of helicopters with a maximum certificated seating configuration up to 9 and with dual controls removed or deactivated accordingly to an approved procedure.

Note

Priority: **H**

comment *964* comment by: *Thomas Baerfuss*

admission shall be allowed in helicopters with single pilot operation on the appropriate passenger seat besides the pilot

Page No: 110

Paragraph No:

AMC OPS.GEN.015 (d)

Comment:

OPS.GEN 015 (d) permits a multi-crew flight to be continued beyond the nearest suitable aerodrome if suitable mitigations are in place to overcome a crew's lack of capacity as a consequence of fatigue, sickness or lack of oxygen. Controlled rest and additional crew members can be accepted as a mitigation for fatigue but not as a mitigation for lack of oxygen or sickness. A comment and suggestion has been made in respect of the rule in OPS.GEN 015. However to ensure complete clarity it is further suggested that AMC OPS GEN.015(d) includes the phrase "in respect of fatigue only" – see proposed text.

Justification:

Clarification.

Proposed Text (if applicable):

MITIGATING MEASURES

The use of additional crew members and controlled rest during flight are considered to be adequate mitigating measures **in respect of fatigue only.**

comment *4602* comment by: *BALPA*

We agree that it makes sense to formalise this issue.

However within this section there are numerous references to "should" ie point 5 states "... the pilot-in-command *should* ensure that:". We feel this must be replaced by "shall" to reinforce the comment.

Section 6e - If it takes 20 minutes to recover from sleep inertia and the minimum time allowed between two subsequent controlled rest periods is also

20 minutes, when will a satisfactory briefing take place?

comment *4159* ☐ comment by: *DGAC*

OPS.GEN.015(a)(4), OPS.GEN.020(f), AMC1 to OPS.GEN.020(a)

It is accepted, as mentioned in OPS.GEN.020 (f), that the flight crew has a responsibility in managing his own fatigue.

However the elements highlighted in AMC1 OPS.GEN.020(a), if the crew member works for an operator is much too detailed. The interpretation of those items will lead to a simplified vision of fatigue without taking into account operational environment, support and resources, nor individual or collective countermeasures.

It is unreasonable to assume that an individual can assess all those factors on the spot. The wording in the IR is considered sufficient to evaluate its own fatigue, notwithstanding tools and countermeasures (i.e. fatigue checklist) that an individual may use as an industry best practice. It should not be the role of a regulation body to provide an exhaustive list for a topic that also include personal life, operational issues, etc. that may impact on the non linear link between physiological fatigue and safety.

comment *4633* comment by: *BALPA*

Paragraph 2 - We feel that "shall" must be used in place of "should".

Remove

comment *6967* comment by: *IACA International Air Carrier Association*

Operators consider fatigue as an input to the airline's Safety Management System (SMS), along with other potential safety hazards such as bird strikes, ATC related hazards, runway incursions…There should not be a separate management system for fatigue. Crew members can already report any event that may endanger flight safety and the operators are required to take mitigating actions under that SMS.

B. II. Draft Decision - Part-OPS - Subpart A - Section I - AMC2 OPS.GEN.020(a) Crew responsibilities p. 112

comment *480* comment by: *EHOC*

Title

The reference should be to (g) and not (a).

comment *692* comment by: *ECA - European Cockpit Association*

Comment on AMC.OPS.GEN.020(a): delete the whole paragraph:

~~**AMC2 OPS.GEN.020(a) Crew responsibilities**~~

~~**REPORTING OF ANY OCCURRENCE RELATED TO THE SAFETY OF THE AIRCRAFT AND ITS OCCUPANTS**~~

~~**Whenever a crew member makes use of the applicable reporting systems, a copy of the report should be communicated to the pilot-in-command.**~~

Justification:

Reference to occurrence reporting system needs to be established in the rule.

comment *2360* comment by: *Dassault Aviation*

Technical comment:

Page 112 AMC2 OPS.GEN.020(a) Crew responsibility: The protection of the report author's anonymity - as sated in EU.OPS1.037(a)(2) - is no longer guaranteed in the NPA2008-22c "Organization Requirement" OR.GEN.200(a)(5) or AMC to OR.GEN.200(a)(5). The flight safety could be thus seriously endangered by deterring the flight crew members to report any incident. We suggest to modify the text as below (underlined): "Whenever a

crew member makes use of the applicable reporting systems, a copy of the report should be communicated to the pilot-in-command. The identity of the author should be protected."

comment 3321 comment by: *AEA*

Relevant text:

Whenever a crew member makes use of the applicable reporting systems, a copy of the report should be communicated to the Pilot in command

Comment:

It is not desirable to always communicate a copy of the report tho the PIC. Especially if the report is about the PIC.

And what about anonymous reporting ?

Proposal:

Delete this requirement.

comment 3358 comment by: *M Wilson-NetJets*

Original text:

REPORTING OF ANY OCCURRENCE RELATED TO THE SAFETY OF THE AIRCRAFT AND ITS OCCUPANTS

Whenever a crew member makes use of the applicable reporting systems, a copy of the report should be communicated to the pilot-in-command.

Suggested new text:

REPORTING OF ANY OCCURRENCE RELATED TO THE SAFETY OF THE AIRCRAFT AND ITS OCCUPANTS

Whenever a crew member makes use of the applicable reporting systems, a copy of the report should be communicated to the pilot-in-command, **unless the crewmember is making use of a confidential reporting structure**.

Comment/suggestion:

For safety systems that provide the possibility to report incidents confidentially there should be the possibility to not have to provide a copy to the PIC.

We support the suggestion of no comsumption of alcohol while on duty or less than 8 hours prior to commencing a flight and a limitation of 0,2 per mille.

B. II. Draft Decision - Part-OPS - Subpart A - Section I - AMC OPS.GEN.030 Transport of dangerous goods p. 112-113

comment *1185* comment by: *CAA-NL*

AMC OPS.GEN.030 1.

Comment: AMC OPS.GEN.030 1. states that the some dangerous goods may be carried when an approval has been granted by the State of Origin, "providing specific conditions which are laid down in the Technical Instructions are met." This quoted text should be deleted.

Justification: The Technical Instructions do not lay down specific conditions in respect of State of Origin approvals.

Proposed Text (if applicable):

"….permitted. The Instructions also make provision for some dangerous goods to be carried when an approval has been granted only by the State of Origin~~, providing specific conditions which are laid down in the Technical Instructions are met~~. "

comment *1533* comment by: *AIRBUS*

The title of the AMC, EXEMPTION AND APPROVAL PROCEDURES OF THE TECHNICAL INSTRUCTIONS, despite being copied from the TGL 44, is misleading. The AMC only refers to the approval of exemptions to the Technical Instructions and not to the approval of the Technical Instructions themselves that are an ICAO document. The title should be changed into "APPROVAL OF EXEMPTIONS FROM THE PROVISIONS OF THE TECHNICAL INSTRUCTIONS".

comment *1534* comment by: *AIRBUS*

The Agency uses the terminology "appropriate national authority" but should rather refer to the term "Competent Authority" for consistency reasons with the wording usually used by EASA.

comment *1535* comment by: *AIRBUS*

The paragraph is copied from the TGL 44, IEM 1.1165(b), except that in the paragraph 2, the following section has been deleted: "However, the Technical Instructions allow for the State of overflight to consider an application for exemption based solely on whether an equivalent level of safety has been

achieved, if none of the other criteria for granting an exemption are relevant." In the paragraph 3, the following section has been deleted: "The Instructions do not specify who should seek exemptions and, depending on the legislation of the particular State, this may mean the operator, the shipper or an agent. If an exemption or approval has been granted to other than an operator, the operator should ensure a copy has been obtained before the relevant flight."

From a general point of view, the Agency should clarify the role of the different states (Origin, transit, overflight and destination) in the context of a single European regulatory framework.

comment *1996* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

B. II. Draft Decision - Part-OPS - Subpart A - Section I - AMC OPS.GEN.030(b) Transport of dangerous goods p. 113

comment *1183* comment by: *CAA-NL*

AMC OPS.GEN.030(b)

Comment: The clarification provided by EU-OPS 1.1160(b) in respect of replacement articles has not been reflected.

Justification: It could be said that OPS.GEN.030 (a) already addresses this (as it refers to the Technical Instructions which highlights the need to treat replacement articles in accordance with those Instructions). But this subject played a major role in the Valujet accident in 1996 when 110 passengers and crew died because of the improper carriage of replacement articles it is suggested that it would be prudent to maintain the text of EU-OPS 1.1160(b) in AMC OPS.GEN.030(b).

Proposed Text (if applicable):

Add a new sub paragraph 3. to AMC OPS.GEN.030(b) as follows:

"3. Dangerous goods which are required to be aboard the aircraft in accordance with the relevant requirements or for operating reasons but which are intended as replacement or which have been removed for replacement must be transported in accordance with the Technical Instructions."

comment *1557* comment by: *Luftfahrt-Bundesamt*

There should be a remark, stating that (according to EU-OPS 1.160(b)) the mentioned objects have to be transported as Dangerous Goods, when defect.

Therefore a new paragraph 3 should be added as follows:

3. Dangerous Goods which are required aboard the aircraft according to the relevant operational requirements but which are intended to be used as replacements only, or such that have been replaced must be transported in accordance with the ICAO Technical Instructions.

comment *1995* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

comment *2305* comment by: *Austro Control GmbH*

It is suggested to change the wording in point 6:

*6. **Content of a** Dangerous Goods Reporting Form*

The following items shall be mandatory content of the Dangerous Goods Reporting form:

1. Operator

2. Date of Occurence

3. Local time of occurence

4. Flight date

...

Justification:

The content of the form has to be mentionned and the form itsself presents an

example, which could be an appendix or appear in AMC (but not in the rule).

It is necessary to define the content; the form represents an example; otherwise it would not be possible to use electronical forms.

comment *2986* comment by: *CAA-NL*

Comment CAA-NL:

In some situations 72 hours is too long in case where there has been no contact with other emergency response services. Therefore the CAA-NL proposes to EASA to add to the article that in cases of where immediate action is required such shall be applied by the operator.

comment *3121* ☐ comment by: *AEA*

Comment:

It should be ensured that all EASA AMC and GM regarding dangerous goods is aligned with the latest edition of the ICAO Technical Instructions. It would therefore be better to refer the current edition of the ICAO TI into an AMC

B. II. Draft Decision - Part-OPS - Subpart A - Section I - GM OPS.GEN.030 Transport of dangerous goods p. 117

comment *1188* comment by: *CAA-NL*

GM OPS.GEN.030

Comment: Contrary to what is indicated by NPA 2009 02f, EU-OPS 1.1145(a) does not appear to be addressed by either OPS.GEN.030 (a) and (b) or GM OPS.GEN.030(2)

Justification: It is suggested the existing EU-OPS text is beneficial in that it offers clarification of the requirement.

Proposed Text :

Amend para 1 of GM OPS.GEN.030 as follows:

"The requirements to transport dangerous goods by air in accordance with the 2007-2008 Edition of the Technical Instructions for the Safe Transport of Dangerous Goods by Air published by decision of the Council of the International Civil Aviation Organization. (ICAO Doc 9284-AN/905.) is irrespective of whether:

a) an approval to carry dangerous goods in accordance with OPS.SPA.001.DG is held; or

b) the flight is wholly or partly within or wholly outside the territory of a state.
"

comment *1192* comment by: *CAA-NL*

GM OPS.GEN.030 (a)

Comment: The text refers to an out of date edition of the International Civil Aviation Organization's Technical Instructions for the Safe Transport of Dangerous Goods by Air.

Justification: A new edition of the Technical Instructions are produced by ICAO every two years; the current edition is the 2009-2010 edition.

Proposed Text (if applicable):

"The requirements to transport dangerous goods by air In accordance with the ~~2007-2008~~ current ~~E~~edition of the Technical Instructions for the Safe Transport of Dangerous Goods by Air published by decision of the Council of the International Civil Aviation Organization. (ICAO Doc 9284-AN/905.) ~~is~~ are irrespective of whether an approval to carry dangerous goods In accordance with OPS.SPA.001.DG is held."

comment *1428* comment by: *International Air Transport Association*

GM OPS.GEN.030 1.

As commented on in OPS.GEN.030, the reference to a specific edition of the ICAO TI is inappropriate. The TI is updated on a biennial cycle to reflect changes to the requirement applicable to the transport of dangerous goods by air. The current edition of the ICAO TI may also be revised form time-to-time by an addendum to reflect urgent changes of a safety nature. For this reason the text of paragraph 1. should refer to the "current edition of the ICAO Technical Instructions, including any addendum to the Technical Instructions issued by ICAO."

comment *1434* comment by: *International Air Transport Association*

GM OPS.GEN.030

As commented on for OPS.GEN.030 there should be reference to notices for passengers and in cargo acceptance areas. On that basis, the text shown in AMC OPS.SPA.040.DG(b) with repect to the provision of this information should also be included in this part.

comment *1559* comment by: *Luftfahrt-Bundesamt*

- No.1 refers to a specific version of the Technical instructions (edition 2007-2008) which is furthermore obsolete. Refering to a specific edition means that the Implementing Rule would have to be changed approximately every 2 years in order to be in compliance with the corresponding valid version of the Technical Instructions. Therefore „in accordance with the 2007 – 2008 Edition" should be changed into **„in accordance with the current edition"**

comment *1997* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

Contrary to what is indicated by NPA 2009 02f, EU-OPS 1.1145(a) does not appear to be addressed by either OPS.GEN.030 (a) and (b) or GM OPS.GEN.030(2)

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC1 OPS.GEN.100 Ice and other contaminants p. 118

comment *7* comment by: *KLM*

Training on icing has to be given to flight crew, cabin crew and relevant operational personnel.

Only training requirements for flight and cabin crew is specified. What other relevant operational personnel is has to be specified or left out.

No specific training requirements for dispatchers is provided anywhere in EU.OPS and either this is specifically given or not required.

comment *482* comment by: *EHOC*

General

There is no objective requirement to which this AMC is provided. At least an objective requirement for Flight in Expected of Known Icing Conditions should be appended to this rule.

"(c) The pilot-in-command shall not commence a flight in known or expected icing conditions unless the aircraft is certificated and equipped to cope with such conditions."

This goes beyond the ERs and places the responsibility with the PIC for entering icing conditions. This will also be seen by Private Pilots who will then know to avoid such conditions.

There might also be a need to provide an objective requirement on which to the requirement for procedures is hung - such as:

"(d) An operator shall establish procedures for flights in expected or actual icing conditions.

comment *1564* comment by: *ECA - European Cockpit Association*

Ref texts:

ACJ OPS 1.345

ACJ OPS 1.346

Comment: change as follows:

Ice and other contaminants

FLIGHT IN EXPECTED OR ACTUAL ICING CONDITIONS

1. In accordance with paragraph 2.a.5 of Annex IV to Regulation (EC) No 216/2008 (Essential requirements for air operations), in case of flight into known or expected icing conditions, the aircraft must be certified, equipped and/or treated to operate safely in such conditions. The procedures to be established by the operator should take account of the design, the equipment, the configuration of the aircraft and the necessary training. For these reasons, different aircraft types operated by the same company may require the development of different procedures. In every case the relevant limitations are those which are defined in the Aircraft Flight Manual (AFM) and other must documents produced by the manufacturer.

2. The operator ensure that the procedures take account of the following:

a. The equipment and instruments which must be serviceable for flight in icing conditions;

b. The limitations on flight in icing conditions for each phase of flight. These limitations may be imposed by the aircraft's de-icing or anti-icing equipment or

the necessary performance corrections which have to be made;

c. The criteria the flight crew should use to assess the effect of icing on the performance and/or controllability of the aircraft;

d. The means by which the flight crew detects, by visual cues or the use of the aircraft's ice detection system, that the flight is entering icing conditions; and

e. The action to be taken by the flight crew in a deteriorating situation (which may develop rapidly) resulting in an adverse affect on the performance and/or controllability of the aircraft, due to:

i. the failure of the aircraft's anti-icing or de-icing equipment to control a build-up of ice; and/or

ii. ice build-up on unprotected areas.

3. Training for dispatch and flight in expected or actual icing conditions. The content of the operations manual must reflect the training, both conversion and recurrent, which flight crew, cabin crew and all other relevant operational personnel require in order to comply with the procedures for dispatch and flight in icing conditions:

a. For the flight crew, the training ~~**should**~~ **must** include **among others**:

i. instruction in how to recognise, from weather reports or forecasts which are available before flight commences or during flight, the risks of encountering icing conditions along the planned route and on how to modify, as necessary, the departure and in-flight routes or profiles;

ii. instruction in the operational and performance limitations or margins;

iii. the use of in-flight ice detection, anti-icing and de-icing systems in both normal and abnormal operation; and

iv. instruction in the differing intensities and forms of ice accretion and the consequent action which should be taken.

b. For the cabin crew, the training should include;

i. awareness of **the ground weather** conditions likely to produce surface contamination; and

ii. the need to inform the flight crew of ~~**significant**~~ **suspected** ice accretion.

comment *3122* comment by: *AEA*

Paragraph No:

AMC1 OPS.GEN.100

Comment:

JAA NPA-OPS 50 (Operation of Helicopters Certified for Flight in Limited Icing Conditions), which followed the JAR 11 process and completed public consultation, was passed to EASA for inclusion in the IRs but has not been transferred. The agreed text of NPA-OPS 50 should be included in the AMC as indicated.

Justification:

Inclusion of text agreed following public consultation and endorsement.

Proposed Text (if applicable):

COMPLEX MOTOR-POWERED HELICOPTERS USED IN NON-COMMERCIAL OPERATIONS AND HELICOPTERS USED IN COMMERCIAL OPERATIONS

4. If the helicopter has been certified for flight in Limited Icing Conditions and it is intended to operate over water (sea areas) departing and arriving from an offshore heliport or heliports at the coast, then the operator should ensure that procedures in the Operations Manual take additional account of the following:

a. The need for the Flight Crew to use the best available information, such as an Area Forecast and liquid water content and temperature profiles, to ensure

that there is no unavoidable icing of a severity worse than the flight manual continuous limit along the planned route at the planned altitudes or flight levels;

b. The aircraft's flight path should ensure that the time to vacate icing conditions by reaching a positive temperature band of air, or landing at the arrival heliport, is not greater than the time stipulated in the Aircraft Flight Manual. The band of positive temperature air should not be less than 500 ft in depth. Offshore, the positive temperature band of air should exist at or above 500 ft AMSL and onshore between MSA and MSA +500 ft. However, an onshore approach in IFR may be conducted with the zero degree isotherm below MSA providing that sub-paragraphs 5(c) and 5(d) can be complied with;

c. If the approach is made in IMC and the 0□C isotherm is at or below the MSA with no band of positive air above MSA, then in order to ensure a missed approach back into icing conditions will not be necessary, the minimum Cloud Ceiling in the Landing Forecast should not be less than DH/MDH + 400 ft;

d. Any descent into the band of positive air should take place over the sea or as part of an instrument procedure;

e. The aircraft Minimum Equipment List (MEL) for flight in icing conditions, should include the requirement for serviceable radio altimeter and weather/mapping radar.

Comment:

JAA NPA-OPS 50 (Operation of Helicopters Certified for Flight in Limited Icing Conditions), which followed the JAR 11 process and completed public consultation, was passed to EASA for inclusion in the IRs but has not been transferred. It is recommended that the agreed text of NPA-OPS 50 be included in the AMC as indicated.

Justification:

Inclusion of agreed JAA text following public consultation and endorsement.

AMC OPS.SPA.001.LVO(b)(1) Low visibility operations (LVO)

Comment:

Such material is in opposition to the concept of "performance-based rulemaking". It is all detailed procedure description, but not a rule to comply with. The flexibility promised by EASA through the "performance-based rulemaking" is odd: It is true that the Implementing Rule **seems** to be leaner now than before, but all the details and in many cases even new texts have been added to the AMC (which are factual rules) and GM (which are factual audit basis).

As presented, the concept of "performance-based rulemaking" fails to convince.

Proposal:

Keep the **Implementing Rules as close as possible to EU-OPS (as having been tasked),** and refrain from detailed and/or extended procedure descriptions in AMC and GM.

comment *5275* comment by: *DGAC*

Proposal : Amend the title as follows:

"AMC~~1~~ **2** OPS.GEN.100 Ice and other contaminants**- In-flight procedures**"

Justification :

The title must reflect the fact that its content only applies to in-flight procedures

As written OPS.GEN 100 only deals with ground-procedures, it is proposed in one of our comments on OPS.GEN.100 to include in-flight procedure in second rank. As a consequence the AMC should be in second rank as well

Proposal : Amend the subtitle as follows:

"FLIGHT IN EXPECTED OR ACTUAL ICING CONDITIONS **- AEROPLANE AND HELICOPTER**"

Justification :

- This AMC includes mainly JAR-OPS ACJ 1/3.346 designed for aeroplane and helicopter only.
- No other category of aircraft is certified to fly in icing condition.

(1) Why refer to the BR and not to GEN OPS 445 as well which is additional for conditions at night.

Proposal :delete references to BR

Justification :

The BR 216 is not complete enough and

covers only "general requiremenll on

the matters.

Besides a hook for in flight procedures has been added in our proposed amendment to add a (c) in OPS GEN 100

IN-FLIGHT PROCEDURES - AEROPLANE AND HELICOPTERS

Therefore the option to delete any reference might be inline with the no repetition policy.

(3)

Proposal : Amend 3. as follows:

"3. Training for dispatch and flight in expected or actual icing conditions. The content of the operations manual should reflect the training, both conversion and recurrent, which flight crew, cabin crew**, technical crew** and all other relevant operational personnel require in order to comply with the procedures for dispatch and flight in icing conditions:

a. For the flight crew, the training should include:

[…]

b. For the cabin crew **and / or technical crew**, the training should include;

[…]"

Justification :

This AMC is applicable both to aeroplane and helicopter. Therefore it should

reflect the specificities of both operations as was layed-down in ACJ OPS-1/3.346 of section to of JAR-OPS 1 et 3

Proposal:

Put in the rule, only what the operator has to do. It's reference document

comment *6975* comment by: *IACA International Air Carrier Association*

Contrary to the AMC, the rule is only dealing with pre-departure icing. Hence, the AMC should be restricted or the rule extended.

comment *7629* comment by: *Cirrus Design Corporation*

This AMC has no relation whatsoever to OPS.GEN.100 and could not be considered a method of compliance. The rule only applies to ground ice contamination and de-icing procedures. This AMC goes into operator procedures, qualifications and operational flight limitations, which are not required by OPS.GEN.100. This AMC should be moved elsewhere or OPS.GEN.100 should include requirements relative to the AMC.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC2 OPS.GEN.100 Ice and other contaminants p. 119-122

comment *649* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.GEN.100(2)(h): change as follows:

h. the pilot-in-command continually monitors the environmental situation after the performed treatment. Prior to take-off he/she **checks the airplane flight control surfaces operate normally and** performs a pre-take-off check, which is an assessment of whether the applied HoT is still appropriate. This pre-take-off check includes, but is not limited to, factors such as precipitation, wind and OAT;

Justification:

It is essential for the safety of flight to check if the flight controls operate normally after de-icing/anti-icing.

comment *1567* comment by: *ECA - European Cockpit Association*

Comment: change paragraph 2.i. as follows :

if any doubt exists as to whether a deposit **exceeds the permitted criteria** may adversely affect the aircraft's performance and/or controllability characteristics, the pilot-in-command should arrange for a pre-take-off contamination check to be performed in order to verify that the aircraft's surfaces are free of contamination **or comply with the permitted criteria**. Special methods and/or equipment may be necessary to perform this check, especially at night time or in extremely adverse weather conditions. If this check cannot be performed just before take-off, re-treatment should be applied; **then the aircraft should be taken to a position where such an inspection can take place. In the event of the criteria not being complied with, then re-treatment must take place before another despatch is attempted.**

Justification:

The wording in the final sentence appears to leaves to the commander some discretion as to the acceptability of deposits. This is not the case and needs clarifying. Also the need for an inspection if doubt exists as to compliance and the subsequent action appears optional. New wording suggested.

comment *1568* comment by: *ECA - European Cockpit Association*

Comment on paragraph 3.c.: change as follows :

c. The operator should comply with any type-specific operational requirement(s), such as an aircraft mass decrease and/or a take-off speed increase **and performance effects** associated with a fluid application;

comment *1569* comment by: *ECA - European Cockpit Association*

Comment on paragraph 4a: add as follows:

a. Before aircraft treatment. When the aircraft is to be treated with the flight crew on board, the flight **crew** and **ground** personnel involved in the operation should confirm the fluid to be used, the extent of treatment required and any aircraft type-specific procedure(s) to be used. Any other information needed to apply the HoT tables should be exchanged;

comment *1570* comment by: *ECA - European Cockpit Association*

Comment: change as follows:

Ice and other contaminants

DE-ICING/ANTI-ICING

1. De-icing and/or anti-icing procedures **must** ~~**should**~~ take into account manufacturer's recommendations, including those that are type-specific and cover:

a. contamination checks, including detection of clear ice and under-wing frost.

Limits on the thickness/area of contamination published in the AFM or other manufacturers' documentation should be followed;

b. procedures to be followed if de-icing and/or anti-icing procedures are interrupted or unsuccessful;

c. post treatment checks;

d. pre take-off checks;

e. pre take-off contamination checks;

f. the recording of any incidents relating to de-icing and/or anti-icing; and

g. the responsibilities of all personnel involved in de-icing and/or anti-icing.

2. Operator's procedures **must** ~~**should**~~ ensure that:

a. when aircraft surfaces are contaminated by ice, frost, slush or snow, they are de-iced prior to take-off; according to the prevailing conditions. Removal of contaminants may be performed with mechanical tools, fluids (including hot water), infra-red heat or forced air, taking account of aircraft type-specific requirements;

b. account is taken of the wing skin temperature versus Outside Air Temperature (OAT), as this may affect:

i. the need to carry out aircraft de-icing and/or anti-icing; and/or

ii. the performance of the de-icing/anti-icing fluids;

c. when freezing precipitation occurs or there is a risk of freezing precipitation occurring which would contaminate the surfaces at the time of take-off, aircraft surfaces should be anti-iced. If both de-icing and anti-icing are required, the procedure may be performed in a one or two-step process, depending upon weather conditions, available equipment, available fluids and the desired hold-over time (HoT). One-step de-icing/anti-icing means that de-icing and anti-icing are carried out at the same time, using a mixture of de-icing/anti-icing fluid and water. Two-step de-icing/anti-icing means that de-icing and anti-icing are carried out in two separate steps. The aircraft is first de-iced using heated water only or a heated mixture of de-icing/anti-icing fluid and water. After completion of the de-icing operation a layer of a mixture of de-icing/anti-icing fluid and water, or of de-icing/anti-icing fluid only, is to be sprayed over the aircraft surfaces. The second step will be applied before the first step fluid freezes, typically within three minutes and, if necessary, area by area;

d. when an aircraft is anti-iced and a longer HoT is needed/desired, the use of a less diluted Type II or Type IV fluid should be considered;

e. all restrictions relative to OAT and fluid application (including, but not necessarily limited to, temperature and pressure) published by the fluid manufacturer and/or aircraft manufacturer, are followed and procedures, limitations and recommendations to prevent the formation of fluid residues are followed;

f. during conditions conducive to aircraft icing on the ground or after de-icing and/or anti-icing, an aircraft is not dispatched for departure unless it has been given a contamination check or a post treatment check by a trained and qualified person. This check **must** ~~**should**~~ cover all treated surfaces of the aircraft and be performed from points offering sufficient accessibility to these parts. To ensure that there is no clear ice on suspect areas, it may be necessary to make a physical check (e.g. tactile);

g. the required entry is made in the technical log;

h. the pilot-in-command continually monitors the environmental situation after the performed treatment. Prior to take-off **the flight crew** ~~**he/she**~~ performs a pre-take-off check (**The Commander has the final saying and responsibility**), which is an assessment of whether the applied HoT is still appropriate. This pre-take-off check includes, but is not limited to, factors such as precipitation, wind and OAT;

i. if any doubt exists as to whether a deposit may adversely affect the aircraft's performance and/or controllability characteristics, the pilot-in-command **must** ~~**should**~~arrange for a pre-take-off contamination check to be performed in order to verify that the aircraft's surfaces are free of contamination. Special methods and/or equipment may be necessary to perform this check, especially at night time or in extremely adverse weather conditions. If this check cannot be performed just before take-off, re-treatment **must** ~~**should**~~ be applied;

j. when re-treatment is necessary, any residue of the previous treatment should be removed and a completely new de-icing/anti-icing treatment should be applied, **preferably in a two-step procedure**; and

k. when a Ground Ice Detection System (GIDS) is used to perform an aircraft surfaces check prior to and/or after a treatment, the use of GIDS by suitably trained personnel should be part of the procedure.

3. Special operational considerations:

a. When using thickened de-icing/anti-icing fluids, the operator should consider a two-step de-icing/anti-icing procedure, the first step preferably with hot water and/or un-thickened fluids;

b. The use of de-icing/anti-icing fluids should be in accordance with the aircraft manufacturer's documentation. This is particularly true for thickened fluids to assure sufficient flow-off during take-off;

c. The operator **must** ~~**should**~~ comply with any type-specific operational requirement(s), such as an aircraft mass decrease and/or a take-off speed increase associated with a fluid application;

d. The operator should take into account any flight handling procedures (stick force, rotation speed and rate, take-off speed, aircraft attitude etc.) laid down by the aircraft manufacturer when associated with a fluid application;

e. The limitations or handling procedures resulting from subparagraphs c and/or d above should be part of the flight crew pre-take-off briefing.

4. Communications:

a. Before aircraft treatment. When the aircraft is to be treated with the flight crew on board, the flight and **ground** personnel involved in the operation should confirm the fluid to be used, the extent of treatment required and any aircraft type-specific procedure(s) to be used. **As the final responsibility rests with the commander, his request for a higher fluid concentration will supersede the ground personnel members judgement and may include additional instructions. However the commander may not cancel a proposed de-/anti-icing procedure when contamination is detected and reported by ground personnel on the critical surfaces of the airplane.**

Any other information needed to apply the HoT tables should be exchanged;

b. Anti-icing code. The operator's procedures **must** ~~**should**~~ include an anti-icing code, which indicates the treatment the aircraft has received. This code provides the flight crew with the minimum details necessary to estimate a HoT

and confirms that the aircraft is free of contamination;

c. After Treatment. Before reconfiguring or moving the aircraft, the flight crew **must** ~~**should**~~ receive a confirmation from the personnel involved in the operation that all de-icing and/or anti-icing operations are complete, **all critical surfaces are free of contaminants** and that all personnel and equipment are clear of the aircraft.

5. Hold-over protection. The operator should publish in the operations manual, when required, the HoTs in the form of a table or a diagram, to account for the various types of ground icing conditions and the different types and concentrations of fluids used. However, the times of protection shown in these tables are to be used as guidelines only and are normally used in conjunction with the pre-take-off check.

6. Training. The operator's initial and recurrent de-icing and/or anti-icing training programmes (including communication training) for flight crew and those of its personnel involved in the operation who are involved in de-icing and/or anti-icing should include additional training if any of the following is introduced:

a. A new method, procedure and/or technique;

b. A new type of fluid and/or equipment;

c. A new type of aircraft.

7. Contracting. When the operator contracts training on de-icing/anti-icing, the operator should ensure that the contractor complies with the operator's training/qualification procedures, together with any specific procedures in respect of:

a. de-icing and/or anti-icing methods and procedures;

b. fluids to be used, including precautions for storage and preparation for use;

c. specific aircraft requirements (e.g. no-spray areas, propeller/engine de-icing, APU operation etc.); and

d. checking and communications procedures.

8. Special maintenance considerations:

a. General. The operator should take proper account of the possible side-effects of fluid use. Such effects may include, but are not necessarily limited to, dried and/or re-hydrated residues, corrosion and the removal of lubricants;

b. Special considerations regarding residues of dried fluids. The operator **must** ~~**should**~~ establish procedures to prevent or detect and remove residues of dried fluid. If necessary the operator **must** ~~**should**~~ establish appropriate inspection intervals based on the recommendations of the airframe manufacturers and/or the operator's own experience:

i. Dried fluid residues. Dried fluid residues could occur when surfaces have been treated and the aircraft has not subsequently been flown and has not been subject to precipitation. The fluid may then have dried on the surfaces;

ii. Re-hydrated fluid residues. Repetitive application of thickened de-icing/anti-icing fluids may lead to the subsequent formation/build up of a dried residue in aerodynamically quiet areas, such as cavities and gaps. This residue may re-hydrate if exposed to high humidity conditions, precipitation, washing, etc., and increase to many times its original size/volume. This residue will freeze if exposed to conditions at or below zero degrees Celsius. This may cause moving parts, such as elevators, ailerons, and flap actuating mechanisms to

stiffen or jam in-flight. Re-hydrated residues may also form on exterior surfaces, which can reduce lift, increase drag and stall speed. Re-hydrated residues may also collect inside control surface structures and cause clogging of drain holes or imbalances to flight controls. Residues may also collect in hidden areas, such as around flight control hinges, pulleys, grommets, on cables and in gaps;

iii. Operators are strongly recommended to obtain information about the fluid dry-out and re-hydration characteristics from the fluid manufacturers and to select products with optimized characteristics;

iv. Additional information should be obtained from fluid manufacturers for handling, storage, application and testing of their products.

comment *1571* comment by: *ECA - European Cockpit Association*

Comment on paragraph 5.: change as follows:

5. Hold-over protection. The operator should publish in the operations manual, when required, the HoTs **unless operations in such conditions are specifically precluded. The HoTs should be** in the form of a table or a diagram, to account for the various types of ground icing conditions and the different types and concentrations of fluids **permitted to be** used. However, the times of protection shown in these tables are to be used as guidelines only and are **to be ~~normally~~** used in conjunction with the pre-take-off check.

Justification:

Unless the Operations Manual has a specific limitation that precludes all operations in such conditions, hold over tables must be provided by an operator. The types of acceptable fluids for which the table s are appropriate should also be clearly indicated. The use of the pre-takeoff check principle should be consistent whenever such procedures are used. Even when the remote de-icing is carried out at the runway end, the same principles should be applied, but in this case it would be a verification that the time from application to departure and hold over time is compatible rather than another physical check.

comment *1572* comment by: *ECA - European Cockpit Association*

Comment on paragraph 8.b.iii.: change as follows:

iii. Operators **should** ~~**are strongly recommended to**~~ obtain information about the fluid dry-out and re-hydration characteristics from the fluid manufacturers and to select products with optimised characteristics;

Justification:

The operators must do this if we are to avoid further incidents involving this problem. Wording amended to oblige operators to get the information

comment *2066* comment by: *Airbus S.A.S.*

The sub-paragraph AMC2 to OPS.GEN.100 (7) is based on ACJ OPS 1.345 (10), which states:

"the operator should ensure that the contractor complies with the operator's quality and training/qualification procedures".

In the proposed paragraph, the word "quality" has been removed.

Please confirm rationale for this change is implementation of SMS

comment *2386* comment by: *Dassault Aviation*

Technical comment:

Page 121 AMC2 OPS.GEN.100 item5: add (underlined) "The operator should publish and update in…"

comment *3125* comment by: *AEA*

Relevant Text:

7. Contracting. When the operator contracts training on de-icing/anti-icing, the operator should ensure that the contractor complies with the operator's training/qualification procedures, together with any specific procedures in respect of: a. de-icing and/or anti-icing methods and procedures; b. fluids to be used, including precautions for storage and preparation for use; c. specific aircraft requirements (e.g. no-spray areas, propeller/engine de-icing, APU operation etc.); and d. checking and communications procedures.

Comment:

item 7, contracting, this item is related to SIN 2008-29 of 04 apr. 2008, item 11, subcontracting.

So, item 7 speaks of "contracting" and item 11 SIN 2008-29 of "subcontracting". Is this an error or intended?

Also in item 7 it speaks about ".....operator contracts training on de-icing/anti-icing.....", while item 11 speaks about ".....operator should ensure that the subcontractor complies....".

Should item 7 in NPA not be same as item 11 in SIN? W/G has no problem with current NPA text if it is meant to be that way, but just wants to make sure it is intended that way.

Proposal:

Clarify the use of contracting / subcontracting

Nothing to do with an AMC; It's only procedures description. It doesn't need to be so detailed

Proposal:

Put in the rule, only what the operator has to do. It's reference document

comment *3699* comment by: *AUSTRIAN Airlines*

Relevant Text:

7. Contracting. When the operator contracts training on de-icing/anti-icing, the operator should ensure that the contractor complies with the operator's training/qualification procedures, together with any specific procedures in respect of: a. de-icing and/or anti-icing methods and procedures; b. fluids to be used, including precautions for storage and preparation for use; c. specific aircraft requirements (e.g. no-spray areas, propeller/engine de-icing, APU operation etc.); and d. checking and communications procedures.

Comment:

item 7, contracting, this item is related to SIN 2008-29 of 04 apr. 2008, item 11, subcontracting.

So, item 7 speaks of "contracting" and item 11 SIN 2008-29 of "subcontracting". Is this an error or intended?

Also in item 7 it speaks about ".....operator contracts training on de-icing/anti-icing.....", while item 11 speaks about ".....operator should ensure that the subcontractor complies....".

Should item 7 in NPA not be same as item 11 in SIN? W/G has no problem with current NPA text if it is meant to be that way, but just wants to make sure it is intended that way.

Proposal:

Clarify the use of contracting / subcontracting

Comment:

Such material is in opposition to the concept of "performance-based rulemaking". It is all detailed procedure description, but not a rule to comply with. The flexibility promised by EASA through the "performance-based rulemaking" is odd: It is true that the Implementing Rule **seems** to be leaner now than before, but all the details and in many cases even new texts have been added to the AMC (which are factual rules) and GM (which are factual audit basis).

As presented, the concept of "performance-based rulemaking" fails to convince.

Proposal:

Keep the **Implementing Rules as close as possible to EU-OPS (as having been tasked),** and refrain from detailed and/or extended procedure descriptions in AMC and GM.

comment *5276* comment by: *DGAC*

Proposal : Amend the title as follows:

"AMC~~**2**~~ **1** OPS.GEN.100 Ice and other contaminants**-ground procedures**"

Justification :

The title must reflect the fact that its content only applies to ground procedures as it comes from ACJ OPS 1.345 "Ice and other contaminants-ground procedures"

As written OPS.GEN 100 only deals with ground-procedures, it is proposed in one of our comments on OPS.GEN.100 to include in-flight procedure in second rank. As a consequence the AMC on groud procedures should be in first rank

Proposal ::

Amend the subtitle as follows :

« DE-ICING/ANTI-ICING **– AEROPLANES**"

and replace throughout the AMC the word "aircraft' by the word "aeroplane":

Justification :

This AMC OPS GEN 100 is based on ACJ OPS 1.345 which is designed for aeroplanes only

Up to know and for the coming years no standard for fluids, de-icing ground procedures, etc…. contained here will be developed for aircraft other than aeroplanes.

Wordings such as : underwing frost, type II , type IV , HOT ….do not make any sense when considering an helicopter, a glider or a balloon.

In this AMC, only §2)a) (partially) and § 6a) and c) could be also applicable to aircraft other than aeroplane. Nevertheless we do not recommend developing ea specific AMC dedicated to those items for other aircraft: indeed these items are so general that they do not add any value, and moreover there applicability would be conditioned by the development of the appropriate material by the manufacturer of the aircraft.

Proposal : Amend the beginning of 6 and 7 as follows:

"6. Training **– Complex motor-powered aeroplanes used in non-commercial operations and aeroplanes used in commercial operations.** The operator's initial and recurrent[…]

7. Contracting**– Complex motor-powered aeroplanes used in non-commercial operations and aeroplanes used in commercial operations.** When the operator contracts […]"

Justification :

This AMC OPS GEN 100 is based on ACJ OPS 1.345 which is designed for aeroplanes in CAT. We understand the benefit of applying it to all commercial operations and to non-commercial operations of CMPAeroplanes as well, but we think that extending it to the other types of operations would require further development in the provision to make it applicable.

comment *5532* comment by: *Swiss International Airlines / Bruno Pfister*

comment *5895* comment by: *ERA*

European Regions Airline Association Comment

ERA members have been in the forefront of applying pressure on EASA to develop without delay rulemaking action on aircraft ground de-icing / anti-icing operations. EASA consider this and other areas of this NPA provide provisions that may meet the concerns related to any lack of current individual rulemaking activity in this area. The ERA Directorate would disagree and stress that EASA as a matter of urgency should be looking at rulemaking action.

There is a need for explicit statements on the establishment of procedures and methods to be considered for incorporation.

Proposal : amend the title of GM1, amend the subtitle of GM3 and regroup the GM 1, 2 and 3 into one single GM1.OPS.GEN.100 to read as follows :"**GM1 OPS.GEN.100 Ice and other contaminants-<u>-Ground procedures - Aeroplanes</u>**TERMINOLOGY

Terminology. Terms used in the context […]

[…]

12. Pre-take-off […] just before commencement of the take-off run.

~~**GM2 OPS.GEN.100 Ice and other contaminants**~~

ANTI-ICING CODES

~~1~~ **<u>13</u>**. The following are examples of anti-icing codes:

[…]

~~2~~ **14.** When a two-step de-icing/anti-icing […] may be included, if desired.

~~**GM3 OPS.GEN.100 Ice and other contaminants**~~

DE-ICING/ANTI-ICING **procedures**

Further guidance material on this issue is given in the International Civil Aviation Organization (ICAO) Manual of Aircraft Ground De-icing/Anti-icing Operations (Doc 9640) (hereinafter referred to as the ICAO Manual of Aircraft Ground De-icing/Anti-icing Operations).

~~1~~ **15**. General:

[…]

Justification :

The title of the GMs must reflect the fact that their content only applies to ground procedures

The title must also reflect the fact that their content only applies to aeroplanes. The material of these GMs is based on ACJ OPS 1.345 which was designed for aeroplanes only.

Up to know and for the coming years no standard for fluids, de-icing ground procedures, etc…. contained here will be developed for aircraft other than aeroplanes.

Wordings such as : underwing frost, type II , type IV , HOT ….do not make any sense when considering an helicopter, a glider or a balloon.

Warning : if it is decided as a consequence of our comment to replace throughout the GM the word "aircraft" by the word "aeroplane", it should be made carefully in order not to change the references (ICAO, ISO, AEA, SAE and other) that shall keep the word aircraft

We do not understand the rational behind splitting the remaining parts of the material coming from ACJ OPS 1.345 into GM 1, 2 and 3 as it is necessary to read the three of them in order to be able to apply OPS.GEN.100 and the related AMCs.

It should be made clear that the third part "DE-ICING/ANTI-ICING specifically deals with procedures

General comment : this GM is applicable to all kind ofoperations with aeroplanes, therefore we wont make a comment requesting to restrict any part of the GM to commercial operations or non-commercial operations of CMPA (contrary to the comment we have made on the AMC).

Comment:

Such material is in opposition to the concept of "performance-based rulemaking". It is all detailed procedure description, but not a rule to comply with. The flexibility promised by EASA through the "performance-based rulemaking" is odd: It is true that the Implementing Rule **seems** to be leaner now than before, but all the details and in many cases even new texts have been added to the AMC (which are factual rules) and GM (which are factual audit basis).

As presented, the concept of "performance-based rulemaking" fails to convince.

Proposal:

Keep the **Implementing Rules as close as possible to EU-OPS (as having been tasked),** and refrain from detailed and/or extended procedure

descriptions in AMC and GM.

comment *5277* ☐ comment by: *DGAC*

Proposal : amend the title of GM1, amend the subtitle of GM3 and regroup the GM 1, 2 and 3 into one single GM1.OPS.GEN.100 to read as follows :

Further guidance material on this issue is given in the International Civil Aviation Organization (ICAO) Manual of Aircraft Ground De-icing/Anti-icing Operations (Doc 9640) (hereinafter referred to as the ICAO Manual of Aircraft Ground De-icing/Anti-icing Operations).

~~1~~ **15**. General:

[…]

Justification :

The title of the GMs must reflect the fact that their content only applies to ground procedures

The title must also reflect the fact that their content only applies to aeroplanes. The material of these GMs is based on ACJ OPS 1.345 which was designed for aeroplanes only.

Up to know and for the coming years no standard for fluids, de-icing ground procedures, etc…. contained here will be developed for aircraft other than aeroplanes.

Wordings such as : underwing frost, type II , type IV , HOT ….do not make any sense when considering an helicopter, a glider or a balloon.

Warning : if it is decided as a consequence of our comment to replace throughout the GM the word "aircraft" by the word "aeroplane", it should be made carefully in order not to change the references (ICAO, ISO, AEA, SAE and other) that shall keep the word aircraft

We do not understand the rational behind splitting the remaining parts of the material coming from ACJ OPS 1.345 into GM 1, 2 and 3 as it is necessary to read the three of them in order to be able to apply OPS.GEN.100 and the

related AMCs.

It should be made clear that the third part "DE-ICING/ANTI-ICING specifically deals with procedures

General comment : this GM is applicable to all kind ofoperations with aeroplanes, therefore we wont make a comment requesting to restrict any part of the GM to commercial operations or non-commercial operations of CMPA (contrary to the comment we have made on the AMC).

European Regions Airline Association Comment

ERA members have been in the forefront of applying pressure on EASA to develop without delay rulemaking action on aircraft ground de-icing / anti-icing operations. EASA consider this and other areas of this NPA provide provisions that may meet the concerns related to any lack of current individual rulemaking activity in this area. The ERA Directorate would disagree and stress that EASA as a matter of urgency should be looking at rulemaking action.

There is a need for explicit statements on the establishment of procedures and methods to be considered for incorporation.

1.

1. GM2 OPS.GEN.100 Ice and other contaminants

Comment:

ANTI-ICING CODES

The following are examples of anti-icing codes:

a. "Type I" at (start time) – To be used if anti-icing treatment has been performed with a Type I fluid;

b. "Type II/100" at (start time) – To be used if anti-icing treatment has been performed with undiluted Type II fluid;

c. "Type II/75" at (start time) – To be used if anti-icing treatment has been performed with a mixture of 75 % Type II fluid and 25 % water;

d. "Type IV/50" at (start time) – To be used if anti-icing treatment has been performed with a mixture of 50 % Type IV fluid and 50 % water. 2. When a two-step de-icing/anti-icing operation has been carried out, the anti-icing code should be determined by the second step fluid. Fluid brand names may be included, if desired.

The proposed anti-icing codes differ from the Association of European Airlines (AEA) guidelines and are not consistent with international standard for such codes.

Non-standard phraseology for aircraft ground deicing could contribute to an accident, personal injury, and or property loss.

Recommendation:

Consider adopting the AEA guidelines. The following is extracted from the AEA document for ground deicing:

3.14.3 Anti-Icing Codes

The following information shall be recorded and be communicated to the Commander by referring to the last step of the procedure and in the sequence provided below:

a) the fluid type; i.e. Type I, II, III, IV

b) the concentration of fluid within the fluid/water mixture, expressed as a percentage by volume;

N NOTE 1: no requirement for Type I fluid

c)c) the local time (hours/minutes) at the beginning of the final de-icing/anti-icing step;

d)d) the date (written: day, month, year);

N NOTE 2: required for record keeping, optional for Commander notification.

e)e) the complete name of the anti-icing fluid (so called "brand name").

N NOTE 3: optional; for type II and IV fluids only.

f) f) the statement "Post de-icing/anti-icing check completed"

N NOTE 4: For specific aircraft types, additional requirements exist e.g. special clear ice checks, such as tactile checks on wings. Additional confirmation for these checks is required.

EXAMPLE

A de-icing/anti-icing procedure whose last step is the use of a mixture of 75% of a type II fluid and 25% water, commencing at 13:35 local time on 20 February 2007, is reported and recorded as follows:

TYPE II/75 13:35 (20th FEB 2007) ("complete name of anti-icing fluid") "Post de-icing/anti-icing check completed".

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC OPS.GEN.110 Carriage of persons p. 125

comment *1575* comment by: *ECA - European Cockpit Association*

Comment: change as follows:

AMC OPS.GEN.110 Carriage of persons

SEATS WHICH PERMIT DIRECT ACCESS TO EMERGENCY EXITS

Persons who are allocated seats which permit direct access to emergency exits should appear to be reasonably fit, strong and **such a size as to be able to safely use such exits. They should be** able to assist the rapid evacuation of the aircraft in an emergency after an appropriate briefing by the crew.

Justification:

There have been instances of individuals who although strong would not appear to be able to use some of the hatch type emergency exits due to their size. These individuals appear to select seats in the exit rows so as to accommodate their size, but their presence leads to the high risk that the exit will become blocked in the event of an emergency and thus unusable. This presents an unacceptable risk to other passengers and there should be a requirement for not only fitness but suitable size in the requirements.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - GM1 OPS.GEN.110 Carriage of persons p. 126

comment *1387* comment by: *Royal Danish Aeroclub*

We do support the exception of parachute operations.

comment *1576* comment by: *ECA - European Cockpit Association*

Comment: change text as follows:

The carriage of operational personnel indispensable to the performance of a task and carried on a flight taking place immediately before, during or immediately after and directly associated with a specialised task, is not considered Commercial Air Transport. **The size of team associated with the operational task should be the minimum compatible with the task or tasks to be carried out. This does not apply to parachute Operations. ~~Except for parachute operations, the number of persons carried should not exceed six, excluding crew members.~~**

Justification:

This is very prescriptive and unnecessary. The size of the crew will be appropriate to the task and if large would require cabin crew etc for safety in any case./ It is suggested that the crew be limited to those relevant to the task being performed and numbers minimised as far as practical.

comment *2070* comment by: *Airbus S.A.S.*

In the last sentence, the paragraph states:

"Except for parachute operations, the number of persons carried should not exceed six, excluding crew members".

Rationales for this statement would be appreciated

comment *2791* comment by: *Southern Cross International*

The maximum number of six persons, excluding crew members, is arbitrary and should be deleted. On large research and test aircraft (e.g. Fokker 100 or Airbus A320) the number of observers, research staff, technical staff et cetera may easily exceed the number of six.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - GM OPS.GEN.110 Carriage of persons p. 126

comment *1160* comment by: *Stefan Huber*

Carriage of persons : No person shall be in any part of an aircraft in flight which is not a part designed for the accommodation of persons, unless temporary access has been granted by the pilot in command for the purpose of taking action necessary for the safety of the aircraft or of any animal or goods

therein.

comment *2072* comment by: *Airbus S.A.S.*

GM OPS.GEN.110 should be renamed as "GM2 OPS.GEN.110"

comment *5916* comment by: *DGAC*

What is the rule applicable for numbering the paragraphs of this part : after GM1 we have GM ?

This GM refers to the AMC OPS.GEN.110, it should therefore be renamed "GM **to AMC** OPS.GEN.110"

comment *6979* comment by: *IACA International Air Carrier Association*

The cabin crew should confirm with the person if they are willing and able to assist the rapid evacuation of the aircraft in an emergency.

comment *7630* comment by: *Cirrus Design Corporation*

The term 'direct access' is not used in OPS.GEN.110 and has no relevant applicability within the rule. This GM should be removed.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC1 OPS.GEN.115 Passenger briefing p. 126

comment *1560* comment by: *Luftfahrt-Bundesamt*

Such impotant things like the definition of safety and emergency equipment should NOT be defined in the AMC-Material but in the accordant paragraph of the Implementing Rule!

comment *2696* comment by: *AOPA-Sweden*

(4): A passenger briefing card does not exist for the small GA-fleet, and should be dropped off this paragraph to let most of the GA-pilots follow the rule.

comment *3324* comment by: *AEA*

A combination of

1. the amended wording of element 2. of the AMC2;

2. the abbrieviated wording of AMC2(from the orginal) in the individual briefing elements (before take-off, after take-off etc.); and

3. the introduction, and wording, of AMC3,

has resulted in lack of clarity about the necessity to brief in flight. This could immediately be rectified by restoring the orginal wording in AMC2 and making clear in AMC3 that the alleviation is only from the initial demonstration/briefing and not from the elements contained in AMC2 paragraph 2.

Paragraph 2.

The original statement of this requirement made it clear the the briefing was required but 'items' would only apply 'if applicable'; the statement as now constructed appears to bring into question whether the briefing is necessary - not the individual items. The text should be amended to:

"Passengers should be briefed on the following items if applicable."

Paragraph 2.b.

To ensure that the intent of ICAO that passengers should be briefed in flight is complied with, the original text should be retained.

"b. After take-off, passengers should be reminded of the following:"

Paragraph 2.c.

To ensure that the intent of ICAO that passengers should be briefed in flight is complied with, the original text should be retained.

"c. Before landing, passengers should be reminded of the following:"

Paragraph 2.d.

To ensure that the intent of ICAO that passengers should be briefed in flight is complied with, the original text should be retained.

"d. After landing, passengers should be reminded of the following:"

Summary of EASA Proposed Requirement:

2. Passengers should be given a briefing, if applicable, on the following items before take –off:

(a) ii back of seat to be in the upright position and tray table stowed before take-off and landing.

Comment:

Reference to landing is not relevant.

Justification:

Proposed Text (if applicable)

Remove text "**and landing"**

comment *6865* comment by: *ETF*

Comment to point 4:

The text is more excluding than the OPS reference as to the possibility to make use of passengers in emergencies. (ABA). This could be interpreted into the previous OPS text. OPS 1.285 (f) "In an emergency during flight, passengers are instructed in such emergency action as may be appropriate to the circumstances." Unless it is covered elsewhere it is suggested to rewrite the text in order to incorporate this item.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC3 OPS.GEN.115 Passenger briefing p. 127

comment *484* comment by: *EHOC*

Title

Because of the title of this AMC, it appears as though this method of compliance is required when "no cabin crew is required to be carried"

In addition, because it refers to paragraph 2 of AMC1 to CAT OPS.GEN.115 (which no longer contains a requirement to brief after take-off, before landing and after landing), it is not clear that these broadcasts are still required when complying with this AMC.

Proposal:

Delete para 2 c

comment *3373* comment by: *M Wilson-NetJets*

Original text:

2. Restrictions on use of PEDs by passengers: If an operator permits passengers to use PEDs on board its aircraft, procedures should be in place to control their use. It is the responsibility of the operator to ensure that all aircraft crew and ground agents are trained to enforce the restrictions on this equipment consistent with these procedures. These procedures should ensure the following: a. Cell phones and other transmitting devices are not used and are switched off from the time at the start of the flight when the passengers

have boarded and all doors have been closed until the end of the flight when a passenger door has been opened. The pilot-in-command may permit the use of cell phones when the aircraft is stationary during prolonged departure delays provided that sufficient time is available to check the cabin before the flight proceeds. Similarly, after landing, the pilot-in-command may authorise cell phone use in the event of a prolonged delay for a parking/gate position (even though doors are closed and the engines are running). This paragraph does not apply to a PED where the sole means of transmission is identified as a low power transmitting device compliant with the "Bluetooth" Standard.

This paragraph may not apply to systems installed in the aircraft for the use of cell phones in-flight;

Suggested new text:

2. Restrictions on use of PEDs by passengers: If an operator permits passengers to use PEDs on board its aircraft, procedures should be in place to control their use. It is the responsibility of the operator to ensure that all aircraft crew and ground agents are trained to enforce the restrictions on this equipment consistent with these procedures. These procedures should ensure the following: a. Cell phones and other transmitting devices are not used and are switched off from the time at the start of the flight when the passengers have boarded and all doors have been closed until the end of the flight when a passenger door has been opened. The pilot-in-command may permit the use of cell phones when the aircraft is stationary during prolonged departure delays provided that sufficient time is available to check the cabin before the flight proceeds. Similarly, after landing, the pilot-in-command may authorise cell phone use in the event of a prolonged delay for a parking/gate position (even though doors are closed and the engines are running).

On aeroplanes with a MPSC of 19 or less the PIC may allow the use of PED up to shortly before take-off and shortly after landing, if it is determined that passengers using PED are easily identified and means exist to communicate with those passengers to command the disuse of PEDs.

This paragraph does not apply to a PED where the sole means of transmission is identified as a low power transmitting device compliant with the "Bluetooth" Standard. This paragraph may not apply to systems installed in the aircraft for the use of cell phones in-flight;

Comment/suggestion:

Aeroplanes with a MPSC of 19 or less can more easily command and check that PEDs are switched off and therefore should be allowed to have PEDs operate until shortly before take-off since there is no apparent safety risk due to the fact that it very difficult to miss a passenger using his/her PED.

The text of the AMC OPS.GEN.125 and GM OPS.GEN.125 is derived from the JAA TGL 29. This TGL was linked to JAR-OPS 1, therefore applicable to Commercail Air Transportation only. As the PED requirements have been placed into the GEN subpart, it is understood that they become applicable to any kind of operation. The AMC and the GM nevertheless remain applicable to CAT only.

The EASA should clarify if it was the original intent to make these requirements applicable to any kind of operation. If this is not the case, the requirement should be shifted into the subpart CAT, as well as the corresponding AMC & GM.

comment *5055* comment by: *Airbus SAS*

Airbus proposes to replace the last 2 sentences of Subsection 2.a., saying:

"2. Restrictions on use of PEDs by passengers:

a. ...

This paragraph does not apply to a PED where the sole means of transmission is identified as a low power transmitting device compliant with the "Bluetooth" Standard.

This paragraph may not apply to systems installed in the aircraft for the use of cell phones in-flight;" ,

by the following text:

"This paragraph does under the conditions within this paragraph not apply to a PED where the sole means of transmission is identified as a low power transmitting device limited to less than 10 to 100 mW effective isotropic radiated power inside the 2.4 to 2.5 GHz ISM band, e.g. early Bluetooth standards. Such radio standards may be operated only, if the aircraft electronic equipment is qualified to a level of 5 V/m and higher in the above mentioned frequency range.

Mobile phones and other transmitting PEDs operation may only be permitted under the provision that the intentional radio transmission inside the aircraft in it's configuration has been demonstrated to not adversely affect safe flight and landing. This shall be demonstrated according to state of the art electromagnetic compatibility (EMC) test procedures, which in particular

address the operational approval of radio transmitter standards inside the aircraft ."

Rationale:

The allowance of operating low power Bluetooth transmitters is too restrictive on the one hand, because only a particular brand and not a low power transmitter in general is described.

The paragraph has turned out being too vague on the other hand, because the brand Bluetooth includes some different radio transmitting standards for the time being, which are also different between each other with respect to their transmission power level.

As Bluetooth initially (2001 at the time when TGL 29 has been written) operates in the 2.4 to 2.5 GHz at RF transmission levels of 10 to 100 mW it may be better practice to name this frequency band and similar standards. Other wise there won't be a physical reason to allow Bluetooth but forbid WLAN 802.11 b/g/n with similar frequency and power characteristic

EUROCAE ED-130, chapter 4, defines the guidance for the operational approval of T-PED technologies new to the aircraft and provides the needed EMC demonstration guidance, that has already been used as a basis for the German "Luftfahrzeug-Elektronik-Betriebs-Verordnung – LuftEBV" , which bases on "Guidance for the Use of Portable Electronic Devices (PEDs) on Board Aircraft EUROCAE, ED-130, Issued December 2006)

comment *5068* comment by: *Airbus SAS*

This comment is related to AMC OPS.GEN.125, subsections 2. e., f. and h.:

- Airbus proposes to replace subsection 2.e. by the following text:

"e. The operator shall establish operational guidance for the crew regarding the operational approval of PED (transmitting and non-intentional transmitting PEDs), which is in line with applicable European aviation standards on the usage of portable electronic devices on board."

- Airbus proposes to delete subsections f. and h.

Rationale:

- For replacing subsection e.:

Subsection e. is precising the guidance, ED-130 chapter 3 and 4 contains the needed guidance.

- For deletion of subsection g. and h.:

Subsection f. is ineffective as PED are battery powered and cannot be switched off. In addition PED in-seat power supplies are no paths of RF-interference, as they are EMC-filtered and in addition coupling from PED takes places via radiation but not via wiring, which has been shown in RTCA and EUROCAE working groups.

Subsection h. has led to many reports but neither an incident could be assigned to a real interference situation caused by PED, nor can the same flight situation be repeated w/o PED, which is a mandatory prerequisite to identify whether or not a PED is the root cause of a particular observation. The better means is to follow the guidance on operational approval of PED given in

ED-130 chapter 4, and harden the aircraft accordingly.

comment *5072* comment by: *Airbus SAS*

Attachment #13

Airbus proposes to rewrite subsection 2.b. from "This restriction applies to..." on , to read as following:

This restriction applies to equipment carried on by the passenger and equipment loaned to the passenger by the aircraft operator *(see rationale a)*

For use during all phases of flight, equipment controlled by the aircraft operator or equipment loaned to the passenger by the aircraft operator shall be qualified against unintentional radio transmission according to a radio frequency emission category H defined in EUROCAE document ED-14 "Environmental Conditions and Test Procedures for Airborne Equipment" *(see rationale a)*

This paragraph does under the conditions within this paragraph not apply to a PED where the sole means of transmission is identified as a low power transmitting device limited to less than 10 to 100 mW effective isotropic radiated power inside the 2.4 to 2.5 GHz ISM band, e.g. early Bluetooth standards. Such radio standards may be operated only, if the aircraft electronic equipment is qualified to a level of 5 V/m and higher in the above mentioned frequency range. *(see rationale b,c,d)*

Rationales:

a)

Eaaaaa) EUROCAE ED-130 page 19, table 6, recommends :

For the table, see the attached .pdf-file

b) The allowance of operating low power Bluetooth transmitters is too restrictive on the one hand, because only a particular brand and not a low power transmitter in general is described.

c) The paragraph has turned out being too vague on the other hand, because the brandmark Bluetooth includes some different radio transmitting standards for the time being, which are also different between each other with respect to their transmission power level.

d) As Bluetooth initially (2001 at the time when TGL 29 has been written) operates in the 2.4 to 2.5 GHz at RF transmission levels of 10 to 100 mW it may be better practice to name this frequency band and similar standards. Other wise there won't be a physica reason to allow Bluetooth but forbid WLAN 802.11 b/g/n with similar frequency and power characteristic.

comment *5092* comment by: *Airbus SAS*

Airbus proposes to delete in AMC Subsection 4.c. the examples in brackets :

"c. ...

Flight and cabin crews should avoid using cell phones and other transmitting devices during critical pre-flight procedures. ~~(e.g. when loading route~~

~~information into navigation systems or when monitoring fuel loading).~~ Otherwise, flight crews and other persons involved in dispatching the aircraft will need to observe the same restrictions as passengers. "

Rationale:

There is no physical mechanism that requires not using RF energy while fueling the aircraft. Example: If this were the case radar observation would have needed to be switched of during a/c fueling. Physical Rationale: RF energy from Cell phones cannot ignite fuel.

comment *5098* comment by: *Airbus SAS*

AIRBUS proposes to add following AMC:

In the context of this AMC, PED are devices including passenger mobile phones, portables devices used by the crew, but excludes Electronic Flight Bags.

If an operator allows the use of PED's aboard its aircraft, procedures should be established and spelled out clearly to control their use during passenger-carrying operations. The procedures, when used in conjunction with an operator's program, should provide the following:

(1) (1) Methods to inform passengers of permissible times, conditions, and limitations when various PED's may be used. This may be accomplished through the departure briefing, passenger information cards, captain's announcement, and other methods deemed appropriate by the operator. The limitations, as a minimum, should state that use of all such devices (except certain inaccessible medical electronic devices, such as pacemakers) are prohibited during any phase of operation when their use could interfere with the communication or navigation equipment on board the aircraft or the ability of the flight crew to give necessary instructions in the event of an emergency.

(2) (2) Procedures to terminate the operation of PED's suspected of causing interference with aircraft systems.

(3) (3) Procedures for reporting instances of suspected and confirmed interferences by a PED.

(4) (4) Cockpit to cabin coordination and cockpit flight crew monitoring procedures.

(5) (5) Procedures for determining acceptability of those portable electronic components to be operated aboard its aircraft. The operator of the aircraft must make the determination of the effects of a particular PED on the navigation and communication systems of the aircraft on which it is to be operated. The operator determines that the operation of such types of PEDs that are exempted from the general prohibition will not interfere with the communication or navigation systems of the aircraft on which they are to be operated.

(6) (6) Prohibiting the operation of any PED's during the takeoff and landing phases of flight. It must be recognized that the potential for personal injury to passengers is a paramount consideration as well as the possibility of missing important safety announcements during these important phases of flight. This is in addition to lessening the possible interference that may arise during sterile cockpit operations (below 10,000 feet).

(7) (7) Prohibiting the operation of any PED's aboard aircraft, which are

classified as intentional radiators or transmitters, unless specific types of PEDs are explicitly authorized.

Rationale:

EASA and FAA have elaborated material, which should be applicable in case an operator is asking for approval of wireless or mobile telephone services onboard of commercial flight, and which should be useable during flight phases in addition to on-gate and taxing. This material is been used for the proposal of the additional AMC (AMC2) and GM (GM2) for OPS.GEN.125 Portable electronic devices.

Sources: EASA CRI SE-37 (AIRBUS single aisle programme) mainly for the proposed AMC material; FAA AC 91.21-1A for the GM.

The text of the AMC OPS.GEN.125 and GM OPS.GEN.125 is derived from the JAA TGL 29. This TGL was linked to JAR-OPS 1, therefore applicable to Commercail Air Transportation only. As the PED requirements have been placed into the GEN subpart, it is understood that they become applicable to any kind of operation. The AMC and the GM nevertheless remain applicable to CAT only.

The EASA should clarify if it was the original intent to make these requirements applicable to any kind of operation. If this is not the case, the requirement should be shifted into the subpart CAT, as well as the corresponding AMC & GM.

Airbus proposes to replace subsection 3.a. by the following text:

"a. Mobile phones:

The full frequency range and effective isotropic power level range and the characteristic modulation (pulsed or continuous wave signal) assigned to a

mobile-phone technology shall be considered for the operational approval of a particular mobile phone technology (e.g. GSM or CDMA). This shall be covered by applying guidance, which considers the electromagnetic interference character of mobile phone standards in terms of modulation, cumulative effects, frequency and maximum transmittable power.

Modern aircraft and upcoming aircraft generations may be designed already being PED (transmitting and non-intentional transmitting PEDs) tolerant. The operator shall obtain a confirmation from the aircraft manufacturer whether an aircraft is approved T-PED tolerant. T-PED tolerance is given for particular mobile phone standards.

Mobile phones shall be allowed only if an operational approval and a T-PED tolerant aircraft design is available for the particular aircraft.

Without electromagnetic compatibility demonstration of the aircraft with the mobile phone standards, the operator should prevent the operation of mobile phones during any phase of flight."

Rationale:

The entire text as proposed by EASA is so far a statement on some technical features of mobile phones, which are technically not completely correct and give no guidance for the aircraft operator. It is more helpful to explain what to do and what to consider for the operational approval of a mobile phone. Otherwise w/o electromagnetic compatibility demonstration the operation of mobile phones should be prohibited. Aircraft programs under development, as A350, include already the feature of T-PED tolerance.

comment *5083* comment by: *Airbus SAS*

Airbus proposes to delete the below stroke-through parts in subsection 1. and add new wording (underlined) at the end:

GM OPS.GEN.125 Portable electronic devices

GENERAL - COMMERCIAL AIR TRANSPORT

1. General:

The use of PEDs on board aircraft by crew members and passengers presents a **well-known** source of electro-magnetic radiation with a **low** risk of adverse interference effects to aircraft systems. ~~Given that a civil aircraft flying at high altitude and high speed in busy airspace is in an obviously hazardous environment, and given that many of the onboard systems are safety devices intended to reduce the risks of that environment to tolerable levels, then anything that degrades the effectiveness of those systems will increase the exposure of the aircraft to the hazards. Consequently,~~ The aircraft operator needs to take measures that will ~~reduce~~ keep the risks ~~to~~ within acceptable limits. *(See rationale a))*

PEDs fall into two main categories; non-intentional transmitters and intentional transmitters. The first category includes, but is not limited to, computing equipment, cameras, radio receivers, audio and video reproducers, electronic games and toys, together with portable, non-transmitting devices intended to assist crew members in their duties. Intentional transmitters are transmitting devices such as remote control equipment (which may include some toys), two-way radios, cell phones and satellite phones. ~~In periods between transmissions, an intgentional transmitter may radiate interference as a non-~~

~~intentional transmitter.~~ In periods between transmissions and during transmission, an intentional transmitter radiates very low level of electromagnetic field strength as a non-intentional transmitter, which might cause low-level radiation. **.** *(See rationale b))*

Rationale:

a) Since the activity of EUROCAE WG 58 and of RTCA SC 202 took place the RF-environment due to PED and transmitting PED is well-known (See annex 4 of ED-130 and Appendix 3 of DO-294) and identified being low.

b) Of course intentional transmitters radiate unintentional signals during and between periods of intentional transmission, if they are switched on. It is a physically unavoidable feature of any electronic.

Wording has been precised in addition, PED do not transmit interference but electromagnetic fields.

comment *5086* comment by: *Airbus SAS*

Airbus proposes to delete the below stroke-through words in subsection 3. and modify the wording as shown in underlined characters:

3. Intentional transmitting PEDs:

PEDs that are intentional transmitters may induce interference directly into aircraft equipment, wiring or components with sufficient power to adversely affect the proper functioning of aircraft systems. ~~Many aircraft have non-metallic floors and internal doors that present no barrier to prevent the transmission from penetrating to the avionics equipment bays and to the flight deck.~~ Tests have shown that demonstrated ~~susceptibility~~ radio-frequency-immunity qualification levels of aircraft equipment, particularly equipment qualified to earlier standards can easily be exceeded, while the true susceptibility being higher than the qualification level is unknown.

Rationale:

A non-metallic floor made of carbon fiber is electrically conductive and in the PED (transmitting and non-intentional transmitting PEDs) transmission frequency range a shield as good as a metallic floor. Deletion of incorrect statements is recommended, the document becomes less attackable.

The wording is from a physical point of view not correct. The susceptibility levels are typically higher than the demonstrated RF-immunity levels. Example: A successful qualification against 5 V/m does not mean that equipment fails at 6 V/m. The 5V/m qualified equipment may even sustain 100 V/m. For economic reasons, susceptibility levels are not necessarily tested up to failure, but only up to specified and agreed values.

comment *5102* comment by: *Airbus SAS*

AIRBUS proposes to add following GM Guidance Material:

If an operator operates an aircraft providing mobile phone services on board following guidance shall be considered in conjunction with the AMC proposed above:

The briefing of the aircraft operator's policy on PED use to passengers,

identifying:

- that mobile phones can only be used onboard the aircraft equipped with a certificated and approved mobile telephone system;

- when mobile phones can be used, i.e. during the cruise phase of flight;

- when they must not be used, such as during safety briefings;

- when all PEDs must be switched off, including during takeoff and landing.

The ability to communicate the policy in a manner that all passengers understand and act on accordingly.

The method of announcing and ensuring that all mobile phones are turned off and remain off prior to commencement of the flight, until such time that safe use is to be permitted.

The method of announcing, and ensuring if necessary, that all mobile phones are turned off, and remain off, if the onboard telephone system is to be switched off in flight. If appropriate this must include the suitable action to take to prevent interference to the aircraft systems, should it becomes evident that mobile phones remain switched on in flight after the announcement to turn them all off has been made.

The operator shall present a strategy covering EMI assessment for such applicable aircraft providing an onboard telephone service and that have major cabin interior or avionic systems upgrades or changes. The strategy shall address the need for re-evaluation of previously approved installations when significant modifications are made to the aircraft avionic systems or to the cabin configuration. The objective is that the operator has to provide evidence, that the new installed aircraft electronic equipments, especially of communication and navigation avionics, are resistant against the electromagnetic threads (PED tolerance). Guidance relating to EMI assessment to achieve PED tolerance, guidance and test instructions for aircraft operator maintenance organization can be found within RTCA DO-307 and EUROCA ED-130.

The necessity to adapt to a change in aircraft occupants' behaviour, identified as follows:

The use of mobile phones onboard large aeroplanes is currently prohibited in flight. The pre-flight briefings provided remind occupants of this policy and of the potential interference to aircraft systems.

The introduction of the Onboard telephone system is intended to result in a change to this policy such that mobile phone use is now shown to be safe. A change in public perception is likely, and it is difficult to judge the change in behaviour that will result, but the continued reliance on existing procedures requesting mobile phones to be turned off before the beginning of the flight, due to the risk of interference to aircraft systems, if the system certification identifies that this is still potentially possible, could possibly be challenged by passengers travelling on an aircraft that permits the use of mobile phones in flight.

Any reliance on procedures to ensure that phones are turned off if the onboard telephone system is switched off during any phase of flight may need to be supplemented by a means of verifying the procedure's effectiveness, to ensure that all phones remain off if the safety analysis identifies that this may cause a safety effect. Supplemental equipment might be required to provide for this.

The aircraft crew's ability to differentiate between PEDs that are permitted and

those that must remain restricted or prohibited

The aircraft operator should be made aware of the increased risk of lithium battery fires that could arise through an expected increase in use of PEDs.

The control of mode of outgoing and incoming calls and text messages, including the ability to select between call and text mode as required by the aircraft.

Use of PEDs, especially mobile phones, has the potential to increase the number of disruptive passenger incidents. Appropriate information should be provided for inclusion within the aircraft crew conflict management training. As a minimum, this should include awareness of:

High speech volume levels that a user may resort to due to confusion caused by high ambient noise levels, with attention paid to speech interference levels and the ambient noise levels within the various parts of the aircraft cabin.

The inability of passengers to move away from a person making a telephone call while seated.

The means to permit only text messaging rather than voice calls, during certain times of the day. This should include the need to consider the different perceptions of passengers especially on long sectors where some passengers will wish to sleep at time when other passengers might be more interested in using their mobile phones.

The continued use of mobile phones during PA broadcasts has the potential to prevent the user, and persons seated nearby due to high speech volume levels, from hearing the broadcast message.

Use of PEDs, especially mobiles, has the potential to increase the number of disruptive passenger incidents. Appropriate information should be provided for inclusion within the aircraft crew conflict management training. As a minimum, this should include awareness of:

- Why the use of mobile phones may be permitted on some aircraft, but not others

- High speech volume levels.

- The inability of passengers to move away from a person making a telephone call.

- The effects of selected denial of service, such as permitting text messages only or preventing incoming calls during certain phases or times of flights.

- The effects of interrupted calls by Passenger Announcements broadcast or loss of the picocell (the onboard telephone transceiver station).

Due to the perceived increased risk of PED induced fires, particularly those with lithium batteries charged from in-seat power supplies, cabin crew awareness or training should be considered.

Licensing conditions that impose geographical and height operating restrictions for the telephone system should be stated in the operating manuals.

The applicant must furnish the appropriate documentation identifying the exact restrictions that apply, for inclusion within the operating manuals.

Procedures should be included in both the Operations Manual and the Cabin Crew Operations Manual, or their equivalent

Guidance relating to PED policy, guidance and training for aircraft operators can be found within RTCA DO-294A Appendix 8A.

Rationale:

EASA and FAA have elaborated material, which should be applicable in case an operator is asking for approval of wireless or mobile telephone services onboard of commercial flight, and which should be useable during flight phases in addition to on-gate and taxing. This material is been used for the proposal of the additional AMC (AMC2) and GM (GM2) for OPS.GEN.125 Portable electronic devices.

Sources: EASA CRI SE-37 (AIRBUS single aisle programme) mainly for the proposed AMC material; FAA AC 91.21-1A for the GM.

comment *5104* comment by: *Airbus SAS*

Airbus proposes to delete the complete Subsection 3.b. and replace it by the following text:

"b. Private Mobile Radios (PMRs):

The full frequency range and effective isotropic power level range and the characteristic modulation (pulsed or continuous wave signal) assigned to a PMR standard shall be considered for the operational approval of a particular PMR standard (e.g. PMR 446). This shall be covered by applying guidance, which considers the electromagnetic interference character of PMR standards in terms of modulation, cumulative effects, frequency and maximum transmittable power.

Modern aircraft and upcoming aircraft generations may be designed already being T-PED tolerant. The operator shall confirm with the aircraft manufacturer whether or not a particular aircraft is within the category of T-PED tolerant aircraft design and whether or not a particular PMR standard is covered prior allowing the use of PMRs.

PMRs shall be allowed only if an operational approval or a T-PED tolerant aircraft design that covers the PMR transmission characteristics or an equivalent demonstration of electromagnetic compatibility with PMR radio transmissions is given for the particular aircraft.

Without electromagnetic compatibility demonstration of the aircraft with the PMR standard, the operator should prevent the operation of PMRs."

Rationale:

It is more helpful to explain what to do and what to consider for the operational approval of a PMR standard. The necessary guidance is available within ED-130. Otherwise w/o electromagnetic compatibility demonstration one should prevent the operation of PMRs. Current aircraft programs under development include already the feature of T-PED tolerance.

comment *5105* comment by: *Airbus SAS*

Airbus proposes to delete the complete subsection 3.c. and replace it by the following text:

"c. Wireless Area Networks:

Wireless Local Area Network (WLAN) is an evolving technology offering wireless data communications, replacing Ethernet cables, for computing

information exchange with a range of about 100 metres. It is limited to typically 100mW effective isotropic radiated power. Most portable computers incorporate such a technology. In general interference is not expected, but older aircraft electronic may lack immunity qualification within the operational frequency band of WLANs, and an immunity demonstration is recommended for affected aircraft.

The full frequency range and effective isotropic power level range and the characteristic modulation (pulsed or continuous wave signal) assigned to a WLAN standard shall be considered for the operational approval of a particular PMR standard (e.g. PMR 446). This shall be covered by applying guidance, which considers the electromagnetic interference character of PMR standards in terms of modulation, cumulative effects, frequency and maximum transmittable power.

Modern aircraft and upcoming aircraft generations may be designed already being tolerant against WLAN operation. The operator shall confirm with the aircraft manufacturer whether or not a particular aircraft is within the category of T-PED tolerant aircraft design and whether or not a particular WLAN standard is covered prior allowing the use of WLAN technology.

Without electromagnetic compatibility demonstration of the aircraft with the WLAN standard, the operator should evaluate the interference risk prior allowing WLAN."

Rationale:

It is more helpful to explain what to do and what to consider for the operational approval of a wireless standard. The necessary guidance is available within ED-130. Otherwise w/o electromagnetic compatibility demonstration one should prevent the operation of wireless standards. Current aircraft programs under development include already the feature of T-PED tolerance.

For Bluetooth the same comments as previously, because the Bluetooth standard has changed since 2000.

comment *5107* comment by: *Airbus SAS*

Airbus proposes to delete subsection 6.a., renumber 6.b. to 6.a. and add a new subsection 6.b., to read as following:

"6. Recommendations:
~~a. Aircraft operators should consider installing detectors in their aircraft, which together with suitable procedures can assist the cabin crew to detect unauthorized transmissions from commonly used types of cell phone.~~

a. Aircraft operators should seek the assistance of airport operators for the display of safety notices at aircraft boarding points reminding passengers to switch off cell phones and other transmitting devices.

b. If the aircraft operator achieved operational approval for a particular cell phone or radio transmission standard, the operator shall provide guidance and crew training regarding the use of radio transmitters on the flights and aircraft affected. "

Rationale:

PED detectors have been identified not being effective within both committees dealing with PEDs (RTCA SC202 and EUROCAE WG 58). The rationale is that on

all aircraft PED including cell phones may be switched on any time. In critical phases of flight when PED may be asked for to be switched off, nobody may physically check this, or the PED is stowed away in cargo or elsewhere. From an operational point of view and considering that on a daily basis many thousand PEDs are switched on during flight, The impact and risk generated by a warning indication without the possibility to switch off the root cause, e.g. a phone in the cargo hold, generates increased crew work load, but does not mitigate anything, while the interference risk is low.

Instead of detecting means, which are insufficient for their intended purpose, the operator shall establish specific crew procedures and trainings.

comment *5108* comment by: *Airbus SAS*

Airbus proposes to modify the last sentence of Subsection 5.b. as shown below:

" However, in the confines of a metallic aircraft fuselage, complex propagation paths arise due to reflections from the metallic structure which can lead to signal cancellation or re-enforcement at different locations in the aircraft. Although the free space equation does not give reliable results under these conditions, tests have shown that the field strength of the interfering cell phone transmission, at maximum power, will exceed by a significant margin the levels used in susceptibility tests for avionic equipment qualified to earlier standards. Similarly, these tests have shown that interference levels would vary by relatively small changes of location of a cell phone and that persons obstructing the transmission path reduce the ~~interference~~ transferred field strength levels. "

Rationale:

Consider accuracy of wording: Interference is nothing which is radiated or what can be reduced, but an observed malfunction of an illuminated device during it's exposition to radio frequency energy or transferred field strengths.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC OPS.GEN.135.A Taxiing of aeroplanes p. 134

comment *650* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.GEN.135.A: add the following proposed text:

QUALIFIED PERSONNEL

A qualified person is either a flight crew member or a person designated by the operator that is:

1. competent to taxi;

2. qualified to use the radio telephone if radio communications are required;

3. has received instruction from a competent person on operational procedures, aerodrome layout, and where appropriate, information on routes, signs, marking, lights, ATC signals and instructions, phraseology and procedures; ~~**and**~~

4. able to conform to the operational standards required for safe aircraft movement at the aerodrome~~.~~ **; and**

5. Taxi in low visibility conditions will not be permitted unless, at least, a flight crew member is at the controls.

Justification:

Taxiing an aeroplane in low visibility conditions requires not only specific training, but also the necessary situational awareness. Only experienced flight crew members have this kind of situational awareness.

comment *6910* comment by: *Flybe*

This seems to adda requirement for all personnel qualified to taxi an aircraft to possess a radio telephone licence. Engineers may be qualified and trained to taxi an aircraft but not be in possession of an R/T licence.

It is proposed that training in radio procedures be acceptable training in place of an R/T licence.

"qualified through training or possession of a radio licence to use the radio telephone if radio communications are required "

B. II. Draft Decision - Part-OPS - Subpart A - Section II - GM OPS.GEN.140.H Rotor engagement p. 134

comment *961* comment by: *Fjallflygarna AB*

There are situations when a pilot has to leave the controls with the rotor spinning for safety reasons or for practical reasons. With this cognizance we believe it is better to allow pilots to leave the aircrafts while the rotor is spinning provided that the operator in the Operations Manual has stated the special conditions that should be met and provided that it is not inappropriate because of the construction of the helicopter. It is better that this is done legally and under stated conditions than illegal and out of control.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC1 OPS.GEN.145 Use of aerodromes/operating sites p. 134

comment *8* comment by: *KLM*

AMC1 OPS.GEN.145 Use of aerodromes/operating sites point i

says site suitability with reference etc.

This had better be changed into: site usability with reference etc.

The word suitability is not to be used because of the connection by many with weather requirements.

comment *651* comment by: *ECA - European Cockpit Association*

Comment on AMC1 OPS.GEN.145(1): change as follows:

1. The ~~**pilot-in-command should have available from**~~ **operator should provide the pilot-in-command** a pre-survey or other publication, for each operating site to be used, diagrams or ground and aerial photographs, depiction (pictorial) and description of:

Justification:

It is the operator's responsibility to provide the pilot-in-command with suitable documentation for the safe conduct of the flight.

comment *2697* comment by: *AOPA-Sweden*

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC2 OPS.GEN.145 Use of aerodromes/operating sites p. 135

comment *85* comment by: *Air Southwest*

AMC2 OPS.GEN.145 This doesn't read properly. 'When defining adequate operating sites ..... an operator should take into account that an adequate site is a site which the operator considers to be satisfactory!' The implication is that the operator has already determined that the site is satisfactory. Sub-paragraph (a) is a definition of an adequate site not criterion by which an adequate site is determined. Paragraph 1 needs to be rewritten.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC4 OPS.GEN.145 Use of aerodromes/operating sites p. 139

comment *768* comment by: *EHOC*

General

The intention of the AMC is not clear: as was previously mentioned in a comment to OPS.GEN.150(d), to 'take account of' might mean that elements of AMC2 OPS.GEN.145 should be considered; this is what a general reading of the text indicates. If that is not the case and the intent was to 'take full account of' the references AMC; perhaps that might have been better expressed by extending the scope of AMC2 to Commercial Operations (and not just to Commercial Air Transport).

This is an interesting case because it has already been noted that in OPS.GEN.150(d) the original text 'take full account of' had been shortened to 'take account of'. In fact it confirms the belief that 'take account of' is meant as 'you have to consider the elements of the AMC but they are not binding'.

It is thought that, in this case, if AMC2 is binding on Aerial Work the scope has to be amended; if that is not the case then another form of words should be used.

If the text of this GM is the definition of an adequate aerodrome see EU-OPS 1.192 (a) and replace by :

"An aerodrome which the operator considers to be satisfactory, taking account of the applicable performance requirements and runway characteristics; at the expected time of use, the aerodrome will be available and equipped with necessary ancillary services such as ATS, sufficient lighting, communications, weather reporting, navaids and emergency services.

Is a GM really the proper place to give a definition ?

Available : is an aerodrome closed unless emergency compliant with this description ?

Where can we find a definition for ATS service ? It should be in a « definition » paragraph

comment *6660* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Comment

The question of emergency services is only adressed in this GM for the whole NPA 2009-02 B. This is firstly not acceptable to not speak more about it and non logic to enclose it in a GM. GMs cannot contain essential safety requirements as important as emergency services.

ICAO annex 14 is not applicable for an air operator but for aerodromes operators.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC OPS.GEN.147(c)(1) Visual Flight Rules (VFR) Operating minima p. 140

comment *86* comment by: *Air Southwest*

This paragraph is applicable to helicopters only (Ref OPS.GEN.147(c)(1)). To maintain the convention should it not have an 'H' somewhere in the paragraph number?

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC1 OPS.GEN.150 Instrument Flight Rules (IFR) operating minima p. 140

comment *87* comment by: *Air Southwest*

The use of "may be" negatively also implies 'may not be'. As a considerable number of operators use Aerad and Jeppesen publications for AOM it is requested that this paragraph be more explicit in stating that the use of such publications **is** acceptable means of compliance.

comment *1833* comment by: *claire.amos*

Highly acceptable

comment *2052* comment by: *Ulrich Baum*

Please clarify. Does this mean looking in the Jeppesen approach plate is enough?

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC2 OPS.GEN.150 Instrument Flight Rules (IFR) operating minima p. 140

comment *485* comment by: *EHOC*

General

It is not clear that sections 2 and 3 of AMC2 OPS.GEN.150 can stand without a requirement. It might be better if there was an additional element in OPS.GEN.150 which would provide the objective on which this method of compliance is hung:

"(b) The minima referred to OPS.GEN.150(a) shall take account of any increment:

(1) imposed by the competent authority; and/or

(2) applied to non-precision minima when a stabilised approach is not flown."

The text from items 2 and 3 of the AMC could then be put into a separate AMC which is attached to OPS.GEN.150(b)(2).

Paragraph 3.

The text of Paragraph 3 contains the following:

"When calculating the minima in accordance with **AMC4** OPS.GEN.150, the applicable minimum Runway Visual Range (RVR) should be increased by..."

It is AMC6 which contains the applicable RVR/CMV.

comment *1832* comment by: *claire.amos*

Investigate implications e.g. ALC runway 28 etc.

comment *3903* comment by: *AIRBUS*

Some confusion is being created by some of the AMCs linked to the paragraph OPS.GEN.150. The subject addressed in the AMCs should be part of the Section IV, Low Visibility Operations of the Subpart OPS.SPA.

comment *4156* comment by: *IAOPA Europe*

It is agreed ha a Continuous Descend Final Approch (CDFA) technique is recommended. However, for non-commercial operation it is not acceptable that RVR must be increased by 2-400 metres in case the CDFA technique is not used.

The CDFA approach requires specialised equipment not normally available in GA aircaft and IAOPA is not aware of any safety concerns with the currently aplied visibility requirements for such operations.

comment *5753* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Comment:

Rules for Low Visibility Operations should not be included as AMCs.

Proposal:

Move rules for LVO from AMCs to Implementation Regulations.

comment *5930* comment by: *DGAC*

Point 3 specifies that for approaches not flown using CDFA, RVR should be increased by 200m or 400m. In fact it can be more than that. Indeed when the CDFA technique is not used, the third line of the Table 3 of AMC6 OPS.GEN.150. has to be used to compute the RVR. By doing this, the Max cut off (1500m cat A and B, 2400 cat C and D) is not applicable and RVR can become greater. Furthermore the add-on 200m/400m is already specified in this table.

Proposal : Write instead:

"When calculating the minima in accordance with AMC 6 OPS GEN 150, RVR could become far higher for approach not flying the CDFA technique…."

comment *6906* comment by: *PPL/IR Europe*

Our comments on the AMC to OPS.GEN150 apply in general because we do not beleive OPS.GEN150 is suitable for non-commercial operations

The application of these AMC (i.e. using them as default minima) to non-commercial operations exceeds ICAO Annex 6 Part II requirements and

therefore in the absence of an explicit safety case, violates the provisions of Art 8(6) of the Basic Regulation. See General remarks.

Landing minima may be covered by state requirements, and the application of restrictive take-off minima are disproportionate to the risk involved in other aspects of non-commercial operations of non-complex aircraft.

Para 3: The application of Continuous Descent Final Approach (CDFA) technique to non-commercial operations of non-complex aircraft is, in particular, unjustified by a safety case. While CDFA makes good sense for commercial operations of transport category aircraft, considerations of equipment, crew composition and aircraft performance do not make CDFA mandatory for light aircraft operations to smaller airports

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC3 OPS.GEN.150 Instrument Flight Rules (IFR) operating minima p. 140-144

comment *88* comment by: *Air Southwest*

As with Appendix 1 to JAR-OPS 1.430(a)(2) in paragraph AMC3 OPS.GEN.150 2.a. the term 'discontinued take-off' is used. Would now be a suitable opportunity to use the more generally accepted term 'rejected take-off' and its accepted abbreviation 'RTO' as defined in SKYbrary (Eurocontrol and ICAO sponsored).

comment *312* comment by: *CAA-NL*

Attachment #14

Sent the attached file as EASA RPF december 2006.

comment *486* comment by: *EHOC*

Paragraph 1.a.

The meaning of the original has not been preserved; it was originally intended to account for some departure procedures where penetration into the OFS was permitted or when performance was insufficient to permit OEI departures ; it might be clearer if the text of the last sentence were modified to say:

~~Depending on the obstacle situation on departure and/or forced landing~~, **Where there is a specific need to see and avoid obstacles on departure and/or for a forced landing**, additional conditions (e.g. ceiling) should be specified;

comment *592* comment by: *ECA - European Cockpit Association*

Comment on AMC3 OPS.GEN.150: This complete part should be an IR, not as

AMC!

Justification:

Take-off minima is crucial information that should be standardised as implementing rule. Operational safety concerns.

comment *596* comment by: *ECA - European Cockpit Association*

Comment on AMC3 OPS.GEN.150 table 1a: change as follows:

Runway edge**/FATO** lighting **and/or** centreline~~ **lighting**~~ **marking**

Justification:

Ref. EU-OPS Appendix 1 to OPS 1.430 Table 1. The text "centreline lighting" makes no sense since there would be 2 different sets of rules in case of runway edge lighting and centreline lighting.

comment *597* comment by: *ECA - European Cockpit Association*

Comment on AMC3 OPS.GEN.150(3)(a)(ii): change as follows:

ii. For multi-engined aeroplanes whose performance is such that they cannot comply with the performance conditions in 3.a.i., in the event of a critical power unit failure, there may be a need to re-land immediately and to see and avoid obstacles in the take-off area. Such aeroplanes may be operated to the following take-off minima provided they are able to comply with the applicable obstacle clearance criteria, assuming engine failure at the height specified. The take-off minima specified by an operator must be based upon the height from which the One-Engine-Inoperative (OEI) net take-off flight path can be constructed. The RVR minima used may not be lower than either of the values given in Table 1a or 2a~~**, unless an approval in accordance with OPS.SPA.001.LVO is obtained**~~;

Justification:

Tables already take into account LVTO approval or not.

comment *599* comment by: *ECA - European Cockpit Association*

Comment on AMC3 OPS.GEN.150(3)(a)(iv): This part should be under OPS.SPA.001.LVO and not under OPS.GEN.150.

comment *892* comment by: *KLM*

Table 2a of AMC3 ops.gen.150

note2:

iv operators approved in accordance with ...etc.

This should not be under note 2 but a next item of the AMC3. This is the non-standard possibility and is a seperate issue.

Therefore it has to be taken out of note 2 and made point 4.

suitable is no longer used and shall be replaced.

comment *1578* comment by: *ECA - European Cockpit Association*

Comment: change note 2 as follows:

Note 2: The reported RVR/visibility value representative of the initial part of the take-off run **and any other consecutive sections that are fully visible from the start of the take-off roll position** can be replaced by pilot assessment.

Justification:

This can be limiting when the whole of the runway is visible. In particular, in conditions where there is shallow fog over grass areas surrounding transmissometers, but the runway is totally clear and visible. The suggested wording allows for take-off where the visibility is such that consecutive sections of runway are visible from the f light deck on line up

comment *1579* comment by: *ECA - European Cockpit Association*

Comment on paragraph A.5. under table 2.a of AMC3 to OPS.GEN.150: change as follows :

5. The required RVR value has been achieved for all of the relevant RVR reporting points **as specified by the operator for the runway and/or runway conditions**.

Justification:

Vague and needs clarificatios to what is relevant for crews to refer to

comment *2799* comment by: *M Wilson-NetJets*

Original text:

See NPA text

Suggested new text:

No suggested text

Comment/suggestion:

Note 2 to Table 1a states that the RVR of the "initial part of the take-off" can be replaced by pilot assessment. The initial part of the take-off is not exactly defined. The lack of definition can lead to significant differences between operators and subsequent differences in levels of safety.

comment *3482* comment by: *UK CAA*

~~Depending on the obstacle situation on departure and/or forced landing~~, ***Where there is a specific need to see and avoid obstacles on departure and/or for a forced landing***, additional conditions (e.g. ceiling) should be specified;

comment *3483* comment by: *UK CAA*

Page No: 143

Paragraph No:

AMC3 OPS.GEN.150 3. iv. A. 3

Comment:

Suggest adoption of "FSTD" – with an appropriate glossary - instead of "flight simulator" throughout.

Justification:

Consistency of terminology

comment *3903* ☐ comment by: *AIRBUS*

Some confusion is being created by some of the AMCs linked to the paragraph OPS.GEN.150. The subject addressed in the AMCs should be part of the Section IV, Low Visibility Operations of the Subpart OPS.SPA.

comment *4311* comment by: *Civil Aviation Authority of Norway*

Comment:

The meaning of the text from EU-OPS/JAR-OPS has not been preserved; it was originally intended to account for some departure procedures where penetration into the OFS was permitted or when performance was insufficient to permit OEI departures.

Justification:

Clarity of purpose.

Proposed Text

(if applicable):

~~Depending on the obstacle situation on departure and/or forced landing~~, ***Where there is a specific need to see and avoid obstacles on departure and/or for a forced landing***, additional conditions (e.g. ceiling) should be specified;

comment *4705* comment by: *IAOPA Europe*

The take/off minimas for non-commercial operations are too restrictive and not aligned with the current practice in Europe.

For non-commercial operations it is suggested to allow operations in accordance with LVTO minimas but without requiring the associated LVTO approval.

This would preserve the existing minimas typically applied in Europe today. There seems to be no indication case that the existing regulation for non-commercial operations is not sufficiently safe.

comment *5754* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

Note 2: The reported RVR/visibility value representative of the initial part of the take–off run can be replaced by pilot assessment.

Note 3: The required RVR value should be achieved for all of the relevant RVR reporting points with the exception given in Note 2 of Table 1a.

Comment:

The text will be more clear and easier to read with the proposed change.

Proposal (including ***new text***):

Note 2: The ~~reported~~ ***required*** RVR~~/visibility~~ value ~~representative of the initial part of the take–off run~~ ***should be achieved for all of the relevant RVR reporting points with the exception that the reported RVR/visibility value representative of the initial part of the take–off run*** can be replaced by pilot assessment.

Note 3: ~~The required RVR value should be achieved for all of the relevant RVR reporting points with the exception given in Note 2 of Table 1a.~~

comment *5755* comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

Paragraph text:

iv. A. 5. The required RVR value has been achieved for all of the relevant RVR reporting points.

Comment:

The possibility for pilot assessment of the RVR/visibility value representative of

the initial part of the take–off run will be clarified by the proposed change.

Proposal (including ***new text***):

iv. A. 5. The required RVR value has been achieved for all of the relevant RVR reporting points ***with the exception that the reported RVR/visibility value representative of the initial part of the take–off run can be replaced by pilot assessment***.

comment *6071* comment by: *Irish Aviation Authority*

Comment:

RVR - There is a potential for confusion over the applicability of the text contained in Note 1 due to the layout. Suggest that the note be contained in a single cell at the foot of the table.

Justification:

Clarification of written text.

comment *6424* comment by: *Konrad Polreich*

AMC3 OPS.GEN.150 (1)(b)

AMC3 OPS.GEN.150 (1)(b) requires, that the PIC should not commence take-off unless the weather conditions at the aerodrome of departure are equal to or better than applicable minima for landing at that aerodrome unless a suitable take-off alternate aerodrome is available.

OPS.GEN.155 does not require a take-off alternate for helicopters, which are not involved in CAT (even if not being able to land at the aerodrome of departure). The AMC3 OPS.GEN.150 (1)(b), as it is written, does require it for all operations, if due to weather necessary. This is the only AMC dealing with take-off minima. Does it mean it is binding for non CAT helicopters? The result for non-commercial ops with helicopter would be, that an AMC does require a take-off alternate, whereas the IR doesn't, which might not be correct.

Suggestion:

Bring both texts in line to either demand an take-off alternate for all operations (if necessary due to weather) or change AMC3 OPS.GEN.150 (1)(b) that this paragraph is meant for all aeroplanes and helicopter involved in CAT only.

comment *6427* comment by: *Konrad Polreich*

AMC3 OPS.GEN.150 (1)(b)

Alternate aerodrome:

Helicopters should be able to use operating sites as alternates, if weather conditions permit. This might be the safest course of action under certain conditions (i.e. if the alternate is also marginal and distant located whereas an operating site might be available close to the aerodrome).

Change AMC3 OPS.GEN.150 (1)(b) to read:

…….unless a suitable take-off alternate aerodrome/operating site is available.

Or:

Insert an new AMC or GM which states, that for helicopters an operating site might be used as take-off and destination alternate aerodrome, if weather conditions permit (= VMC).

comment *6428* comment by: *Konrad Polreich*

AMC3 OPS.GEN.150 (3)(b)

Acc. AMC3 OPS.GEN.150 (3)(a)(iv) there is the possibility to reduce the take-off minima to below 150 m for airplanes, whereas it is not for helicopters. This is not adequate, since this procedures can also be flown in helicopters (MPH) with a high safety level, when proper procedures are established and trained in simulators.

Suggestion:

Insert the same options for helicopters as there are for airplanes, to reduce the take-off minima below 150 m (under the same provisions, as training, etc.).

Comment on AMC4 OPS.GEN.150: Required visual reference for NPA.

Justification:

The required visual reference for non precision approaches is missing in the NPA.

Ref. EU-OPS Appendix 1 to OPS 1.430 (b)(3)

comment 602 comment by: *ECA - European Cockpit Association*

Comment on AMC4 OPS.GEN.150: Required visual reference for Cat1

Justification:

The required visual reference for Category 1 precision approaches is missing in the NPA.

Ref. EU-OPS Appendix 1 to OPS 1.430 (c)(3).

comment 603 comment by: *ECA - European Cockpit Association*

Comment on AMC4 OPS.GEN.150: There should be different texts for non precision approach and precision approach cat1 to improve readability.

comment 722 comment by: *EHOC*

Table 1 of AMC4 OPS.GEN.150

Table 1 - the system minima vs facilities - has been amended from that contained in EU-OPS and JAR-OPS to include a row for RNAV/LNAV; the aeroplane cell contains a lowest MDH of 300ft; the helicopter cell contains n/a.

ICAO Doc 8168 contains the procedure description for RNAV procedures applicable to helicopters in Part IV of Volume II; in 1.1 - General - is contained the wording:

1.1.1 The general criteria in Part I, Section 4, as well as Part III, Section 2, Chapter 2, as amplified or modified by the criteria in this chapter apply to area navigation (RNAV) approach procedures for basic GNSS receivers. These specified instrument procedures may be developed for the use of helicopters. It is intended that these specified procedures be designed using the same conventional techniques and practices for aeroplane categories as those explained elsewhere in this document.

The section then goes on to describe the provision of such procedures for helicopters.

A number of States have already started to develop RNAV procedures for helicopters and, in some States, these are already in use. It is not clear why, in

the light of the contents of Doc 8168, when the table was amended it was not deemed appropriate to apply the limit for aeroplanes also to helicopters.

It is recommended that n/a be replaced by 300ft.

comment *799* comment by: *French SAMU using helicopters for medical transport*

Why is there no value in the last column helicopter in the RNAV/LNAV ? 300 feet should be inserted instead of N/A

ICAO has already developed procedures for helicopters

And they are used in the US, Australia and in development in several EU member states such as France and Switzerland.

"Circling" is not anymore in use by ICAO for helicopters during the visual phase [PANS-OPS ICAO doc 8168 paragraph "**7.1.2 Applicability to helicopters**

Circling procedures are not applicable to helicopters. The helicopter pilot has to conduct a visual manoeuvre in adequate meteorological conditions to see and avoid obstacles in the vicinity of the final approach and take-off area (FATO) in the case of Category H procedures, or a suitable landing area in the case of Category A or point-in-space procedures. However, the pilot must be alert to any operational notes regarding ATS requirements while manoeuvring to land. »]

Delete "circling" after ONSHORE and replace it by" visual maneuver

1 delete "for circling is the term in use to describe"

Insert "is the part " after The visual phase

2 delete "circling"

3 delete "circling"

comment *1002* comment by: *EHOC*

General

See also the comment on OPS.GEN.200(c).

See also the comment on the absence of RNAV/LNAV for helicopters.

This AMC does not appear to include a paragraph with the required *visual references* - this is the correct place-holder for such text, not OPS.GEN.200 (which specifically addresses the approach ban); the table includes RNAV/LNAV which might, when applied to helicopters, not result in a termination at a runway. The absence of a *visual reference* paragraph, prevents a flexible approach to procedures which might not fit into the fixed wing standard.

comment *1831* comment by: *claire.amos*

Point 3:- The DH for APV approach is not reflected in Point 4 or in Table 1 of AMC4 OPS.GEN.150.

comment *4666* comment by: *Eurocontrol CND*

In 3. The definition of APV is not good even though we are aware that it comes from ICAO. It says that APV does not meet the requirements for precision approach and landing and that the DH cannot be lower than 250ft. In the US APV procedures using WAAS are already flown down to 200ft DH with equivalent requirements to ILS Cat I. In Europe we intend to do the same using EGNOS once some experience has been gained. The 250ft limitation is too restrictive for this document. Approach classification is currently under review in ICAO.

I would propose that you do not say what APV is not and leave the door open for APV down to 200 ft as follows:

An Approach Procedure with Vertical guidance (APV) is an instrument approach which uses lateral and vertical guidance using SBAS or Barometric VNAV with a DH not lower than 200 ft and an RVR of not less than 550 m for aeroplanes and 500 m for helicopters.

comment *5931* comment by: *DGAC*

In this AMC, APV are limited to a DH 250ft.

However LPV (APV SBAS) can be published with a DH 200ft. FAA has published several approach procedure with DH 200'. EASA is issuing an AMC (AMC 20-28) which gives the airworthiness and operational criteria for LPV including LPV 200.

Proposal : LPV 200 should then be introduced in this AMC4. Otherwise European operator would not be able to fly LPV 200

comment *6325* comment by: *Eurocontrol CND*

In Table 1: RNAV/LNAV approaches can be designed to a 250ft OCH there is no obvious reason to add is 50ft and require 300ft minimum. There is no reason for the minimum DH/MDH to be higher for an LNAV/VNAV then a VOR/DME when the OCH is 250ft.

Please amend LNAV/VNAV minima to 250ft.

comment *6430* comment by: *Konrad Polreich*

AMC4 OPS.GEN.150

Why does it state n/a for RNAV/LNAV and NDB/DME facilities (approaches) in the coloumn 'Helicopters', since also helicopters should be able to fly approaches using these facilities.

Suggestion:

RNAV/LNAV and NDB/DME: Insert the same values as for airplanes.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC5 OPS.GEN.150 Instrument Flight Rules (IFR) operating minima p. 145-146

comment *605* comment by: *ECA - European Cockpit Association*

Comment on AMC5 OPS.GEN.150:

The limit for the vertical profile is changed to 4.5 degrees for Cat A & B aeroplanes and 3.77 degrees for Cat C & D aeroplanes instead of 4 degrees in current EU-OPS

The limit of 3.77 degrees will have a clear impact on operations on certain aerodromes. What is RVR to be used in case of steeper vertical profile? Max of AMC6 Table3?

comment *2349* comment by: *EHOC*

General

In taking this text from Appendix 1 to (New) OPS 3.430(b), only paragraphs 1 to 5 (of 6) were reproduced. As a consequence, paragraph '6. Visual reference' has been omitted. This is the only procedure where the visual reference is not contained in the text.

Although it could be regarded as illogical to provide an operational instruction inside a method of establishing approach (and take-off) minima, from the very inception of JAR-OPS Appendix 1 to OPS X430 has been provided in the form of a template with each of approach procedures 'hung' onto the skeleton. All procedures had one paragraph dedicated to *Visual Reference*.

Operators/pilots become familiar with templates and, when producing their operational manuals or, when seeking to clarify the provisions of a procedure, reference to the regulations is simple and familiar.

Is is suggested that paragraph 6 is reinstated to ensure elements, required for visual reference, are in the procedure.

comment *7427* comment by: *Axel Schwarz*

Under 2. amend the first sentence with "for precision approaches, or the MAPt for non-precision approaches", since a DA/H is only specified for precision approaches.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC6 OPS.GEN.150.A Instrument Flight Rules (IFR) operating minima p. 146-149

comment *90* comment by: *Air Southwest*

There seems to be something wrong with either the formula in paragraph 2, or

the computed figures in table 2(FALS).

Taking a CAT I ILS with 3 deg GP with DH = 200ft; and ICAO CAT I lighting (centreline = 900m) this gives:

(200 x 0.3048) = 60.96; 60.96 ÷ tan 3 deg (0.0524) = 1164; 1164 - 900 = 264m (table 2 (FALS) gives 550m)

It just about works for DH = 250ft (554m v table 2 = 550m), but for MDH 350ft it gives 1136m (table 2 = 900m)

There also seems to be a discrepancy in the figures in table 2 (FALS) and those in EU-OPS App 1 to OPS 1.430 tables 4a and 5.

Also, there doesn't seem to be a statement anywhere (OPS.GEN.150 or OPS.CAT.150 or in the AMCs or GMs) that the minimum RVR for CAT I operations is 550m. In EU-OPS App 1 to OPS 1.430(c)(1) it is clearly stated that the minima for CAT I is DH 200ft and 550m RVR. The cross reference to EU-OPS App 1 to OPS 1.430(c) [page 27 of section f.] refers to AMC5 OPS.GEN.150, but this is erroneous.

Note also, ICAO Annex 14 (5.3.4.10 - Note) states that where a CAT I approach lighting system is less than 900m CAT I operations may be prejudiced. {At 200ft on a 3 deg GP the aircraft will be 900m from the threshold}.

comment *307* comment by: *Rega / Swiss Air-Ambulance*

AMC6 OPS.GEN.150.A Instrument Flight Rules (IFR) operating minima

Scope:

Application of RVR in relation to DH for ILS category I approach operation. Typing error to be corrected.

Text to be added:

Paragraph 5a. of AMC6 OPS.GEN.150.A Instrument Flight Rules (IFR) operating minima needs to corrected.

a. for Category I approach operations to runways with Full Approach Light Systems (FALS), Runway Touchdown Zone Lights (RTZL) and Runway Centerline Lights (RCLL), provided that the DH is not **less** than 200 ft.

Proof:

Focusing to Table 2 of AMC6 OPS.GEN.150.A RVR/CMV vs DH/MDH the wording "provided that the DH is not more than 200ft" makes no sense, the correct wording must be "provided that the DH is not less than 200ft"

Background:

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. Its services range from providing medical advice to repatriating patients to/from Switzerland or any other point of the world. Swiss air-ambulance is a private, non-profit organisation, which operates in accordance with the guiding priniples of the Red Cross. It comes to the aid of people in distress, without

respect of their nationality, religious convections or social status. Swiss air-ambulance operates under the Air Operator Certificate CH-AOC-No.1015 issued by the Federal Office of Civil Aviation Switzerland (FOCA) and is compliant with EU-OPS. Please visit www.rega.ch

comment *606* comment by: *ECA - European Cockpit Association*

European Regions Airline Association Comment

The text is understood to apply also to non-circling procedures to provide an upper cut-off for special (one-off) approach operations with clear public interest. However this is not clear so some clarification is required.

comment *5933* comment by: *DGAC*

There are some mistakes in the minima table, in particular for DH from 441 ft to 500ft, when the class of lightning is BALS

Please consider the EU OPS table 5 of the appendix 1 OPS 1.430 instead.

The differences are highlighted below :

Table 2 (AMC 6A OPS.GEN.150)	Table 5 (App 1 1.430 (d))
Part-OPS (AMC6 OPS.GEN.150.A)	***EU-OPS (App 1 1.430 (d))***

DH ou MDH	Class of lighting facility				Class of lighting facility			
	FALS	IALS	BALS	NALS	FALS	IALS	BALS	NALS
ft	m				m			
421-440	1300	1600	1800	2000	1300	1600	1800	2000
441-460	1400	1700	***1800***	2100	1400	1700	***1900***	2100
461-480	1500	1800	***1900***	2200	1500	1800	***2000***	2200
481-500	1500	1800	***2000***	2300	1500	1800	***2100***	2300
501-521	1600	1900	2100	2400	1600	1900	2100	2400

Table 3 of AMC6 OPS.GEN.150.A

For non precision approaches which do not fulfil the CDFA criteria (3rd category), add the following sentence (bold underlined text) :

Max	According to table 2 of AMC6 OPS.GEN.150.A if flown using the CDFA technique, otherwise an add-on of 200/400m applies to the values in Table 2 of AMC6 OPS.GEN.150.A but not to result in a value exceeding 5000 m. **If this value is lower than the Min value, the maximum value to be considered is the value from the above Min line.**

Reason: To avoid misinterpretation when the "maximum" value extracted from table 2 is lower than 1000m (CAT A & B) or 1200m (CAT C & D): It is just to emphasize that in any case RVR cannot be lower than those minimal values.

comment *6454* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Comment

There are 4 types of facilities defined according ICAO + FAA requirements by now. What is the reason and benefits for including FAA concerns into European legislation ?

comment *6456* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Comment

Moreover BALS figures and DH/MDH between 441 and 500 ft must be harmonized between EU-OPS (Appendix 1 to OPS 1.430 (New)) and Part-OPS as those figures come from the same formula (Required RVR/Visibility (m) = [(DH/MDH (ft) x 0.3048)/tan a] - length of approach lights(m)).So It cannot vary.

Proposal

The calculation for Table 2 of AMC6 OPS.GEN.150.A RVR/CMV vs DH/MDH may be done again.

Justification

obvious

comment *6613* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Comment

Even if Table 3 of AMC6 OPS.GEN.150.A complies with new requirements of appendix 1 (new) to OPS 1.430 from EU-OPS, it is still hardly understandable for operators.

Proposal

The appearance, explanation and use of this table should be more explicit and practical.

Justification

Table 2 of AMC6 OPS.GEN.150.A RVR/CMV vs DH/MDH

Comment:

The figures of the table are not correct and different from EU-OPS

441-460 BALS =1800 (EU-OPS: 1900)

461-480 BALS =1900 (EU-OPS: 2000)

481-500 BALS = 2000 (EU-OPS : 2100)

Proposal:

Realign with EU-OPS

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC7 OPS.GEN.150.H Instrument Flight Rules (IFR) operating minima p. 150-151

comment *1003* comment by: *EHOC*

General

See also the comment on OPS.GEN.200(c).

See also the comment on the absence of RNAV/LNAV for helicopters.

This AMC does not appear to include a paragraph with the required *visual references* - this is the correct place-holder for such text, not OPS.GEN.200 (which specifically addresses the approach ban); the table includes RNAV/LNAV which might, when applied to helicopters, not result in a termination at a runway. The absence of a *visual reference* paragraph, prevents a flexible approach to procedures which might not fit into the fixed wing standard

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC8 OPS.GEN.150.A Instrument Flight Rules (IFR) operating minima p. 151-152

comment *609* comment by: *ECA - European Cockpit Association*

Comment on AMC8 OPS.GEN.150.A: This complete part should be an IR, not as AMC.

Justification:

All requirements of MDH/RVR should be published as Implementing Rules.

comment *1581* comment by: *ECA - European Cockpit Association*

Comment on paragraph 4.: change as follows:

4. Notwithstanding the requirements in AMC8 OPS.GEN.150.A 3. above and limited to locations where there is a clear public interest to maintain current operations, the visibility may ~~**not be increased above**~~ **be permitted at** the values derived from Table 1 of AMC8 OPS.GEN.150.A. **This will require a documented safety case, establishing the extent and nature of the variation and the mitigating factors in place to justify it. This will take not be increased above the values derived from Table 1 of AMC8 OPS.GEN.150.A,** taking into account the operator's experience, training programme, documentation and flight crew qualification.

Justification:

If there is a reason for the minima to be increased then there needs to be clear and transparent method for justifying another value. The operators experience is actually the experience of the crew. There needs to be a formal analysis of how such operations have been carried out and a documented rationale developed to ensure continued compliance with a target level of safety, otherwise it would be very easy to lose sight of what made the operation acceptable. The suggested wording deals with that aspect.

comment *3465* comment by: *M Wilson-NetJets*

Original text:

(4) Notwithstanding the requirements in AMC8 OPS.GEN.150.A 3. above and limited to locations where there is a clear public interest to maintain current operations, the visibility may not be increased above the values derived from Table 1 of AMC8 OPS.GEN.150.A, taking into account the operator's experience, training programme and flight crew qualification.

Suggested new text:

4. Notwithstanding the requirements in AMC8 OPS.GEN.150.A 3. above and limited to locations where there is a clear public interest to maintain current operations, the visibility may not be **decreased below** the values derived from Table 1 of AMC8 OPS.GEN.150.A, taking into account the operator's experience, training programme and flight crew qualification.

Comment/suggestion:

It appears that the visibility requirement has been reversed.

comment *5904* comment by: *ERA*

European Regions Airline Association Comment

The text is understood to apply also to non-circling procedures to provide an upper cut-off for special (one-off) approach operations with clear public interest. However this is not clear so some clarification is required.

comment *311* comment by: *CAA-NL*

Attachments #15 #16

Sent the attached file as EASA RPF december 2006.

This proposed rulemaking form has opbviously been used for this NPA as it is fully translated into table 1 of AMC2 OPS.SPA.020.LVO.

Unfortunately the translation into table 1 of this AMC has gone wrong due to misreading of the columns on the 'RVR assessment systems' and 'approach lights'. For both the left column should equal the right.

Furthermore item 2c above table 1 concerns cat II/III and should be deleted as this is mentioned in AMC2 OPS.SPA.020.LVO.

For completeness the initial EASA RPF and table have been added.

comment *774* comment by: *Lukas KISTLER*

Helicopters conducting a Precision Approach CAT I to an onshore facility can do so even without any lighting system (as described in Table 2 of AMC7 OPS.GEN.150.H).

Given that fact a downgraded facility (Approach lights u/s in Table 1 of AMC12 OPS.GEN.150) should still be available to helicopters using a minimum RVR of 1000m.

comment *882* comment by: *Condor Flugdienst GmbH - FRA HO/R*

Referint to AMC 12 OPS.GEN.150 – Table 1:

We suggest to retain „no effect for

CAT I" when all **RVR assessment systems** are inop (refer to EU OPS). Furthermore, we suggest for CAT I without approach lights same minima as for NALS. We suggest for CAT I with approach lights of only 210 m to use the same minima as for NALS. There is no logic in prohibiting either an CAT I approach without approach lights nor a CAT I approach with rudimentary approach lights.

comment *925* comment by: *REGA*

Helicopters conducting a Precision Approach CAT I to an onshore facility can do so even without any lighting system (as described in Table 2 of AMC7 OPS.GEN.150.H).

Given that fact a downgraded facility (Approach lights u/s in Table 1 of AMC12 OPS.GEN.150) should still be available to helicopters using a minimum RVR of 1000m.

comment *1234* comment by: *AUSTRIAN Airlines*

How shall we use the table falied or downgraded equipment for LTS Cat I and OTS Cat II?

The problem:

1) LTS Cat I and OTS Cat II are not shown in table falied or downgraded equipment

2) In GM1 OPS.SPA.001.LVO - Terminology the definition shows:

h. 'Lower than Standard Category I Operation'. A Category I Instrument Approach and Landing Operation using Category I DH, with an RVR lower than would normally be associated with the applicable DH.

i. 'Other than Standard Category II Operation'. A Category II Instrument Approach and Landing Operation to a runway where some or all of the elements of the ICAO Annex 14 Precision Approach Category II lighting system are not available.

that implies, that for the LTS Cat 1 the "standard" Cat I rules (tables) apply (if not otherwise indicated) and for OTS Cat 2 the "standard" Cat II rules (tables) apply (if not otherwise indicated).

Now back to table falied or downgraded equipment: with this interpretation i use Cat I column for LTS Cat I and Cat II column for OTS Cat II. 3) The problem now is that the LTS Cat I requires autoland and the visual references like Cat II and OTS Cat II does NOT require a Cat II approach light system but can also be used with NALS, IALS, etc .. Some examples where this does not match in table falied or downgraded equipment:

When i use the Cat I column for LTS Cat I:

- Column "Touchdown zone RVR assessment system": should be the same as Cat 2

When i use the Cat II column for OTS Cat II:

- Column "Approach lights": Should be same as for Cat I (Minima for NALS apply)
- Column "Approach lights except the last 210 m": Should be same as for Cat I (Minima for NALS apply)
- Column "Whole runway light system": Should be same as for Cat I (Minima for NALS apply)
- Column "Centreline lights": Day RVR 300 is not applicable as lowest RVR cat OTS Cat II is 350!
- Column "Touchdown zone lights": Day RVR 300 is not applicable as lowest RVR cat OTS Cat II is 350!

comment *1583* comment by: *ECA - European Cockpit Association*

Comment: changes in the table as follows:

Edge lights, threshold lights and runway end lights:

- Day – no effect
- Night – not permitted **<u>at any time during an approach</u>**

Centreline lights :

- No effect if ~~**F/D,**~~ HUDLS or auto-land otherwise RVR 750 m

Justification:

Not sure why the F/d has been included, as the landing manoeuvre is a visual one and F/D offers no assistance.. Suggest F/D be deleted

comment *1779* comment by: *claire.amos*

Does this mean loss of the entire combination or any part thereof?

comment *2076* comment by: *Airbus S.A.S.*

The sub-paragraph AMC12 OPS.GEN.150.A (2)(a) reads:

"Multiple failures of runway / FATO lights other than indicated in Table 1 of AMC12 OPS.GEN.150 may not be acceptable".

This provision, as written, is unclear.

In this sentence, "may not be acceptable" should be replaced by "are not acceptable".

Paragraph No: AMC12 OPS.Gen.150 (1.)

Comment:

Para 1. refers to outer marker or equivalent position.

The reference should be to 1000ft above aerodrome.

Justification:

The outer marker or equivalent position is no longer used as the approach ban point. OPS.GEN.200 now refers to 1000 ft above the aerodrome.

Proposed Text (if applicable):

AERODROME MINIMA – EFFECT ON LANDING MINIMA OF TEMPORARILY FAILED OR DOWNGRADED GROUND EQUIPMENT

1. These instructions are intended for use both pre-flight and in-flight. It is however not expected that the pilot-in-command would consult such instructions after passing ~~the outer marker or equivalent position~~ ***1000ft above the aerodrome***. If failures of ground aids are announced at such a late stage, the approach could be continued at the pilot-in-command's discretion. If failures are announced before such a late stage in the approach, their effect on the approach should be considered as described in Table 1 of AMC12 OPS.GEN.150, and the approach may have to be abandoned to allow this to happen.

comment *7351* comment by: *FAA*

1. Table 1 of AMC12 OPS.GEN.150; *and*

paTable 1 of AMC2 OPS.SPA.020.LVO

Comment:

The tables which describe the affect of failed or downgraded equipment on landing minima only apply to operational requirements. A similar strategy should be applied to navaid facility, aerodromes, and air traffic control requirements. The determination that a facility or instrument approach procedure is not suitable for use negates the intent and the effects of these tables for operators. Similar standards are needed to authorize continued operations in the event of system downgrades or failures. In some circumstances, it may be appropriate for approved operators to continue in the event of component failures if those operators use suitable equipment, training, and procedures to mitigate the failure of specific components.

Recommendation:

Apply similar navaid facility, aerodrome, and air traffic control requirements in the event of component failure.

comment *7355* comment by: *FAA*

1. Table 1 of AMC12 OPS.GEN.150

Comment:

The rows "Approach Lights" and "Approach lights except the last 210 m" indicates that Category I is not permitted. This should be changed to "minima as for NALS" which is the same as the APV. Category I operations can be conducted without approach lights.

Recommendation:

The "Minima as for NALS" should be used for both columns.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - GM1 OPS.GEN.150.A Instrument Flight Rules (IFR) operating minima p. 154

comment *610* comment by: *ECA - European Cockpit Association*

Comment on GM1 OPS.GEN.150.A: This complete part should be an IR, certainly not as GM.

Justification:

Airplane categories is crucial information and should be standard categories established as implementing rule.

comment *1584* comment by: *ECA - European Cockpit Association*

Comment on paragraph 3.: change as follows:

3. Permanent change of category (maximum landing mass):

a. An operator may impose a permanent, lower, landing mass, and use this mass for determining the VAT **amendable only via the operations manual**

and not varied on a frequent basis. A change should not be valid for not less than a month unless exceptional circumstances occur, such as permanent substitution caused by technical reasons occur;

b. The category defined for a given aeroplane should be a permanent value and thus independent of the changing conditions of day-to-day operations;

c. The category should be stated in the operations manual, where required.

Justification:

ECA requests clarification:

The term "permanent needs" clarification. Definition of the term is needed.

comment *3376* comment by: *M Wilson-NetJets*

Original text:

3. Permanent change of category (maximum landing mass):

a. An operator may impose a permanent, lower, landing mass, and use this mass for determining the VAT;

b. The category defined for a given aeroplane should be a permanent value and thus independent of the changing conditions of day-to-day operations; c. The category should be stated in the operations manual, where required.

Suggested new text:

4. Permanent change of category (maximum landing mass) for certain aerodromes:

a. An operator may impose a permanent, lower, landing mass for certain aerodromes, and use this mass for determining Vat;

b. The category for a given aeroplane at a given aerodrome should be a permanent value thus independent of changing conditions of day to day operations in and out of that aerodrome;

c. The category should be clearly stated in the route manual for that given aerodrome:

d. The operator shall conduct special training as necessary to familiarize flight crew with the limitations of operating to a lower category at that aerodrome and should have mitigating procedures in place to prevent flight crew flying at higher categories at that aerodrome than designated by the operator;

e. The operator should ensure that no other limitation of the aerodrome and its associated procedures are exceeded.

Comment/suggestion:

Certain aerodromes have limiting categories for aeroplanes. These limitations usually are due to airspace or procedural restrictions. Due to the limited number of movements of these business jet operators at those aerodromes it would not be cost effective to design new procedures or change airspace restrictions to accommodate higher categories as it would for an airline operator with less total number of destinations and a subsequent larger number of movements at those destinations. It is feasible to operate at lower categories if there are sufficient safeguards and training in place to prevent accidently flying at higher categories and that no other limitations are exceeded. Therefore, it is suggested to add a 4th point describing this

possibility.

comment *7320* comment by: *ANE (Air Nostrum) OPS QM*

We suggest to add the following:

For aircraft certified for Landing with different flap setting the operator has to choose one flap setting for selecting Aircraft approach category (A; B, C, D) The operator can choose any flap setting for any landing as long as he applies at least the minimums that apply to that approach cat. The operator should be able, after being approved, to be able to aply a different approach minima.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - GM2 OPS.GEN.150.A Instrument Flight Rules (IFR) operating minima p. 155-165

comment *540* comment by: *ECA - European Cockpit Association*

Comment on GM2 OPS.GEN.150.A:

ECA requests clarification:

An approach using the CDFA technique will always be flown as an SAp, since this is a requirement for applying CDFA.

Is a Stabilised approach a prerequisite for a CDFA?

According to blz 103 GM OPS.GEN.010 Definitions:

"Stabilised Approach (SAp)' means an approach which is flown in a **controlled and appropriate** manner in terms of configuration, energy and control of the flight path" and is applicable to <u>any</u> approach.

comment *562* comment by: *ECA - European Cockpit Association*

Comment on GM2 OPS.GEN.150.A(5)(f): editorial change:

The number "1000" should be written on one line.

comment *563* comment by: *ECA - European Cockpit Association*

Comment on GM2 OPS.GEN.150.A(7): change as follows:

7. Operational procedures and instructions for using the CDFA technique or not:

a. The operator should establish procedures and instructions for flying approaches using the CDFA technique ~~**and**~~ **<u>or</u>** not. These procedures should be included in the operations manual and should include the duties of the flight crew during the conduct of such operations:

comment *564* comment by: *ECA - European Cockpit Association*

Comment on GM2 OPS.GEN.150.A(6): change as follows:

6. Visual reference and path-control below MDA/H when not using the CDFA technique~~.~~ **:**

In addition to the requirements stated in OPS.GEN.150 and its AMC material the pilot should have attained a combination of visual cues to safely control the aeroplane in roll and pitch to maintain the final approach path to landing. This should be included in the standard operating procedures and reflected in the operations manual.

Justification:

Under point 6: a ":" should follow the first sentence i.s.o. a dot.

General

It is not possible to distinguish the contents of any of the AMCs/GMs to OPS.GEN.150 from the description in the index; there is a necessity to have the description of the material (the second line) within the index. Without an appropriate entry, an intimate knowledge of the contents is required before any guidance can be found.

Paragraph 6.

Within paragraph 6. - Visual Reference, is the following text: "In addition to the requirements stated in OPS.GEN.150 and its AMC material".

In the original rules each type of procedure (take-off, non-precision, Cat 1, Cat 2, Cat 3A and B and ARA) had a description contained in Appendix 1 to JAR-OPS X.430. Each type of procedure was logical described and always included a single paragraph which was dedicated to *'Visual Reference'*.

It is clearly understood why the procedures have been split into that contained in OPS.GEN.150 - which can be applied without approval, and Subpart SPA.LVO which requires a separate approval.

The text that is contained in Subpart SPA.LVO, and specifically Appendices 2 and 3, follows quite closely the order that was contained in the original text; they both also contain a specific paragraph that deals with the required *'Visual Reference'*.

On examination of the AMCs to OPS.GEN.150 whilst it can be seen that whilst AMC3 to OPS.GEN.10 - Take-off Minima, follows quite closely the intent and order of the original rule and therefore contains two paragraphs on the requirement for '*Visual reference*', the same is not true for non-precision and Cat 1 approaches where there is now no appropriate paragraph.

Bearing in mind that the most important part of the procedure is the transition from instrument flying to visual flying - which might occur at the DA/H, MDA/H, it is imperative that text for '*Visual Reference'* is reinstated into the appropriate AMCs.

comment *1585* comment by: *ECA - European Cockpit Association*

Comment on paragraph 4.g.: change as follows:

g. When applying CDFA on an approach with a nominal vertical profile to a DA/H, it ~~**may**~~ **will** be necessary to apply an add-on to the published minima (vertical profile only) to ensure sufficient obstacle clearance **and that obstacle surfaces are not penetrated**. The add-on, if applicable, should be published in the operations manual **for each airport performance class** (Aerodrome Operating Minima). However, the resulting procedure minimum will still be referred to as the DA/H for the approach;

Justification:

An add-on is vital to avoid penetrating the obstruction surfaces. Guidance should be given as to the minimum values required to allow for the initiation of the go-around maneuver in timely manner so as not to penetrate these surfaces. Ideally these should be for each category of aircraft and helicopter.

comment *1586* comment by: *ECA - European Cockpit Association*

Comment on paragraph 4.h.: change as follows:

h. Operators should establish a procedure to ensure that an appropriate callout (automatic or oral) is made when the aeroplane is approaching DA/H. If the required visual references **as specified for the approach** are not established at DA/H, the missed approach procedure is to be executed promptly. Visual contact with the ground alone is not sufficient for continuation of the approach. With certain combinations of DA/H, RVR and approach slope, the required visual references may not be achieved at the DA/H in spite of the RVR being at or above the minimum required for the conduct of the approach. The safety benefits of CDFA are negated if prompt go-around action is not initiated;

Justification:

Operators will need to specify what cues are acceptable for certain approaches where visual cues may be non standard. Wording amended to reflect this.

comment *1587* comment by: *ECA - European Cockpit Association*

Comment on paragraph 5.g.: add text as follows:

g. For approaches where the pilot has visual reference with the ground, stabilisation should be achieved not later than 500 ft above aerodrome

elevation. However, it is recommended that **whenever possible** the aeroplane should be stabilized when passing 1000 ft above runway threshold elevation; **in the case of circling approaches flown after a CDFA, it is recommended that the aircraft be stabilised in the circling configuration not later than passing 1000 ft above the runway elevation.**

Justification:

To cater for circling approaches the wording be modified to reflect the circling configuration requirements. This may usefully be added to the IFR approach

requirements.

comment *1778* comment by: *claire.amos*

Point f. ii

Can MDA really be used as DA?

comment *2077* comment by: *Airbus S.A.S.*

The text proposed in GM2 OPS.GEN.150.A (3)(h) endorses the complete TGL 44 Para 3.8 (TGL page 65). For clarity and consistency reasons, also the sub-title "Missed approach" should be kept in front of " The manoeuvre associated with...", as used in TGL 44.

comment *2079* comment by: *Airbus S.A.S.*

Typo error.

The end of first line of sub-paragraph GM2 OPS.GEN.150.A (4)(i)(ii) should read:

"The target ROD should not exceed 1000 fpm". Delete ")"

comment *2081* comment by: *Airbus S.A.S.*

The text proposed in GM2 OPS.GEN.150.A (4)(i)(ii) endorses provisions of TGL44, § 4.9(b) "Rate of Descent" (Page 66). The TGL paragraph allows a ROD deviation up to ±300 fpm from the target ROD.

The proposed text reads:

"The ROD should deviate by no more than + 300 fpm".

For consistency reason with TGL 44, replace wording "+ 300 fpm" with "±300 fpm".

comment *3095* comment by: *Michael Hoeck*

Page 163, Item 8 Training:

to me its not clear if the CDFA technique training is required for ALL operators or the AOC holders only. this is because of the cross reference to Part OR.OPS.FC

In Addition I think that legislation has been overtaken by reality, I doubt that many operators don´t use their aircrafts abilities to fly an CDFA`s. The modern avianic suites mnake it way easier to fly an CDFA rather than a non CDFA.

Make the CDFA an requirement on a Class/Typerating used in IFR and then there is no need for further trainng. For existent C/R´s and or T/R`s make a

CDFA mandatory on the checkride and then we are done.

Special training is IMO not required.

GM2 OPS.SPA.001.LVO Low visibility operations (LVO)

AMC OPS.SPA.001.LVO(b)(1) Low visibility operations (LVO)

Comment:

Such material is in opposition to the concept of "performance-based rulemaking". It is all detailed procedure description, but not a rule to comply with. The flexibility promised by EASA through the "performance-based rulemaking" is odd: It is true that the Implementing Rule **seems** to be leaner now than before, but all the details and in many cases even new texts have been added to the AMC (which are factual rules) and GM (which are factual audit basis).

As presented, the concept of "performance-based rulemaking" fails to convince.

Proposal:

Keep the **Implementing Rules as close as possible to EU-OPS (as having been tasked),** and refrain from detailed and/or extended procedure descriptions in AMC and GM.

Put in the rule, only what the operator has to do. It's reference document

comment *5936* comment by: *DGAC*

Inconsistency between 1.d and 2.b.1 :

1.d says that **CDFA** is a technique to fly any non precision approach (that is to say an approach which has **no designated vertical profile**).

*2.b.1 introduces the concept of **designated vertical profile** for a **CFDA***

APV is not considered as a non precision approach, since it is an approach which has a designated vertical profile which has to be flown with the appropriate vertical guidance.

AMC5 OPS.GEN.150 clearly makes the distinction between approach with designated vertical profile (ILS, MLS, GLS, PAR and APV) and instrument approach procedure flown using CDFA technique

Solution: All the reference to APV should be suppressed from this GM2..

B. II. Draft Decision - Part-OPS - Subpart A - Section II - GM3 OPS.GEN.150.A Instrument Flight Rules (IFR) operating minima p. 165-168

comment *565* comment by: *ECA - European Cockpit Association*

Comment on GM3 OPS.GEN.150.A(2): change as follows:

GM3 OPS.GEN.150.A Instrument Flight Rules (IFR) operating minima

AERODROME MINIMA – CIRCLING – AEROPLANES

1. Terminology: XLS = ILS/MLS/GLS etc.

2. Visual manoeuvring (circling)~~.~~ **:**

The purpose of this guidance material is to provide operators with supplemental information regarding the application of aerodrome operating minima in relation to circling approaches.

Justification:

After '(circling)' a : should follow i.s.o. a dot.

comment *798* comment by: *French SAMU using helicopters for medical transport*

AERODROME MINIMA –VISUAL MANOEUVERS –HELICOPTERS chapter is totally missing

We consider that something similar to the AEROPLANE PART should be developed. It is important to specify that during the visual phase the pilot shall maintain a minimum speed between VTOSS and VIMC and attract pilot attention that low speed with strong down winds may generate vortex or settling with power risk.

comment *1588* comment by: *ECA - European Cockpit Association*

Comment on paragraph 3.: add point d. as follows:

3. Conduct of flight – General:

a. The MDH and OCH included in the procedure are referenced to aerodrome elevation;

b. The MDA is referenced to mean sea level;

c. For these procedures, the applicable visibility is the meteorological VIS.

d. Operators shall provide tabular guidance of the relationship between height above threshold and the in-flight visibility required to obtain and sustain visual contact during the circling manoeuvre.

Justification:

This does not require a clear explanation of the relationships between the visibility minima and the In flight visibility likely to be needed to execute such an approach. For example, 2400 meters is a little over 1.3 nm, at which value the runway threshold would be visible at only 450 ft in ideal conditions on a 3

degree descent path.

Guidance should be provided to ensure that realistic assumptions are made as to the likelihood of success of an approach flown in poor visibility. The suggested wording adds a requirement for the operator to provide this as guidance.

comment *1589* comment by: *ECA - European Cockpit Association*

Comment on paragraph 4.f.: change as follows:

f. Descent below MDA/H should not be initiated until the threshold of the runway to be used has been appropriately identified ~~**and t.**~~ **The aeroplane must be is in a position to continue clear of all obstructions along the line of flight, with a normal rate of descent and land within the touchdown zone. The stabilised approach criteria of should be observed, in particular the suggested 1000ft and 500ft minimums for stabilisation. Caution should be exercised when flying outside of the defined areas of coverage of any visual approach aids such as PAPIS, as obstacle clearance may be reduced.**

Justification:

This is still somewhat vague and is open to misinterpretation as to what constitutes a "normal" rate of descent and how this relates to the obstacle clearance planes around a runway and the extended centreline. This needs to be clarified, in particular where the obstructions dominating the minima may be within the segment flown. The criteria should at least contain the clear position of the aircraft relative to the threshold and the centreline. The wording is indicative of the type of wording required.

comment *3258* comment by: *Eurocontrol CND*

1. introduces XLS terminology, but excludes PAR - in citations before PAR was always included. What is the reason for not mentioning PAR?

comment *5106* comment by: *M Wilson-NetJets*

comment *6439* comment by: *Konrad Polreich*

GM4 OPS.GEN.150.H

What is the sense of the requirement to be 'clear of cloud at TDP' when taking-off in fog with a visibility of 150 m?

Is this fog condition considered a cloud?

I suggest to change to the following sentence.

Suggestion:

The visibility (or conditions) should be such as to allow for the pilot flying to remain in sight of the surface, as to be able to safely reject the take-off, until reaching the Take-off Decision Point (TDP)/Defined Point After Take-Off (DPATO) and the minimum speed for flight in IMC, as stated in the AFM.

Or use the sentence of AMC1 OPS.CAT.335.H (1)(b), which is sufficient.

GM1 OPS.GEN.155.A (a)(3)

This reference doesn't exist. Should it be GM1 OPS.GEN.155. (e)(3)?

Second: Why is there no definition of an isolated place of intented landing for helicopters, since there is a requirement to plan a PNR, when flying to an isolated landing site.

Change GM1 OPS.GEN.155.A (a)(3) into GM1 OPS.GEN.155. (e)(3) and add a suitable definition of an isolated place of intented landing for helicopter also.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - GM2 OPS.GEN.155.H Selection of alternate aerodromes p. 168-169

comment *2519* comment by: *Royal Aeronautical Society*

The text in paragraph 3 a refers to "a specified period of validity, which is normally not less than nine hours, or more than 24 hours in duration". TAFs are now issued with a period of validity up to 30 hours. **It is suggested that '24' be amended to read '30'**.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC OPS.GEN.165.A Noise abatement p. 170

comment *91* comment by: *Air Southwest*

Paragraph 1 doesn't make sense (is the word "which" superfluous?).

Paragraph 2 is ambiguous. Does the noise abatement procedure or the pilot-in-command have the detrimental effect of aircraft safety? Suggest re-write "

Noise abatement procedures are to be complied with except when aircraft safety would be prejudiced."

comment 542 comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.GEN.165.A: add the following text:

3. Noise abatement procedures should only be applied when noise benefits can be expected.

4. Noise abatement procedures should only be considered in a balanced approach to the local noise problem.

comment 1678 comment by: *Dassault Aviation*

Editorial comment.

Page 170: AMC OPS.GEN.165.A §1: removed "which" to read "*The operator's noise abatement procedures for departure and arrival/approach for each aircraft type, ~~which~~ should be designed to be simple and safe to operate with no significant increase in crew workload during critical phases of flight.*"

comment 2520 comment by: *Royal Aeronautical Society*

Paragraph 1 contains an unnecessary comma followed by the unnecessary word 'which'. **It is suggested that the relevant text should be amended to read, '… for each aircraft type should be designed …'.**

A third paragraph is needed to reflect the recent insertion in ICAO PANS-OPS (Doc 8168), Volume I, Part V, Chapter 2 subparagraph 2.1.3 and in PANS-ATM (Doc 4444) Chapter 7 subparagraph 7.2.5, thus: **'3. A pilot-in-command prompted by safety concerns can refuse a runway offered for noise preferential reasons'**. ICAO sanctioned this amendment as a partial response to a fatal accident in a European State in which a pilot did not challenge an air traffic instruction driven largely by noise mitigation reasons to perform a non-precision approach in poor weather conditions when a precision approach was available on another runway.

comment 3193 comment by: *AEA*

Relevant Text:

Operating Procedures shall take into account the need to mimise the effect of aircraft noise

Comment:

The possibility for the pilot in command not to follow the noise abatement procedures whenever there is a detrimental effect on aircraft safety should not be in the AMC (see page 170, AMC.OPS.GEN.165A) but should be in the hard-law. As currently written, EASA seems to give priority on environmental issue above safety. The unclear spread of noise abatement requirements between

hard-law, AMC and guidance material does not provide legal certainty. This proposal is therefore unacceptable to AEA since it could result in some airport authorities forcing airlines to fly unsafe procedures.

Proposal:

Realign with EU-OPS 1.235 at the level of hard law

1. The operator's noise abatement procedures for departure and arrival/approach for each aircraft type, which should be designed to be simple and safe to operate with no significant increase in crew workload during critical phases of flight.

Comment:

Delete the word 'which' (editorial)

Proposed Text:

1. The operator's noise abatement procedures for departure and arrival/approach for each aircraft type, ~~which~~ should be designed to be simple and safe to operate with no significant increase in crew workload during critical phases of flight.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - GM OPS.GEN.165.A Noise abatement p. 170

comment *92* comment by: *Air Southwest*

Use of the word "may" is vague. Suggest re-write to read "Commercially available information specifying minimum terrain altitudes is acceptable as means of compliance."

comment *544* comment by: *ECA - European Cockpit Association*

Comment on GM OPS.GEN.165.A: change as follows:

4. "Sequence of actions" means the order**, height/altitude** and the timing in which these pilot's actions are done.

5. Example:

For a given aeroplane type, when establishing the distant NADP, an operator should choose either to reduce power first and then accelerate, or to accelerate first and then wait until slats/flaps are retracted before reducing power. The two methods constitute two different sequences of actions. For an aeroplane type, each of the two departure climb profiles may be defined by:

a. one sequence of actions (one for close-in, one for distant);

b. two Above Aerodrome Level (AAL) altitudes/heights:

c. the altitude of the first pilot's action (generally power reduction with or without acceleration). This altitude should not be less than 800 ft AAL; or

d. the altitude of the end of the noise abatement procedure. This altitude should usually not be more than 3 000 ft AAL.

~~**These two altitudes may be runway specific when the aeroplane Flight Management System (FMS) has the relevant function which permits the crew to change thrust reduction and/or acceleration altitude/height. If the aeroplane is not FMS equipped or the FMS is not fitted with the relevant function, two fixed heights should be defined and used for each of the two NADPs.**~~

Justification:

Every different altitude/height for acceleration or configuration change constitutes of a different noise abatement procedure. (In fact, this is implied by

timing).

This restriction is to increase the pilot's oversight and awareness and enhance the pilot's mental picture of the vertical profile. Easy FMS programming of this profile is not relevant for increasing a mental picture.

comment *1679* comment by: *Dassault Aviation*

Editorial comment.

Page 170: GM OPS.GEN.165.A §1 Noise abatement: "should" to be replaced by "may" to read "*For each aeroplane type only two departure procedures may be defined, in accordance with Part I Section 7 of ICAO PANS-OPS Volume 1 (Doc 8168-OPS/611), as follows:*"

a. one sequence of actions (one for close-in, one for distant);

b. two Above Aerodrome Level (AAL) altitudes/heights:

c. the altitude of the first pilot's action (generally power reduction with or without acceleration). This altitude should not be less than 800 ft AAL **(certain departures with low intitial level-off altitudes may require earlier thrust/power reductions during low take-off mass departures or for high performance aeroplane types)**; or

d. the altitude of the end of the noise abatement procedure. This altitude should usually not be more than 3 000 ft AAL. These two altitudes may be runway specific when the aeroplane Flight Management System (FMS) has the relevant function which permits the crew to change thrust reduction and/or acceleration altitude/height. If the aeroplane is not FMS equipped or the FMS is not fitted with the relevant function, two fixed heights should be defined and used for each of the two NADPs.

Comment / suggestion:

Certain departure procedures require level-off at low altitudes/heights above the AAL. These level-offs require aeroplanes that take-off at low take-off mass or high performance aeroplane type in general to reduce thrust/power at an altitude lower than 800ft AAL to be able to capture the lower altitude/height and not overshoot it.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - GM OPS.GEN.175 Minimum flight altitudes p. 172

comment *487* comment by: *EHOC*

General

Whilst it is understood that this is in GEN and therefore is available to anyone, it was provided in the original to permit en-route let down whilst offshore - i.e. a cloud break procedure over water to VFR below (used to: avoid complex RADAR let downs at the oil field; or as part of the coastal airport procedure etc.). Attempting to generalize the rule has now made it completely obscure and probably not practical. Perhaps the best that can be done it to return the use to the application for which it was provided - offshore operations.

"An aircraft shall not be flown below specified minimum altitudes, except when:

(a)...

(b) descending in accordance with procedures approved by the State of the Operator."

This was never intended to be used for VFR operations as is now evident in by GM OPS.GEN.175; perhaps element 2. of that GM should be removed.

It is also not clear how an approval could be obtained from the 'State Overflown'.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC OPS.GEN.180.H Routes and areas of operation p. 172

comment *488* comment by: *EHOC*

General

This text in OPS.CAT.180 refers generally to terrain. This AMC for coastal transit is written to account for operations in a defined hostile environment (such as the North Sea - for which this concept was designed); this permits operation outside the specification contained in AMC4 OPS.CAT.355.H 1.a.

"PERFORMANCE CLASS 3 CRITERIA 1. Operations in Performance Class 3 should only be conducted:

a. from/to those aerodromes/operating sites and over such routes, areas and diversions contained in a non-hostile environment;"

The North Sea (by definition) is a 'hostile environment' and precludes operations in PC3. This is therefore an alleviation which permits entry to the coastal transit around the coasts of North Sea States, but only on the basis of 'non-hostile conditions'.

Perhaps "AMC H CAT OPS.GEN.180 Routes and areas of operation" should be promoted into this IR.

comment *6444* comment by: *Konrad Polreich*

AMC OPS.GEN.180.H

There is no definition of 'helicopter coastal transit operation'

Suggestion:

Insert a definition for 'helicopter coastal transit operation'

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC2 OPS.GEN.185 Meteorological conditions p. 174

comment *303* comment by: *Rega / Swiss Air-Ambulance*

AMC2 OPS.GEN.185 Meteorological conditions

Scope:

To gain the full picture for flight preparation, pilots shall also carefully evaluate (amongst the topics already specified) the winds aloft.

Text to be added:

Pilots should carefully evaluate the available meteorological information relevant to the proposed flight, such as applicable surface observations, temperatures aloft, **winds aloft**, ... rest of text no change

Proof:

Besides temperatures aloft, the winds aloft also must be carefully evaluated by the pilots to gain the full picture during flight preparation.

Background:

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. Its services range from providing medical advice to repatriating patients to/from Switzerland or any other point of the world. Swiss air-ambulance is a private, non-profit organisation, which operates in accordance with the guiding priniples of the Red Cross. It comes to the aid of people in distress, without respect of their nationality, religious convections or social status. Swiss air-ambulance operates under the Air Operator Certificate CH-AOC-No.1015 issued by the Federal Office of Civil Aviation Switzerland (FOCA) and is compliant with EU-OPS. Please visit www.rega.ch

comment *3196* comment by: *AEA*

Relevant Text:

Pilots should carefully evaluate the available meteorological information relevant to the proposed flight, such as applicable surface observations, temperatures aloft, terminal and area forecasts, AIRMETs, SIGMETs, and pilot reports. The ultimate decision whether, when, and where to make the flight rests with the pilot-in-command. A pilot also should continue to re-evaluate changing weather conditions.

Comment:

Pilots are not charge of weather prevision and observation. The provision of meteorological products is a task of the MET providers, In addition, meteo products are evolving.

Proposal:

Delete AMC2 OPS.GEN.185. Stick to EU-OPS provisions.

comment *3727* comment by: *AUSTRIAN Airlines*

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC OPS.GEN.190.B Take-off conditions p. 174

comment *5271* comment by: *Graham HALLETT*

AMC OPS.GEN.190.B

This is completely pointless and again shows a complete lack of understanding of balloon operations. This must perforce be a hand-held anemometer, since balloon operations can take place from any suitable location, rather than fixed locations, such as aerodromes. A hand held anemometer will provide an indication of the windspeed at just over two metres above ground, within the wind shadow of any suitable shelter which the prudent pilot will have selected. A balloon is 30 metres or more tall. Any balloonist with sufficient experience to be a pilot in command will be able to gauge whether the wind at 2 metres high is acceptable or not. Of more importance is the wind just above the ground, into which the balloon is launching, which will not be revealed by an anemometer

comment *5354* comment by: *Danish Balloon Organisation*

We suggest the following wording:

At the take-off site an anemometer or other suitable wind assessment equipment should be provided by the operator

Justification: Pi-balls (small helium filled balloons) give a more accurate wind assessment possibility.

comment *7541* comment by: *Pascal JOUBERT*

Most of take-off sites are protected: glades, in the trough of valley … So a take-off site anemometer is only appropriate for the beginning of inflation. This is not a guarantee of the in-flight wind.

Does air duct is an appropriate anemometer?

comment *7651* comment by: *European Balloon Corporation*

Most of take-off sites are protected: glades, in the trough of valley … So a take-off site anemometer is only appropriate for the beginning of inflation. This is not a guarantee of the in-flight wind.

Does air duct is an appropriate anemometer? If you use an anemometer at what height of the ground will you measure the wind ? The anemometer should be calibrated.

Completely overruled : remove

The only reliable meteorologic source of weather information is the nearest airport

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC OPS.GEN.195 Approach and landing conditions p. 174

comment *893* comment by: *KLM*

FATO suitability

what does suitability mean here; it should be defined or in terms and definitions specified what suitability means and comprises.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC OPS.GEN.200 Commencement and continuation of approach p. 175

comment *94* comment by: *Air Southwest*

Paragraph 2. CMV is the converted met visibility not the reported visibility. The sentence needs re-writing "...by converting the reported visibility into CMV

....."

comment 95 comment by: *Air Southwest*

Paragraph 3. Semantics perhaps, but MDA cannot be referenced to aerodrome elevation. To be correct, the first part of of paragraph 3 should read: "If the MDH is greater than 500ft or the MDA is greater than aerodrome elevation plus 500ft ....."

The last sentence could be looked at also.

comment 96 comment by: *Air Southwest*

Paragraph 4. EU-OPS 1.405(f) states that the touchdown RVR is always 'controlling.' I don't see any advantage to be gained by replacing this word with "prevailing over the other RVR values." Why use 6 words when 1 is more than adequate!

comment 566 comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.GEN.200:

ECA requests clarification:

What about a "CAT IIIb no DH", what is minimum RVR for that approach?

comment 652 comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.GEN.200(4):change text as follows:

4. The touchdown zone RVR is always prevailing over the other RVR values. If reported and relevant, the mid point and stop end RVR are also controlling. The minimum RVR should be at least:

a. 125 m for the mid-point; or

b. the RVR required for the touchdown zone; and

c. 75 m for the stop-end.

For aeroplanes equipped with a rollout guidance or control system, the minimum RVR value for the mid-point is 75 m. 'Relevant' means that part of the runway used during the high speed phase of the landing down to a speed of approximately 60 knots.

For instrument approach and landing operations, aerodrome operating minima below 800 m visibility should not be authorized unless RVR information is provided.

Justification:

This paragraph is in line with ICAO Annex 6 and should be taken into account.

comment *1099* comment by: *Condor Flugdienst GmbH - FRA HO/R*

Condor suggests to keep the rule according to EU OPS 1.405 (e)
which means the landing can be completed even if MDA +500 < RVR
provided that the required visual reference is established at the DA/H
or MDA/H and is maintained.

comment *2700* comment by: *AOPA-Sweden*

Another point where the author only thinks about major airline and airports, even that the context is relevant to GA-operations, but RVR is not used at non-tower airports. The majority of take-offs are from non-tower airports

comment *3197* comment by: *AEA*

Relevant Text:

4. The touchdown zone RVR is always prevailing over the other RVR values. If report and relevant, the mid point and stoop end RVR are also controlling:

a. 125m for the mid-point or

b. The RVR required for the touchdown zone and

c. 75m for the stop-end

Comment:

This requirement is not fully in line with EU-OPS 1.405 (Commencement and continuation of approach) since the reference of EU-OPS 1.405(e) (the approach may be continue below DA/H or MDA/H and the landing may be completed provided the required visual reference is established at the DA/H or MDA/H and is maintained) is missing.

Proposal:

Realign with EU-OPS

comment *3479* comment by: *M Wilson-NetJets*

Original text:

(4) The touchdown zone RVR is always prevailing over the other RVR values. If reported and relevant, the mid point and stop end RVR are also controlling. The minimum RVR should be at least:

a. 125 m for the mid-point; or

b. the RVR required for the touchdown zone; and

4. The touchdown zone RVR is always prevailing over the other RVR values. If report and relevant, the mid point and stoop end RVR are also controlling:

a. 125m for the mid-point or

b. The RVR required for the touchdown zone and

c. 75m for the stop-end

Comment:

This requirement is not fully in line with EU-OPS 1.405 (Commencement and continuation of approach) since the reference of EU-OPS 1.405(e) (the approach may be continue below DA/H or MDA/H and the landing may be completed provided the required visual reference is established at the DA/H or MDA/H and is maintained) is missing.

Proposal:

Realign with EU-OPS 1.405. This requirement should be hard law and not AMC.

General Comment:

NPA 2009-2 in its entirety is unfit for the purpose for which it is intended and must be withdrawn and reconsidered.

comment *1027* comment by: *EUROCOPTER*

This AMC has to be renamed AMC2 OPS.COM.205 because applicable to "Commercial Operations other than CAT".

In parallel a new paragraph OPS.COM.205 has to be created.

comment *5273* comment by: *Graham HALLETT*

AMC4 OPS.GEN.205.

This AMC appears to seek to show compliance with something that isn't in the regulations.

For balloons, OPS.GEN.205 merely requires that a balloon has a certain amount of reserve fuel. Any balloon refuelling procedures are the same , be it private, commercial or CAT. This AMC seems excessively proscriptive.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - AMC OPS.GEN.210 Refuelling with passengers embarking, on board or disembarking p. 176-177

comment *653* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.GEN.210(1)(b)(i): change as follows and add point xi. under b.:

1. Whenever applicable, the following precautions should be taken:

a. Fire fighting facilities of the appropriate scale should be ~~**positioned so as to be immediately**~~ available **and ready for use during re-fuelling** ~~**in the event of a fire**~~, when using operating sites;

b. For aeroplanes:

i. One qualified person should remain at a specified location during fuelling operations with passengers on board. This qualified person should be capable of handling emergency procedures concerning fire protection and fire-fighting, handling communications ~~**and initiating**~~ and directing an evacuation **initiated by the pilot in command**;

[...]

xi. There should be qualified persons on-board the aircraft able to control passengers and manage the aircraft systems needed to enable timely disembarkation or the emergency evacuation of passengers should the need arise. When flight crew are not present there shall be procedures defined to ensure that properly trained and qualified individuals are present able to carry out communications required to alert emergency services in the event of either a hazardous or an emergency situation arising.

Justification:

It is paramount to highlight that an evacuation should only be ordered by the pilot-in-command or any other crew member under the authority of him/her. This is consistent with paragraph 7.c. of Annex IV to regulation (EC) No 216/2008.

comment *654* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.GEN.210(2): change as follows:

2. When re/defuelling with passengers on board, ground servicing activities and work inside the aircraft, such as catering and cleaning, should be ~~**conducted in such a manner that they do not create a hazard and that the aisles and emergency doors are unobstructed**~~ **suspended until the re/defueling has finished**.

Justification:

Allowing activities like cleaning or catering while re/defueling with pax on board poses a significant risk in the event of an evacuation. The (cleaning/catering) staff is not familiar with evacuation procedures and the equipment used for these activities may impede the conduct of a safe evacuation.

comment *884* comment by: *Condor Flugdienst GmbH - FRA HO/R*

We suggest prohibition of Defuelling with PAX on board, embarking or disembarking.

Reason: ICAO 9137, Part I, §16.3.3.

comment *1561* comment by: *Luftfahrt-Bundesamt*

Such impotant things like precautions to be taken when refuelling with passengers on board should NOT be defined in the AMC-Material but in the accordant paragraph of the Implementing Rule!

comment *1731* comment by: *claire.amos*

Point b. vii states 'sufficient' qualified personnel....

Who would be considered to be sufficiently qualified in these circumstances? Clarification required.

comment *1732* comment by: *claire.amos*

Point 3

Clarification is required so each operator is clear as to whether they are required to follow this process or not. This could be interpreted differently by different NAA's thus leading to inconsistency across Europe.

comment *2065* comment by: *claire.amos*

1.a.

Question; Should be qualified by a risk assessment indicating need?

comment *2085* comment by: *Airbus S.A.S.*

In AMC OPS.GEN.210, Subparagraph 1 (b)(vii), the extent of the word "sufficient" is not clear.

More detailed provision should be provided.

B. II. Draft Decision - Part-OPS - Subpart A - Section II - GM OPS.GEN.220.B Operational limitations - balloons p. 179

comment *6572* comment by: *Volker Loeschhorn*

There a more reasons for balloons landings during night than emercency landings:

1. Landings during the night that are dangerous:

Landings due to unattended weather situations, also called safety landings - unexpected thunderstorms, change of wind direction or speed towards the sea or to borders of countries that could not be overflown

2. Landings the night that are not dangerous:

For example, a balloon is flying towards the sun, and so the sight is not good to detect powerlines. So it will be better to wait for the sunset, and made then the landing. It could happen you have to overfly a forest, and you are some minutes to late... now do all the paperwork for an emercency landing - wherefor?

Other situation: The wind is calming down. You are over a forest, you have had the landing field in sight during the daylight, but you are fighting half an hour for the last fifty meters to reach it, your ground crew is already on the landing field, and you are shure that there are no obstacles - is that really an emercency situation?

Future: Perhaps there will be development for nightvision systems that allows also safe night landings - why to fix a limitation?

B. II. Draft Decision - Part-OPS - Subpart A - Section III - AMC1 OPS.GEN.305 Weighing p. 180

comment *1484* comment by: *Airbus*

In AMC1 OPS.GEN.305 § 2, read "maximum structural landing mass" instead of "maximum landing mass".

Reason: consistency with other sections (e.g. AMC2 OPS.GEN.305.A § 1.a)

comment *1640* comment by: *Luftfahrt-Bundesamt*

Add: …..with an approved mass controll programme

General

This text is almost totally hidden from view buried as it is the text about dry operating mass. It might be less obscure if it were spit into two parts the second of which could be the CREW MASSES:

"DRY OPERATING MASS

To calculate the dry operating mass and the associated CG of the aircraft, the operator should take into account the mass of all operating items and crew members, and the influence of their position on the aircraft CG.

"CREW OPERATING MASSES

Crew operating masses should be established by weighing or using the standard masses of 85 kg for flight and technical crew members and 75 kg for cabin crew members, including hand baggage. Account shall be taken of any additional baggage. On flights where crew masses, including hand baggage, are expected to exceed the standard crew masses, the actual mass of the crew should be determined by weighing."

comment *841* comment by: *Reto Ruesch*

Mass values for passenger, when the number of passenger seats available is less than 6 for helicopters.

comment *2732* comment by: *Austro Control GmbH*

Generally it must be mentioned that the weight of 85/75 kg differences between the kind of job of crew members. In reality this implies a hidden difference between male flight deck and female cabin crew.

By analogy to passenger weight and for genderman reasons there should be a distinction between male/female crew members and not between flight/cabin crew members.

comment *2800* comment by: *M Wilson-NetJets*

Original text:

AMC OPS.GEN.310(a)(1) Mass and balance system - complex motor-powered aircraft used in non-commercial operations and aircraft used in commercial

operations

DRY OPERATING MASS

To calculate the dry operating mass and the associated CG of the aircraft, the operator should take into account the mass of all operating items and crew members, and the influence of their position on the aircraft CG. This should be done by weighing or using the standard masses of 85 kg for flight and technical crew members and 75 kg for cabin crew members, including hand baggage. Account shall be taken of any additional baggage. On flights where crew masses, including hand baggage, are expected to exceed the standard crew masses, the actual mass of the crew should be determined by weighing.

Suggested new text:

No suggested text

Comment/suggestion:

This paragraph requires to take into account the exceedance of standard crew masses. This has serious implications for the quicksheet and keeping track of crewmember weight.

Original text:

1. When a. the number of passenger seats available is:

i. less than **10** for aeroplanes; or

ii. less than 6 for helicopters; or

b. the number of passengers is less than 11 for balloons, passenger mass may be calculated on the basis of a statement by, or on behalf of, each passenger, adding to it a predetermined mass to account for hand baggage and clothing. The predetermined mass for hand baggage and clothing should be established by the operator on the basis of studies relevant to his particular operation. In any case, it should not be less than:

i. 4 kg for clothing; and

ii. 6 kg for hand baggage.

The passengers' stated mass and the mass of passengers' clothing and hand baggage should be **checked** prior to boarding and adjusted, if necessary.

Suggested new text:

1. When
a. the number of passenger seats available is:

comment *6507* comment by: *UK CAA*

Page No: 182

Paragraph No:

AMC2 OPS.GEN.310(a)(2) Table 2

Comment:

The alleviation which permits 6kg to be deducted from the figures in Table 2 is too restrictive and should be extended to all aeroplanes, including those in Table 1. Although the text reflects that in EU-OPS, the UK CAA believes it has always been unnecessarily restrictive and has written to the Commission seeking approval for a derogation against EU-OPS.

Justification:

There is no safety reason to restrict aeroplanes with 20 or more seats from deducting 6kg from the passenger mass values in the same way that smaller aeroplanes and all helicopters (including those with more than 20 seats) are permitted to. The larger an aeroplane, then less significant is the effect of any difference between the actual mass values of passengers' hand baggage and the assumed mass values included in Tables 1 and 2. If it is suitably safe for the deduction to be made on small aeroplanes, then it is certainly as safe, or even more so, to allow the same on larger aeroplanes.

There are currently some operations, with larger aeroplanes, where passengers are prohibited from carrying any hand baggage for operational reasons. In these cases, operators will be unnecessarily penalised by having to use a standard weight which is too high and therefore unrepresentative.

Proposed Text (if applicable):

On ~~aeroplane flights with 19 passenger seats or less and on all helicopter~~ flights where no hand baggage is carried in the cabin or where hand baggage is accounted for separately, 6 kg may be deducted from the figures in Table**s 1 and** 2 above.

The subtitles of these AMC and GM show that they are applicable to aircraft used in commercial air transport only. One may wonder why these AMC/GM are located in AMC/GM Subpart A (General operating and flight rules) instead of Subpart B (Commercial Air Transport).

comment *5956* comment by: *Irish Aviation Authority*

Comment:

Appendix 1 to JAR-OPS 3.620(h) paragraph c) 2 & 3 are the same as the EU-OPS requirement for aeroplanes. Hence amend subparagraph 3 b) and 3 c) to read aircraft not aeroplane as detailed below.

Proposed text:

b. On **aircraft** with 20 or more passenger seats, these averages should apply as revised standard male and female mass values. c. On smaller **aircraft**, the following increments should be added to the average passenger mass to obtain the revised standard mass values:

Table 1 of AMC4 OPS.GEN.310(a)(2) Mass and balance system

Number of passenger seats	Required mass increment
1 – 5	16 kg
6 – 9	8 kg
10 – 19	4 kg

Alternatively, all adult revised standard (average) mass values may be applied on **aircraft** with 30 or more passenger seats. Revised standard (average) checked baggage mass values are applicable to aircraft with 20 or more passenger seats.

B. II. Draft Decision - Part-OPS - Subpart A - Section III - GM1 OPS.GEN.310(a)(2) Mass and balance system - complex motor-powered aircraft used in non-commercial operations and aircraft used in commercial operations p. 186

comment *1486* ☐ comment by: *Airbus*

The subtitles of these AMC and GM show that they are applicable to aircraft used in commercial air transport only. One may wonder why these AMC/GM are located in AMC/GM Subpart A (General operating and flight rules) instead of Subpart B (Commercial Air Transport).

B. II. Draft Decision - Part-OPS - Subpart A - Section III - GM2 OPS.GEN.310(a)(2) Mass and balance system - complex motor-powered aircraft used in non-commercial operations and aircraft used in commercial operations p. 186-189

comment *104* comment by: *Air Southwest*

Is it intended to include all this statistical analysis in the final document? Whilst it is appreciated that it is only guidance material (GM) it is difficult to see what is the practical use of this information. It is also appreciated that IEM OPS 1.620(g) contained this analysis method it is suggested that perhaps this information should be in another specific document and a reference provided in this section Of Part OPS to that document.

comment *1493* comment by: *Airbus*

Is it always true that "passengers should be evenly distributed in the cabin"? Required distribution of passengers may depend on particular aircraft type, cabin configuration, fuel load, cargo load…

The text in the existing regulation, Appendix 1 to OPS 1.605, paragraph (d), should be adopted.

comment *2404* comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

Comment:

There is no definition of 'worst case'. There have to be reasonable assumptions -Boeing and Airbus curtail the trim envelope around **reasonable assumptions.** [A worst case could be all passengers forward or aft queuing for the toilets but this is highly unlikely]

Proposal:

Use the Boeing/Airbus terminology based upon reasonable assumptions.

comment *3210* comment by: *AEA*

Relevant Text:

CG limits - operational CG envelope – commercial air transport

*'Operator procedures should fully account for the **worst case variation** of CG travel during flight caused by passengers/crew movement and fuel consumption/transfer*

Comment:

This requirement (reference to worst case variant) is different from EU-OPS (Appendix 1 to EU-OPS 1.605 para d 2 which states that there is a need to take account for the extreme variation which according to the manufacturers' mass and balance manual does not mean the worst case scenario). Such a requirement would be impractical and it could have significant impact on flight operations.

Proposal:

Realign with the exact wording of Appendix 1 to EU-OPS 1,605 paragraph d 2

Proposal:

change 2nd para. 3 into para. 4

comment *5940* comment by: *DGAC*

Proposal: Insert a new 2. and renumber the following paragraphs accordingly:

2. Subject to the approval of the competent authority, an operator may omit some of this Data from the mass and balance documentation.

3 ~~2~~. For Performance Class B

Justification: The provision of Subparagraph (a)(1)(ii) of Appendix 1 to EUOPS/JAROPS 1/3.625 has been omitted with no justification in the explanatory note. It should therefore be reintroduced :

(3) and (3) : there are two paragraphs (3)

(6): What does "via data" mean ?

comment *5955* comment by: *Irish Aviation Authority*

Comments:

Incorrect paragraph numbering, there are 2 paragraph "3"s.

Appendix 1 to JAR-OPS 3.625, paragraph c) permits the use of approved onboard mass and balance systems. This has been omitted and an additional

subparagraph 9 needs to be added as detailed below.

Proposed text:

9. On-board mass and balance systems. An operator must obtain the approval of the Authority if he wishes to use an on-board mass and balance computer system as a primary source for despatch.

B. II. Draft Decision - Part-OPS - Subpart A - Section III - AMC OPS.GEN.315.B(b) Performance - general p. 194

comment *5135* comment by: *UK CAA*

Page No: 194

Paragraph No:

GM OPS.GEN.315.B(b)

Comment:

Balloon pilots should be permitted to determine the suitability of a site in a congested area using criteria pre-determined by the competent authority.

Justification:

Requiring the competent authority to carry out a site inspection and issue an approval is too onerous and restrictive on the industry.

B. II. Draft Decision - Part-OPS - Subpart A - Section III - AMC1 OPS.GEN.320.A(a) Take-off - complex motor-powered aeroplanes used in non- commercial operations and aeroplanes used in commercial operations p. 194-195

comment *445* comment by: *ECA - European Cockpit Association*

Comment on AMC1 OPS.GEN.320.A(a): change as follows:

4. the runway slope in the direction of take-off**, including the effects of non-linear runway slope** ;

Justification:

Runway slope definitions are not unambiguous. As take-off performance may have an acceleration phase and a deceleration phase, concave or convex runway slope may have a detrimental effect on aircraft performance, although the slope figure (depending upon the calculation method) may evaluate to zero or close to zero. State-of-the art requires the inclusion of these non-linear effects on take-off performance.

comment *457* comment by: *ECA - European Cockpit Association*

Comment on AMC1 OPS.GEN.320.A(a): include current text under AMC1 OPS.GEN.320.A(3) under OPS.GEN.320.A or OPS.GEN.315

3. the runway surface condition and the type of runway surface;

Justification:

The list under proposed AMC1 OPS.GEN.320.A(a) is either a consequence of physics or agreed upon for many years (headwind/tailwind). The list does not need the flexibility of AMC material and should be included in OPS.GEN.320.A. As the list is partially or completely repeated for other phases of flight, further improvement and simplification of the regulation could be achieved by moving the list to OPS.GEN.315.

comment *1777* comment by: *claire.amos*

Point 3

Type of runway surface?

comment *3869* comment by: *M Wilson-NetJets*

Original text:

(5) not more than 50% of the reported head-wind component or not less than 150% of the reported tailwind component; and

Suggested new text:

No suggested text

Comment/suggestion:

Better clarification is required to include or not include forecasted/expected gusts in the performance calculation.

comment *5943* comment by: *DGAC*

This paragraph applies to CMPA used in non commercial operations but (6) refers to AMC OPS.CAT.A.316(a)(4) which is for CAT operations only. Performance classes A and C are not applicable for non CAT operations because the performances classes definition is in CAT subpart.

B. II. Draft Decision - Part-OPS - Subpart A - Section III - AMC2 OPS.GEN.320.A(a) Take-off - complex motor-powered aeroplanes used in non- commercial operations and aeroplanes used in commercial operations p. 195

comment *5944* comment by: *DGAC*

Proposal:

Clarify "best information available"

Justification:

As such the wording is a bit vague and loose…

B. II. Draft Decision - Part-OPS - Subpart A - Section III - GM1 OPS.GEN.320.A(a) Take-off - complex motor-powered aeroplanes used in non- commercial operations and aeroplanes used in commercial operations p. 195

comment *3492* comment by: *UK CAA*

Page No: 195 of 464

Paragraph No:

AMC2 OPS.GEN.320.A(a)

Comment:

The operation of complex motor-powered aeroplanes on contaminated runways should only be based on appropriate performance data that has been subject to oversight approval of some form.

Justification:

Relying on the use of "the best information available" is potentially too hazardous for complex motor-powered aeroplanes.

Proposed Text (if applicable):

Wet and contaminated runway performance data, if made available by the manufacturer, should be taken into account. If such data is not made available, the operator should account for wet and contaminated runway conditions by using the best information available**, acceptable to the Member State**.

B. II. Draft Decision - Part-OPS - Subpart A - Section III - AMC1 OPS.GEN.320.A(b) Take-off - complex motor-powered aeroplanes used in non- commercial operations and aeroplanes used in commercial operations p. 195

comment *514* comment by: *ECA - European Cockpit Association*

Comment on AMC1 OPS.GEN.320.A(b): Upgrade to OPS.GEN:

Justification:

In line with the original phraseology used in EU-OPS 1.495(f) requiring that an operator shall establish contingency procedures AMC status is inappropriate and the requirement should be move to the rule.

comment *1720* comment by: *ECA - European Cockpit Association*

Comment on AMC1 OPS.GEN.320.A(b): Move text to OPS.GEN.320.A(c)

The proposed text under AMC1 OPS.GEN.320.A(b) is an essential safety requirement and does not need the flexibility of AMC material and should be moved to the rule as a new paragraph OPS.GEN.320.A(c)

B. II. Draft Decision - Part-OPS - Subpart A - Section III - GM1 OPS.GEN.320.A(b) Take-off - complex motor-powered aeroplanes used in non- commercial operations and aeroplanes used in commercial operations p. 195-196

comment *5945* comment by: *DGAC*

The title is "Take-off" but this paragraph concerns also landing.

B. II. Draft Decision - Part-OPS - Subpart A - Section III - GM2 OPS.GEN.320.A(b) Take-off - complex motor-powered aeroplanes used in non- commercial operations and aeroplanes used in commercial operations p. 196

comment *5946* comment by: *DGAC*

For the adequate margin at take-off, the paragraph refers to ICAO annex 6 part 1 (international commercial air transport operations) although it concerns non commercial operations with CMPA.

It is not sufficient to refer to an ICAO annex : the regulation should clearly state what is the required margin for take-off with CMPA in non commercial operations and commercial operations.

8. : Cut "GM OPS.GEN.400(e) Instruments and equipments - General " at the end of bullet number 8 and paste it at the beginning of page 198 (as a title for paragraph "ACCESSIBILITY AND POSITIONING OF INSTRUMENTS AND EQUIPMENT ")

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - GM2 OPS.GEN.400(c) Instruments and equipments - General p. 197-198

comment *47* comment by: *George Knight*

"ACCESSIBILITY AND POSITIONING OF INSTRUMENTS AND EQUIPMENT

This requirement implies that whenever an instrument is required in an aircraft operated in a multi-crew environment, the instrument needs to be visible from each flight crew station."

This is not sensible guidance in all aircraft – in particular training aircraft with tandem seating. Replication should be an acceptable alternative.

comment *350* comment by: *ECA - European Cockpit Association*

Comment: editorial change:

8. Sea anchors and equipment for mooring.~~GM OPS.GEN.400(e) Instruments and equipments - General~~

GM OPS.GEN.400(e) Instruments and equipments - General

ACCESSIBILITY AND POSITIONING OF INSTRUMENTS AND EQUIPMENT This requirement implies that whenever an instrument is required in an aircraft operated in a multi-crew environment, the instrument needs to be visible from each flight crew station.

comment *1742* comment by: *Richard David Jordan*

We are in disagreement with the proposals for the following reasons:-

There is no safety case for the proposal.

Mechanical failure over water hasn't been a major reason for accidents in the past 20 years.

PPLH pilots have been flying over water without floats and without ELT for many years. There is no good reason to change the current regulations.

Costs of altering small helicopters to fit this extra equipment is expensive (Euro 30,800 just to fit it) and the extra weight would reduce safety and would consume more fuel!

If a helicopter pilots should be fit to decide if they want to install expensive and complex extra equipment.

If a helicopter fitted with floats crashes into anything other than flat-calm water then it will sink and be lost.

comment *4862* comment by: *IAOPA Europe*

If the proposal to accept a PLB to satisfy the ELT requirement then the PLB should be added to this list since a portable PLB should not be subject to a Part-21 approval.

Of course the PLB should still be approved by Caspass-Sarsat

comment *5966* comment by: *DGAC*

This paragraph misses its title which remained attached to the end of previous paragraph (GM2 OPS.GEN.400(c) Instruments and equipments – General)

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - GM OPS.GEN.405(a)(1) Equipment for all aircraft p. 198

comment *4778* comment by: *TAP Portugal*

Relevant Text:

Seats for the minimum required cabin crew members should be located close to the emergency exits and where cabin crew members can best assist

passengers in the event of an emergency evacuation.

Comment:

This new requirement is different from EU-OPS 1.730 a 6. It would have a huge impact in relation to Type III exits which cannot be justified. This trade union (ETF) proposal was discussed in-depth within the JAA which concluded that such a proposal cannot be justified on safety grounds. We urge EASA to stick to EU-OPS

Proposal:

Stick to EU-OPS and realign with EU-OPS 1.730 a 6

comment *5736* comment by: *AS Miller*

OPS.GEN.405.Equipment for all aircraft

"...(1) except in the case of aerobatic flights...."

AMC.OP.GEN.405(a)(1) Equipment for all aircraft

Aerobatic aircraft are not the only ones to experience frequent, alternating, flight loads during normal operations. Launching gliders into lee wave system can require the tug aircraft to repeatedly climb and descend in the extremely turbulent air associated with strong air flows in the lee of mountains. Once off tow, the glider can climb in the smooth higher air, but the tug immediately returns for a further dose.

Proposal *change the wording in the IR to: "(1) except in the case of aerobatic, and other flights as approved by NAAs, at least one ....."*

and the AMC to:

2. For aerobatic, and other flights as approved by NAAs, the hand fire extinguishers may become a hazard due to frequent, alternating, flight loads.

comment *5970* comment by: *DGAC*

1. The GM is not the proper place to give the rational for the provision requiring hand fire extinguisher. Further more composite materials can be found in any part of any aircraft. Proposal : delete paragraph 1.

2. The GM is not the proper place to give the rational for the provision exempting hand fire extinguisher for aerobatic flights.

Proposal : Delete paragraph 2 and put a definition of aerobatic flights in OPS.GEN.010 Definitions "Any flights including manoeuvres other than…"

comment *6323* comment by: *Aero-Club of Switzerland*

We propose: 1. A hand fire extinguisher is mandatory on all powered aircraft with more than seven seats.

On other aircraft the carriage of fire extinguishers may be voluntary.

Justification: Fires can never be exluded in case of an accident or incident. We know, however, the risks of operating a powder fire extinguisher in flight: There will be instant IMC.

2. Onboard of aircraft performing aerobatic flights hand fire extinguishers may left on ground.

Justification: They may become a hazard due to high g-loads.

comment *7436* comment by: *European Sailplane Manufacturers*

A hand fire extinguisher is comple useless or even dangerous in the typically small environment of a glider.

Also there is no history of frequent accidents with fires for sailplanes.

The manufacturers oppose required installation of fire extinguishers for sailplanes.

comment *1743* comment by: *Richard David Jordan*

We are in disagreement with the proposals for the following reasons:-

There is no safety case for the proposal.

Mechanical failure over water hasn't been a major reason for accidents in the past 20 years.

PPLH pilots have been flying over water without floats and without ELT for many years. There is no good reason to change the current regulations.

Costs of altering small helicopters to fit this extra equipment is expensive (Euro 30,800 just to fit it) and the extra weight would reduce safety and would consume more fuel!

If a helicopter pilots should be fit to decide if they want to install expensive and complex extra equipment.

If a helicopter fitted with floats crashes into anything other than flat-calm water then it will sink and be lost.

comment *5875* comment by: *Danish Powerflying Union*

We also find use of a wrist watch displaying hours, minutes and seconds sufficient for operating other than complex motor-powered aircrafts on VFR flights.

comment *6556* comment by: *Sloane Helicopters Ltd*

AMC OPS.GEN.410(a)(4)

A number of helicopters are fitted with ASI calibrated in MPH. This could lead to confusion and danger of speed exceedance and conflict the aircraft's manual.

comment *6574* comment by: *Baden-Württembergischer Luftfahrtverband*

AMC OPS.GEN.410(a)(2)

Wording in the NPA

1. For other than complex motor-powered aircraft not involved in commercial operations, a means of measuring and displaying the time in hours, minutes and seconds may be a wrist watch capable of the same functions.

Our proposal

Keep this wording

Issue with current wording

We support this regulation

Rationale

Many especially small aircraft and sailplanes do not have clocks built into the panel often due to space limitations. Since pilots usually carry wrist watches a second clock in the panel would be an unnecessary.

comment *7439* comment by: *European Sailplane Manufacturers*

For tapical sailplane operations even requiring only a wrist watch showing not only the hours and minutes but also the seconds is too onerous because it is not needed.

Opposed by the manufacturers.

comment *351* comment by: *ECA - European Cockpit Association*

Comment: change as follows:

2. In the case of sailplanes **,** ~~**and**~~ balloons **and aerobatic aeroplanes,** calibration in metres (m) is acceptable.

comment *1389* comment by: *Royal Danish Aeroclub*

We see no real reason to prohibit altimeters for VFR-flights to display in meters or feet.

The text should be changed to "...calibrated in feet (ft) or meters (m)...".

Paragraph 2. should be deleted.

comment *1454* comment by: *R Spiers*

AMC OPS.GEN.410(a)(4)

Calibration of ASI in MPH (miles per hour) should be an acceptable AMC for a non complex helicopter, especially in non commercial flight

Reason

A number of helicopters (e.g. Bell Jet Ranger) are fitted with ASI calibrated in MPH. This references air speeds given in the Pilot Operating Handbook. There is no safety case to change the helicopter's equipment and manual. Not to allow a MPH ASI would be dangerous, as confusion could arise between knots and MPH, and limitation speeds could be exceeded, creating danger.

Suggested Text:

AMC OPS.GEN.410(a)(4)

CALIBRATION OF THE INSTRUMENT INDICATING AIR SPEED – SAILPLANES, AEROPLANES AND HELICOPTERS

The instrument indicating air speed should be calibrated in knots (kt). In the case of sailplanes with a maximum certified take-off mass below 2000 kg, and other non-complex aeroplanes and helicopters with a maximum certified take-off mass below 2000 kg, calibration in kilometres (km) per hour or statute miles (mph) per hour is acceptable.

comment *2702* comment by: *AOPA-Sweden*

This part cannot be applicable on third country aircraft, because if you change the altimeter from hg/inch to hectopascals, the aircraft is not airworthy anymore by the originator. "Should" shall be interpreted as "should"

comment *5876* comment by: *Danish Powerflying Union*

We see no reason to demand pressure altitude to be displayed in feet (ft) only.

We suggest following text:

The instrument measuring and displaying pressure altitiude should be calibrated in feet (ft) **or meters (m)**, with a sub-scale....

comment *6098* comment by: *DGAC*

Proposal:

Add "3. In case of flight remaining outside of controlled areas, a non ajustable altimeter is acceptable."

comment *6575* comment by: *Baden-Württembergischer Luftfahrtverband*

AMC OPS.GEN.410(a)(3)

Wording in the NPA

1. The instrument measuring and displaying pressure altitude should be calibrated in feet (ft), with a sub-scale setting, calibrated in hectopascals/millibars, adjustable for any barometric pressure likely to be set during flight.

2. In the case of sailplanes and balloons, calibration in metres (m) is acceptable.

Our proposal

2. In the case of sailplanes and balloons and other than complex motor-powered aeroplanes with a maximum certificated take-off mass below 2 000 kg, calibration in metres (m) is acceptable

Issue with current wording

It is usefull if tow planes have the same altitude indication as the towed sailplanes

Rationale

Aeroplanes mainly used for sailplane towing are often equipped with altitude measuring instruments calibrated in meters to match the instruments in the sailplanes. We strongly support the option to have instruments calibrated in meters since this is the usual instrumentation for all sailplanes in Germany. This change aligns this rule with AMC OPS.GEN.410(a)(4).

comment *7442* comment by: *European Sailplane Manufacturers*

For sailplanes calibration in metres or feet is accepted.

We consider this also being true for all type of VFR operations.

comment *7610* comment by: *AOPA UK*

(a)(3)1 This part cannot be applicable on third country. aircraft, because if you change the altimeter from hg/inch to hectopascals, the aircraft is not airworthy anymore by the originator. "Should" shall be interpreted as "should"

comment *1529* comment by: *Chris Fox*

Many older light helicopters are ftted with ASI's calibrated in statue Miles Per Hour, and the associated Flight Manual limitations are given in M.P.H.

There is no basis for requiring these aircraft to change their ASI's, and indeed it could cause additional hazards due to confusion between Flight Manual limits in given in MPH and instruments reading knots.

Where already fitted and appropriately certified, continued use of ASI's calibrated in M.P.H. should be permitted.

comment *1670* comment by: *JSLEE*

Page 200

AMC Ops. Gen.410(a)(4)

The proposal to replace ASI calibrated in MPH.

I can only assume this a tongue in the cheek suggestion by EUC bureaucrats. What does it achieve? There are thousands of fixed wing aircraft fitted with MPH ASI'S why are they not required to change. An aircraft fitted with an ASI calibrated in MPH has an operator's handbook which contains the aircraft performance figures which are calculated in MPH and are issued by the manufacturer and can only be changed by them. Are ESEA going to pay the manufacturers to amend them? What if the manufacturer no longer exists?

The fact that the proposal excludes those helicopters fitted with ASI'S calibrated in KPH it is clearly aimed at non main land European manufactured helicopter's which is at least prejudicial.

comment *1760* comment by: *Richard Dawson*

(d)(1)(i)

There is no reason to standardise on knots. Many helicopters e.g. Jetrangers use different units and these are supported by the operating documentation. This would require new instruments for no benefit.

comment *1873* comment by: *Aeromega*

Why should airspeed indicators have to be calibrated in knots. Many ASI's are currebntly calibrated in MPH they are no less safe providing pilots are aware of the units in use. This requirement simply increases the cost of compliance with no increase in safety. It cannot be justified.

comment *2414* comment by: *Denis Ferranti Meters*

AMC.OPS.GEN410.(A)(4)

States that ASI should be calibrated in Kt or Kms.

This rule has no provision for MPH marking which some older helicopters have. It is disproportionate to expect owners to change the ASI purely to fall into line with a law requiring a pointless recalibration which changes nothing other than the frustration level of an owner. It is also costly.

Recommendation: Allow the rule to include MPH as a calibration on the ASI

comment *2620* comment by: *John Matchett*

There is no benefit in changing calibration of ASI in mph when pilots are rated accordingly. Such a change could prove dangerous for a pilot who has never used any other form of ASI measurement.

comment *2704* comment by: *AOPA-Sweden*

"Should" shall be interpreted as "should", because a lot of older aircraft has an instrument indicating in mph and also some few older, usually annex 2 ones, over 2,000 kg indicating in km/h.

comment *3437* comment by: *Peter Waldron*

The calibration of the Air Speed Indicator in MPH should be acceptable for a non complex helicopter and especially those involved in non commercial flight.

Those helicopters already fitted with ASI in MPH refer to the Pilot Operating Manual with air speeds provided. There can be no case to change the helicopter's equipment and manual. If necessitated, this could be dangerous and may cause confusion between knots and MPH.

Therefore calibration in Kilometres (km) per hour or statute miles (mph) per

hour should be acceptable.

comment *4863* comment by: *IAOPA Europe*

Calibration in mph should also be accepted - particularly for aeroplanes other than complex motor-powered aeroplanes. This calibration the standard in some older GA aircraft imported from the US.

comment *5317* comment by: *Light Aircraft Association UK*

This AMC should be altered to allow airspeed indicators to be in miles per hour if the operators' manual gives limitations in these units, for non-complex aircraft.

comment *5348* comment by: *European Private Helicopter Alliance*

Page 200

Calibration of ASI in Miles Per Hour should be an acceptable AMC for a non complex helicopter, especially in non commercial flight

Reason

Many helicopters (e.g. Bell Jet Ranger) are fitted with ASI calibrated in MPH. This references air speeds given in the Pilot Operating Handbook. There is no safety case to change the helicopter's equipment and manual. Not to allow a MPH ASI would be dangerous, as confusion could arise between knots and MPH, and limitation speeds could be exceeded, creating danger.

Suggested Text:

AMC OPS.GEN.410(a)(4)

CALIBRATION OF THE INSTRUMENT INDICATING AIR SPEED – SAILPLANES, AEROPLANES AND HELICOPTERS

The instrument indicating air speed should be calibrated in knots (kt). In the case of sailplanes with a maximum certified take-off mass below 2000 kg, and other non-complex aeroplanes and helicopters with a maximum certified take-off mass below 2000 kg, calibration in kilometres (km) per hour or statute miles (mph) per hour is acceptable.

comment *5877* comment by: *Danish Powerflying Union*

Air Speed indication in miles per hours should also be accepted for other than complex motor-powered aeroplanes.

comment *6469* comment by: *George Heritage*

410(a) (4) - Quite unnecessary and badly thought-out.

comment *6576* comment by: *Baden-Württembergischer Luftfahrtverband*

AMC OPS.GEN.410(a)(4)

Wording in the NPA

The instrument indicating air speed should be calibrated in knots (kt). In the case of sailplanes with a maximum certificated take-off mass below 2 000 kg and aeroplanes other than complex motor-powered aeroplanes with a maximum certificated take-off mass below 2 000 kg, calibration in kilometres (km) per hour is acceptable.

Our proposal

We strongly support this wording especially also the inclusion of aeroplanes.

Issue with current wording

None

Rationale

All sailplanes in Germany are equipped with speed indicators calibrated in km/h. Especially tow planes are often also equipped with speed indicators calibrated in km/h to match the indication in the towed sailplane.

comment *6774* comment by: *Clive Morrell*

'Air Speed Indicators should be calibrated in knots (kts)'

Comment; There are many light aircraft, including he licopters, with Air Speed Indicators calibrated in Miles per Hour. This is particularly the case with aircraft of US manufacture.

It would be very expensive to change these ASI s with all the associated extra work of amending limitations and flight manuals etc. Such changes could also be positively dangerous.

Light aircraft have been flying in European airspace for decades with MPH calibrated Air Speed Indicators with no problems. Why change now?

comment *6839* comment by: *EFLEVA*

The EFLEVA notes that the AMC must be changed to allow, for non-complex aircraft, airspeed indicators to be calibrated in miles per hour if the operators manual uses these units.

comment *7182* comment by: *Paul Monahan*

AMC OPS.GEN.410(a)(4). I object to this proposal. Not to allow calibration of ASI in mph would be confusing and very dangerous.

comment *7270* comment by: *DHV*

AMC OPS.GEN.410(a)(4)

Calibration of ASI in Miles Per Hour should be an acceptable AMC for a non complex helicopter, especially in non commercial flight

Reason

Many helicopters (e.g. Bell Jet Ranger) are fitted with ASI calibrated in MPH. This references air speeds given in the Pilot Operating Handbook. There is no safety case to change the helicopter's equipment and manual. Not to allow a MPH ASI would be dangerous, as confusion could arise between knots and MPH, and limitation speeds could be exceeded, creating danger.

Suggested Text:

AMC OPS.GEN.410(a)(4)

CALIBRATION OF THE INSTRUMENT INDICATING AIR SPEED – SAILPLANES, AEROPLANES AND HELICOPTERS

The instrument indicating air speed should be calibrated in knots (kt). In the case of sailplanes with a maximum certified take-off mass below 2000 kg, and other non-complex aeroplanes and helicopters with a maximum certified take-off mass below 2000 kg, calibration in kilometres (km) per hour or statute miles (mph) per hour is acceptable.

comment *7416* comment by: *DAvid Monks*

Aviation standard IAS and TAS units are nauticle miles therefore calibration in MPH is not required.

comment *7503* comment by: *David George*

AMC.OPS.GEN.410 a4:-

"The instrument indicating airspeed should be calibrated in knots (kt)."

A number of helicopters have airspeed indicators that are calibrated in miles per hour and the reference speeds in their Pilot's Operating Handbooks are also in miles per hour. There is no safety case for this proposal - indeed, I believe it would lead to confusion and would increase the chance of operating limitations being exceeded.

comment *7611* comment by: *AOPA UK*

"Should" shall be interpreted as "should", because a lot of older aircraft has an instrument indicating in mph and also some few older, usually annex 2 ones, over 2,000 kg indicating in km/h.

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC p. 200

OPS.GEN.410(b)(3) Flight instruments and equipment - VFR flights

comment *2313* comment by: *Ravenair*

Operator Comment on NPA 2009-02b

NPA 2009-02b contains the following statement, about which we make the representations below:

'AMC OPS.GEN.410(b)(3) and OPS.GEN.415(a) Flight instruments and equipment - VFR flights and flight instruments and equipment - VFR night flights and IFR flights

ALTIMETERS - AEROPLANES

The altimeters of aeroplanes operating VFR flights when the aircraft cannot be maintained in a desired attitude without reference to one or more flight instruments, and of IFR flights, should have counter drum-pointer or equivalent presentation.'

Cheshire Flying Services Limited Trading as Ravenair EU-OPS 1 AOC GB 1071. Aircraft types: MEP Class including PA23 Aztec, PA34 Seneca, PN68 Partenavia.

We hold exemption Exemption No F 0017: in respect of OPS 1.652 (c) Counter Drum Pointer Presentation, issued by the UK CAA.

Our company has held an exemption issued by the UK CAA since we became a JAROPS-1 operator. Our MEP fleet of aircraft (9 in total) have 3-Pointer Presentation Altimeters fitted. The exemption was granted on the basis that an acceptable safety case was submitted to the UK CAA.

The MEP aircraft that are operated have a restriction placed on them in the Operations Manual that they are not permitted to be operated above FL100. The aircraft operate both Public Transport (PT) /Commercial Air Transport (CAT), Aerial Work (AW) (Flight Training) and Privately.

In the past we had asked the UK CAA to check the MOR Safety Database to generate events that have occurred as a consequence of 3 pointer altimeters being used in aircraft restricted to operations below FL100. No such events were held in the database.

We note that the JAR-OPS1 / EUOPS-1 is only applicable to AOC operators who perform CAT flying. Therefore any other operations, private, aerial work which would include all types of aerial platform (helicopters, gliders, light aircraft) do not have the requirement to have Counter Drum presentations. This differs from other requirements such as Transponder type, approval requirements for RVSM/MNPS etc. As this mix of aircraft/traffic would see aircraft operated with differing altimeter equipment it cannot therefore be seen by the Agency as a significant safety issue. It could be argued that some MEP aircraft could be operated above FL100 with oxygen systems fitted as is offered in some AFM's. From commercial operations that we have knowledge of it is unlikely that such systems are fitted. Even if operators fit oxygen systems to MEP aircraft, this would place similar operations to ours into the 'rarely' above FL100 category as opposed to the 'never' above FL100 category, which is as per the research we have performed on commercial helicopter operations. The Agency is likely to refrain from requiring helicopters to fit Counter Drum presentations, as they 'rarely' fly above FL100.

NPA 2009-02A Paragraph 80 contains the following:

'The implementing rules do not require helicopters to be equipped with a counter drum pointer altimeter because it was not required in JAROPS 3. The justification given by the former JAA Helicopter SubSectorial Team (HSST) was that it is questionable whether the ICAO Standard is sustainable for helicopters operating predominantly below Flight Level (FL) 100.'

Another option for the Agency is to specify that any operator wishing to avail itself of an exemption must prohibit flight above FL100 in its Operations Manual. There are similar prohibitions on flight above FL80 for non-BRNAV equipped aircraft already, and above FL280 for non-RVSM equipped aircraft, so such a system of level restrictions is already in operation and accepted by operators and the legislative, and is entirely workable.

All of our aircraft have two of the same type of altimeter fitted, not one three pointer and one counter drum as some aircraft have.

The majority of our MEP operations are conducted in VFR conditions. Flight training, Survey flying.

Commercial considerations exist in the procurement, modification process and EASA/National fees, aircraft downtime and labour and pilot training. The lead time required is lengthy and as an operator we would be commercially unable to commit to the cost of the project without knowing the outcome of EASA/EUOPS decision. Due to our fleet size we estimate that retrofit of this type of equipment would cost in the region of 150,000.00 GBP to 175,000.00 GBP depending on the equipment, EASA/National Fees and exchange rates.

The types of aircraft operated continue to provide vital support to customers who include governments, environmental organisations, health authorities, financial community and afford access to aerodromes where larger aircraft cannot be operated.

AMC OPS.GEN.410~~(b)~~***(a)***(3)

comment *3498* comment by: *UK CAA*

Page No: 200

Paragraph No:

AMC OPS.GEN.410(b)(3) and OPS.GEN.415(a)

Comment:

Although this reflects the requirement in EU-OPS, the UK CAA has consistently argued that this is not a reasonable requirement. Only when an aeroplane with a three pointer type altimeter flies above 10,000 feet is there any possibility of confusion being caused by the third pointer (which displays units of tens of thousands of feet). Therefore, the undoubted safety benefit of a counter drum-pointer altimeter only comes into effect when an aircraft flies above 10,000 feet. If an aeroplane is subject to an operational limit whereby it does not fly above 10,000 feet, altimeters other than those with a counter drum-pointer indicator would provide the pilot with an equivalent presentation to that achieved with a counter drum-pointer altimeter. A safety level equivalent to that attained by OPS 1.652(c) would be achieved.

The requirement for a counter drum-pointer display altimeter to be be restricted to pressurised aeroplane conducting operations above 10,000 feet. Below 10,000 feet with unpressurised aeroplanes a three-pointer display is acceptable.

Justification:

Inappropriate Requirement.

Proposed Text (if applicable):

ALTIMETERS - AEROPLANES

(a) The altimeters of aeroplanes operating VFR flights when the ~~aircraft~~ ***aeroplanes*** cannot be maintained in a desired attitude without reference to one or more flight instruments, and of IFR flights, should have counter drum-pointer or equivalent presentation.

(b) Notwithstanding (a), unpressurised aeroplanes operating below 10,000 feet may be equipped with a three-pointer display altimeter.

comment *4472* comment by: *Directflight Limited*

NPA 2009-2b.

AMC OPS.GEN.410(b)(3) and OPS.GEN.415(a) Flight instruments and equipment – VFR flights and flight instruments and equipment – VFR night flights and IFR flights.

ALTIMETERS - AEROPLANES

It is unclear what is meant by "aeroplanes operating VFR flights when the aircraft cannot be maintained in the desired attitude without reference to one or more flight instruments". Are not all flight instruments used on all flights to a greater or lesser degree in order to maintain and refine the desired attitude?

Are these flights (whatever they are) together with IFR flights demonstrably safer when operating below 10,000 ft with counter drum-pointer altimeters than with either three pointer or counter drum altimeters?

Should there be a provision (alternative AMC?) for flights below 10,000 ft to operate with three pointer or counter drum altimeters?

comment *4925* comment by: *IAOPA Europe*

The requirement for counter drum-pointer for all aircraft operating IFR and and for VFR flight when the aircraft cannot be maintained in desired attitude without reference to one or more flight instruments is absolutely unacceptable for non-complex GA aircraft.

Most of these aircraft are unpressurised and therefore always operated below 10.000 ft because of oxygen requirements and there is therefore no safety gain in a counter drum-pointer. Helicopters are exempted from this requirement for the same reason.

This requirement would require the majority of the GA fleet operating IFR to ahve their altimters exchanged. The cost of this would be very significant with no safety benefit.

comment *5267* comment by: *DGAC*

Proposal : Renumber this AMC as follows :

"AMC OPS.GEN.410~~(b)~~**(a)**(3) and OPS.GEN.415(a)".

Justification: it is not (b)(3) of OPS.GEN.410 that deals with altimeters but (a)(3).

comment *5279* comment by: *DGAC*

Proposal:

Add: "Non-pressurized aeroplanes with a maximum take-off weight of 5700 kg or less, certificated with a single pilot crew, and operated at altitudes of less than 10000 ft, can be equipped with other than counter drum-pointer altimeter in designated airspace with approval of the competent authority."

Justification:

The 10000ft operating limit reduces the risk of misreading of the altimeter. And the installation of a new altimeter is very costly for small operators that operate at low altitudes in low traffic airspace.

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC OPS.GEN.410(b)(4) and OPS.GEN.415(a) Flight instruments and equipment - VFR flights and flight instruments and equipment - VFR night flights and IFR flights p. 201

Page 202

AMC OPS.Gen.415H(a)(6)

Proposal Landing Lights Helicopters

It is unreasonable to insist on a pilot operated movable landing light when many helicopters such as mine are already fitted with emergency "Flares" for use at night and two Fixed Landing Lights. Of my 1500 hours of helicopter flying only 20 hours have been at night. Once again the capital and installation cost for fitting a external movable landing light cannot be justified when for 30 years the emergency flares and fixed lights have met the UK CAA requirements.

It may not be possible to fit a movable light to some helicopters, which can be operated by the pilot whilst using both hands to control the helicopter. In any case it will be a very expensive modification and may require CAA approval with associated costs. Very few private helicopter pilots fly at night and those that do, fly helicopters already fitted with an existing UK CAA approved emergency landing lights.

The cost of fitting pilot operated movable landing light will be expensive, will

increase the weight and increase drag, hence a decrease in performance.

comment *1781* comment by: *Chris Fox*

Light helicopters used for night VFR operations are rarely fitted with a trainable landing light. In particular, Robinson helicopters are fitted with fixed lights that illuminate a wide area, and are perfectly adequate for private operations.

Trainable landing lights are heavy, complex and expensive. It is disproportionate to require them for private VFR operations at night in simple helicopters.

comment *1874* comment by: *Aeromega*

It is not practical to fit trainable landing lights on small helicopters such as the R22. This means that night qualifications would have to be conducted on larger more expensive types. There would be an increased cost to operators and CPL (H) students which could not be justified. If this requirement is to remain it should only apply to aircraft used to landing at unlit/off airfied sites.

comment *1923* comment by: *Tony Castro*

In my case - Hughes 500 there is only one type of steerable light that is very large , expensive and will add drag, increasing fuel comsumption, polution, noise, etc and so on..... Fixed lights are much simpler and relatively affordable. By all means demand a pair but Playing around with a steerable light could result in loss of orientation and certain crash !! Keep things simple and they work better.

comment *1987* comment by: *Helifly (UK) Ltd*

Objection to AMC OPS.GEN.415.H a6

A steerable light is a complex and heavy item to have to retrofit to a light helicopter. Standard night kit for a Robinson R44 includes two landing lights angled differently to give good forward visibility as well as two high power emergency lights. By angling the aircraft using the flight controls an acceptable spread of light can be achieved without the need for a complex steerable lighting unit.

Once again the proposal is heavy handed for non-complex light helicopters; would be difficult to implement without causing significant mass and balance implications, would be expensive and is disproportionate within the context of private operations.

comment *2250* comment by: *Patrick Wilkinson*

This is an unnecessary requirement. My R44 helicopter is equipped with fixed

landing lights and two powerful emergency lights for night flight. The cost of a moveable light is unjustified. It brings no benefits and and is both impractical and useless in single pilot night operations.

comment *2258* comment by: *Ian MACDONALD*

Trainable lights are unnecessary and potentially dangerous. Many light helicopters currently carry 2 fixed lights for landing at night which is perfectly adequate. During final approach the pilot is already coordinating Collective, Throttle, Cyclic and Pedals against a fixed sight picture. the increased workload plus the possibility of loosing sight of an already predetermined landing site due to movement of the light is dangerous.

comment *2623* comment by: *John Matchett*

Steerable landing lights are an unwelcome distraction for the pilot

of a small helicopter attempting a difficult autorotation.

All attention needs to be directed to flying the aircraft.

comment *2808* comment by: *Ed Sturmer*

Trainable landing light expensive and unnecessary and dangerous to operate in small helicopter in VFR single crew. Present light satisfactory.

comment *3031* comment by: *Richard Dawson*

Robinson R44's (and indeed most light helicopters) do not have a a trainable light built into their original design nor are they retrofittable. They are however fitted with two landing lights positioned at different angles to give two vertical angles of light. Additionally, many are also fitted with fixed emergency lights which point ahead of the helicopter. By moving the aircraft the pilot can adjust where the lights point.

A steerable light would be impractical to fit and operate from the perspective of the single private pilot, even if one was available and was certified (which there is not).

No requirement, other than for a landing light, should be included in the regulations.

comment *3443* comment by: *Peter Waldron*

A lot of light helicopters already have two or more fixed emergency landing lights and not a steerable light. The fixed lights are able to illuminate the ground to the front of the helicopter and can be moved as the helicopter is moved with the flight controls.

Many UK helicopters such as the Robinsons are already fitted with additional lights which can provide broad spread illumination. A steerable light is complex as well as heavy and costly to install.

Fixed lights should be an AMC for non complex helicopters in private use.

comment *5350* comment by: *European Private Helicopter Alliance*

Page 202

AMC OPS.GEN.415.H (a)(6)

Many light helicopters are fitted with two or more fixed emergency landing lights, and not a steerable light. These fixed lights illuminate the area of ground in front of the helicopter, and the light beam can be moved by moving the helicopter with the flight controls.

Reason

A steerable light is complex, heavy and costly and is unsuited to many light helicopters.

Many EU helicopters, especially Robinson Helicopters, are already fitted with such additional fixed lights, which provide broad spread adequate illumination. Such fixed lights should be an AMC for non complex helicopters in private flight.

Suggested text:

AMC OPS.GEN.415.H (a)(6)

LANDING LIGHT – HELICOPTERS

The landing light should be trainable, at least in the vertical plane, or alternatively, for non complex helicopters, two or more fixed lights arranged to provide a broad spread of light in front of and below the helicopter.

comment *5691* comment by: *DON BURT*

Fitting a trainable landing light would be expensive and difficult. It would also neccesitate the re-balancing of the aircraft. Equally if there is only yhe pilot on board it would impossible to operate bearing i n mind it would normally be used when landing when both arms and both feet are occupied with maneouvring the aircraft.

comment *6471* comment by: *George Heritage*

Quite unnecessary - reinventing the wheel!

comment *6557* comment by: *Sloane Helicopters Ltd*

AMC OPS.GEN.415.H (a)(6)

A steerable light is complex and expensive and not suited to many light

helicopters.Some helicopters are already fitted with additional lights, which provide adequate illumination. Therefore these should be an AMC for non complex helicopters in private flight.

AMC OPS.GEN.415.(b)

A knee pad illuminated either by internal lighting, or aircraft pinpoint lighting should be an AMC for all non complex aircraft in non commercial flight.

Suggested Text:

An acceptable means of compliance with the chart holder requirement would be to display a pre-composed chart on an Electronic Flight Bag (EFB), or in non complex aircraft, an illuminated kneeboard

comment *6776* comment by: *Clive Morrell*

'Helicopters should be fitted with a trainable landing light'

Comment; A steerable landing light is expensive, heavy and complicated. It is also not possible to fit one in some small helicopters. An alternative would be to have two or more lights suitably adjusted as is widely the case at the present time.

Two or more fixed landing lights should be acceptable for non complex helicopters.

comment *7184* comment by: *Paul Monahan*

I object to this proposal. A steerable light is expensive and heavy and is unsuited to many helis.

comment *7271* comment by: *DHV*

comment *7490* comment by: *Arno Glover*

The fitment of ELT for private, non-commercial aircraft and helicopters should be discretionary – again there is no reason to discriminate between private helicopters and fixed wing aircraft.

Please note that there is no current UK CAA requirement for private non commercial aircraft to be fitted with ELT – rather it would be more than acceptable for crews and passengers to carry a Personal Locator Beacon.

comment *7504* comment by: *David George*

AMC.OPS.GEN.415 H a6:-

"The landing light should be trainable, at least in the vertical plane."

"Trainable" landing lights are extremely expensive, heavy and complicated. Also, it is not practically possible to fit them to most light helicopters. However, in UK, single engined helicopters used for night operations are normally fitted with two, or more, fixed emergency landing lights in addition to the standard equipment landing lights. These provide adequate light in the event of an emergency at night.

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC OPS.GEN.415(b) Flight instruments and equipment - VFR night flights and IFR flights p. 202

comment *100* comment by: *EUROCOPTER*

It is too restrictive to impose EFB as the only published AMC. Classical charts on chart holders should be also acceptable. Moreover the installation requirement of the chart illumination currently in the IR should be transferred into the AMC.

Wording modifications proposal:

*CHART ~~**HOLDER**~~ **DISPLAY***

*~~An~~ Acceptable means of compliance with the chart holder **display** requirement would be **either to use a chart holder or to** display a pre-composed chart on an Electronic Flight Bag (EFB).*

The chart holder, when used, should be located so that the chart can be illuminated for night operations.

I suggest that an acceptable means of compliance with the chart holder

requirement would be an illuminated kneeboard.

comment *7614* comment by: *AOPA UK*

An EFB (class not mentioned) can not be the only way to show compliance

comment *7634* comment by: *Cirrus Design Corporation*

Besides an Electronic Flight Bag (EFB) another source of chart data could be onboard systems such as charts shown on a Multi Function Display (MFD). These displays have already been shown to have sufficiently high reliability such that paperless cockpits have been permitted. The reliability of a MFD is better than the reliability of a pilot remembering to carry current charts. Cirrus recommends onboard chart systems also be added to this AMC as an alternative to of a cockpit chart holder.

comment *1744* comment by: *Richard David Jordan*

We are in disagreement with the proposals for the following reasons:-

There is no safety case for the proposal.

Mechanical failure over water hasn't been a major reason for accidents in the past 20 years.

PPLH pilots have been flying over water without floats and without ELT for many years. There is no good reason to change the current regulations.

Costs of altering small helicopters to fit this extra equipment is expensive (Euro 30,800 just to fit it) and the extra weight would reduce safety and would consume more fuel!

If a helicopter pilots should be fit to decide if they want to install expensive and complex extra equipment.

If a helicopter fitted with floats crashes into anything other than flat-calm water then it will sink and be lost.

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC OPS.GEN.420(f) Flights over water p. 203

comment *579* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.GEN.420(f)(1):

ECA requests clarification:

What is a remote control deployable life raft and why does one need to carry them?

comment *946* comment by: *Aersud*

Comment

With this request you will stop the flight over water of the major parts of the helicopters fleet present in Europe. In general helicopters of the 3 tons class and less have not physically the space to improve a remote control for the deployment of the life rafts (R22, R44, MD500, EC120, AS350, AW119, *Schweitzer 300, etc.)*. In general these helicopter, that brings less than 6 passengers carry only 1 life raft directly in the cabin. We propose to follow the "CS 27.1415 Ditching equipment" where it is clearly written that "Each raft and each life preserver must be approved and must be installed so that **it is readily available to the crew and passengers**" and not deployable by remote control.

Proposal

Change:

1. When only one (1) life raft is carried, it shall be readily available to the crew and passengers;

2. For more than one (1) life raft carried, at least 50% ~~of the life raft carried~~ should be deployable by remote control.

3. Rafts which are not deployable by remote control and which have a mass of more than 40 kg should be equipped with some means of mechanically assisted deployment.

Note

Priority: **H**

comment *1368* comment by: *Helicopter Club of Great Britain*

Page 203

AMC OPS.GEN.420(f) Life Rafts

Most pilots who have space in their helicopter would choose to carry a life raft. However for private flights in non-complex helicopters it should be left to the pilot's free choice whether or not to carry a life raft. The rule needs to be proportionate.

Reason

The practical benefit of life raft carriage in small helicopters depends on whether or not the crew and passengers have time to deploy it correctly. It is of doubtful value in an unexpected ditching, but can be very useful in a precautionary ditching, e.g. should a helicopter run short of fuel. In many helicopters, when carrying just 1 or 2 people, it would have to be carried in the back seat, and would be inaccessible during an emergency. Most 2 seat helicopters do not have the physical space or available weight capacity to carry a life raft, and if the pilot is alone, it would have to be placed next to him, and restrained so as not to interfere with the flying controls. Such carriage creates a risk, both of interference with the helicopter controls in it’s passive state and the risk of uncommanded inflation and the subsequent large inflated obstruction in the cockpit. A 4 place life raft can cost approx. €1500, weigh 12Kg and occupy a space 30 x 60 x 15cm.

Automatically deployable life rafts are technically impossible in non complex helicopters, and such a rule is not proportionate.

For private flights in non-complex helicopters it should be left to the pilot's free choice whether or not to carry a life raft.

AMC OPS.GEN.420(f) Life Rafts

LIFE-SAVING RAFTS – COMPLEX HELICOPTERS

comment *1457* comment by: *R Spiers*

AMC OPS.GEN.420(f) Life Rafts

Where space available most helicopter pilots would choose to carry a life raft. Unfortuantely in most non complex helicopters used for private flights this is easy to do and should be left to the pilot to chose.

Reason

The value of a life raft in small helicopters is dependent on the crew being able to deploy it at the time of a ditching. It is likely that is a small helicopter it will not be possible to safetly extract a liferaft from back seat position and inflate. An automatic deployment mechanism would potential cause more injury that the ditching event itself. Finding a safe location to store such as device on a small helicopter would be probably create risks regarding centre of gavity and out of balance conditions.

Automatically deployable life rafts are technically impossible in non complex helicopters, and such a rule is not proportionate.

For private flights in non-complex helicopters it should be left to the pilot's free choice whether or not to carry a life raft.

Suggested Text

AMC OPS.GEN.420(f) Life Rafts

LIFE-SAVING RAFTS – COMPLEX HELICOPTERS

comment *1672* comment by: *JSLEE*

Page 203

AMC OPS.GEN. 420(f) Life Rafts

The proposal is that a helicopter should carry a life raft for flights over water more than 3 minutes from land if there is space to do so.

What is the definition of "if there is space to do so?"

An R22 with two on board does not have room, but with a pilot only it does have room. A Bell 206 with five on board does not have room.

Is the definition of enough space depending on the pay load carried and at the discretion of the pilot? The carrying of a life raft in all small helicopters including a B206 is impractical, unless there is space in the rear with a passenger.

Where is it suggested that a life raft is stowed in a R22 with a pilot and a passenger? On the passengers lap? Or maybe he or she could sit on it. The same problem would exist in almost any small helicopter.

When flying solo where would I stow one in a B206? On the co-pilots seat? Where it may come loose and interfere with the controls? On the back seats where it cannot be reached?

What if it accidentally inflates?

Let us consider what happens in the event of a landing on water with or without passengers and floatation equipment. When do you deploy the life raft assuming you can reach it? After the perfect landing you are unlikely to make as you have never been able to practice force landings on water and the helicopter will probably have rolled over. The life raft trapping the passenger on whose lap it has been stowed or it is so secured the sole pilot has not got time to release it.

Perhaps the passenger if there is one can drop the life raft in the approach to land?

If it is the type that inflates on contact with the water, where will it be after the evacuation? It could well be beyond reach due to winds tide etc. If does not inflate

I hope the ELT is not attached.

The numbers of private helicopters that have had to make a landing on water over the last 30 years have been 5 and to my knowledge no one has died as a result. It should be left to the pilot discretion when to carry a life raft on a private flight, in my experience most pilots already

Take into consideration the risks when flying over water and carry a life raft if they have space and the means to deploy it.

Experience tells us to minimise the time over water in a single engine aircraft. The proposal should be. To make it compulsory to wear a life jacket at all times when flying more than 10 minutes from land. This would allow an aircraft including helicopters to cross places like the Thames estuary, The Wash and the islands in Scotland without having to wear a life jacket.

comment *1782* comment by: *Chris Fox*

It is not clear to me from this text whether the intent of the NPA is to require the carriage of life rafts in ALL helicopters for over-water flights.

On the worst-case assumption that it is the intention:

In light helicopters it is hard to see where a life raft could be stowed in flight and still be accessible in an emergency. In an R22, for example, the only possible stowage is on the second seat, with attendant risks of interference with the controls - particularly in the case of inadvertent deployment. It would also make two-person flights over water impossible.

In slightly larger helicopters such as the Robinson R44, the liferaft would most probably be stowed on a rear seat, again blocking a passenger seat and

unlikely to be readily accessible in an emergency.

This requirement is disproportionate for simple helicopters operated privately.

comment *1875* comment by: *Aeromega*

The carriage of a life raft in a small helicopter is more likely to interfere with exiting a ditched aircraft and therefore more likely to lead to fatalities. What evidence is there of passengers who have survived the impact of a ditching subsequently escaping the helicopter only to perish due to no life raft being carried. I do not believe there are any statistics to make the case.

comment *1991* comment by: *Helifly (UK) Ltd*

Objection to AMC OPS.GEN.420 f

Once again, by including non-complex light helicopters in the same class as their twin-engined IFR brothers EASA is proposing regulations that cannot be complied with.

Automatic life rafts are not feasable in light helicopters and this proposal is therefore not propotionate.

Carriage of a life raft should be down to the pilot when the machine is being operated privately. In many cases the only place to stow the raft would not be accesable to the pilot / passengers in the event of a ditching. In most 2 seat light helicopters there would be no space to carry a raft.

comment *2810* comment by: *Ed Sturmer*

Small helicopters have no room for life rafts!

comment *3033* comment by: *Richard Dawson*

This regulation would not work for non-complex private helicopters such as my R44. It is not possible to fit a remotely deployable life raft on a R44. If it were, the cost would be significant for 1 hour over water per annum. We usually carry a liferaft on the passenger seat and its deployment is subject to the pilot or passengers retaining and launching it successfully on ditching.

The pilot should have discretion about whether to carry a liferaft on board the aircraft as they may not have the capacity to carry a liferaft (R22) at all.

comment *3259* comment by: *Suffolk Helicopters*

Comment

Life rafts are totally impractical for light helicopters, add weight and take up room (of which there wouldn't be any in 2 seaters) multi seat helicopters would

effcetively be reduced to two seaters if forced to carry a life raft.

The extra weight would reduce range and endurance and lead to excessive fuel consumption.

A solo pilot on a long trip over water might choose to carry a life raft but in most cases life jackets and PLBs would provide the level of safety required.

comment *3447* comment by: *Peter Waldron*

In non-complex private flight helicopters it should be the pilot's decision wheter or not to carry a life raft. This rule should be proportionate.

A 4 place life raft can cost 1500 Euros with a weight of 12kg and would take up a space of 30 x 60 x15 cm. Clearly this could create a risk both in terms of space and obstruction with the cockpit.

comment *5355* comment by: *European Private Helicopter Alliance*

Page 203

AMC OPS.GEN.420(f) Life Rafts

Most pilots who have space in their helicopter would choose to carry a life raft. However for private flights in non-complex helicopters it should be left to the pilot's free choice whether or not to carry a life raft. The rule needs to be proportionate.

Reason

The practical benefit of life raft carriage in small helicopters depends on whether or not the crew and passengers have time to deploy it correctly. It is of doubtful value in an unexpected ditching, but can be very useful in a precautionary ditching, e.g. should a helicopter run short of fuel. In many helicopters, when carrying just 1 or 2 people, it would have to be carried in the back seat, and would be inaccessible during an emergency. Most 2 seat helicopters do not have the physical space or available weight capacity to carry a life raft, and if the pilot is alone, it would have to be placed next to him, and restrained so as not to interfere with the flying controls. Such carriage creates a risk, both of interference with the helicopter controls in it’s passive state and the risk of uncommanded inflation and the subsequent large inflated obstruction in the cockpit. A 4 place life raft can cost approx. €1500, weigh 12Kg and occupy a space 30 x 60 x 15cm.

Automatically deployable life rafts are technically impossible in non complex helicopters, and such a rule is not proportionate.

For private flights in non-complex helicopters it should be left to the pilot's free choice whether or not to carry a life raft.

comment *5696* comment by: *DON BURT*

How can 50% be automatically deployed by remote control when only one raft is carried.

comment *5894* comment by: *Michael Taylor*

It is impractical to carry a life raft in a four seat light helicopter such as the Robinson R44, when all four seats are occupied. I believe that the safety record of the helicopter should be relied upon for the tiny percentage of the time that the helicopter is operated over water. I would estimate that less than 0.3% of the flight hours per year involve over water operation.

comment *6475* comment by: *George Heritage*

Light and non-complex helicopters do not have space and they would interfere with the controls.

comment *6559* comment by: *Sloane Helicopters Ltd*

AMC OPS.GEN.420(f) Life Rafts

The decision to carry a liferaft in a non-complex privately operated helicopter should rest with the pilot. For example, the Robinson R22 would be impractical and possibly dangerous to have a liferaft in the cockpit. Similarly it would prove difficult to achieve in some other types (R44) as it would require the pilot to re-enter a ditched aircraft to retrieve the liferaft. This would be a dangerous act.

comment *6905* comment by: *Luftsport-Verband Bayern*

…life rafts…

Die bei Meisterschaften und damit im nichtgewerblichen Bereich genutzten Hubschrauber haben nur teilweise genügend Platz, um einen „life raft" an Bord mitzuführen. comment *7491* comment by: *Arno Glover*

With to the requirement to carry a life raft in helicopters this should be discretionary In addition the rules need to be proportionate.

The requirement of carrying a life raft small helicopters will be dictated on whether or not the occupants of the aircraft will have time to deploy it correctly.

Automatically deployable life rafts are technically impossible in non complex helicopters.

comment *7506* comment by: *David George*

AMC.OPS.GEN.420 f:-

"1. At least 50% of the life rafts carried should be deployable by remote control. 2. Rafts which are not deployable by remote control and which have a mass of more than 40 kg should be equipped with some means of mechanically assisted deployment."

It is not possible to install life rafts deployable by remote control in small helicopters.

There are a number of views regarding the carriage of life rafts in small helicopters for over water flights. In a two seat helicopter, the life raft would have to be strapped into the passenger area and there are obvious risks associated with this - not least an uncommanded inflation of the life raft in the small cockpit area. In a four seat helicopter, carrying one or two people, the life raft could be stowed on the rear seat. However, in an emergency, I doubt that it could be deployed correctly.

I would suggest that both pilot and passengers should always put on life jackets prior to departure for an over water flight but that the carriage of life rafts should not be mandatory.

comment *1488* comment by: *Dorian Walker*

dear sirs,

the use of floats on any light helicopter is absured unless the sea conditions are compleatly flat, light helicopters do not have the endurance for any long term flight, let along over water,the addinal weight and air flow puts strain on the machine while being used over the ground, nobody spends time over the sea, the 3x robinson r 44 that i have owned have done over 3,000 hours and have spent 5% 150 hours over the sea with out incident, there is no president or reson to fit floats to a private helicopter,helicopters land softly unlike a plane

comment *1762* comment by: *EUROCOPTER*

Proposal: This GM is useless and should be deleted.

Justification: All operations in Performance Class 2 or 3 are exposed to a power unit failure; it is not the particular case of helicopters operated in Performance Class 2 and taking off or landing over water.

comment *2625* comment by: *John Matchett*

Many helicopters do not have space to carry a life raft or have time to deploy it successfully.

This could cause a fatality rather than save it. A good life jacket is normally sufficient.

comment *3034* comment by: *Richard Dawson*

A lifejacket should be worn by all crew and passengers in non-complex private helicopters where the time over water is ecpected to be more than 10 minutes - the regulation should require these to be fitted before departure of the helicopter as there is insufficient time and space in the event that a ditching would occur.

This is our standard practice.

comment *3451* comment by: *Peter Waldron*

There is no greater risk to helicopters than there is to fixed wing aircraft, although it can be awkward to put on a life jacket in a short time. It should be ensured that passengers wear a life jacket prior to departure on a flight over water.

With non-complex helicopters in non commercial flight the flotation requirement should be met with an AMC of wearing a life jacket.

comment *5635* comment by: *Stevens Construction Ltd*

To propose that they must have floats is completely unnecessary and impracticable as well as costly.

Modern helicopters and their engines are extremely reliable, to fit floats certainly will be no improvement in safety and in fact probably prove to cause more accidents, floats are bulky and make landing on uneven sites more hazardous and apparently only work in very calm water.

We urge you to please re-consider this proposal and not implement floats on Helicopters.

comment *6116* comment by: *Brian Cullen*

Regarding proposed new easa rules "OPS.GEN.425.H Ditching - Helicopters"

I wish to register my very strong view that it should NOT be mandatory to have floats fitted to light private helicopters.

I own a Robinson R44 and the cost of this would be out of all proportion to the risk. I would be unable to bring my aircraft to the UK as usual for it's annual CofA.

Helicopters should not be discriminated against private fixed wing aircraft.

In addition I do not consider there is a safety case for this proposal, in fact floats add a significant danger due to loss of performance and weight.

I hope this clearly ridiculous and unreasonable proposed rule will not be adopted.

comment *7446* comment by: *European Sailplane Manufacturers*

The regulation sregarding ELTs do not really take into account the problems of ELT installations in sailplanes.

Such an installation should only be required in areas where search and rescue would be especially difficult.

The observation until today is that ELT are by far too expensive to be installed in all sailplanes or powered sailplanes and that outside such eas where search and rescue would be especially difficult the probability of unwanted activation of ELT is by far outweighting the benefit of an installed ELT.

comment *7494* comment by: *Arno Glover*

AMC OPS.GEN.430 ELT

For private flights in non-complex aircraft it should not be mandatory to have an automatic system. AMC could be achieved by the carriage and wearing of a suitable Portable Locator Beacon (PLB) or ELT(S) with GPS information.

comment *6788* comment by: *Air Lloyd Deutsche Helicopter Service GmbH*

Dear Sirs,

the formulation (50% of there useful life) isn't totaly clear for us.

We use the KANNAD 406 AF and AF-Compact ELT's. According the Operation Manual (page: 105, date: 01/2008):

"The useful life time of batteries is twelve (12) years. To be in compliance with FAR regulations they have to replaced every six (6) years when 50 percent of there useful life has expired."

This expiring date is marked on the outside of the ELT. Does the formulation mean 50 % of 12 or 6 years? Because according the Operation Manual (page: 610, date: 01/2008):

"Battery replacement is mandatory:

after more than 1 hour of real transmission (cumulated duration);

before or on the battery expiration date;

after use in an emergency;

after an inadvertent activation of unknown duration."

The useful life time of ELT batteries is an essential part of the certification process. From our point of view no additional limitations are necessary as long as the operator follows the ELT Operation Manual.

Yours faithfully

Helmut Appelfeller

Flight Operation Manager

We are in disagreement with the proposals for the following reasons:-

There is no safety case for the proposal.

Mechanical failure over water hasn't been a major reason for accidents in the past 20 years.

PPLH pilots have been flying over water without floats and without ELT for

many years. There is no good reason to change the current regulations.

Costs of altering small helicopters to fit this extra equipment is expensive (Euro 30,800 just to fit it) and the extra weight would reduce safety and would consume more fuel!

If a helicopter pilots should be fit to decide if they want to install expensive and complex extra equipment.

If a helicopter fitted with floats crashes into anything other than flat-calm water then it will sink and be lost.

comment *2251* comment by: *Patrick Wilkinson*

The fitment of a fixed ELT to sinlge engined light helicopters is inappropriate. A portable ELT is much more use. It stays with the person, not the aircraft, which in the case of helicopters, sink rapidly. Fixed ELTs do not always activate with soft autorotative water landings. The cost is not justified for no appreciable benefit.

comment *2709* comment by: *AOPA-Sweden*

A reference to an ICAO-document should not be in this rule, because a GA-pilot/owner doesn't have an access to them.

comment *3604* comment by: *PPL/IR Europe*

For non-commerical operations within European airspace, we believe that an additional paragraph should be added permitting the use of Personal Locator Beacons as a means of complying with OPS.GEN.430

We currently have an unsatisfactory situation where rules for PLBs/ELTs are not consistant across Europe, and cause some significant uncertainty and inconvenience for GA operators. In many cases, they depend on relatively obscure or temporary exemptions.

comment *5704* comment by: *DON BURT*

The requiremnt that a helicopter should have one fixed and one portable ELT is excessive. Bearing mind that most private flights are not over water or in areas when location is difficult an ELT(S) would seem to be sufficient and would be on an equal footing to light fixed wing aircraft.

comment *7617* comment by: *AOPA UK*

3 A reference to an ICAO-document should not be in this rule, because a GA-pilotlowner does not have an access to them.

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC OPS.GEN.430.H(b)(2) Emergency Locator Transmitter (ELT) p. 204

comment *1370* comment by: *Helicopter Club of Great Britain*

Page 203

AMC OPS.GEN.430 ELT

For private flight, in non complex aircraft, carriage and wearing attached to the person a Portable Locator Beacon (PLB) or ELT(S) with GPS information should be an alternative to the requirement that the aircraft to be fitted with an ELT.

Reason

Both the UK CAA and the French DGAC are allowing this AMC under their current rules. As detailed previously, the PLB and ELT(S), with GPS location, are more effective in light aircraft and helicopters in locating survivors than an expensive and complex fixed ELT installation. It is not proportionate to demand expensive and complex fixed installations. It is more important to locate the survivors than to locate the aircraft.

Suggested Text

AMC3 OPS.GEN.430 ELT

For non-complex Aeroplanes and Helicopters in private flight the ELT fitment requirements may be satisfied by a person on board attaching a PLB or ELT(S), with GPS location information, to their person.

comment *1783* comment by: *Chris Fox*

As commented previously, the benefits of a fixed automatic ELT are questionable, particularly in the case of ditching.A Personal Locator Beacon (PLB) or ELT(S) is much more lightly to be effective in locating survivors.

The UK and French national authorities currently permit the use of a PLB in circumstances requiring an ELT for private flight. This should be continued.

comment *1901* comment by: *RCC*

the requirement does not make sence especialy as most helicopters float top down with floats

comment *2811* comment by: *Ed Sturmer*

Portable beacon better in Small helicopter operations.

comment *5371* comment by: *European Private Helicopter Alliance*

Page 203

AMC OPS.GEN.430 ELT

AMC3 OPS.GEN.430 ELT

For non-complex Aeroplanes and Helicopters in private flight the ELT fitment requirements may be satisfied by a person on board attaching a PLB or ELT(S), with GPS location information, to their person.

comment *7191* comment by: *Paul Monahan*

I object to this proposal. It is more important to locate survivors than the aircraft.

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - GM OPS.GEN.435 Survival equipment – Motor powered aircraft p. 204

comment *356* comment by: *ECA - European Cockpit Association*

Comment on GM.OPS.GEN.435,2: the second paragraph is redundant

2. Areas that are largely uninhabited and where:

a. The competent authority responsible for managing search and rescue has not published any information to confirm whether search and rescue would be or would not be especially difficult; and

b. The competent authority referred to in 1. does not, as a matter of policy, designate areas as being especially difficult for search and rescue.

comment *904* comment by: *KLM*

gm ops.gen.435 2.b.

How can an operator know the policy of the authority.

Most of the States that are known to be incapable of providing SAR do not publish anything on this.

This point has no meaning and therefore has to be deleted.

comment *1491* comment by: *Dorian Walker*

should all be left for the pilot in command to add and addinal safty equipment

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC OPS.GEN.435(a)(3) Survival equipment – Motor powered aircraft p. 204-205

comment *358* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.GEN.435(a)(3)3: this paragraph seems redundant:

3. If any item of equipment contained in the above list is already carried on board the aircraft in accordance with another requirement, there is no need for this to be duplicated.

comment *895* comment by: *Aero-Club of Switzerland*

Regarding b. the knife: Please state, that the knife is part of the equipment of the aircraft and that it shall not be carried by the crew or by passengers.

Justification: In doing so difficulties with controllers of all kinds can be avoided.

comment *2710* comment by: *AOPA-Sweden*

How to bring the knife end the "ice-saw" through "security"???

comment *4924* comment by: *Virgin Atlantic Airways*

Relevant Text:

AMC OPS.GEN.435(a)(3)

" 1a. 500 ml of water for each 4, or fraction of 4, persons on board;"

Comment:

1. Current EU-OPS survival equipment requirements (AMC OPS 1.835(c) - Survival Equipment) requires:-

a. 2 litres of drinkable water for each 50, or fraction of 50, persons on board provided in durable containers;

EASA.OPS OPS.GEN.435 requires 2 litres of water for every 16 persons on board. The new requirement represents a significant increase in the amount of water required to be carried. Currently for a typical long range wide body

aircraft, 16 litres of water needs to be carried. Under the proposed regulations 58 litres of water would be required resulting in an estimated additional fuel burn penalty of USD 3,000 pa for a typical long range aircraft.

What is the safety justification for this additional requirement?

VAA suggest an alternate means of compliance is included, for example water purification tablets

Proposed Text:

Do not change the existing requirement:-

AMC OPS.GEN.435(a)(3)

'2 litres of drinkable water for each 50, or fraction of 50, persons on board provided in durable containers.'

Or include alternate means of compliance:-

'A means of making sea water drinkable, for example water purification tablets capable of producing 500ml of water for each 4, or fraction of 4, persons on board'

1.b.,2.b. How to bring the knife and the "ice-saw" through "security"???

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC OPS.GEN.440(a) High altitude flights - Oxygen p. 205

comment *48* comment by: *George Knight*

"Breathing oxygen should be provided by a quick donning mask."

Many sailplanes and other light aircraft operating at altitudes where oxygen is necessary use cannula instead of full masks at heights up to about 18,000' and facemasks at higher altitudes. These work well with Electronic Aviation Delivery Systems such as that supplied by market leader Mountain High. The rules should not exclude modern technology for sailplanes and light GA aircraft. Cannula should be permitted in such environments.

comment *1841* comment by: *Airbus SAS*

OPS.GEN.440(a) requires that – under specified conditions – breathing oxygen be supplied to crew and passengers without specifying the means to supply.

The related AMC reads: "Breathing oxygen should be provided by a quick donning-mask for the flight crew".

Airbus considers Quick donning masks inappropriate for use by passengers and cabin crew.

==> To clarify the AMC applicability for flight crew only, Airbus proposes to revise the AMC to read as follows:

"Breathing oxygen should be provided by a quick donning-mask for the flight

crew only."

==> Further, Airbus proposes to introduce into the AMC appropriate information for Cabin Crew and Passenger oxygen masks.

comment *2711* comment by: *AOPA-Sweden*

Page No: 205

Paragraph No:

AMC OPS.GEN.440(a)

Comment:

The AMC refers the reader to a GM OPS.COM for details of the requirement. Therefore, the content of GM OPS.CAT should be part of AMC OPS.GEN.

Justification:

Incorrect drafting of guidance material.

Proposed Text (if applicable):

AMC OPS.GEN.440(a) High altitude flights - Oxygen

BREATHING OXYGEN -

Breathing oxygen should be provided by a quick donning mask ~~(See GM OPS.CAT.440(b)(1)).~~

~~**GM OPS.CAT.440(b)(1) High altitude flights - Oxygen requirements - Motor powered aircraft**~~

~~QUICK DONNING MASKS~~

which:

1. can be placed on the face from its ready position, properly secured, sealed and supplying oxygen upon demand, with one hand and within five seconds and will thereafter remain in position, both hands being free;

2. can be donned without disturbing eye glasses and without delaying the flight crew member from proceeding with assigned emergency duties;

3. once donned, does not prevent immediate communication between the flight crew members and other crew members over the aircraft intercommunication system; and

4. does not inhibit radio communications.

comment *6118* comment by: *DGAC*

Proposal:

Complete subtitle to read:

"BREATHING OXYGEN - PRESSURIZED AIRCRAFT ABOVE 25000 FT"

Justification:

Quick donning masks are necessary for rapid decompression, which cannot happen in an unpressurized aircraft!!

This is also in line with ICAO requirements.

comment *7448* comment by: *European Sailplane Manufacturers*

The best and proven systems used on gliders often do not use quick donnings masks for very good reasons.

This wording is unsuitable for gliding operations.

Contents of "First Aid Kits" is enlarged compared to JAR-OPS 1.745 Section 2, without any justification. Leave the contents "as is".

comment *7068* comment by: *Embraer - Indústria Brasileira de Aeronáutica - S.A.*

We need some clarification on this item. Since, according to 1., " these kits should be adapted by the operator according to the characteristics of the operation", does it mean that the equipment and medications presented in 2. are recommended, and not required?

IV cannulae and bronchodilator are prescriptive items in some countries, such as USA. The requirement for all presented items may bring the necessity to make different FAKs available for the operators, depending on the country of operation. This will impose a severe burden on operators to have to control the configuration of the onboard FAK on a flight-by-flight basis.

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - GM1 OPS.GEN.460(a) and (b) Airborne Collision Avoidance System (ACAS) II p. 207-208

comment *1775* comment by: *claire.amos*

Reference to source documents is an improvement.

comment *2522* comment by: *Royal Aeronautical Society*

The list of guidance material shown in GM1 was developed and published by the JAA in JAR-OPS 1 ACJ OPS 1.398 many years before ICAO published instructions for the operation of ACAS and training guidelines for pilots in PANS-OPS (Doc 8168). The text of GM2 had its origins in the JAA Temporary Guidance Leaflet 11 (which itself had been based upon Attachment E of ICAO State Letter AN 7/1.3.7.2-97/77, since superseded) and does not now accurately reflect current ICAO guidance. Subsequently, ICAO has published comprehensive instructions for the operation of ACAS and training guidelines for pilots in PANS-OPS, Volume I, Part III, Chapter 3 and Attachments A and B thereto with the specific intention that all pilots of aeroplanes and helicopters that are equipped with ACAS shall be taught and operate this equipment in accordance with *exactly the same instructions*. Note should be taken of ICAO Annex 6 Part II, Chapter 9, paragraph 9.1.2 that was designed to include pilots of aeroplanes whose operation would not necessarily be governed by an 'operations manual' (eg General Aviation). To address this omission in the NPA, and to retain the requirement that operators should specify identical procedures and training, the suggested replacement text below makes use of words published in the Annex 6 Part II Standard. References in the NPA GM2 to TCAS II Version 6.04A and to ACAS III are redundant.

The text of GM1 OPS.GEN.460 should be amended to read as follows:

GM1 OPS.GEN.460 Airborne Collision Avoidance System (ACAS) II

GENERAL

ACAS training programmes established to ensure that each pilot seated at the controls has been appropriately trained to competency in the use of ACAS II equipment and the avoidance of collisions should take into account GM2 OPS.GEN.460. This guidance material reflects the contents of Attachments A and B to ICAO PANS-OPS (Doc 8168), Volume I, Part III, Chapter 3.

ACAS operational procedures should take into account the following guidance material that reflects the contents of ICAO PANS-OPS (Doc 8168), Volume I, Part III, Chapter 3:

OPERATION OF AIRBORNE COLLISION AVOIDANCE SYSTEM (ACAS) EQUIPMENT

(insert the contents of ICAO PANS-OPS (Doc 8168), Volume I, Part III, Chapter 3, with the exception of Note 3 that follows paragraph 3.1.3 to that Chapter.)

Page No: 215

Paragraph No:

GM2 OPS.GEN.460(a) and (b) 6 c. ii. D

Comment:

The final part of paragraph D reads "The change in vertical speed should be accomplished with an acceleration of approximately ¼ g (gravitational acceleration of 9.81 m/sec^{-2}).

To the non-technical reader this could be interpreted that g itself was actually 4 times 9.81. Furthermore the abbreviation used (m/sec^{-2}) is mathematically incorrect as acceleration is a change in velocity and is metres per second (velocity) per second (m.sec^{-2} or m/sec^{2}).

Justification:

Clarification and scientific exactitude.

Proposed Text (if applicable):

D. For corrective RAs, the response should be initiated in the proper direction within five seconds of the RA being displayed. The change in vertical speed should be accomplished with an acceleration of approximately ¼ g ~~(gravitational acceleration of 9.81 m/sec²);~~ ***(Where "1 g" is the acceleration due to the earth's gravity measured near the surface of the earth. An approximate average value of g is 9.81 metres per***

second per second (i.e. 9.81 m.sec^{-2})).

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - GM2 OPS.GEN.460(a) and (b) Airborne Collision Avoidance System (ACAS) II p. 208-217

comment *361* comment by: *ECA - European Cockpit Association*

Comment on GM1.OPS.GEN.460(a) and (b) Section 7:

ECA does not recognize the figure of check airman:

b. The flight crew member's understanding of the manoeuvre training items should be assessed in a flight simulator equipped with an ACAS display and controls similar in appearance and operation to those in the aircraft the flight crew member will fly, and the results assessed by a qualified instructor, inspector~~**, or check airman**~~. The range of scenarios should include: corrective RAs; initial preventive RAs; maintain rate RAs; altitude crossing RAs; increase rate RAs; RA reversals; weakening RAs; and multi-threat encounters. The scenarios should also include demonstrations of the consequences of not responding to RAs, slow or late responses, and manoeuvring opposite to the direction called for by the displayed RA.

comment *628* comment by: *ECA - European Cockpit Association*

Comment on GM2 OPS.GEN.460(a) and (b) (5)(b)(ii)(C): change as follows:

C. Use of the TA only mode. Objective: To verify that a flight crew member understands the appropriate times to select the TA only mode of operation and the limitations associated with using this mode. Criteria: The flight crew member should demonstrate the following:

1. Knowledge of the operator's guidance for the use of TA only;

2. Reasons for using this mode. **With an engine shut down, aircraft performance may be inadequate to correctly follow a potential CLIMB RA and the use of TA ONLY mode may be part of the engine-out procedure.** ~~**If TA only is not selected when an airport is conducting simultaneous operations from parallel runways separated by less than 1 200 ft, and to some intersecting runways, RAs can be expected.**~~ If for any reason TA ~~**only**~~ **ONLY** is not selected and an RA is received ~~**in these situations**~~, the response should **still endeavour to** comply with ~~**the operator's approved procedures**~~ **the RA as far as possible, and never to manoeuvre opposite to the sense of the posted RA**.

3. All TA aural annunciations are inhibited below 500 ft agl (1 000 ft agl for version 6.04A). As a result, TAs issued below 500 ft agl may not be noticed unless the TA display is included in the routine instrument scan.

Justification:

The detail of the ACAS training as shown in C.2 is outdated, even if may still be included in ICAO GM.

OPS.GEN.460 clearly states – in compliance with the current ICAO PANS-OPS –

that "ACAS … shall be used in normal conditions during flight in a mode that enables Resolution Advisories (RAs) …"

"Normal conditions" do include parallel runway operations, and these situations should no longer be promulgated as cases when to switch off RA. Switching to "TA ONLY" is restricted to "non-normal" or "abnormal" conditions in connection with technical malfunctions that might prevent correct compliance with RAs.

comment *2523* comment by: *Royal Aeronautical Society*

The list of guidance material shown in GM1 was developed and published by the JAA in JAR-OPS 1 ACJ OPS 1.398 many years before ICAO published instructions for the operation of ACAS and training guidelines for pilots in PANS-OPS (Doc 8168). The text of GM2 had its origins in the JAA Temporary Guidance Leaflet 11 (which itself had been based upon Attachment E of ICAO State Letter AN 7/1.3.7.2-97/77, since superseded) and does not now accurately reflect current ICAO guidance. Subsequently, ICAO has published comprehensive instructions for the operation of ACAS and training guidelines for pilots in PANS-OPS, Volume I, Part III, Chapter 3 and Attachments A and B thereto with the specific intention that all pilots of aeroplanes and helicopters that are equipped with ACAS shall be taught and operate this equipment in accordance with *exactly the same instructions*. Note should be taken of ICAO Annex 6 Part II, Chapter 9, paragraph 9.1.2 that was designed to include pilots of aeroplanes whose operation would not necessarily be governed by an 'operations manual' (eg General Aviation). To address this omission in the NPA, and to retain the requirement that operators should specify identical procedures and training, the suggested replacement text below makes use of words published in the Annex 6 Part II Standard. References in the NPA GM2 to TCAS II Version 6.04A and to ACAS III are redundant.

The text of GM2 OPS.GEN.460 should be amended to read as follows:

GM2 OPS.GEN.460 Airborne Collision Avoidance System (ACAS) II

ACAS TRAINING GUIDELINES FOR PILOTS

(insert as published the entire contents of Attachments A and B to ICAO PANS-OPS (Doc 8168), Volume I, Part III, Chapter 3, replacing the existing NPA texts. It should be noted that the replacement text is largely the same as that published in the NPA but includes revisions that reflect developments and changes introduced since the original JAA TGL 11 text was developed.)

Too much detail and requirements.

Requirement to train the full range of scenario's over a two year period is very restrictive and does not comply with the spirit of the GM principle.

Proposal:

Change the requirement into; "***a number of critical scenario's should be trained over a certain period of time***"

comment *3598* comment by: *William Eaton*

An ELT in a small helicopter (r22) would be useless if attached to the helicopter, as it would sink immediately. It would be far better to have one attached to the pilot or a suitably instructed crew member. I would suggest the pilot could also carry flairs.

I cannot see any need to replace an ASI if calibrated in MPH what so ever. If necessary a

Floats on r22s would mean that for most of the flying, which is over land) unnecessary weight would be carried and only of use on very calm water. However I suspect there is no emergency float system suitable for an r22.

History would sugest there is no need to have floats on small helicopters used for private flying.

In order for private helicopters to fly over water for periods of more that say 60 minutes with out floats and a fixed ELT, a provision of corridors could be established with regular radio transmissions and or a transponder being used?

In addition, if a life raft cannot be carried, the wearing of immersion suits could be encouraged in the months where the water temperature is low or the flight time over water exceeds 45 minutes.

As for night flight, the installation of a pilot movable landing light should only be allowed for pilots with three hands and possibly two brains . For goodness sake!

comment *364* comment by: *ECA - European Cockpit Association*

Comment on GM2 OPS.GEN.465.A.3.a.ii.A.1:

"A. Surveillance:

1. The GPWS computer processes data supplied from an air data computer, a radio altimeter, an Instrument Landing System (ILS)/Microwave Landing System(MLS)/Multi-Mode (MM) receiver, a roll attitude sensor, and flap and gear selector position sensors."

Comment:

It should not sense the flap and gear selector position, but the actual position of the surfaces and of the landing gear.

comment *2524* comment by: *Royal Aeronautical Society*

On page 223 the subparagraph numbers in paragraph E should be '**1**' and '**2**', not '1' and 'ii', with the text of the second subparagraph aligned with that of the first. This whole paragraph is of critical importance since it specifies the **only** circumstances in which a 'pull-up' response to a TAWS *warning* may be replaced by that which is appropriate to a *caution*. Unless **both** criteria exist, the pilot should respond only with a manoeuvre that is appropriate for a warning. Consequently, each criterion must be linked with the other in the NPA text.

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC OPS.GEN.485.A Crash axes and crowbars - Aeroplanes p. 224

comment 105 comment by: Air Southwest

In OPS 1.795(b) this matter was considered so important that it was included in the main body of the article text. It also used the word 'must' to apply total compliance. In this section it would appear that the importance of the requirement has been played down by inclusion in the AMC section and also the use of the word 'should'. It is suggested that OPS.GEN.485.A is amended to include AMC OPS.GEN.485.A and the word 'must' is reinstated.

comment 3508 comment by: UK CAA

Page No: 224

Paragraph No:

AMC OPS.GEN.485.A

Comment:

The text refers to CAT aeroplanes requirement and therefore should be moved to AMC OPS.CAT as indicated in the proposed text.

Justification:

Consistency

Proposed Text (if applicable):

AMC OPS.CAT.485.A Crash axes and crowbars - Aeroplanes

POSITION OF CRASH AXES AND CROWBARS FOR AEROPLANES USED IN COMMERCIAL AIR TRANSPORT OPERATIONS

For aeroplanes used in commercial air transport operations, crash axes and crowbars located in the passenger compartment should be stored in a position not visible to passengers.

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC1 OPS.GEN.490.A Flight data recorder - Aeroplanes p. 224-229

comment *1642* comment by: *Luftfahrt-Bundesamt*

The LBA cannot agree to the move of FDR – parameter tables into the AMC – material. JAA especially prepared an NPA to move these tables in Section 1 of JAR-OPS in order to provide legal clarity.

Justification: see LBA - General Comment, reasons 1 and 2.

comment *1694* comment by: *Dassault Aviation*

Technical comment.

Page 224 AMC1 OPS.GEN.490.A (FDR Aeroplanes): Since FDR in GEN is required for aeroplanes > 5.7 tonnes and first issued with a CoA > 01 jan 2005, or aeroplanes > 27 tonnes and first issued with a CoA > 31 december 1988 (see OPS.GEN.490 for aeroplanes on. Page 50), the title of this AMC should, in addition to quote the date of the first CoA, also quote the maximum take off mass. Our proposal is "LIST OF PARAMETERS TO BE RECORDED FOR AEROPLANES WITH A MAXIMUM CERTIFICATED TAKE OFF MASS EXCEEDING 5,700 KG AND FIRST ISSUED WITH AN INDIVIDUAL CERTIFICATE OF AIRWORTHINESS ON OR AFTER 1 JANUARY 2010".

comment *1695* comment by: *Dassault Aviation*

Technical comment.

Page 228 AMC1 OPS.GEN.490.A Table 2 (FDR Aeroplanes): for parameter 38a (Pilot) and parameter 38b (First officer), it should be added "SELECTED BAROMETRIC SETTING".

comment *2714* comment by: *AOPA-Sweden*

This is a design requirement, doesn't fit in here

comment *3260* comment by: *Eurocontrol CND*

page 228 Table 2 of AMC1 OPS.GEN.490.A

Item 26 should contain GLS distance to threshold. In items 60 add a note to clarify that GLS details can be identified by combination of 60a and 33f. The same is true for Table 2 of AMC1 OPS.GEN.490.H, and Table 2 of AMC2 OPS.GEN.490.H This may require updating ED-55 and/or ED-122.

comment *3509* comment by: *UK CAA*

Page No: 224

Paragraph No:

AMC1 OPS.GEN.490.A

Comment:

The ICAO (FLIRECP) compliance date has been postponed to 2016.

Justification:

Amendment to compliance date.

Proposed Text (if applicable):

LIST OF PARAMETERS TO BE RECORDED FOR AEROPLANES FIRST ISSUED WITH AN INDIVIDUAL CERTIFICATE OF AIRWORTHINESS ON OR AFTER 1 JANUARY ~~2010~~ ***2016***

comment *3510* comment by: *UK CAA*

Page No: 224 – 235

Paragraph No: AMC OPS.GEN.490.A

Comment:

The break down of the FDR AMC OPS.GEN duplicates those in EU-OPS (Commercial Air Transport) and not ICAO Annex 6 Part II.

OPS.GEN breaks down the AMCs into:

After 1 January 2010

After 1 April 1998

After 1 June 1990 & before 30 March 1998

Before 1 June 1990

ICAO Annex 6 Part II breaks down the Requirement into:

After 1 January 2005

After 1 January 1989

Justification:

Incorrect compliant dates.

Proposed Text (if applicable):

AMC1 OPS.GEN.490.A Flight data recorder - Aeroplanes

LIST OF PARAMETERS TO BE RECORDED FOR AEROPLANES FIRST ISSUED WITH AN INDIVIDUAL CERTIFICATE OF AIRWORTHINESS ON OR AFTER 1 JANUARY 2010

Delete: AMC2 OPS.GEN.490.A Flight data recorder – Aeroplanes and AMC3 OPS.GEN.490.A Flight data recorder – Aeroplanes

~~AMC4~~ *AMC2* OPS.GEN.490.A Flight data recorder - Aeroplanes

LIST OF PARAMETERS TO BE RECORDED FOR AEROPLANES FIRST ISSUED WITH AN INDIVIDUAL CERTIFICATE OF AIRWORTHINESS BEFORE ~~1 JUNE 1990~~ *1 JANUARY 1989*

The flight data recorder should, with reference to a timescale, record the parameters listed in Table 1 of ~~AMC4~~ *AMC2* OPS.GEN.490.A.

When determined by the competent authority responsible for type certification or supplemental type certification and agreed by the Agency, the FDR of aeroplanes with a maximum certificated take-off mass exceeding 27 000 kg that are of a type which was first type certificated after 30 September 1969 does not need to record the parameters 13, 14 and 15b in Table 1 of ~~AMC4~~ *AMC2* OPS.GEN.490.A, when any of the following conditions are met: a. Sufficient capacity is available on a FDR system; b. The sensor is readily available; c. A change is not required in the equipment that generates the data.

When so determined by the competent authority responsible for type certification or supplemental type certification and agreed by the Agency, the FDR does not need to record individual parameters that can be derived by calculation from the other recorded parameters.

Table 1 of ~~AMC4~~ *AMC2* OPS.GEN.490.A

AEROPLANES WITH A MAXIMUM CERTIFICATED TAKE-OFF MASS EXCEEDING 27000 KG

comment *4059* comment by: *Airbus SAS*

AIRBUS asks to add a third point to AMC1 OPS.GEN.490.A Flight data recorder - Aeroplanes to read as following:

"3. Or, the parameters to be recorded as defined by AMC1 item1 should meet performance specifications (Range, Accuracy (sensor input), seconds per sampling interval, and Resolution) of an acceptable international standard recognized sufficient to comply with ICAO Annex 6, for example as defined in

Appendix M to US 14 CFR 121.344 Digital flight data recorders for transport category airplanes."

Rationale:

The operational requirements established by the FAA (so-called 88 parameters) are satisfying the valid ICAO Annex 6 requirements with respect to Digital Fligth Recorders (Type 1A recorders). The industry (aircraft manufactures, operators, STC providers) implemented these FAA requirements on most current types of aeroplanes. Accepting these requirements concerning the parameter specification as an alternative means of compliance would provide only one standard for such in-production types of aeroplanes.

This also would improve the envisaged approach for Harmonization of rules between Europe and USA. Operators in Europe and in the USA would not be faced with unnecessary different requirements and with different costs to implement such requirements.

comment *4071* comment by: *Airbus SAS*

AMC3 OPS.GEN.490.A Flight data recorder - Aeroplanes and

AMC4 OPS.GEN.490.A Flight data recorder - Aeroplanes contain following paragraph:

"When determined by the competent authority responsible for type certification or supplemental type certification and agreed by the Agency, the flight data recorder does not need to record individual parameters that can be derived by calculation from the other recorded parameters."

AIRBUS asks to include the same requirement to "AMC1 OPS.GEN.490.A Flight data recorder – Aeroplanes" and "AMC2 OPS.GEN.490.A Flight data recorder – Aeroplanes".

Rationale:

This requirement is common to all implementations. AIRBUS does not see, why this requirement should be dependent on the condition when an Aeroplane receives its First Issue of INDIVIDUAL CERTIFICATE OF AIRWORTHINESS.

comment *4340* comment by: *Airbus SAS*

Airbus proposes to replace, in the first sentence of AMC1 OPS.GEN.490.A, the fixed effectivity threshold of 1 January 2010 by an implementation date depending on the effectivity date of the rule , to read as following:

"LIST OF PARAMETERS TO BE RECORDED FOR AEROPLANES FIRST ISSUED WITH AN INDIVIDUAL CERTIFICATE OF AIRWORTHINESS ON OR AFTER ***[insert date 2 years from the effective date of the final rule]***,…"

Rationale:

To record the parameters listed in Table 1 of AMC1 OPS.GEN.490.A and the additional parameters listed in Table 2 of AMC1 OPS.GEN.490.A shall be considered as a new requirement. These lists provide significant differences from the current valid EU-OPS-1.715 requirements (Appendix 1 to OPS 1.715: Tables A1, A2, B, C and ED55). As a consequence, the applicant has to provide significant changes to the aircraft architecture. Not only the Recoding system

must be changed, but also a couple of "source systems" (Navigation, Flight Control systems), which deliver the requested parameters, must be modified as well. This requires a significant lead-time to develop and to certify the required changes.

Two years after the final introduction of the rule OPS.GEN.490 should be provided to implement the required changes to comply with the AMC1 OPS.GEN.490.A.

A corresponding comment has been given under CRT comment no. 4047 concerning AMC1 OPS.CAT.490.A.

comment *4769* comment by: *Airbus SAS*

Airbus proposes to modify Item 2. "The parameters to be recorded should meet the performance specifications (designated ranges, sampling intervals, accuracy limits and minimum resolution in read-out) as defined in the relevant tables of the European Organization for Civil Aviation Equipment (EUROCAE) ED-112." to read as following (changed parts in bold letters):

"The parameters to be recorded should meet the performance specifications (**minimum recording ranges, maximum recording interval**, **recording accuracy, and recording resolution**) as defined in the relevant tables of the European Organization for Civil Aviation Equipment (EUROCAE) ED-112 **(Issue 2003), except for parameter no.78. Parameter no.78 is specified in GM xxx OPS.GEN.490.A."**

Consequently, Airbus proposes to add a GM to specify parameter 78 in accordance with provision included JAA NPA OPS-39 "JAR-OPS 1 Omnibus".

Rationale:

- The changed text is to align the requirement of AMC1 OPS.GEN.490.A with the terms used within the ED-112 document, and to avoid possible misinterpretations.

- The addition of the "Issue 2003" is requested to allow a clear reference to an established industrial standard.

- The table 2 contains Parameter 78 : ANP or EPE or EPU**.** ED-112 does not contain any specification for parameter 78.

comment *6189* comment by: *Air Accidents Investigation Branch*

The requirements for the specific parameters to be recorded (together with accuracy, range and resolution) must not be 'downgraded' to what is effectively only a recommendation as the NPA only addresses them in the AMC section. If these are not required as part of the rule it is likely that any standardisation currently in place in Europe will be lost. The tables need moving back to the rule.

comment *6907* comment by: *Ryanair*

This date should be changed to January 1 2012 to permit operators to take

account of the changes as aircraft already scheduled for delivery are on the production line and this could cause a delay on delivery or have an enconomic affect not already accounted for.

comment *7071* comment by: *Embraer - Indústria Brasileira de Aeronáutica - S.A.*

The following items in Table 2 of AMC1 OPS.GEN.490.A is not clear to us. Are parameters 38a and 38b to be understood that both the pilot's and first officer's selected barometric settings are to be recorded?

comment *7620* comment by: *AOPA UK*

This is a design requirement, does not fit in here

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC2 OPS.GEN.490.A Flight data recorder - Aeroplanes p. 229-234

comment *1643* comment by: *Luftfahrt-Bundesamt*

The LBA cannot agree to the move of FDR – parameter tables into the AMC – material. JAA especially prepared an NPA to move these tables in Section 1 of JAR-OPS in order to provide legal clarity.

Justification: see LBA - General Comment, reasons 1 and 2.

The requirements for the specific parameters to be recorded (together with accuracy, range and resolution) must not be 'downgraded' to what is effectively only a recommendation as the NPA only addresses them in the AMC section. If these are not required as part of the rule it is likely that any standardisation currently in place in Europe will be lost. The tables need moving back to the rule.

Duplication of information recorded in EUROCAE Document ED 55

Justification:

Duplication of Information.

Proposed Text (if applicable):

Appendix 1 to AMC3 and AMC4 OPS.GEN.490.A Flight data recorder - Aeroplanes

PERFORMANCES SPECIFICATIONS FOR THE PARAMETERS TO BE RECORDED FOR AEROPLANES FIRST ISSUED WITH AN INDIVIDUAL CERTIFICATE OF AIRWORTHINESS BEFORE 1 APRIL 1998

1. The parameters to be recorded should meet the performance specifications (designated ranges, recording intervals and accuracy limits) defined ~~in Table 1 of Appendix 1 to AMC3 and AMC4 OPS.GEN.490.A~~ ***in table A1.5 of EUROCAE ED 55.***

2. FDR systems for which the recorded parameters do not comply with the performance specifications of ~~Table 1 of Appendix 1 to AMC3 and AMC4 OPS.GEN.490.A~~ ***table A1.5 of EUROCAE ED 55.*** (i.e. range, sampling intervals, accuracy limits and recommended resolution readout) may be acceptable to the competent authority responsible for the type certification or supplemental type certification.

Delete: Table 1 of Appendix 1 to AMC3 and AMC4 OPS.GEN.490.A

comment *4066* comment by: *Airbus SAS*

The following comment is related to point 1. in AMC4 OPS.GEN.490.A

"1. The flight data recorder should, with reference to a timescale, record the parameters listed in **Table 1 of AMC4 OPS.GEN.490.A**."

Airbus comment:

The current equivalent rule corresponding to AMC4 OPS.GEN.490.A (AEROPLANES FIRST ISSUED WITH AN INDIVIDUAL CERTIFICATE OF AIRWORTHINESS BEFORE 1 JUNE 1990) is EU OPS-1.725.

EU-OPS 1.725 makes additional constraints (alleviations) for airplanes manufactured before 1969, before 1987, or before 1989. The rule provides for these periods different requirements (basically subsets of parameters mentioned in AMC Table 1).

For example:

For airplanes with more than 27000kg MCTOM and first issued with an Individual Certificate of Airworthiness between 1969 and 1987 only recording of parameters 1...15b is required.

Airbus requests EASA may change the Table 1 of AMC4 OPS.GEN.490.A in a way that it correlates completely with the requirements given by EU OPS-1.725.

Rationale:

If the alignment with the existing EU-OPS 1.725 will not be done, operators of aeroplanes manufactured before 1st June 1987 are faced by significant issues. Their recording systems have usually the capability to record just parameters 1..15b.

The required changes to comply with AMC4 OPS.GEN.490.A will be very expensive and time consuming. (We assume, that this is not the intention of EASA).

comment *6197* comment by: *Air Accidents Investigation Branch*

The requirements for the specific parameters to be recorded (together with accuracy, range and resolution) must not be 'downgraded' to what is effectively only a recommendation as the NPA only addresses them in the AMC section. If these are not required as part of the rule it is likely that any standardisation currently in place in Europe will be lost. The tables need moving back to the rule.

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC1 OPS.GEN.490.H Flight data recorder - Helicopters p. 241-244

comment *1607* comment by: ***EUROCOPTER***

Wording modification proposal:

LIST OF PARAMETERS TO BE RECORDED FOR HELICOPTERS FIRST ISSUED WITH AN INDIVIDUAL CERTIFICATE OF AIRWORTHINESS ON OR AFTER 1 JANUARY ~~***2010***~~ ***2016****.*

Justification:

It is explained in page 24, item n° 80, of the Explanatory Note that the date of applicability of the ICAO type IVA FDR is postponed to 01.01.2010 because the ICAO SARP already require helicopters to be equipped with type IVA FDRs after 01.01.2005, and as a compromise solution resulting from the JAA NPA-OPS 67 (which proposed applicability from 01.01.2010).

Eurocopter would like to make the following comments:

- the date of 01.01.2005 written in ICAO Annex 6 Part III has never been realistic and implementable (some suppliers did not have compliant equipment at that time) and should be modified in accordance with the latest work done by the ICAO FLIRECP. Moreover, for most of ICAO States, this requirement and implementation date have not been transferred in in their national Operational Regulations up to now.

- as far as Europe is concerned, the date of 01.01.2010 written in JAA NPA-OPS 67 was proposed at the date of definition of this NPA, so in 2006; nevertheless such a requirement for FDRs Type IVA has never been included in JAR-OPS 3.

- today the implementation date for FDRs type IVA to be included in the future Part OPS cannot be the "copy and paste" of a date (01.01.2010) which was defined by JAA in 2006.

- it has to be noted that operators cannot, or will have big difficulties to modify the helicopters in order to retrofit Type IVA FDRs without the help of helicopter manufacturers.

- There are important delays for retrofitting Type IVA FDRs on existing aircraft types because of significant technical difficulties to gather the requested data on sub systems (e.g. AFCS, Instrumentation, Navigation) which are:

* Performance of already installed high technology components (e.g. acquisition units) is no longer sufficient to cope with the new requirements. * A new step of technology is necessary (additional inputs, increased update rates, increased computation power).

* New equipment has to be developed and serialized to receive/structure the requested data.

* Installation (new or supplement for the existing one) has to be developed, qualified, certified and introduced into a serial production.

* New software has to be developed for a significant amount of legacy systems, which have to provide the necessary data.

Proposal: Eurocopter propose to postpone the applicability date of Type IVA FDRs to the one proposed by ICAO (Letter to States Ref SP 55/4-09/56 dated 24 July 2009), so 01.01.2016.

comment *1647* comment by: ***Luftfahrt-Bundesamt***

The LBA cannot agree to the move of FDR – parameter tables into the AMC – material. JAA especially prepared an NPA to move these tables in Section 1 of JAR-OPS in order to provide legal clarity.

Paragraph No:

AMC OPS.GEN.490 and 495

Comment:

Neither OPS.GEN.490 nor OPS.GEN.495 has a reference to combination recorders. Therefore, the AMC should be amended to include the text below.

Justification:

The AMC text must be linked to the Rule.

Proposed Text (if applicable):

AMC OPS.GEN.490 and OPS.GEN.495 Flight data recorder and cockpit voice recorder

~~COMBINATION RECORDERS~~

1. Compliance with FDR and CVR requirements can be achieved by the use of combination recorders.

~~1~~. ***2***. A combination recorder is a flight recorder that records:

a. all voice communications and the aural environment required by the

applicable CVR AMC; and

b. all parameters and specifications required by the applicable FDR AMC.

Renumber paragraphs 2 and 3 as ***3*** and ***4***.

comment *3515* comment by: *UK CAA*

Page No: 248

Paragraph No:

AMC OPS.GEN.490 and OPS.GEN.495

Comment:

COMBINATION RECORDERS

The text contains no provision for helicopters to use Combination Recorders. This is contrary to JAR OPS 3.705(e) and 3.720(h).

Justification:

The rule allows for aeroplanes, but not helicopters to use combination recorders. There is no safety reason why such recorders should not be used by helicopters.

Proposed Text (if applicable):

Add:

4. **"**For helicopters, compliance with CVR and FDR requirements may be achieved by a combination recorder"

comment *3807* comment by: *Civil Aviation Authority of Norway*

Comment:

The text does not specifically permit a combined recorder (as specified and recommended in ICAO Annex 6 Part III).

There is no rule which appears to permit the use of combination recorders. Suggested additional text to this AMC might be:

4. For helicopters, compliance with CVR and/or FDR may be achieved with a combination recorder.

Justification:

Alignment with ICAO

Proposed Text

(if applicable):

4 For helicopters, compliance with CVR and/or FDR may be achieved with one combination recorder.

comment *6231* comment by: *Air Accidents Investigation Branch*

This does not address combination recorders for helicopters, something that ICAO Annex 6 does address.

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC1 OPS.GEN.500 Data link recording - Aeroplanes and Helicopters p. 248-249

comment *2716* comment by: *AOPA-Sweden*

This is a design requirement, doesn't fit in here

comment *4022* comment by: *Airbus SAS*

Airbus proposes to delete the words "and by which provider" at the end of point 2 in AMC 1 to OPS.GEN.500, to read as following:

"2. As a means of compliance with OPS.GEN.500 (a)(2), the operator should enable correlation by providing information, which allows an accident investigator to understand what data was provided to the aircraft."

Rationale:

The requirement related to the last part of this section *(…and by which provider*) couldn't be complied with. The term "provider" is not specified concerning the expected information. Identifications of providers are not part of the recorded information, unless it is part of the message.

comment *4920* comment by: *Airbus SAS*

Airbus proposes to delete Item 7. in AMC1 OPS.GEN.500 saying "The applications to be recorded should meet the performance specifications defined in the relevant tables of part IV CNS/ATM recorder systems of EUROCAE ED-112."

Rationale:

-- The applications and the definition of messages, which shall be recorded, should be completely defined by **AMC2** OPS.GEN.500 Data link recording.

- The reference to Tables of part IV CNS/ATM recorder systems of EUROCAE ED-112 is inadequate. There is a common agreement (based on the work made by FRSG/JAA) that these tables were established without appropriate maturity, and that they contain a couple of inconsistencies. AIRBUS proposes not to reference the table "CNS/ATM Recording Requirements" adopted from ED112, but to use a more consistent listing to avoid misinterpretation.

comment *7622* comment by: *AOPA UK*

This is a design requirement, does not fit in here

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC2 OPS.GEN.500 Data link recording - Aeroplanes and Helicopters p. 249-251

comment *1700* comment by: *Dassault Aviation*

Technical comment.

Page 249 AMC2 OPS.GEN.500 (D/L recording): what are exactly the data link messages that must be recorded ? What would constitute an approved message set ? The proposed requirements are open to interpretation. In §OPS.GEN.500 the requirements concern the data link communication messages, whereas Table 1 and 2 of AMC2 OPS.GEN.500 concern data link communication messages and data link surveillance messages. We propose to record only data link communication messages as FAA regulation.

comment *2380* comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

Comment:

Dates are not aligned with **EC Regulation 29/2009** Data link services Article 3 requiring data link services defined in Annex II as from February 2015

comment *4018* comment by: *Airbus SAS*

AIRBUS proposes to add an additional point 3. to AMC2 OPS.GEN.500 Data link recording - Aeroplanes and Helicopters LIST OF APPLICATIONS, to read as following:

"3. For aeroplanes and helicopters first issued with an individual certificate of airworthiness on or after 8 April 2012, data link communications messages that support the applications as requested by FAA AC 20-160 (Onboard Recording of Controller Pilot Data Link Communication In Crash Survivable Memory)."

Rationale:

The requirements established by the FAA 25-124, 91-300, 121-338, 125-54, 129-45 & 135-113) are satisfying the valid ICAO Annex 6 requirements with respect to Datalink Recording. The industry (aircraft manufactures, operators, STC providers) will implement these FAA requirements on most types of aeroplanes, for which a first CoA will be issued on or after April 7. 2010. FAA established an AC 20-160 to define the approved data set that has to be recorded. Accepting these requirements as an alternative means of compliance would provide one standard.

This also would improve the envisaged approach for harmonization of rules between Europe and USA. Operators in Europe and in the USA would not be faced with unnecessary different requirements and with different costs to implement such requirements. If EASA would not accept this recommendation, an US operator, even operating in European Airspace have much less datalink recording capability than an European one. This will lead of course to higher costs for all European operators.

comment *4977* comment by: *Airbus SAS*

Attachment #17

The AMC2 OPS.GEN.500 as proposed is structured in 2 parts affecting

1. aircraft first issued with a type certificate after 31 december 2009 (sentence 1. and table 1 on NPA page 249) and

2. aircraft first issued with a type certificate before 1 January 2010 (sentence 2. and table 2 on NPA page 250).

AIRBUS proposes to remove the dependency on the date of "first issued with a type certificate", and to replace sentences/tables 1 and 2 by a single table 1 covering all new manufactured aircraft and a single sentence 1. saying:

"1. For aeroplanes and helicopters first issued with an individual certificate of airworthiness on or after 8 April 2012, data link communications messages that support the applications in Table 1 of AMC2 OPS.GEN.500 should be recorded."

For the Airbus-proposal for that single table 1 see the .pdf-file attached to this comment.

Rationale:

a) AIRBUS would prefer to "unify" the Table 1 and Table 2 of AMC2 OPS.GEN.500 Data link recording in the proposed way, that no dependency would be made between the two conditions. To simplify the requirement, we recommend just introducing **one requirement** applicable for all airplanes first issued with an individual certificate of airworthiness on or after 8 April 2012.

Remark: If EASA will follow this proposal, **AMC1 OPS.GEN.500 item 1** becomes obsolete.

b) EASA and AIRBUS discussed the requirements concerning datalink recording in detail during the Type Certification Process of A380, A400M and currently of A350. The bus-proposed table is the final result of the assessment made by EASA concerning the Application Types, the Application description, and the required Recording Content (extract of the CRI F-26 for the AIRBUS A350). AIRBUS asks to use this table to cover both classes of aircrafts (independent from TC date).

Airbus understanding is, that EASA accepted already our arguments to remove AOC and Graphic Information from the list.

For parameters, where applications, like AOC, are not normalized nor specified (airlines normally specify applications individually) , AIRBUS (as the A/C manufacturer) cannot consider them within the architecture and cannot define recording capabilities. On the other hand, an operator does not have the technical competence to "add" recording capabilities for such complex computers like the ATSU.

The regulation OPS.GEN.500 "Data link recording" requires under paragraph (a)(1) **"...**shall be equipped with a means of recording the following, where applicable:

(1) Data link communication messages related **to air traffic services communications to and from the aircraft**;"

From this basic requirement, AIRBUS does not derive that information related to AOC items would be required to be recorded. we consider the same interpretation is applicable for "Graphics". Consequently, AOC and graphic information were removed from the table established by EASA in CRI

F-26.

comment *7056* comment by: *IACA International Air Carrier Association*

1. and 2.

Dates are not aligned with EC Regulation 29/2009 Data link services Article 3 requiring data link services defined in Annex II as from 5 February 2015.

comment *7072* comment by: *Embraer - Indústria Brasileira de Aeronáutica - S.A.*

Embraer understand that EASA requirement for datalink recording should be harmonized with FAA rule.

In that way, the message set to be recorded on the CVR should be the same as identified on specified on FAA AC 20-160A

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - GM OPS.GEN.500 Data link recording - Aeroplanes and Helicopters p. 251-253

comment *5724* comment by: *Airbus SAS*

With CRT comment no.4977 Airbus proposes to modify AMC2 OPS.GEN.500 to replace tables 1 and 2 by a single table covering all newly manufactured aircraft.

Consequently, in case EASA would implement Airbus comment no.4977, the GM OPS.GEN.500 would need to be adapted.

Airbus considers explanations for items "C" and "M" sufficient as GM to supplement the AMC. The item "*" may be required if EASA introduces the single table with item "*" included.

Further , Airbus proposes to delete the remaining parts of GM OPS.GEN.500. They are not useful as they do not contain additional information concerning recording capabilities

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC OPS.GEN.505(d) Preservation of FDR and CVR recordings - Aeroplanes and Helicopters p. 253

comment *568* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.GEN.505(d)(1): change as follows:

1. save the recordings for the period of operating time as required by OPS.GEN.490, OPS.GEN.495 and OPS.GEN.500, except that, for the purpose of testing ~~**ad**~~ **and** maintaining recorders, up to one hour of the oldest recorded material at the time of testing may be erased;

comment *1701* comment by: *Dassault Aviation*

Technical comment.

Page 253 AMC OPS.GEN.505(d) §3: is the fact to preserve a record of at least one representative flight made within the last 12 months a new requirement ? Second comment is on the operational check and evaluation of recordings themselves: we suggest that the operational check be done on the FDR itself, and the evaluation of recordings be done on the QAR (Quick Access Recorder) when equipped and when the QAR is connected to the same bus as the FDR - evaluation to be done on the FDR otherwise. The rationale is to say that the QAR can be downloaded in a much easier way that the FDR, it has longer recording duration so that a representative flight is more likely to be recorded, and it prevents damage to the FDR connections if the evaluation of recordings was required to be done from the FDR. This could be part of a new subparagraph 4 as follows: "Operational check has to be done from the FDR, and Evaluation recordings could be done from the FDR or the QAR is the aircraft is equipped and if QAR is connected to the same bus than the FDR".

comment *6249* comment by: *Air Accidents Investigation Branch*

It should be a rule that operators keep the documentation required to convert stored data into engineering units. Without this information a) the operator would be unable to establish the continued airworthiness of the FDR, b) the operator would (for large aircraft) be unable to carry out Flight Data Monitoring as required by ICAO and c) in the event of a serious incident or accident, accident investigation authorities would be unable to use the FDR data which would slow down the identifiaction of any safety deficiencies.

Due to continued issues with recorder serviceability, the ICAO Flight Recorder Panel is recommending that a) the need for the operator to hold this documentation becomes a Standard, and b) it becomes a requirement that both flight recorders are checked for correct operation on a periodic basis.

comment *385* comment by: *ECA - European Cockpit Association*

Comment on GM OPS.GEN.505(b) and (c) 1 :

Reference to new Attachment E to ICAO Annex 13 is missing.

comment *3106* comment by: *Michael Hoeck*

AMC OPS.GEN 505 (d), Point 3 can possibly collide with OPS.GEN 510 (a), if one crewmember does not consent the recording. WE, as an example, have only 2 crewmembers employed so if I´d refuse to use the recording for the 12 month storage, what then? I don´t see the need to anyhow, and then how is a small cooperate flight department such as ours supposed to do that? Legislative unnessary overkill. A functional test before each flight and a yearly checkup by the maintenance is more than enough.

Point 2: it would make more sense to have such a document at either the countries authority airplane register or preferable the EASA for EVERY Airplane. This could be in an electronic file and be accessible for any investigation team instantly.

comment *4917* comment by: *BEA*

GM OPS.GEN.505 (b) and (c)

The new ICAO annex 6 proposal states about inspections of FDR and CVR flight recorder systems:

3.1 7.1 Prior to the first flight of the day, the built-in test features on for the flight deck for the CVR, FDR recorders and flight data acquisition unit (FDAU), when installed, should shall be monitored by manual and/or automatic checks.

3.2 7.2 Annual inspections should/shall be carried out as follows:

a) the readout an analysis of the recorded data from the FDR and CVR should flight recorders shall ensure that the recorder operates correctly for the nominal duration of the recording;

b) the analysis of the FDR should shall evaluate the quality of the recorded data to determine if the bit error rate (including those introduced by recorder, the acquisition unit, the source of the data on the aeroplane and by the tools used to extract the data from the recorder) is within acceptable limits and to determine the nature and distribution of the errors;

c) a complete flight from the FDR should shall be examined in engineering units to evaluate the validity of all recorded parameters. Particular attention should/shall be given to parameters from sensors dedicated to the FDR. Parameters taken from the aircraft's electrical bus system need not be checked if their serviceability can be detected by other aircraft systems;

d) the readout facility should shall have the necessary software to accurately convert the recorded values to engineering units and to determine the status of discrete signals;

e) an annual examination of the recorded signal on the CVR should shall be carried out by replay of the CVR recording. While installed in the aircraft, the CVR should shall record test signals from each aircraft source and from relevant external sources to ensure that all required signals meet intelligibility

standards; and

f) where practicable, during the annual examination, a sample of in-flight recordings of the CVR should shall be examined for evidence that the intelligibility of the signal is acceptable.: and

g) an annual examination of the recorded images on the AIR shall be carried out by replay of the AIR recording. While installed in the aircraft, the AIR shall record test images from each aircraft source and from relevant external sources to ensure that all required images meet recording quality standards.

3.3 6.3 Flight recorder systems should/shall be considered unserviceable if there is a significant period of poor quality data, unintelligible signals, or if one or more of the mandatory parameters is not recorded correctly.

It is proposed that the wording should be consistent with future ICAO wording rather than referring to a version which will be soon replaced. Otherwise reference to ED-112 is ok.

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - GM OPS.GEN.505(d) Preservation of FDR and CVR recordings - Aeroplanes and Helicopters p. 253

comment *496* comment by: *EHOC*

General

This text was originally inserted in the rule because there might have been occasions when the aircraft had been dispatched under the conditions of the MEL. Such representative flights are conducted in order to establish the servicability of the recorders; if on return, the recorder is not servicable (all required fields recorded) then the requirement of the rule has not been satisfied.

The requirement to record and retain one flight will only be done when the recorder is serviceable.

The guidance is related only to clauses (b) and (c) of the rule.

In view of the title and header needs to be changed to:

"GM OPS.GEN.505(c) and (d) Preservation of FDR and CVR recordings - Aeroplanes and Helicopters

RETENTION OF DATA"

and the preamble to:

"Data may not have been recorded if:"

comment *721* comment by: *ECA - European Cockpit Association*

Comment on GM OPS.GEN.505(d): NIL

The change from EU OPS has been noted, but it is accepted.

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC OPS.GEN.515(b) and OPS.GEN.520(a) Microphones - Aeroplanes and Helicopters and Flight Crew interphone system p. 253-254

comment *1702* comment by: *Dassault Aviation*

Technical comment.

Page 253 AMC OPS.GEN.515(b) and OPS.GEN.520(a) Microphones - Aeroplanes and Helicopters and Flight Crew interphone system § Headsets: The sentence "Headset boom microphones should be of noise cancelling type" is not clear. Usually there is a squelch doing that and located in the audio panel.

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - GM OPS.GEN.525(b) Communication equipment p. 254

comment *937* comment by: *KLM*

To say that 121.5 Mhz is the emergency freq is useless information that is provided elswhere.

B. II. Draft Decision - Part-OPS - Subpart A - Section IV - AMC OPS.GEN.530 Pressure-altitude-reporting transponder p. 254

comment *106* comment by: *Air Southwest*

AMC OPS.GEN.530 3. This has a double standard. The requirement is for the additional SSR facilities to be carried when required by the airspace. The statement then gives the option of carriage. Incorrect use of the word 'may' creates this problem. The wording should be "The airspace may require additional SSR transponder capabilities."

comment *5924* comment by: *ERA*

European Regions Airline Association Comment

1. When an operator of a complex motor-powered aeroplane uses a navigation database which supports an airborne navigation application as a primary means of navigation**, the navigation database supplier should hold a Type 2 Letter of Acceptance (LoA),** or equivalent.

EASA need to send this paragraph back to experts. It is currently understood that such Type 2 LOA are required only for P-RNAV approval, not for B-RNAV

approval. Can B-RNAV be the primary means of navigation ?

comment *5978* comment by: *DGAC*

Put the bold text "**When compliance [..] failure of any other**" back to standard text and insert a "return carriage" between that text and the terms "**AMC OPS.GEN.540.A(b) Electronic Navigation Data Management - complex motor-powered aeroplanes** " which are in fact the title for the next paragraph "NAVIGATION DATA PRODUCTS NEEDED FOR OPERATIONS IN ACCORDANCE WITH OPS.SPA ")

comment *6282* comment by: *Lufthansa CityLine GmbH*

EASA needs to send this paragraph back to experts. It is currently understood that such Type 2 LOA are required only for P-RNAV approval, not for B-RNAV approval. Can B-RNAV be the primary means of navigation ?

comment *6510* comment by: *Jeppesen*

Jeppesen comments regarding AMC OPS.GEN.540.A(b).

Please note the comments are being posted here refer to AMC OPS.GEN.540.A(b). Rulemaking Process Support asked me to post comments here as there was a slight editorial error where the reference was linked to the previous one (AMC.OPS.GEN.525 and 535. The comments (via attachment) I am posting relate to AMC OPS.GEN.540.A(b).

Thanks for your consideration.

AMC OPS.GEN.540.A(b) Electronic Navigation Data Management – complex motor-powered aeroplanes

NAVIGATION DATA PRODUCTS NEEDED FOR OPERATIONS IN ACCORDANCE WITH OPS.SPA

1. When an operator of a complex motor-powered aeroplane uses a navigation database which supports an airborne navigation application as a primary means of navigation, the navigation database supplier should hold a Type 2 Letter of Acceptance (LoA), or equivalent.

From EASA's CONDITIONS FOR THE ISSUANCE OF LETTERS OF ACCEPTANCE FOR NAVIGATION DATABASE SUPPLIERS BY THE AGENCY, the definition of a Navigation Database is as follows:

Navigation Database - Data (such as navigation information, flight planning waypoints, airways, navigation facilities, SID, STAR) that is stored electronically in a system that supports an airborne navigation application.

Jeppesen's Position on Navigation Databases and Acceptable Means of Compliance Navigation Databases covered under a Type 2 Letter of Acceptance (LoA) should include more database types than those cited above, and should be applicable to all phases of flight (not just airborne) including databases utilized for navigation from gate-to-gate. By expanding the definition beyond airborne to all phases of flight, EASA will be more closely harmonized with

other regulatory agencies like the FAA. Other benefits of the expanded navigation database definition will include additional data being available for flight crews including the offering of three dimensional data (these data types include vertical data).

These additional navigational database types include terrain, obstacles, and airport moving map, and each of these data types offer additional information for flight crews to utilize for gate-to-gate navigation. Therefore, Jeppesen proposes EASA expand the acceptable means of compliance to recognize and include these other forms of navigational databases. The EASA "CONDITIONS FOR THE ISSUANCE OF LETTERS OF ACCEPTANCE FOR NAVIGATION DATABASE SUPPLIERS BY THE AGENCY" should be reviewed accordingly.

B. II. Draft Decision - Part-OPS - Subpart A - Section V - AMC OPS.GEN.600 Documents and information to be carried on all aircraft p. 256

comment *712* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.GEN.600 5.c.:

Paragraph 5.c. should be transferred to OPS.GEN.605(a)(8).

Justification:

Compliance with EU OPS contents.

comment *804* comment by: *CAA-NL*

Regarding the following part of AMC OPS.GEN.600

2. The documents and information may be available in a form other than on printed paper. Accessibility, usability and reliability should be assured.

Proposal CAA-NL:

Add:

permission from the authority.

Reason:

EU-OPS and JAR-OPS requires permission from the authority. Re-implement this requirement.

Add:

Take also into account the EFB requirements and type of operation.

Reason:

To give the operator means of compliance in order to introduce documents and information other than on paper

comment *1548* comment by: *Luftfahrt-Bundesamt*

The possibility of no. 1. allowing an operator to operate for a limited duration without certain documents on board might not be in line with procedures stipulated in NPA 2009-02D for the conduct of ramp-inspections (AR.GEN.435 and following).

comment *1774* comment by: *claire.amos*

Point 2

Implies that electronic copies may be carried

comment *5313* comment by: *Light Aircraft Association UK*

The LAA applauds the note in the paragraph 2 that allows documentation to be carried in non-printed paper form.

comment *6004* comment by: *Ryanair*

Para 3 - Clarification of 'competent authority' required as follows:

Proposal

Competent authority designated by the Member State where the operator has its principle place of business

Para 5 - Clarification of 'states concerned' required as follows:

Proposal

"....that may be pertinent to the flight or required by the competent authority designated by the Member State where the operator has its principle place of business"

comment *6509* comment by: *UK CAA*

Page No: 256

Paragraph No:

AMC OPS.GEN.600 (5)(b)

Comment:

The carriage of cargo and/or passenger manifests is a requirement of Article 29 of the Chicago Convention. Therefore, it should be a rule and moved to OPS.GEN .600.

Justification:

A requirement of the Chicago Convention should be Rule material in OPS.GEN.

Proposed Text (if applicable):

OPS.GEN.600 Documents and information to be carried on all aircraft

(a) On any aircraft, the following documents shall be carried on each flight:

(1) the Aircraft Flight Manual or equivalent documents;

(2) the Certificate of Airworthiness;

(3) the Certificate of Registration;

(4) the original or copy of the Noise Certificate, if applicable;

(5) the original or copy of the third party liability Insurance Certificate;

(6) the journey log book for the aircraft;

(7) current and suitable aeronautical charts for the route of the proposed flight and all routes along which it is reasonable to expect that the flight may be diverted;

(8) procedures and visual signals for use by intercepting and intercepted aircraft which shall be easily accessible to the flight crew;

(9) ***if passengers and/or cargo are carried, a passenger and/or cargo manifest;*** and

(***10***) any other documentation which may be pertinent to the flight or is required by the States concerned with the flight.

Delete AMC OPS.GEN.66 (5)(b)

comment *7069* comment by: *IACA International Air Carrier Association*

See also comments on OPS.GEN.600 (a)

Replace in (3) "to be carried on all aircraft" by "to be available on all aircraft".

Delete "original or copy" from (4) and (5) as this implies the option is not available to the other documents. AMC OPS.GEN.600 2. states the documents and information may be available in a form other than on printed paper; this implies also electronic documents and/or hard copies.Please clarify.

Please also clarify that the requirement to carry the Airworthiness Review certificate adequately covered by the mandatory carriage of the Certificate of Airworthiness ?

comment *7624* comment by: *AOPA UK*

If there is no log book issued, how can there be compliance? See our comments above.

AMC OPS.GEN.605

1. The information pertinent to the intended flight concerning search and rescue services **and** should be easily accessible in the cockpit

Either there is missing an item after 'and', or 'and' is obsolete.

B. II. Draft Decision - Part-OPS - Subpart A - Section V - AMC OPS.GEN.610 Journey log book p. 256-257

comment *499* comment by: *EHOC*

General 1

The Operational Flight Plan is used to document exactly how the flight is to be conducted and what resources will be required: "the operator's plan for the safe conduct of the flight based un considerations of aircraft performance, other operating limitations and expected conditions on the route to be flown and at the aerodromes concerned".

On the other hand, the Journey Log Book is a document that provides a post flight record used to: complete flight records; bill customers; provide the data for engineering schedules etc. In commercial operations, the Technical Log may be used instead of the Journey Log Book.

Because of their disparate uses and the timing of their completion, it might be better to establish the contents of each individually and separately.

General 2

The construction of the form would be much clearer if the elements were set out as they were previously - as it is in ICAO Annex 6 Part I Chapter 11.4.

"...journey log book should contain the following items and the corresponding roman numerals"

General 3

Not sure of the benefit of not having the flight time box provided on the journey log; if it is necessary (and it probably is) it should be provided as it is in Annex 6.

Paragraph 2.

Part GEN is referring to the aircraft log book, not the technical log. Currently some CAT operators use the Technical Log as part of the journey log to meet current requirements, not the aircraft log book. As Technical Log books are not required for non CAT operations this would need to be referred to. Part Gen should be expanded to include:-

"The journey log may be combined with the aircraft log book as required in Part M.A.305 or the technical log as required in M.A.306."

comment *2717* comment by: *AOPA-Sweden*

If there is no log book issued, how to do? See our comments above.

comment *3108* comment by: *Michael Hoeck*

Why e) Purpose of flight?

Point c) Crew names: can we use TLC´s please?

comment *4222* comment by: *DGAC*

OPS.GEN.600 + OPS.GEN.610 + AMC OPS.GEN 610

Proposal :

Return to the wording of EU-OPS 1055(b)

(b) An operator may be permitted not to keep an aeroplane journey log, or parts thereof, by the Authority if the relevant information is available in other documentation.

Justification

As written OPS.GEN.600 + OPS.GEN.610 seem to imply that a journey log has to be established and carried on board, which is not consistant with the possibility provided in EU-OPS OPS 1.125 & 135 + OPS 1.1055b, which allowed to gather this information in other documentations.

comment *6049* comment by: *Ryanair*

The use of the word 'retained' implies for record keeping purposes. This information may be submitted in electronic format

Proposal

The information or parts thereof may be ~~retained~~ *submitted*/retained in a form other than on printed paper.....

B. II. Draft Decision - Part-OPS - Subpart A - Section V - GM OPS.GEN.610 Journey log book p. 257

comment *6050* comment by: *Ryanair*

Please refer to earlier proposal in relation to the definition of a 'series of flights'

B. II. Draft Decision - Part-OPS - Subpart A - Section VI p. 258

comment *781* comment by: *ECA - European Cockpit Association*

The whole section on security should be deleted. ECA believes the provisions of the security section should be deleted as they overlap with Regulation 300/2008. If, however it is decided to keep this section within OPS, ECA recommends to amend the text (see below comments).

B. II. Draft Decision - Part-OPS - Subpart A - Section VI - GM OPS.GEN.700 Disruptive Passenger Behavior p. 258

comment *782* comment by: *ECA - European Cockpit Association*

The paragraph should be deleted. ECA believes the provisions of the security section should be deleted as they overlap with Regulation 300/2008 (see comment n° 781). If, however it is decided to keep this section within OPS, the following changes are needed:

GM OPS.GEN.700 Disruptive Passenger Behavior

GENERAL

1. Operators engaged in the transportation of passengers should take into account that their passengers could ~~**obstruct**~~ **jeopardise** the safe operation of the aircraft. **Undesirable** ~~**P**~~**p**assenger behaviour may be affected by a variety of factors, including:

a. limitations on personal 'freedom', such as restrictions on smoking or on the use of mobile phones;

b. ~~**physical**~~ **physiological** effects, ~~**such as**~~ **possibly** from **medication**, consummation of alcohol **or illicit drugs**, illness, ~~**or taking of medication, possibly increased from**~~ **including the** effects of higher altitude and ~~**less available**~~ **with the consequent reduction in** oxygen;

c. social or psychological effects, such as from fear of flying, claustrophobia, or reluctance to follow instructions.

2. The pilot-in-command should consider preventive measures when ~~**the possibility of**~~ disruptive passenger behaviour is anticipated. Such measures **may** ~~**could**~~ include~~**, but are not limited to**~~:

a. communication ~~**on behalf of the pilot-in-command**~~ with the potentially disruptive passenger in an effort to reduce the likelihood of disruptive behaviour;

b. reseating a potentially disruptive passenger to an area where there is less risk of passenger interference;

c. deny boarding to the potentially disruptive passenger or cancel the flight.

Justification:

Pilots should not leave the flight deck during in-flight security incidents as this presents flight safety and security hazards.

comment *2071* comment by: *claire.amos*

Para 2: potentially and disruptive

This paragraph duplicates requirements in EC300 Chapter 10.1(b) potentially disruptive passengers shall be subjected to appropriate security measures during a flight.

Definition of potentially disruptive passengers is deportees, inadmissables and prisoners - a security issue. This paragraph should be changed to cover dealing with actual disruptive behaviour by deleting the word "potentially" from a. b. and c.

OPS GEN.700 is about

comment *5979* comment by: *DGAC*

Justification : In the title of GM.OPS.GEN.700 "Disruptive Passenger *Behavior*", the US spelling is used for the word behaviour. As in the rest of the text (including the title of OPS.GEN.700 "Disruptive Passenger *Behaviour*") the British spelling is used, the following change should be done to ensure spelling consistency throughout the text :

Proposal : In the title of GM.OPS.GEN.700 replace "behaviour" by "behaviour"

comment *6077* comment by: *Ryanair*

Paragraph 2

The term "potentially disruptive passenger" in the context of Regulation (EC) 300/2008 means a "passenger who is either a deportee, a person deemed to be inadmissible for immigration purposes, or a person in lawful custody".

Although we cannot find any definition of the term "potentially disruptive passenger" or "disruptive passenger" in Regulation 216, it is clear that the term "disruptive passenger" is used in a much wider context. This anomaly must be addressed and any confusion removed.

Paragraph 2 (a)

Any provision which suggests that the pilot-in-command should communicate with a disruptive passenger (particularly in the context of flight deck security) must be removed.

Proposal

REMOVE

Paragraph 2 (c)

Any suggestion that the pilot-in-command should consider cancelling a flight in these circumstances is unacceptable and must be removed.

Proposal

REMOVE

comment *7330* comment by: *ANE (Air Nostrum) OPS QM*

Paragraph 2.

We stance about this subject is very different to the one explained in this section. We took a stand on disruptive passenger and communication with cockpit, according to OPS 1.1255 Flight crew compartment security, that states that the Company will establish means of communication between cabin and cockpit but always keeping the integrity of cockpit. For this reason we can not agree with this measure (mentioned above), from our point of view it is against the philosophy of keeping secure flight crew compartment.

On the other hand, if the pilot will leave cockpit and start conversation with the disruptive passenger, if this measure goes wrong the damage can be bigger.

B. II. Draft Decision - Part-OPS - Subpart B - Section I - AMC1 OPS.CAT.010 Definitions p. 259

comment *9* comment by: *KLM*

2.Contingency fuel

Change definition into

- An amount of Fuel to cover unforseen events that could negatively influence the planned fuel consumption.

The rest of the text has to be deleted as:

an individual aircraft that deviates from the expected fuel consumption has to be covered by the high/low fuel consumption percentage or fuel factor and not by contingency fuel. So this has to be deleted from the defintion.

A definition has to cover the total and not suggest that meteorological conditions and/or cruising level deviations are the only events that may be covered. Therefore these examples should be taken out of the defintion.

comment *500* comment by: *EHOC*

General

Editorial: List should be in alphabetical order.

Paragraph 8.

Should be in OPS.GEN.010 as it is used in OPS.CAT.365.H.

A general point; it would assist in the understanding of the regulations if all the definitions were in one place. In the case of helicopter performance, all of the terms could be provided under the definition 'Helicopter Performance' containing the terms used.

comment *1158* comment by: *Stefan Huber*

Point 30 : Blood, organs or drugs which does not need any medical equipment shall not be considerated as HEMS.The final decision shall remain with the National Authority.

comment *5710* comment by: *Irish Aviation Authority*

Comment:

A lot of these definitions pertain to all helicopter operations, not just CAT. Particularly the performance related ones such as: LDP, RTODRH, RTODAH and TDP etc. They should be moved to OPS.GEN.010 Definitions.

comment *5980* comment by: *DGAC*

There is no paragraph OPS.CAT.010 Definitions to link this AMC to.

Generally speaking it is very difficult to have several places to check when one looks for a definition. All definitions should be in the same place: OPS.GEN.010. The definitions should not be in AMC as a definition must be clear and unambiguous and shall not require any "acceptable mean of compliance" to be understood. A definition is a reference and therefore has to be in the rule (IR).

comment *6458* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Comment

There is a need for a global part dedicated to definitions.

Proposal

We suggest a specific part or the EASA regulation framework may contain a comprehensive and exhaustive list of definitions, applicable to the whole EASA regulation, which is the best way to have consistent and non-redundant definitions.

Jusfication

This might be a legal issue regarding the scope of understanding and cause problems of reading

B. II. Draft Decision - Part-OPS - Subpart B - Section I - AMC OPS.CAT.040 Carriage of weapons and ammunition p. 259

comment *687* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.040(1): delete completely:

AMC OPS.CAT.040 Carriage of weapons and ammunition

STOWAGE OF WEAPONS AND AMMUNITION

~~**1. If the aircraft does not have a separate compartment in which weapons can be stowed, procedures should take into account the nature of the flight, its origin and destination, and the possibility of unlawful interference. As far as possible, the weapons should be stowed so they are not immediately accessible to the passengers (e.g.**~~

~~**in locked boxes, in checked/personal baggage which is stowed under other baggage or under fixed netting). The pilot-in-command should be notified accordingly.**~~

Justification:

Requirement is inappropriate to security requirements – weapons shall never be accessible to passengers.

Comment on AMC OPS.CAT.040(2): clarify if needed:

2. The applicability of OPS.GEN.035 should be taken into account.

Justification:

OPS.GEN.035 not existing, wrong cross-reference.

comment *1024* comment by: *Beat Fahrni*

Getrennte Aufbewahrung der Waffen und der Munition zu den Passagieren. Der Pic muss Kentniss über den Transport von Waffen und Munition haben.

comment *1163* comment by: *CAA-NL*

Comment: Carriage of weapons in other than separate compartment should only be permitted if the approval of all states concerned has been granted, as required by EU-OPS 1.065 (b).

Justification: The current wording is vague and the wording "as far as possible" may provide for the operator not implementing adequate measures.

Proposed Text (if applicable):

Amend AMC OPS.CAT.040 1. as follows:

"If the aircraft does not have a separate compartment in which weapons <u>and ammunition</u> can be stowed, <u>carriage of such items is subject to approval by all States concerned. In such instances,</u> procedures should take into account the nature of the flight, its origin and destination, and the possibility of unlawful interference. ~~As far as possible,~~ The weapons should be stowed so they are not immediately accessible to the passengers (e.g. in locked boxes, in checked/personal baggage which is stowed under other baggage or under fixed netting). The pilot-in-command should be notified accordingly."

AMC OPS.CAT.040

Comment: The conditions of AMC OPS.CAT.040 are equally relevant to weapons of war and munitions of war.

Justification: Weapons of war and munitions of war will often be firearms and so need to be inaccessible to passengers and unloaded.

Proposed Text (if applicable):

Amend AMC OPS.CAT.040 as follows:

"OPS.CAT.040 Carriage of sporting weapons, weapons of war, munitions of war and ammunition

Sporting weapons, weapons of war, munitions of war and ammunition carried in an aircraft shall be:"

comment *1197* comment by: *CAA-NL*

B. II. Draft Decision - Part-OPS - Subpart B - Section I - GM OPS.CAT.045 Carriage of weapons and ammunition p. 260

comment *720* comment by: *ECA - European Cockpit Association*

Comment on GM OPS.CAT.045: add the following text:

Where weapons of war or munitions of war are also dangerous goods by definition (e.g. torpedoes, bombs, etc.), Subpart will also apply.

Justification:

Reference to DG req is missing.

B. II. Draft Decision - Part-OPS - Subpart B - Section I - AMC OPS.CAT.050 Information on emergency and survival equipment carried p. 260

comment *501* comment by: *EHOC*

General

The ATS flight plan will not contain the detailed information (such as those elements that are already included in the text) that is necessary to establish survival time. The method of compliance appears to go below the objective standard set in the ICAO rule.

The last sentence should be deleted.

B. II. Draft Decision - Part-OPS - Subpart B - Section II - AMC1 OPS.CAT.110 Carriage of special categories of passengers p. 261

comment *1734* comment by: *claire.amos*

2. c.

This appears to be a new addition and does not reflect the current procedures which are in line with the recently implemented PRM guidelines. This statement infers the crew are responsible for the PRM in the case of emergency. Under our Standard Operating Procedures (SOP) the passenger is to be self sufficient or travel with an ABP. If the crew are to be responsible for assisting a PRM in an emergency further training in manual handling of passengers may be require which in term could extend the training and have cost implications.

comment *4757* comment by: *Virgin Atlantic Airways*

Relevant Text:

"When carrying special categories of passengers, the following should be taken into account:

a.The number and category of those persons;

b.The total number of passengers carried compared to the seating capacity of the aircraft configuration;

c.The number and composition of the crew able to assist special categories of passengers in case of emergencies."

Comment:

PRMs are now in the 'special category' of passengers which now includes both disabled and able-bodied passengers, rather than in a separate category as previously.

It seems the carriage of PRMs has been amalgamated with the restrictions for seating special categories of pax in exits rows. Although it is correct to say that PRMs are included in the category of passengers who should not be seated at exits, their carriage presents other safety challenges e.g. in an emergency and evacuation, therefore we need to consider limits.

The Air Carriers Access Act and EU PRM have given disabled passengers additional rights, so long as safety levels can be maintained. It is therefore

incumbent on us to ensure this can be achieved.

As it stands, we could have any numbers of each of the types listed as special category, e.g. children, deportees, inads, prisoners, pax with animals, PRMs. It will be impossible for either check-in or the cabin crew comply with (b) or (c)

Proposed Text:

"When carrying special categories of passengers, the following should be taken into account:

a.The number and category of those persons.

b.The total number of passengers carried compared to the seating capacity of the aircraft configuration.

c.The number of PRMs should not exceed the number of able-bodied persons capable of assisting with an emergency evacuation.

d.The number and composition of the crew able to assist special categories of passengers in case of emergencies."

comment *5129* comment by: *Pietro Barbagallo ENAC*

Comment: no indications is given to avoid seating positions adiacent to emergency exits.

Justiifcation: Any person with reduced mobility (PRM) expecially disable at various level of physical incapacity as blind passengers with their guide dogs, seated adiacent to emergency exit jeopardize the flow passengers in case of emergency evacuation.

comment *6117* comment by: *Ryanair*

Ref GM OPS.CAT.100 - "special categories of passengers" includes deportees, inadmissible passengers and persons in custody. Such persons are already defined and legislated for in Regulation (EC) 300/2008 as "potentially disruptive passengers". This conflict must be removed.

B. II. Draft Decision - Part-OPS - Subpart B - Section II - GM OPS.CAT.110 Carriage of special categories of passengers p. 261

comment *107* comment by: *Air Southwest*

Sub paragraph 2. specifies 'children and infants.' Definition 42 defines what an infant is (a person under the age of 24 months) but there is no definition of a child. For the sake of regularity, please define a child by age.

comment *886* comment by: *Condor Flugdienst GmbH - FRA HO/R*

It appears unreasonable to classify children as "Special category Passengers".

comment *5121* comment by: *Elaine Allan Monarch*

Page No.

261

Ref No.

NPA 2009 – 2b AMC OPS.CAT.110 page 261 of 464

Summary of EASA Proposed Requirement:

Carriage of special categories of passengers

2. When carrying special categories of passengers, the following should be taken into account:

a. The number and category of those persons;

b. The total number of passengers carried compared to the seating capacity of the aircraft configuration;

c. The number and composition of the crew able to assist special categories of passengers in case of emergencies.

Comment:

It appears that PRMs have been included in special category passengers, which means that there may be a significant number of passengers onboard that fall into the special category.

Justification:

Currently PRMs are a separate category.

Proposed Text (if applicable)

When carrying special categories of passengers, the following should be taken into account:

a. The number and category of those persons;

b. The total number of passengers carried compared to the seating capacity of the aircraft configuration.

Add text **c. the number of PRMS should not exceed the number of able-bodied persons capable of assisting in an emergency evacuation.**

d. The number and composition of the crew able to assist special categories of passengers in case of emergencies.

comment *5987* comment by: *DGAC*

Where is the definition for child/children ? There should be a single location for all definitions

comment *6119* comment by: *Ryanair*

Ref GM OPS.CAT.100 - "special categories of passengers" includes deportees, inadmissible passengers and persons in custody. Such persons are already defined and legislated for in Regulation (EC) 300/2008 as "potentially disruptive passengers". This conflict must be removed.

comment *7075* comment by: *IACA International Air Carrier Association*

2.

Children should not be a "special category of passenger".

B. II. Draft Decision - Part-OPS - Subpart B - Section II - AMC2 OPS.CAT.110.B Carriage of special categories of passengers p. 261

comment *5136* comment by: *UK CAA*

Page No: 261

Paragraph No:

AMC2 OPS.CAT.110.B

Comment:

An additional requirement is needed to ensure that passengers are able to understand and respond to instructions given by the crew. Persons unable to understand the crew may not necessarily be children nor PRMs.

Justification:

The UK Air Accident Investigation Branch made such a recommendation following an accident caused (in part) by a balloon passenger not understanding the passenger briefing.

Proposed Text (if applicable):

AMC2 OPS.CAT.110.B Carriage of special categories of passengers

~~CARRIAGE OF CHILDREN AND PERSONS WITH REDUCED MOBILITY – BALLOONS~~

An operator may exclude **passengers** ~~children and/or PRMs~~ from transportation in a balloon, when:

1. their presence may impede:
   a. the crew in their duties;
   b. access to emergency equipment; or
   c. the emergency evacuation of the balloon; and/or
2. those persons are:
   a. unable to take a proper brace position; or
   b. smaller than the height of the basket plus 20 cm**; or**
   c. unable to understand and respond to instructions given by the crew

comment *5987* ☐ comment by: *DGAC*

comment *2403* comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

AMC2 OPS.CAT.120 item 2.

Proposal:

Replace "guide dogs" with "registered assistance dogs".

comment *2813* comment by: *M Wilson-NetJets*

Original text:

CARGO CARRIAGE IN THE PASSENGER COMPARTMENT – MOTOR-POWERED AIRCRAFT The following should be observed before carrying cargo in the passenger compartment:

1. Dangerous goods should not be allowed;

2. For aeroplanes, a mix of passengers and live animals should only be allowed for pets weighing not more than eight kg and guide dogs;

3. The weight of cargo should not exceed the structural loading limits of the floor or seats;

4. The number/type of restraint devices and their attachment points should be capable of restraining the cargo in accordance with applicable certification specifications;

5. Cargo should be located such that, in the event of an emergency evacuation, it will not hinder egress nor impair the crew's view.

Suggested new text:

CARGO CARRIAGE IN THE PASSENGER COMPARTMENT – MOTOR-POWERED AIRCRAFT The following should be observed before carrying cargo in the passenger compartment:

1. Dangerous goods should not be allowed;

2. For aeroplanes, a mix of passengers and live animals should only be allowed for pets weighing not more than eight kg and guide dogs;

3. For aeroplanes with 19 seats or less, dogs of more than eight Kg but not more than forty Kg may be carried in the passenger cabin if for each such dog a seat is available and each dog is restrained such that no dog can reach another dog and each required crewmember can exercise his/her safety duties without being hampered by any dog;

4. The weight of cargo should not exceed the structural loading limits of the floor or seats;

5. The number/type of restraint devices and their attachment points should be capable of restraining the cargo in accordance with applicable certification specifications;

6. Cargo should be located such that, in the event of an emergency evacuation, it will not hinder egress nor impair the crew's view.

Comment/suggestion:

A restriction for dogs of 8KG in the cabin is a problem for our owners since they take Labradors etc. and this is part of the whole experience of flying or owning a private jet. For airline operations the restriction is sensible because the a larger dog can be a issue for other passengers that not voluntarily want to be near or come in contact with a larger dog. On private jets the other passengers have a relationship in one form or another with the owner or lead passenger of the flight. This relationship indicates that they can have direct information and knowledge about the dog and, if they board, do not have any issues with the cabin with the dog. Furthermore, in the suggested text extra safeguards have been built in to ensure Flight and Cabin Crew safety and a limit as to prevent overcrowding of the passenger cabin with dogs.

comment *5988* comment by: *DGAC*

The paragraph deals only with stowage of the cargo, not with carrying :

"CARGO ~~CARRIAGE~~ **STOWAGE** IN THE PASSENGER COMPARTMENT – MOTOR-POWERED AIRCRAFT The following should be observed before ~~carrying~~ **stowing** cargo in the passenger compartment"

comment *7076* comment by: *IACA International Air Carrier Association*

comment *306* comment by: *Rega / Swiss Air-Ambulance*

Attachment #18

AMC OPS.CAT.155.A Selection of aerodromes - Aeroplanes

Scope:

The table of "Application of aerodrome forecasts" is completely wrong formatted --> multiple typing errors.

Text to be added:

Please find the correct formatted table under JAR-OPS 1 AMT 13 TGL 44 AMC OPS 1.297 and also in the added file.

Proof:

Self explanatory.

Background:

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. Its services range from providing medical advice to repatriating patients to/from Switzerland or any other point of the world. Swiss air-ambulance is a private, non-profit organisation, which operates in accordance with the guiding priniples of the Red Cross. It comes to the aid of people in distress, without respect of their nationality, religious convections or social status. Swiss air-ambulance operates under the Air Operator Certificate CH-AOC-No.1015 issued by the Federal Office of Civil Aviation Switzerland (FOCA) and is compliant with EU-OPS. Please visit www.rega.ch

comment *569* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.155.A(1)(b): change as follows: delete the two asterix after PROB:

b. Application of forecast The prevailing weather conditions forecast in the initial part of the TAF should be fully applied with the exception of the mean wind and gusts (and crosswind) which should be applied in accordance with the policy in the column 'BECMG AT and FM' in the table below. This may however be overruled temporarily by a 'TEMPO' or 'PROB~~**~~' if applicable according to the table below.

Justification:

Suggests additional info below the table, see single asterix at the bottom. There is no additional info presented and necessary.

comment *570* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.155.A(2): change:

- In the column "*BECMG (alone), BECMG FM, BECMG TL, BECMG FM…* TL in case of*", insert a vertical line at row 'DESTINATION at ETA ± 1 hr'.

- In the box below '*Deterioration*' insert text: '**Applicable from the time of start of the change**'.

- In the box below '*Improvement*' insert text: '**Applicable from the time of end of the change**'.

- In the column '*FROM (alone) and BECMG AT*' change text in row 'DESTINATION at ETA ± 1 hr' into '**Applicable from the time of start of the change**'

Justification:

The table as proposed is not correct. Reference: JAR-OPS 1.297 (AMC OPS p. 2-D-13). The proposed changes make it correct.

comment *571* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.155.A(2): All horizontal lines within "aerodromes planned as" with same applications should be erased.

Justification:

As table is presented now it is not clear and might be confusing. For instance blanc boxes behind t/o altn. If horizontal lines are deleted in the applications for destination, t/o altn, dest altn, enroute altn, it will become far more clear which applications apply for all of them. Same remark also for etops enroute altn applications. See also jar-ops table AMC OPS 1.297

comment *955* comment by: *KLM*

For ETOPS enroute alternate it should be:

gusts exceeding crosswind/tailwind limits should be fully applied

comment *3278* comment by: *AEA*

Relevant Text:

Becoming columns for Destination at ETA +/-1 hour (deterioration and improvement)

Comment:

This table is not line with JAR-OPS. For the improvement case, it should be the time of end of change' rather than 'time of start of change'. It seems to be a mistake since this proposal would reduce flight safety margins.

Proposal:

No suggested text:

Comment/suggestion:

Second row under point 1b. After PROB** there are no two** in the for notes the indication "BECMG AT and FM" should be worded as in the column below "FM(alone) and BECMG AT"

Sometimes the wording "Applicable from the start of the change" and "Applicable from the time of the start of the change", suggest consistent wording

TAF or Trend improvement allows application from the start of the change, this should be end of change because the change might not yet be completed and worse weather conditions could be encountered (ETOPS alternate has the correct restriction).

It appears that some errors were made in formatting the table (e.g. empty field for Take-Off alternate and Dest Alternate)

comment *108* comment by: *Air Southwest*

" ... in accordance with AMC1 CAT OPS.GEN.205 3." Is this wrong!

comment *5990* comment by: *DGAC*

The reference given at the end of the GM "AMC1 CAT OPS.GEN.205 3" can not be accessed as it does not exist (anyhow the numbering is not standard)

B. II. Draft Decision - Part-OPS - Subpart B - Section II - AMC OPS.CAT.155.A(b) Selection of aerodromes - Aeroplanes p. 269-270

comment *3* comment by: *KLM*

The term 3% enroute alternate ERA aerodrome is to be replaced by :

Fuel en route alternate (ERA) aerodrome. See definitions.

This en route alternate is also applicable for fuel policies with statistical data and does not necessariliy implies a reduction of the contingency fuel to 3%,

but a decrease of the contingency fuel in general.

comment *5991* comment by: *DGAC*

The purpose of a 3% ERA aerodrome is :

- either to select one ERA aerodrome and one destination aerodrome (see OPS.CAT.155.A(b)
- either and mostly to reduce the contingency fuel with a reduced fuel contingency procedure.

Then this AMC should be transferred to AMC2 OPS.CAT.205.A Fuel and oil supply

B. II. Draft Decision - Part-OPS - Subpart B - Section II - GM OPS.CAT.155.A(d) Selection of aerodromes - Aeroplanes p. 270

comment *956* comment by: *KLM*

Wrong methodology; see table on page 61 what is required is a margin in weather and not in facilities.

The facility that is available and usable has to be plannable and an addon in wx (200ft-400mtrs) notams and components out table take care of unserviceability.

This is a more logical and workeable way to ensure that weather complies with the required minima,than looking into the next facility always ending up with unnecessary high minima.

The methodology used for ETOPS with an increment added to the usable facility is easier and more appropriate.

comment *6601* comment by: *KLM*

The use of APV BaroVNAV procedures shall be included in the weather minima to be applied for alternates.

Since this type of procedures is in between Precision- and Non Precision procedures there is a sepearte view required and the methodology has to be chnaged to enable this.

Here is what I propose:

Approach Facility or equipment	**Ceiling minimum**:	**Visibility/RVR/CMV minimum**:

Precision Approach Procedure or GBAS/SBAS	Authorised DH/DA plus an increment of 200 ft	Authorised visibility plus an increment of 800 metres
APV BaroVNAV procedure	Authorised DH/DA plus an increment of 300 ft	Authorised Visibility plus an increment of 1000 metres
Non-Precision Approach or Circling Approach APV LNAV only	Authorised MDH/MDA plus an increment of 400 ft	Authorised visibility plus an increment of 1500 metres

Important text has been omitted in the draft from the original in JAR-OPS 3 AMC OPS 3.295(c)(1) and needs to be reinstated as indicated.

Justification: Accuracy of text.

Proposed Text (if applicable):

2. The following should be taken into account:

a. Suitability of the weather based on the landing forecast for the destination;

b. The fuel required to meet the instrument flight rules requirements ***less alternate fuel***;

B. II. Draft Decision - Part-OPS - Subpart B - Section II - AMC OPS.CAT.170 Minimum terrain clearance altitudes p. 273-274

comment *10* comment by: *KLM*

amc ops cat 170

2. c. any foreseeable contingencies along the planned route.

This has to be changed into something that is intended to be specified here; a contingency is by definition unforeseen.

Beter is to delete this because if an event is foreseen it has to be included in the flightplan and if it is a contingency meaning not expected.

comment *503* comment by: *EHOC*

General

This is not a method of compliance but an set of objective requirements – it would be better if it was promoted into the IR leaving the methods of compliance as shown in GM OPS.CAT.170 (which might be renamed to AMC).

Paragaph 1.a.

Editorial: The accuracy **with** which...

comment *957* comment by: *KLM*

1.e.

How can possible inaccuracies in aeronautical charts be determined.

Only for areas that are indicated in the chart as unsurveyed this may have a meaning. For the rest a chart is accurate and it is 1934 way of thinking to assume that is not.

Delete these meaningless points.

B. II. Draft Decision - Part-OPS - Subpart B - Section II - GM OPS.CAT.170 Minimum terrain clearance altitudes p. 274-277

comment *2093* comment by: *Airbus S.A.S.*

Typo error.

In GM OPS.CAT.170 (4)(a)(ii), wording "to a maximum of 60 nm See Note 2 below)" should be shifted on the right, to be placed below "10% of the segment length up" and a bracket should be opened before "See note 2", to read:

" ii. Segmant lenght more than 100 nm - 10% of the segment lenght up

to a maximum of 60 nm (See Note 2 below)"

B. II. Draft Decision - Part-OPS - Subpart B - Section II - AMC1 OPS.CAT.205 Fuel and oil supply p. 277

comment *655* comment by: *ECA - European Cockpit Association*

Comment on AMC1 OPS.CAT.205(1)(b): add the following text:

1. Fuel planning should be based on:

a. data provided by the aircraft manufacturer; or

b. current aircraft specific data derived from a fuel consumption monitoring system.

The operator should demonstrate to the competent authority that this monitoring system is based on consistent calculations and historical data.

Justification:

A fuel consumption monitoring system is valid only if the data and calculations have been validated by a competent authority.

comment *2097* comment by: *Airbus S.A.S.*

Typo error.

In AMC1 OPS.CAT.205 (2)(b)(iv), close bracket after word "ETOPS", to read:

"(e.g. Extended Range Twin-Engine Operations (ETOPS));"

comment *5992* comment by: *DGAC*

(2)(b)(iv): Additional fuel is not only for ETOPS operations.

Proposed text : amend 2.b.iv as follows :

"iv. additional fuel, if **necessary** ~~required by the type of operation~~ (e.g. Extended Range Twin-Engine Operations (ETOPS)**, Pre-Determined Point (PDP) Procedure, etc.)**; and"

B. II. Draft Decision - Part-OPS - Subpart B - Section II - AMC2 OPS.CAT.205.A Fuel and oil supply p. 277-280

comment *547* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.205.A(2)(a)(iii): change as follows:

2. Reduced Contingency Fuel (RCF) Procedure:

If an operator uses pre-flight planning to a destination 1 aerodrome with a reduced contingency fuel procedure using a decision point along the route and a destination 2 aerodrome (optional refuel destination), the amount of usable fuel, on board for departure, should be the greater of a.**,** ~~**or**~~ b. **or c.** below:

a. The sum of:

i. Taxi fuel;

ii. Trip fuel to the destination 1 aerodrome, via the decision point;

iii. Contingency fuel equal to not less than 5% of the estimated fuel consumption from the decision point to the destination 1 aerodrome;

iv. Alternate fuel or no alternate fuel if the decision point is at less than six hours from the destination 1 aerodrome and the requirements of OPS.CAT.A.155(a)(3) are fulfilled;

v. Final reserve fuel;

vi. Additional fuel; and

vii. Extra fuel, if required by the pilot-in-command.

b. The sum of:

i. Taxi fuel;

ii. Trip fuel to the destination 2 aerodrome, via the decision point;

iii. Contingency fuel equal to not less than the amount calculated in accordance with 1.c.i. from departure aerodrome to the destination 2 aerodrome;

iv. Alternate fuel, if a destination 2 alternate aerodrome is required;

v. Final reserve fuel;

vi. Additional fuel; and

vii. Extra fuel, if required by the pilot-in-command.

c. an amount to fly for five minutes at holding speed at 1 500 ft (450 m) AAL above the destination aerodrome in standard conditions.

Justification:

Include the 5min holding fuel requirement to avoid the possibility that contingency fuel is reduced to an equivalent of 1 or 2 minutes flying time, since in real life the contingency fuel will be used on the approach.

comment *656* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.205.A(1)(b)(iv): change as follows:

iv. fuel for **a complete instrument** approach and landing at the destination aerodrome;

Justification:

Fuel for a complete instrumental approach procedure should be considered even if the aerodrome is under visual conditions. Instrumental approaches can be done for reasons other than meteorological conditions.

comment *657* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.205.A(1)(c)(i)(A)(4): delete the paragraph:

c. Reserve fuel, consisting of:

i. Contingency fuel; except as provided for in 2. below 'Reduced Contingency Fuel', which should be the higher of A. or B. below:

A.

1. 5% of the planned trip fuel or, in the event of in-flight re-planning, 5% of the trip fuel for the remainder of the flight; or

2. not less than 3% of the planned trip fuel or, in the event of in-flight re-planning, 3% of the trip fuel for the remainder of the flight, provided that an ERA aerodrome is available in accordance with AMC OPS.CAT.A.155(b); or

3. an amount of fuel sufficient for 20 minutes flying time based upon the planned trip fuel consumption provided that the operator has established a fuel consumption monitoring programme for individual aeroplanes and uses valid data determined by means of such a programme for fuel calculation; or

~~**4. an amount of fuel based on a statistical method which ensures an appropriate statistical coverage of the deviation from the planned to the actual trip fuel. This method is used to monitor the fuel consumption on each city pair/aeroplane combination and the operator uses this data for a statistical analysis to calculate contingency fuel for that city pair/aircraft combination.**~~

Justification:

The contingency fuel should not be based on statistical data because contingency fuel is required for unexpected conditions. "Unexpected" should be understood as something that previous experience has not taken into account.

comment *658* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.205.A(1)(c)(ii)(E): change as follows:

E. fuel for **a complete instrument** executing an approach and landing at the destination alternate aerodrome; and

Justification:

Fuel for a complete instrumental approach procedure should be considered even if the aerodrome is under visual conditions. Instrumental approaches can be done for reasons other than meteorological conditions.

comment *659* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.205.A(1)(c)(iv)(C): change as follows:

C. make an **instrument** approach and landing; and

Justification:

Fuel for a complete instrumental approach procedure should be considered even if the aerodrome is under visual conditions. Instrumental approaches can

be done for reasons other than meteorological conditions.

comment *660* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.205.A(2): delete the following paragraph:

~~**2. Reduced Contingency Fuel (RCF) Procedure: If an operator uses pre-flight planning to a destination 1 aerodrome with a reduced contingency fuel procedure using a decision point along the route and a destination 2 aerodrome (optional refuel destination), the amount of usable fuel, on board for departure, should be the greater of a. or b. below: a. The sum of: i. Taxi fuel; ii. Trip fuel to the destination 1 aerodrome, via the decision point; iii. Contingency fuel equal to not less than 5% of the estimated fuel consumption from the decision point to the destination 1 aerodrome; iv. Alternate fuel or no alternate fuel if the decision point is at less than six hours from the destination 1 aerodrome and the requirements of OPS.CAT.A.155(a)(3) are fulfilled; v. Final reserve fuel; vi. Additional fuel; and vii. Extra fuel, if required by the pilot-in-command. b. The sum of: i. Taxi fuel; ii. Trip fuel to the destination 2 aerodrome, via the decision point; iii. Contingency fuel equal to not less than the amount calculated in accordance with 1.c.i. from departure aerodrome to the destination 2 aerodrome; iv. Alternate fuel, if a destination 2 alternate aerodrome is required; v. Final reserve fuel; vi. Additional fuel; and**~~

~~**vii. Extra fuel, if required by the pilot-in-command.**~~

Justification:

This kind of practice should be avoided because it shifts the task of calculating fuel requirements from the dispatch office into the cockpit whilst in flight, resulting in an unnecessary increase in workload in an unsuitable environment for this type of calculation.

comment *950* comment by: *CAA-NL*

Comment regarding:

NPA 2009-02b AMC 2 OPS.CAT.205.A 1 c iV

Suggestion CAA-NL:

Text should be in accordance with EU-OPS text. CAA-NL propses to EASA to change the text according to EU-OPS, being:

EU-OPS App1 to OPS1.255 1.6.:

1.6. The minimum additional fuel, which shall permit:

(a) the aeroplane to descend as necessary and proceed to an adequate alternate aerodrome in the event of engine failure

or loss of pressurisation, whichever requires the greater amount of fuel based on the assumption that such a

failure occurs at the most critical point along the route, and

(i) hold there for 15 minutes at 1 500 ft (450 m) above aerodrome elevation in

standard conditions; and

(ii) make an approach and landing,

except that additional fuel is only required, if the minimum amount of fuel calculated in accordance with subparagraphs

1.2. to 1.5. above is not sufficient for such an event, and

(b) Holding for 15 minutes at 1 500 ft (450 m) above destination aerodrome elevation in standard conditions, when

a flight is operated without a destination alternate aerodrome;

comment *2821* comment by: *M Wilson-NetJets*

Original text:

b. Trip fuel, which should include: i. fuel for take-off and climb from aerodrome elevation to initial cruising level/altitude, taking into account the expected departure routing;

Suggested new text:

b. Trip fuel, which should include: i. fuel for take-off and climb from aerodrome elevation to initial cruising level/altitude, taking into account the expected departure routing **and applicable or expected altitude restrictions;**

Comment/suggestion:

Many aerodromes have known and fixed altitude and speed restrictions which should be included in the calculation of the trip fuel.

comment *5043* comment by: *IAOPA Europe*

Non-commercial operators of complex aircraft should also have the option to follow this AMC since it allows in some aspects more flexibility than the general rules.

Particularly it allows for aircraft with turbine engines a final reserve fuel of 30 minutes where the general requirement is 45 minutes.

It is a well-established principle that commercial requirements are more conservative since they should protect the safety of non-involved paying passengers. It would be a violation of this principle to force non-commercial operators to have larger reserves than commercial operators.

comment *5077* comment by: *M Wilson-NetJets*

Original text:

(c) (iii) Final reserve fuel:

A. For aeroplanes with reciprocating engines, fuel to fly for 45 minutes;

B. For aeroplanes with turbine engines, fuel to fly for 30 minutes at holding speed at 1 500 ft (450 m) above aerodrome elevation in standard conditions, calculated with the estimated mass on arrival at the destination alternate

aerodrome or the destination aerodrome, when no destination alternate aerodrome is required and

Suggested new text:

No suggested text

Comment/suggestion:

This is already in the IR (OPS.CAT.205 (b)(4))

comment *5993* comment by: *DGAC*

(1)(c)(iv): Additional fuel :

Proposal:

Go back to the philosophy of EU-OPS (1.6 of Appendix 1 to OPS 1.255)

Justification :

What is the rational behind the change of philosophy from EU-OPS?

The wording "if not already included in 1.c.i.A.1 and 2." implies that the additional fuel must be compared to contingency fuel (5% or 3%) whereas the present rule in EU-OPS (1.6 of Appendix 1 to OPS 1.255) is that additional fuel is only required if the minimum amount of fuel calculated for trip fuel and reserve fuel (contingency, alternate, and final reserve) is not sufficient for such an event.

comment *6065* comment by: *Irish Aviation Authority*

Comment:

The guidance material makes reference to 205 A and 205 H but there is no such subdivision of the OPS.CAT.205 in the main rule text.

Justification:

Standardisation throughout the rule structure.

comment *6872* comment by: *AIR FRANCE*

1.C.i.A.2 "not less than 3% of the planned trip fuel or, in the event of in-flight re-planning, 3% of the trip fuel for the remainder of the flight, provided that an **3%** ERA aerodrome is available in accordance with AMC OPS.CAT.A.155(b); or"

Suggest to add "3%" before ERA for clarity. The "3% ERA" is defined in OPS GEN 010

comment *6878* comment by: *AIR FRANCE*

"iv. Additional fuel, if required by the type of operation (e.g. ETOPS).

The minimum additional fuel, **if not already included in 1.c.i.A.1.**

and 2., should allow:

A. the aeroplane to descend as necessary and proceed to an adequate alternate aerodrome in the event of engine failure or loss of pressurisation, whichever requires the greater amount of fuel based on the assumption that such a failure occurs at the most critical point along the route;

B. hold there for 15 minutes at 1 500 ft (450 m) above aerodrome elevation in standard conditions;

C. make an approach and landing; and

D. holding for 15 minutes at 1 500 ft (450 m) above destination aerodrome elevation in standard conditions, when a flight is operated without a destination alternate aerodrome;"

The trial to simplify the EU OPS text results here in an error.

Bullet A, B and C belong all three to the same scenario for additional fuel

and this additional fuel does not need to be added to the total fuel

if the reserve fuel covers the issue.

BUT

Bullet D is an other case which, this time, must always be added to

the total fuel.

Suggest to strictly stick to the EU OPS text (appendix 1.255 §1.6)

comment *7144* comment by: *M Wilson-NetJets*

Original text:

b. 2. Why 20-to 25NM only?

comment *5850* comment by: *Norsk Luftambulanse*

1. wrong reference

comment *6068* comment by: *Irish Aviation Authority*

Comment:

The guidance material makes reference to 205 A and 205 H but there is no such subdivision of the OPS.CAT.205 in the main rule text.

Justification:

Standardisation throughout the rule structure.

comment *6234* comment by: *HSD Hubschrauber Sonder Dienst*

2.local area

where does 20 to 25 miles come from? That seems to be wronly referenced.

comment *6285* comment by: *Peter Moeller*

Why is the "fuel remaining" (final reseerve fuel??) in a local area (well known to the crew) with 30 minutes more than required according to AMC 3 OPS. CAT. 205 H (1)(c)(iii)(A) with 20 minutes

OPS.CAT.215.b is a wrong reference

The definition for local area should not be limited to 20-25 NM. This equals only 10 - 13 minutes flight time. It should be depending on geographical circumstances (flat area, mountaineous etc), local weather etc and should be defined in the OM of the operator

comment *6936* comment by: *Konrad Polreich*

AMC5 OPS.CAT.205.H (1)

Due to the limited endurance of helicopters and its ability to execute landings in any open fields, I suggest to use 20 min remaining fuel at normal cruising speed upon completion of the flight. 30 minutes would reduce the operatonability too much for no real additional safety gain.

B. II. Draft Decision - Part-OPS - Subpart B - Section II - GM1 OPS.CAT.205 Fuel and oil supply p. 282-283

comment *661* comment by: *ECA - European Cockpit Association*

Comment on GM1 OPS.CAT.205: delete the paragraph:

~~**GM1 OPS.CAT.205 Fuel and oil supply**~~

~~**CONTINGENCY FUEL STATISTICAL METHOD**~~

~~**1. As an example, the following values of statistical coverage of the deviation from the planned to the actual trip fuel provide appropriate statistical coverage:**~~

~~**a. 99% coverage plus 3% of the trip fuel, if the calculated flight time is less than two hours, or more than two hours and no suitable ERA aerodrome is available; b. 99% coverage if the calculated flight time is more than two hours and a suitable ERA aerodrome is available; c. 90% coverage if: i. The calculated flight time is more than two hours; and ii. A suitable ERA aerodrome is available; and iii. At the destination aerodrome two separate runways are available and usable, one of which is equipped with an ILS/MLS, and the weather conditions are in**~~

~~**compliance with OPS.CAT.A.156(b)(1)(ii); or the ILS/MLS is operational to Cat II/III operating minima and the weather conditions are at or above 500 ft/2 500 m. 2. The fuel consumption database used in conjunction with these values should be based on fuel consumption monitoring for each route/aeroplane combination over a rolling two-year period.**~~

Justification:

The contingency fuel should not be based on statistical data because contingency fuel is required for unexpected conditions. "Unexpected" should be understood as something that previous experience has not taken into account.

B. II. Draft Decision - Part-OPS - Subpart B - Section II - AMC1 OPS.CAT.215 In-flight fuel checks p. 283

comment *669* comment by: *ECA - European Cockpit Association*

Comment on AMC1 OPS.CAT.215(1): add the following text:

1. Fuel checks should be carried out in-flight at regular intervals. The usable remaining fuel should be recorded and evaluated to:

a. compare actual consumption with planned consumption;

b. check that the usable remaining fuel is sufficient to complete the flight; and

c. determine the expected usable fuel remaining on arrival at the destination aerodrome~~.~~**;**

d. distribution of remaining fuel in tanks.

Justification:

Have been a couple of instances of having adequate fuel but a tank has been empty.

comment *6268* comment by: *HSD Hubschrauber Sonder Dienst*

Here we have again the term " within the local area", which is not clearly defined for everyone. A clear definition would state, who has to perform an inflight fuel check under which conditions,(the others do not have to).

At least the lenght of the intended leg should be one of the conditions, because it does not make sense to perform the check on a 10 minute sector, for example.

comment *7211* comment by: *European HEMS & Air Ambulance Committee (EHAC)*

Chapter b. Airframe systems, third chapter; replace "single-engine operation" with the term "one-engine inoperative operation".

The equipment (including avionics necessary for extended diversion times should have the ability to operate acceptably follwing failures in the cooling system or electrical power systems.

For **one-engine inoperative** operations, the remaining power ... rest of text no change

Proof:

Instead of the term "single-engine operation" the term "one-engine inoperative" operation shall be used to be consistent.

Background:

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. Its services range from providing medical advice to repatriating patients to/from Switzerland or any other point of the world. Swiss air-ambulance is a private, non-profit organisation, which operates in accordance with the guiding priniples of the Red Cross. It comes to the aid of people in distress, without respect of their nationality, religious convections or social status. Swiss air-ambulance operates under the Air Operator Certificate CH-AOC-No.1015 issued by the Federal Office of Civil Aviation Switzerland (FOCA) and is compliant with EU-OPS. Please visit www.rega.ch

comment *309* comment by: *Rega / Swiss Air-Ambulance*

AMC OPS.CAT.225.A(c) Maximum distance from an adequate aerodrome for two engined aeroplanes

Ingress: Swiss Air-Ambulance is operating dedicated ambulance jets soley in the MEDEVAC and repatriation role (see background information at the end of the comment). Commenced ambulance jet MEDEVAC and repatriation operation decades ago with a mixed fleet consisting of Learjet 24/35, BAe-125 Hawker and Canadair CL-600/601 jets, Swiss Air-Ambulance operates now since 2002 a uniformed fleet of 3 dedicated Bombardier CL-604 Challenger ambulance jets.

Due to the specific type of Aeroplane Emergency Medical Service (AEMS) operation it is of upmost importance for Swiss Air-Ambulance to have the ability to conduct MEDEVAC and/or repatriation operations worldwide, thus having the capability to operate also routings like

- Azores Islands - Carribean islands and vice versa
- United States of America West Coast - Hawaii Islands and vice versa
- Easter Islands (Chile)- South America West Coast and vice versa

Therefore, Swiss Air Ambulance requests as designated Aeroplane Emergency Medical Service (AEMS) operator to be allowed for operations between 120 and 240 minutes diversion (threshold) time being compliant with the requirements stipulated in AMC.OPS.CAT.225.A(c).

The Swiss NAA Federal Office of Civil Aviation (FOCA) issued the Air Operator Certificate CH-AOC-No.1015 to Swiss Air Ambulance for type(s) of operation "A3 Emergency Medical Service" and granted Swiss Air Ambualance under Swiss Air Ambulance Operations Manual OM A 14.1.2 the following exemption: "Long range operations between 180 and 240 minutes diversion (threshold) time".

Without having the possibility to operate up to 240 minutes from an adequate aerodrome, Swiss Air Ambulance will loose the capability to react swift and in due time to medevac/repatriation requests from persons in distress and need. Furthermore and first Swiss Air Ambulance will not be able anymore to reach certain spots around the globe and second will not be able to operate e.g. Azores Islands - Carribean islands and vice versa on the shortest possible routing but is forced e.g. to route via New Fundland and so loosing valuable time focussing on the well being of the patient on board.

For your information: Swiss Air Ambulance is calculating with a One Engine Inoperative (OEI) long range cruise speed of 300 KTAS as published in the Bombardier CL-604 Challenger "Flight Planning & Cruise Control Manual).

Swiss Air Ambulance requests to establish and publish a new AMC.OPS.CAT.225.A(c)(1) for dedicated Aeroplane Emergency Medical Service (AEMS) operators.

Text to be added (new paragraph):

AMC.OPS.CAT.225.A(c)(1) Maximum distance from an adequate aerodrome for two-engined aeroplanes operated in accordance with dedicated Aeroplane Emergency Medical Service (AEMS) Operations

OPERATION OF DEDICATED AIR AMBULANCE TWIN TURBOJET AEROPLANES HAVING A MAXIMUM PASSENGER SEATING CONFIGURRATION OF 19 OR LESS

AND HAVING A MAXIMUM TAKE-OFF MASS OF LESS THAN 45360 KG BETWEEN 120 AND 240 MINUTES FROM AN ADEQUATE AERODROME - OPERATIONAL CRITERIA FOR SMALL TWINS WITHOUT ETOPS CAPABILITY

Rest of text as per draft text AMC.OPS.CAT.225.A(C); no change

Proof:

- Swiss Air Ambulance is compliant with the requirements stipulated in AMC.OPS.CAT.225.A(c) when operating under the "ETOPS for NON ETOPS" regime
- Swiss Air Ambulance has no history of incidents or accidents when operating under the "ETOPS for NON ETOPS" regime

Background:

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. comment *2102* comment by: *Airbus S.A.S.*

In AMC OPS.CAT.225.A(c) (1), wording “Relevant information” is considered to be not clear enough.

Please, specify what is considered to be “relevant”.

comment *2105* comment by: *Airbus S.A.S.*

In AMC OPS.CAT.225.A(c) (3)(a), the wording “Supplementary (S)TC” is misleading. It could be interpreted as a new acronym for “Supplemental Type Certificate”, as defined in IR Certification Part 21 Subpart E.

In our interpretation, substantiated by the following sub-paragraph (b), the wording “(S)TC holders” refers to both Supplemental Type Certification holders and Type Certification holders.

The sub-paragraph (3)(a) should read as follows:

“All powerplant events and operating hours should be reported by the operator to the airframe and engine TC holders, to Supplemental TC (STC) holders as well as to the competent authority.”

TOWBARLESS TOWING

1. Towbarless towing should be based on the applicable SAE ARP (Aerospace Recommended Practices), i.e. 4852B/4853B/5283 (as amended) or manufacturer instructions.

Comment/suggestion:

Some manufacturers issue their own instructions on towbarless towing. Therefore, this should be included in this paragraph.

B. II. Draft Decision - Part-OPS - Subpart B - Section II - AMC OPS.CAT.235 Air Traffic Services - motor-powered aircraft p. 289-290

comment *2125* comment by: *Airbus S.A.S.*

AMC OPS.CAT.235 (1) is based on EU-OPS 1.216, which reads:

"in-flight operational instructions involving a change to the air traffic flight plan

shall, when practicable, be coordinated with the appropriate air traffic service unit before transmission to an aeroplane."

The wording "before transmission to an aeroplane" should be kept in the proposed text, to read:

"In-flight operational instructions involving a change to the air traffic flight plan should be co-ordinated with the appropriate ATS unit before transmission to an aeroplane."

comment *2136* comment by: *Airbus S.A.S.*

The sub-paragraph AMC OPS.CAT.235 (4) aims at defining the wording "Local area operation".

However, such wording is not used in any IR-OPS proposed requirement and it seems to be out of context here. For consistency reasons and to ease readability, this definition should be moved to OPS.GEN.010.

comment *2826* comment by: *M Wilson-NetJets*

Original text:

2. When unable to submit or to close the ATS flight plan due to lack of ATS facilities or any other means of communications to ATS, an operator should alert search and rescue services.

Suggested new text:

2. When unable to submit or to close the ATS flight plan due to lack of ATS facilities or any other means of communications to ATS, an operator should advise search and rescue services.

Comment/suggestion:

The word "alert" in search and rescue is associated with alerting the search and rescue facilities of a missing aircraft. Therefore, change the word "alert" into "advise".

B. II. Draft Decision - Part-OPS - Subpart B - Section III p. 291

comment *1482* comment by: *Airbus*

A number of our comments on AMC OPS.CAT Section III (pages 291-312) are about the difficulty to read and sort, paragraph by paragraph, the performance requirements that apply to one aeroplane performance class. It would be much easier to have a clear split between the performance classes, like in EU OPS 1 subparts F (performance general), G (performance class A), H (performance class B), and I (performance class C).

comment *5996* comment by: *DGAC*

This section is very difficult to read as almost all the performance and limitations requirements from EU-OPS subparts F to I have been transferred in a lot of AMCs, with a classification that is not clear.

comment *7275* comment by: *Ryanair*

General Comments

1. The structure of the Performance Section is too complicated and confusing. Aeroplane Performance Class A should be separated from Class B and C Aeroplane and Helicopters.

2. There is no clear distinction between certified/dispatch and in-flight landing performance requirements and factors which should be considered for each case.

B. II. Draft Decision - Part-OPS - Subpart B - Section III - AMC OPS.CAT.316.A(a) Performance General – Aeroplanes p. 291

comment *959* comment by: *KLM*

Charts have to be accurate and when it is known to be inaccurate an operator will have them adjusted to be accurate or find another provider

comment *1494* comment by: *Airbus*

One may wonder why the charting accuracy should be taken into account in CAT only.

comment *1773* comment by: *claire.amos*

Existing requirement, but how is compliance demonstrate?

comment *1231* ☐ comment by: *Loganair Limited*

Turbine Powered aircraft with 19 seats Currently Operating to United Kingdom AN(G)R Performance C for Lifeline and Public Service Obligations where no alternative exists

The regulations do not cater for for turbine propeller powered aircraft with up to 19 passenger seats designed for STOL operations, such as the DHC6 Twin Otter, currently operating on Public Service Obligation and Lifeline routes to United Kingdom AN(G)R Performance C (Broadly equivalent to EASA/EU-OPS Performance Class B.) The purpose for which the aircraft was designed (Commercial Air Transport Short Take-Off and Landing (STOL) operations) is not recognised, by omission rather than specifically stated, in either EU-OPS or the proposed implementing rules. **Both EU-OPS and the proposed implementing rules need to recognise that Commercial Air Transport STOL operations exist within Europe and are necessary to meet Public Service Obligation requirements.**

Performance Class A requirements cannot be met because of the physical characteristics of the runways and obstacles. Typical examples are operations where no hard runway is available such as where Commercial Air Transport Operations are required to operate from a beach or where it would not be physically possible extend an existing runway. Example airfields are the beach airfield at Barra (EGPR) and Isles of Scilly (EGHE).

Performance Class A data is becoming available for aircraft such as the DHC6 Twin Otter, but the aircraft cannot be operated from certain airfields in Performance Class A. In the case of the Beach airfield at Barra no aircraft currently exists that can comply with the Public Service Obligation requirements and meets either Performance Class A, Performance Class B or Performance Class C.

Enforcing the performance Class A requirement on aircraft which have operated safely out of these airfields under United Kingdom AN(G)Rs for over 40 years would terminate air services which are operated purely for Public service Obligations and to provide lifeline services to remote and isolated Islands and Regions. During the Winter months these services are frequently the only method of transport available. It is clear that the imposition of Performance Class A requirements on STOL - type aircraft such as the DHC6 Otter has effectively removed the Short Take Off capability of the type as there

is no provision for Short Take Off techniques in Performance Class A. Loganair believes that there is no case to answer in this respect and that the operating safety record of the type under AN(G)R has been exemplary. Loganair cannot overstress the importance of short field capability in Public Service Obligation Commercial Air Transport Operations.

The only alternatives are:

1. Continue to allow operations with current aircraft to United Kingdom AN(G)R Performance C or EASA Performance Class B at airfields where Performance Class A requirements cannot be met.

OR

2. Cease operations to remote and isolated regions or Islands.

Proposal

Amend AMC OPS.CAT.316.A(1) by making it an acceptable means of compliance for Turbine Propeller aircraft with a seating capacity of 19 seats or less to operate to Performance class B criteria at airfields where Performance A criteria cannot be met ie STOL operations.

AMC OPS.CAT.316.A(a)(1)1. would then read:

Performance Class A. Performance class A aeroplanes should be multi-engined aeroplanes powered by turbo-propeller engines with a maximum passenger seating configuration of more than 9 or a maximum take-off mass exceeding 5700 Kg, amd all multi-engined turbojet powered aeroplanes. ***Turbine propeller aircraft with a passenger seating configuration of 19 seats or less and a maximum take-off mass not exceeding 5700 Kg may be classified as a performance B aeroplane at airfields where Performance A criteria cannot be be met for reasons of airfield physical characteristics. In this case supplemental Performance B data must be incorporated in the Aeroplane Flight Manual in addition to the Performance A data.***

This would cater for STOL operations*.*

Equivalent safety case

Operations would meet the current level of safety at the very few airfields where Performance A criteria could not be applied, but would meet the level of safety afforded by performance B. In effect the the level of safety of Performance A is met by the increased visibility requirements for take-off for Performance B, which will be the same for all aircraft with a maximum take-off mass of 5700Kg or less, irrespective of the number of passengers carried. The increased take-off visibility requirements will allow the pilot "to see and avoid" obstacles which is unlikely to be valid on aircraft with a maximum take-off mass greater than 5700Kg due the increased speed, energy, inertia and consequently radius of turn. This technique has served DHC6 operations well and has resulted in an exemplary safety record.

In summary provided operations are restricted to operating in Visual Meteorological Conditions (VMC) to 300ft above aerodrome level and the aircraft Maximum Take-Off Mass is limited to 5700Kg, regardless of the number of passengers, the level of safety will be equivalent to that of a Performance A aircraft operating in Instrument Meteorological Conditions (IMC) from Take-Off to 300ft. The Shortfield Landing case is already covered by the regulations and in the Rejected Take-off case level of safety is improved because the Take-off has to be made in VMC instead of visibilities down to 500 metres or less as the regulations permit.

comment *2526* comment by: *Royal Aeronautical Society*

The text in each paragraph is written as a sentence when it need not be so, for in each case the words provide a description: the words 'should be' are inappropriate as is use of 'engined' in place of 'engine' (as used in EU-OPS, OPS 1.470). **It is suggested that each definition should read as, 'Performance Class A: multi-engine aeroplanes powered by …; Performance Class B: propeller driven aeroplanes …; Performance Class C: aeroplanes powered by …' as appropriate.**

Single engine turbojet aeroplanes such as are currently being manufactured for uses that could include commercial air transport cannot be accommodated in existing EU-OPS/proposed EASA Class A, B and C descriptions. **It is suggested that the aeroplane Performance Class text in this AMC should be amended to include single engine turbojet aeroplanes.**

comment *2754* comment by: *Isles of Scilly Skybus*

Response from Isles of Scilly Skybus to NPA-2009-02b.

Item. Classification of Turbo propeller driven Aircraft with 19 seats or less and MTOW of less than 5700kg currently operating under UKAN(G)R Performance C on Lifeline services to remote communities.

The current proposal to group Turbo propeller driven aircraft with 19 seats or less and a MTOW of 5700kg or less into performance group A would mean the performance requirements of that group cannot be met by the physical characteristics and location of certain airfields. Examples of this are St Mary's Isles of Scilly off the south west of England and the Isle of Barra in the Western Isles of Scotland.

The current operators that service these island communities have safely operated the Twin Otter for many years on these routes under UK AN(G)R performance C which is broadly equivalent to EASA/EU-OPS performance class B.

The communities affected rely on the air services not only for local transport to and from the islands but also for Royal Mail. Essential freight deliveries (especially during the winter months when it is regularly the only method of transport to the islands), and in respect of the Isles of Scilly the main source of income the tourist industry.

Performance data that is becoming available for the DHC6 to operate under performance class A would prevent operations from these remote communities with the loss of life line services. At present there is no comparable alternative aircraft capable of operating into these restricted airfields.

Possible amendment to proposal

A permanent exemption issued to affected operators from the UK Civil Aviation Authority to allow continued operation under UK AN(G)R performance C or EASA/EU-OPS performance Group B where performance group A requirements cannot be met at certain airfields.

If the above decision was accepted the AMC 316.A(a)(1) could be worded as follows.

Performance Class A . Performance class A aeroplanes should be multi-engined

aeroplanes powered by turbo-propeller engines with a maximum passenger seating configuration of more than 9 or a maximum take-off mass exceeding 5700kg and all multi-engined turbojet powered aeroplanes.

Turbo-propeller aircraft with a passenger seating configuration of 19 seats or less and a maximum take-off mass less than 5700kg may be classified as a performance group B aeroplane at airfields where performance group A criteria cannot be met due to airfield physical characteristics. In this case the Operators National Aviation Authority will issue a local approval to operate into the airfield under performance Group B and Performance group B data must be available in the Aeroplane Flight Manual.

Safety Case.

Operations into the affected airfields would maintain the levels of safety achieved under current performance where performance A criteria cannot be achieved, but would also meet the levels of safety afforded by performance group B. The level of safety would be the same for all aircraft with a maximum take-off weight of 5700kg or less irrespective of the number of passengers carried.

The increased visibility requirements of Performance group B would allow the pilots to see and avoid obstacles. This may not be possible on aircraft with a take-off mass greater than 5700kg due to the greater inertia and radius of turn

Paragraph No:

AMC OPS.CAT.316.A(a)(1)

Comment:

This paragraph should be rule material.

Justification:

This paragraph defines which performance category each aeroplane belongs to and the standards to which it must operate. The relegation of this material to AMC and the use of the word 'should' instead of 'must' will cause operators to question whether these definitions are negotiable. Indeed, this confusion has already happened with one operator.

Proposed Text (if applicable):

Transfer AMC1 OPS.CAT.316.A(1) to OPS.CAT.316(A)(1).

The definitions of Aeroplane performance classes should not be in an AMC. All definitions should be grouped in one single paragraph of the IR, for instance in OPS.GEN.010. The definitions should not be in AMC as a definition must be clear and unambiguous and shall not require any "acceptable mean of compliance" to be understood. A definition is a reference and therefore has to be in the rule (IR).

The concept of performance classes is yet used in some AMC and GM of subpart A GEN which demonstrates that definition of performance classes is a main issue.

This paragraph misses the intent of the concept of performance classes:

Performance classes were meant in JAR-OPS 1 (subparts F, G , H and I) as:

- performance class A: operations with engine failure accountability at nearly all flight phases

- performance class B: operations with partial engine failure accountability at take-off and landing phases

- performance class C: operations with partial engine failure accountability adapted to early design aeroplanes equipped with reciprocating engines

Comment from Isles of Scilly Skybus.

Operation of aircraft designed to operate STOL (short take off and landing).

As an operator for many years of the DHC6 Twin Otter into airfields limited on runway length by their location it seems apparent that STOL operations are no longer to be accepted under EASA. There are a number of aircraft in service and under review to be built, that are designed specifically for operating into airfields of restricted length either by their remote location or nature of terrain. The manufacturers have produced performance supplements for STOL operations of these aircraft and these have been accepted by National Aviation Authorities up until now.

In order to maintain lifeline services to these remote locations and to take advantage of technological changes in aircraft development and improved safety, future aircraft operations may depend on airlines requiring STOL performance into these airfields.

An additional paragraph could be added to AMC316.A(a)(1) regarding STOL operations, and addition training criteria laid down.

Example.

Short Take off and Landing Performance (STOL)

Aircraft specifically designed for STOL operations may be operated without full compliance to the appropriate performance group providing the operator utilises the manufacturers approved performance supplement and operations are conducted to an equivalent level of safety. Operators requiring the use of STOL must be approved by the National Aviation Authority.

Additional Requirements.

The operator must demonstrate the need for STOL operations regarding public interest,operational necessity and remoteness/physical limitations of the Airfield.

STOL Operations may only be approved for aeroplanes where the vertical distance between the path of the pilots eye and the lowest part of the wheels does not exceed 3 metres.

Aerodrome operating minima needs to be specified in the operations manual. Visibility should not be below 1500m and wind limitations should be stated.

Aircrew must receive specific training on the aircraft into the approved Airfields

The Authority may impose further restrictions as deemed necessary for safe operation.

Turbine Powered aircraft with 19 seats Currently Operating to United Kingdom AN(G)R Performance C for Lifeline and Public Service Obligations where no alternative exists

The regulations do not cater for for turbine propeller powered aircraft with up to 19 passenger seats designed for STOL operations, such as the DHC6 Twin Otter, currently operating on Public Service Obligation and Lifeline routes to United Kingdom AN(G)R Performance C (Broadly equivalent to EASA/EU-OPS Performance Class B.) The purpose for which the aircraft was designed (Commercial Air Transport Short Take-Off and Landing (STOL) operations) is not recognised, by omission rather than specifically stated, in either EU-OPS or the proposed implementing rules. **Both EU-OPS and the proposed implementing rules need to recognise that Commercial Air Transport STOL operations exist within Europe and are necessary to meet Public Service Obligation requirements.**

Performance Class A requirements cannot be met because of the physical characteristics of the runways and obstacles. Typical examples are operations where no hard runway is available such as where Commercial Air Transport Operations are required to operate from a beach or where it would not be physically possible extend an existing runway. Example airfields are the beach airfield at Barra (EGPR) and Isles of Scilly (EGHE).

Performance Class A data is becoming available for aircraft such as the DHC6 Twin Otter, but the aircraft cannot be operated from certain airfields in Performance Class A. In the case of the Beach airfield at Barra no aircraft currently exists that can comply with the Public Service Obligation requirements and meets either Performance Class A, Performance Class B or Performance Class C.

Enforcing the performance Class A requirement on aircraft which have operated safely out of these airfields under United Kingdom AN(G)Rs for over 40 years would terminate air services which are operated purely for Public service Obligations and to provide lifeline services to remote and isolated Islands and Regions. During the Winter months these services are frequently the only method of transport available. It is clear that the imposition of Performance Class A requirements on STOL - type aircraft such as the DHC6 Otter has effectively removed the Short Take Off capability of the type as there is no provision for Short Take Off techniques in Performance Class A. Loganair believes that there is no case to answer in this respect and that the operating safety record of the type under AN(G)R has been exemplary. Loganair cannot overstress the importance of short field capability in Public Service Obligation Commercial Air Transport Operations.

The only alternatives are:

1. Continue to allow operations with current aircraft to United Kingdom AN(G)R Performance C or EASA Performance Class B at airfields where Performance Class A requirements cannot be met.

OR

2. Cease operations to remote and isolated regions or Islands.

Proposal

Amend AMC OPS.CAT.316.A(1) by making it an acceptable means of compliance for Turbine Propeller aircraft with a seating capacity of 19 seats or less to operate to Performance class B criteria at airfields where Performance A criteria cannot be met ie STOL operations.

AMC OPS.CAT.316.A(a)(1)1. would then read:

Performance Class A. Performance class A aeroplanes should be multi-engined aeroplanes powered by turbo-propeller engines with a maximum passenger seating configuration of more than 9 or a maximum take-off mass exceeding 5700 Kg, amd all multi-engined turbojet powered aeroplanes. ***Turbine propeller aircraft with a passenger seating configuration of 19 seats or less and a maximum take-off mass not exceeding 5700 Kg may be classified as a performance B aeroplane at airfields where Performance A criteria cannot be be met for reasons of airfield physical characteristics. In this case supplemental Performance B data must be incorporated in the Aeroplane Flight Manual in addition to the Performance A data.***

This would cater for STOL operations***.***

Equivalent safety case

Operations would meet the current level of safety at the very few airfields where Performance A criteria could not be applied, but would meet the level of safety afforded by performance B. In effect the the level of safety of Performance A is met by the increased visibility requirements for take-off for Performance B, which will be the same for all aircraft with a maximum take-off mass of 5700Kg or less, irrespective of the number of passengers carried. The increased take-off visibility requirements will allow the pilot "to see and avoid" obstacles which is unlikely to be valid on aircraft with a maximum take-off mass greater than 5700Kg due the increased speed, energy, inertia and consequently radius of turn. This technique has served DHC6 operations well and has resulted in an exemplary safety record.

In summary provided operations are restricted to operating in Visual Meteorological Conditions (VMC) to 300ft above aerodrome level and the aircraft Maximum Take-Off Mass is limited to 5700Kg, regardless of the number of passengers, the level of safety will be equivalent to that of a Performance A aircraft operating in Instrument Meteorological Conditions (IMC) from Take-Off to 300ft. The Shortfield Landing case is already covered by the regulations and in the Rejected Take-off case level of safety is improved because the Take-off has to be made in VMC instead of visibilities down to 500 metres or less as the regulations permit.

comment *437* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.316.A(a)(3)(2): Proposal from JAA DNPA-OPS 47:

2. For performance purposes, an operator should consider a damp runway, other than a grass runway, to be dry.

Justification:

State of the art practise and latest scientific knowledge indicate that damp runways do not produce effective dry braking action for an aircraft. Although measurements with runway friction testing equipment might suggest otherwise, there is currently no scientifically based and agreed correlation with aircraft and friction testing equipment. ECA is unaware of flight test data indicating an effective dry braking action for aircraft on damp runways and strongly urges adoption of the proposals contained in JAA DNPA-OPS 47. Additionally damp runway seems not to be defined under OPS.GEN.010.

This would cater for STOL operations*.*

Equivalent safety case

Operations would meet the current level of safety at the very few airfields where Performance A criteria could not be applied, but would meet the level of safety afforded by performance B. In effect the the level of safety of Performance A is met by the increased visibility requirements for take-off for Performance B, which will be the same for all aircraft with a maximum take-off mass of 5700Kg or less, irrespective of the number of passengers carried. The increased take-off visibility requirements will allow the pilot "to see and avoid" obstacles which is unlikely to be valid on aircraft with a maximum take-off mass greater than 5700Kg due the increased speed, energy, inertia and consequently radius of turn. This technique has served DHC6 operations well and has resulted in an exemplary safety record.

In summary provided operations are restricted to operating in Visual Meteorological Conditions (VMC) to 300ft above aerodrome level and the aircraft Maximum Take-Off Mass is limited to 5700Kg, regardless of the number of passengers, the level of safety will be equivalent to that of a Performance A aircraft operating in Instrument Meteorological Conditions (IMC) from Take-Off to 300ft. The Shortfield Landing case is already covered by the regulations and in the Rejected Take-off case level of safety is improved because the Take-off has to be made in VMC instead of visibilities down to 500 metres or less as the regulations permit.

comment *1495* comment by: *Airbus*

It should be made clear that paragraphs 1.a and 1.b are applicable to performance class A aeroplanes only.

comment *1722* comment by: *ECA - European Cockpit Association*

Comment: Remove paragraph b

~~**b. if the performance data has been determined on the basis of a measured runway friction coefficient, a procedure correlating the measured runway friction coefficient and the effective braking coefficient of friction of the aeroplane type over the required speed range for the existing runway conditions should be applied; and**~~

Justification :

As indicated in relation to paragraph a of this AMC the JAA Performance Subcommittee identified in JAA DNPA-OPS 47 that data on wet and contaminated runways are normally developed by the aeroplane manufacturer and consequently operators do not generally have the means to be able to demonstrate that a method acceptable to the Authority has been used.

Additionally the major manufacturers do not provide a means or support a correlation between friction measurements and aircraft braking action. Scientific research over the last couple of decades indicates that friction measurements are inherently subject to large inaccuracies or uncertainties. More so, optimistic correlation by operators between friction measurements and aircraft braking performance have led in the past to unsafe situations including incidents and accidents. Industry activity is ongoing at the moment with regard to this subject, including work done by the FAA Takeoff and Landing Performance Assessment Aviation Rulemaking Committee (TALPA ARC) and the ICAO Friction Task Force.

As such the wording in current paragraph b should be either deleted or rewritten in accordance with state-of-the art knowledge from industry activities.

comment *2307* comment by: *Austro Control GmbH*

General Comment to this paragraph:

a calculation method by multipling data for a dry runway with a certain factor should also be possible for easier procedure.

CS 23 certified aeroplanes have mostly only factors.

comment *4025* comment by: *UK CAA*

Page No: 292

Paragraph No:

AMC OPS.CAT.316.A(a)(3) paragraph 1a

Comment:

The sub-paragraph 1(a) "the performance data should be determined in accordance with CS 25.1591 or equivalent;" has been amended from the text in JAR-OPS 1 and is deficient as a result, because it applies the latest standards ("or equivalent") of CS 25.1591 to existing, in-service, aeroplanes. This is not appropriate, not least because the wet take-off performance certification requirements have been moved to CS 25.109. Consequently, a reference to CS 25.1591 is not relevant to wet runway take-off performance. The objective of the original requirement in JAR-OPS 1 was that wet and contaminated runway operations should be based upon the use of appropriate, though not necessarily the latest, standard of performance data. This aspect was recognised by the JAA Performance Sub-Committee, who were responsible for this text.

Justification:

Applying the latest standards of CS 25.1591 is not necessarily appropriate for all in-service aeroplanes.

Wet and contaminated performance data is normally developed by the aeroplane manufacturer and consequently operators do not generally have the means to be able to demonstrate that a method acceptable to the Authority has been used.

Additionally, the publication of Change 15 to JAR-25 resulted in the transfer of the wet take-off performance certification guidelines of AMJ 25X1591 from Section 3 of JAR-25 (Advisory Material – Joint) to Section 1 (Requirements). Consequently, a reference to CS 25X1591 would no longer be relevant to wet runway take-off performance data produced in accordance with Change 15 of JAR-25 or later.

The following proposals clarify the objective and intention of the original JAR-OPS 1 text, namely that the required standard of wet runway take-off data is that which has been determined either in accordance with JAR-25 Change 13 (which was the first edition of JAR-25 to specify a satisfactory standard of wet and contaminated runway performance), or that which is appropriate to the type certification basis of the aeroplane, whichever is the later. An additional proposed GM paragraph provides clarification of the intention that the performance data need only account for the effect of the contaminant on runway performance and that existing methodologies used in the certified performance data remain valid.

Proposed Text (if applicable):

1. For a wet and contaminated runway:

a. the performance data ***~~should be determined in accordance with CS 25.1591 or equivalent~~ that complies with Change 13 of JAR-25, or that appropriate to the type certification date, whichever is the later, must be used. (See GM OPS XYZ)****.*

GM OPS XYZ

General – Wet and contaminated runway data

The performance data that is used to show compliance with the take-off requirements of OPS.CAT XYZ on wet and contaminated runways need only reflect the effects of drag and runway braking on the performance data determined at the time of type certification. Accordingly therefore, the performance assumptions used by the type's certification standard remain valid, except as modified by the

effects of contaminants. These include, for example, accelerate-stop distance definition, time delays, take-off distance definition, and braking means. For aeroplanes whose type certification date precedes Change 13 of JAR-25, the data should be acceptable to the Authority and provide an equivalent similar level of safety to, and thus comply with the safety intent of, Change 13 of JAR-25

comment *4026* comment by: *UK CAA*

Page No: 292

Paragraph No:

AMC OPS.CAT.316.A(a)(3) Para 1 (b)

Comment:

Sub-para b. states that "if the performance data has been determined on the basis of a measured runway friction coefficient, a procedure correlating the measured runway friction coefficient and the effective braking coefficient of friction of the aeroplane type over the required speed range for the existing runway conditions should be applied"

No such correlation currently exists. Delete sub-para b. and re-number sub-para c.

Justification:

This is a topic being examined by the ICAO Friction Task Force and in practice this is currently unattainable.

Proposed Text (if applicable):

1. For a wet and contaminated runway:

a. …..

~~b. if the performance data has been determined on the basis of a measured runway friction coefficient, a procedure correlating the measured runway friction coefficient and the effective braking coefficient of friction of the aeroplane type over the required speed range for the existing runway conditions should be applied; and~~

~~c~~.*b*.on a wet or contaminated runway, the take-off mass should not exceed that permitted for a take-off on a dry runway under the same conditions.

comment *4027* comment by: *UK CAA*

Page No: 292

Paragraph No:

AMC OPS.CAT.316.A(a)(3) Para 2.

Comment:

2. For performance purposes, an operator should consider a damp runway, other than a grass runway, to be dry.

The use of 'damp' is incorrect.

Justification:

ICAO does not define a 'damp' runway. A damp runway implies visible moisture and therefore should be taken as wet.

Proposed Text (if applicable):

Delete paragraph 2

~~2. For performance purposes, an operator should consider a damp runway, other than a grass runway, to be dry.~~

comment *5999* comment by: *DGAC*

(2) : Considering a damp runway as a dry one is not compliant with definition of a dry runway of ICAO annex 6 part 1 supplement C (amendment 33) :

Dry runway. A dry runway is one which is clear of contaminants and visible moisture within the required length and the width being used

The conclusion of previous PERF HWG has been that a damp runway should be assumed to be wet for performance purposes, based on research results comparing braking coefficient on dry, wet and damp surfaces (FAA reports, NASA technical notes and ESDU studies).

Moreover, a definition of damp runway is missing in this set of texts. The definition from EU-OPS 1.480 should be incorporated somewhere..

comment *6685* comment by: *Ryanair*

According to harmonised FAA/JAA position the damp runway should be considered to be wet, not dry

comment *7195* comment by: *ECA - European Cockpit Association*

Comment on paragraph 1.a.: rewrite according to JAA DNPA-OPS 47:

1. For a wet and contaminated runway:

a. the performance data ~~**should be**~~ determined in accordance with **Change 13 of JAR-25 , or that appropriate to the type certification date, whichever is the later, must be used.**~~**CS 25.1591 or equivalent**~~;

Justification:

Two issues were identified by the JAA Performance Subcommittee:

Firstly, these data are normally developed by the aeroplane manufacturer and consequently operators do not generally have the means to be able to demonstrate that a method acceptable to the Authority has been used.

Secondly, the publication of Change 13 to JAR-25 resulted in the transfer of the wet take-off performance certification guidelines of AMJ 25X1591 from section 3 of JAR-25 (Advisory Material – Joint) to section 1 (Requirements). Consequently, a reference in JAR-OPS 1 to JAR 25X1591 would no longer be

relevant to wet runway take-off performance data produced in accordance with Change 15 of JAR-25 or later.

These arguments are equally valid for the proposed text in relation to CS 25.1591 and the text should therefore be amended.

In combination with other comments, ECA strongly urges adoption of the changes published in DNPA-OPS 47 of the JAA Performance Subcommittee.

Paragraph No:

AMC OPS.CAT.316.A(a)(4) (See also UK CAA comment on AMC1 OPS.CAT.345.A(a)(1))

Comment:

It is suggested that the improved text which was developed and agreed by the JAA Performance Sub-Committee should be considered in the development of the implementing rules for air operations.

Justification:

Provides improvement and clarification of the requirement:-

It is fundamental to operational safety that the aeroplane is despatched with the ability to conduct safely a missed approach upon arrival at the destination and destination alternate airports, even if power is lost from the most critical engine. Instrument approach procedures are designed to provide protection from obstacles, and this includes obstacle clearance throughout the missed approach part of the procedure. Having allowed for a transition from the approach configuration to the missed approach climb configuration, a nominal climb gradient of 2·5% is specified, though occasionally increased gradients may be required if necessitated by the obstacle environment or other considerations.

It is proposed to replace paragraphs AMC OPS.CAT.316.A(a)(4) paragraphs 3(a) and (b) with a new paragraph (a). It applies to all instrument approaches, regardless of the decision height, and requires that the aeroplane is capable of a go-around climb gradient of 2·5%, or the published missed approach climb gradient, whichever is the greater. This is similar to existing paragraph 3(b), but which is currently applicable only to Category 2 and 3 approaches.

For consistency with the instrument approach procedure design outlined above, it is also proposed in the new paragraph 3(a) that the configuration used to

comply with the climb gradient prescribed for the missed approach must be achievable within the horizontal distance allowed for in the transition to the climb configuration. This is accomplished by placing limits on the acceleration and changes in flap necessary to achieve the missed approach climb configuration as follows:-

(i) The specified go-around speed must not exceed the speed used during the approach (V_{REF}) by more than 10 knots.

(ii) The go-around flap angle setting should not result in an increase in stall speed of more than 10% of that in the landing configuration.

These constraints are intended to limit the prolonged acceleration close to the ground which could otherwise be required during the transition to the go-around configuration. The constraint relating to stall speed is consistent with the recent harmonised certification standards agreed for CS-25/FAR 25.121(d).

A provision for the operator to use an alternative procedure or method, acceptable to the Authority, is retained in the new paragraph (a).

Proposed Text (if applicable):

3. Landing mass for missed approach for Performance Class A aeroplanes.

~~***a. For instrument approaches with a missed approach gradient greater than 2.5%. an operator should verify that the expected landing mass of the aeroplane allows a missed approach with a climb gradient equal to or greater than the applicable missed approach gradient in the one-engine inoperative missed approach configuration and speed (CS 25.121(d) / JAR-25.121(d)); and***~~

a. *For* ***all*** *instrument approaches* ***appropriate to the landing runway*** ~~***with decision heights below 200 ft***~~*, an operator should verify that the expected landing mass of the aeroplane****, taking into account the take-off mass and the fuel expected to be consumed in flight,*** *allows a missed approach gradient of climb, climb****, with the critical engine failed, at a speed not exceeding V_{REF} +10 knots and with the approach flap setting associated with the landing configuration used to show compliance with AMC OPS.CAT.345 as appropriate,*** *with the critical engine failed and with the speed and configuration used for go-around of at least 2.5%, or the published gradient, whichever is the greater (CS-AWO 243 / JAR-AWO 243).* ***The speeds and configurations used to show compliance with this paragraph shall be the same as the approved recommended procedures. The use of an alternative procedure and/or method must be accepted by the Authority.***

Original text:

MASS OF THE AEROPLANE FOR TAKE-OFF, IN-FLIGHT AND LANDING

1. Take-off and in-flight mass. The mass of the aeroplane at the start of the take-off or, in the event of in-flight re-planning, at the point from which the revised operational flight plan applies should not be greater than the mass at which the requirements can be complied with for the flight to be undertaken allowing for expected reductions in mass as the flight proceeds, and for fuel jettisoning as is provided for in the particular provision.

When determining the maximum permitted take-off mass, in addition to AMC1 OPS.GEN.320.A(a), an operator should also take into account the following:

a. the impact of engine failures on the take-off distance required;

b. the runway slope in the direction of take-off as indicated in Appendix 1 to AMC OPS.CAT.325.A(a)(4); and

c. the loss, if any, of runway length due to alignment of the aeroplane prior to take-off as indicated in Appendix 2 to AMC OPS.CAT.325.A(a)(4).

comment *6001* comment by: *DGAC*

In § 1 the reference to "the requirements" lacks accuracy

Justification:

JAR/EU OPS 1.475(a) from which the text of § 1 has been copied refers to "the requirements of the appropriate subpart"

Proposed Text:

Amend text as follows:

"1. Take-off and in-flight mass. The mass of the aeroplane at the start of the take-off or, in the event of in-flight re-planning, at the point from which the revised operational flight plan applies should not be greater than the mass at which the requirements **of this section** can be complied with for the flight to be undertaken allowing for expected reductions in mass as the flight proceeds, and for fuel jettisoning as is provided for in the particular provision."

§ 1.a. refers to "the impact of engine failures on the take-off distance required", whereas airworthiness codes do not take into account the failure of more than one engine.

Proposed Text:

Amend text as follows:

"a. the impact of **an** engine failure~~s~~ on the take-off distance required;"

comment *6690* comment by: *Ryanair*

Paragraph 2

Certification requirement for landing performance for large aeroplanes and landing performance data/software provided by manufacturers do not include effect of ambient temperature.

Paragraph 3.a

This paragraph describes operational performance requirements for instrument approach procedures missed approach climb gradients >2.5%. At the same time it refers to certification WAT requirements from CS 25.121(d) which has nothing to do with IAP missed approaches climb gradients.

comment *7203* comment by: *SWISS AERODROMES ASSOCIATION*

The slope calculation (1.b) should be the calculation of the effective runway slope

B. II. Draft Decision - Part-OPS - Subpart B - Section III - AMC OPS.CAT.316.A(c) Performance General – Aeroplanes p. 294-295

comment *1497* comment by: *Airbus*

This material, which is applicable to performance class B aeroplanes only, is located between other AMC and GM that are applicable to different performance classes (sometimes mixed). This is just an example of the difficulty to sort the information related to a given performance class in Section III AMC and GM. The structure of the performance provisions in OPS 1 and TGL 44, with a clear split between performance classes, is much more user-friendly.

comment *1723* comment by: *ECA - European Cockpit Association*

Comment: delete 1:

TAKE-OFF AND LANDING CLIMB FOR CLIMB CRITERIA FOR PERFORMANCE CLASS B AEROPLANES

~~**1. The climb criteria should be those required by the applicable airworthiness code (e.g. CS 23.63(c)(1); CS 23.63(c)(2) or equivalent).**~~

2. Take-off Climb

Justification:

The original requirement in Appendix 1 to EU-OPS 1.525(b) contained a statement on which certification requirement the climb were based. This seems to be translated in the proposed text as a general requirement for the climb criteria to meet the applicable standards in the airworthiness code. This would mean that those aircraft certified to a standard which does not meet the requirements under 2 can still be considered to satisfy the requirement of OPS.CAT.316.A. This was not the intent of EU-OPS 1.525(b) as the requirements under proposed 2 are meant as a minimum. By removing the unnecessary reference to the airworthiness code under 1 the original intent is restored.

Paragraph No:

OPS.CAT.316.A(c) & AMC OPS.CAT.316.A(c)

Comment:

OPS.CAT.316.A(c) specifies that aeroplanes with insufficient climb performance with one-engine-inoperative should be subject to the same operational restrictions as single-engined aeroplanes. The existing criteria specified in AMC OPS.CAT.316.A(c) to satisfy this objective are the CS-23 WAT climb limits applicable to aeroplanes greater than 2,730kg. As well as being complex these criteria require data whch is not required to be available in the AFM/POH.

Justification:

In order to enable the operator to determine without difficulty whether the aeroplane has the necessary one-engine inoperative performance capability, the criteria has to be set in simpler terms and make use of the data already available in the AFM/POH. To that end, instead of the existing CS-23 WAT criteria, it is proposed to specify a minimum one-engine inoperative rate of climb figure that needs to be achievable in the en-route configuration. The text below is a further refinement of proposals that were agreed within the JAA Performance Sub-Committee.

Proposed Text (if applicable):

(i) Amend OPS.CAT.316.A(c) as follows:-

*(c) **~~Two~~** **Multi-engined** propeller-driven aeroplanes. **~~Two~~** **Multi-engined** propeller-driven aeroplanes which **are not capable of a steady rate of climb in the en-route configuration with one-engine-inoperative of 150 feet per minute at:-***

(i) 1,500ft above the altitude and air temperature of the departure aerodrome and

***(ii) 1,500ft above the altitude and air temperature of the destination and destination alternate aerodromes** **~~do not meet the applicable climb criteria~~** shall be treated as single**-engined** propeller-driven aeroplanes and shall comply with (b).*

(ii) Delete AMC OPS.CAT.316.A(c).

Point 1

SHOULD is a change from MUST

Also, no DRY check required. No objection. Wording is more achievable. This reflects that performance is a plan with the best information and not a totally exact science.

comment *6002* comment by: *DGAC*

The text in paragraph 1.d only applies to paragraph 1, not 2 and 3.

Proposed Text:

Amend § 1.d as follows:

"compliance with this ~~**AMC**~~ **paragraph** should be shown using a single value of V1 for the rejected and continued take-off."

Paragraph 1.b. is redundant with OPS.GEN.320.A (a)(1) which says that : "the take-off distance shall not exceed the take-off distance available, with a clearway distance not exceeding half of the take-off run available" and is applicable for all aeroplanes in commercial operations, therefore is also applicable to CAT.

The whole paragraph 3 for operators of class B aeroplanes must be modified.

Proposed text:

Amend paragraph 3 as follows :

"3. Operators of Performance Class B aeroplanes should ensure that the unfactored take-off distance, as specified in the AFM does not exceed :

a. when multiplied by a factor of 1.25, the take-off run available; or

b. when clearway is available, the following:

i. the take-off run available;

ii. when multiplied by a factor of 1.25, the take-off distance available; and/or

c. when stopway is available, the following :

i. the take-off run available;

ii. when multiplied by a factor of 1.25, the accelerate-stop distance available.

~~b. when stopway and/or clearway is available, the following:~~

~~i. the take-off run available;~~

~~ii. when multiplied by a factor of 1.15, the take-off distance available; and~~

iii. ~~when multiplied by a factor of 1.3, the accelerate-stop distance available.~~ "

Justification :

The present wording is confusing because it seems to melt stopway and clearway which are completely different even if only one is available.

The three requirements (i), (ii) and (iii) are effective even if only one of clearway and stopway, is available. The way it is written, it appears that in most of cases for small aerodromes, if no stopway or a short stopway is available, it doesn't provide any benefit for the operator (stopway < 4% runway) who cannot take advantage of the clearway. Clearly separating the different cases and leaving to the operator the choice of using or not a stopway when available, the result could be more useful. That's why we should replace "and" by "and/or".

Moreover, the safety coefficients are not relevant. For example : TORA = 1000m and clearway = 100m :

- Without clearway, we would have : 1000/1.25=800m then the margin

between TOD and TODA is 200m

- 1100/1.15=956m then the margin TOD/TODA is 144m which is less than 200m

- with a new coefficient of 1.25 for the TOD : 1100/125=880m then the margin is 220m. In this case we take benefit of the clearway without lowering the safety level.

The same coefficient of 1.25 should therefore be used for all cases.

Proposal :

Amend AMC 1 OPS.CAT.326.A by replacing point 3 as follows :

"1. Operators of Performance Class A aeroplanes and for such Performance Class C aeroplanes, for which take-off field length data accounts for engine failures in their AFM, […]

2. Operators of Performance Class C aeroplanes for which the AFM does not include engine failure accountability[…]

3. Operators of Performance Class B aeroplanes should ensure that the unfactored take-off distance, as specified in the AFM does not exceed:

c. when multiplied by a factor of 1.25, the take-off run available; or

~~d. when stopway and/or clearway is available, the following:~~

~~iv. the take-off run available;~~

~~v. when multiplied by a factor of 1.15, the take-off distance available; and~~

vi. ~~when multiplied by a factor of 1.3, the accelerate-stop distance available.~~

b. when clearway is available, with a clearway distance not exceeding half of the take-off run available, the following:

iii. the take-off run available;

iv. when multiplied by a factor of 1.25, the take-off distance available; and/or

e. when stopway is available, the following :

j. the take-off run available;

ii. when multiplied by a factor of 1.25, the accelerate-stop distance available."

Justification :

The present wording is confusing because it seems to melt stopway and clearway which are completely different even if only one is available and uses irrelevant safety coefficient (for example : TORA = 1000 m and stopway = 20 m, it is better not to take the stopway into account as 1020/1.3 < 1000/1.25, but with a clearway of 1 m 1001/1.15 is much > than 1000/1.25). The same coefficient of 1.25 should therefore be used for all cases. In addition, clearway length should be limited to half of the runway length as for performance class A aeroplanes.

B. II. Draft Decision - Part-OPS - Subpart B - Section III - GM2 OPS.CAT.326.A Take-off requirements - Aeroplanes p. 297

comment *1502* comment by: *Airbus*

The subtitle of this GM shows that it is applicable to performance class A and class C aeroplanes.

It should be mentioned in paragraph 2 that AMC 25.1591 is relevant to performance class A aeroplanes only.

OPS 1 provisions have to be accurately transposed.

comment *5094* comment by: *M Wilson-NetJets*

Original text:

(2) An adequate overall level of safety will only be maintained if operations in accordance with AMC 25.1591 or equivalent are limited to rare occasions. Where the frequency of such operations on contaminated runways is not limited to rare occasions, operators should provide additional measures ensuring an equivalent level of safety. Such measures could include special crew training, additional distance factoring and more restrictive wind limitations.

Comment on AMC2 OPS.CAT.327.A: change as follows:

AMC2 OPS.CAT.327.A Take-off obstacle clearance - Aeroplanes

DETERMINATION OF THE HORIZONTAL, VERTICAL AND LATERAL DISTANCES FOR THE ~~**TAKE-OFF FLIGHT PATH**~~ **NET TAKE-OFF FLIGHT PATH** OBSTACLE CLEARANCES

1. Horizontal distances or vertical mrgins. Operators should ensure that the ~~**take-off flight path**~~ **net take-off flight path** clears all obstacles by horizontal or vertical distances as following:

a. for aeroplanes with a wingspan of 60 m or more, by a horizontal distance of at least 90 m plus 0.125 x D, where D is the horizontal distance the aeroplane has travelled from the end of the take-off distance available or the end of the take-off distance if a turn is scheduled before the end of the take-off distance available;

b. for aeroplanes with a wingspan of less than 60 m, by a horizontal distance of half the aeroplane wingspan plus 60 m, plus 0.125 x D; or

c. for Performance Class A aeroplanes (Appendix 1 to AMC2 OPS.CAT.327.A), by a vertical margin of at least 35 ft and for any part of the net take-off flight path in which the aeroplane is banked by more than 15° by a vertical margin of at least 50 ft; or

d. for Performance Class B (Appendix 2 to AMC2 OPS.CAT.327.A) and Performance Class C aeroplanes, by a vertical margins of at least 50 ft.

2. Where the intended ~~**take-off flight path**~~ **net take-off flight path** does not require track changes of more than 15°, an operator does not need to consider those obstacles which have a lateral distance greater than:

a. 300 m, if the pilot is able to maintain the required navigational accuracy (Appendix 3 to AMC2 OPS.CAT.327.A) through the obstacle accountability area; or

b. 600 m, for flights under all other conditions.

3. Where the intended ~~**take-off flight path**~~ **net take-off flight path** does require track changes of more than 15°, an operator does not need to consider those obstacles which have a lateral distance greater than:

a. 600 m, if the pilot is able to maintain the required navigational accuracy (Appendix 3 to AMC2 OPS.CAT.327.A) through the obstacle accountability area; or

b. 900 m for flights under all other conditions.

4. For the compliance with 1. to 3. above, it should be assumed that:

a. track changes are not allowed up to the point at which:

i. the ~~**take-off flight path**~~ **net take-off flight path** for Performance Class B and C aeroplanes is not less than 50 ft above the elevation of the end of the take-off run available; and
ii. the net take-off flight path for Performance Class A aeroplanes has achieved a height equal to one half the wingspan but not less than 50 ft above the elevation of the end of the take-off run available.

b. thereafter, up to a height of 400 ft the aeroplane is banked by no more than 15°;

c. above 400 ft, the aeroplane is banked by no more than 25° for Performance Class A and C aeroplanes.

5. Operators of Performance Class A aeroplanes may use special procedures, to apply increased bank angles (Appendix 4 to AMC2 OPS.CAT.327.A) of not more than 20º between 200 ft and 400 ft, or not more than 30º above 400 ft.

6. For showing compliance with 2.a. and 3.b above, operators of Performance Class B aeroplanes should ensure that the flight is conducted under conditions allowing visual course guidance navigation, or if navigational aids are available, enabling the pilot to maintain the intended flight path with the same accuracy.

Justification:

Is is essential that the climb gradient reductions specified in the certification specifications are included when showing compliance with obstacle clearance criteria. As such all references to take-off flight path should be amended to net take-off flight path.

comment *1503* comment by: *Airbus*

Again, this AMC is a mix of provisions of different applicability with regard to the performance class, difficult to sort. The structure of the performance requirements in OPS 1, with separate subparts for each performance class, is

much more user-friendly.

comment *1724* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.327.A: change as follows:

4. For the compliance with 1. to 3. above~~, it should be assumed that~~:

Justification:

The original requirement of EU-OPS 1.495(c) constitutes a requirement not only for obstacle clearance but also for operating procedures by limiting bank angles and track changes. The current proposal implies by the wording "it should be assumed" that the requirements under (a) to (c) are intended only for showing compliance with the obstacle clearance criteria and not as operating limits. To avoid confusion the wording should be deleted.

comment *1725* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.327.A:

Change 1.d. as follows:

"For Performance Class B (Appendix 2 to AMC2 OPS.CAT.327.A)~~ and Performance Class C aeroplanes,~~ by a vertical margin of at least 50 ft."

Add 1.e. as follows:

"**1.e. For Performance Class C by a vertical margin of at least 50 ft plus 0.01 x D.**"

Justification:The original requirement contained in EU-OPS 1.570(a) is not properly reflected in the proposed text.

comment *2858* comment by: *M Wilson-NetJets*

Original text:

Where the intended take-off flight path does not require track changes of more than 15°, an operator does not need to consider those obstacles which have a lateral distance greater than:

Suggested new text:

Where the intended take-off flight path does not require track changes of more than 15º of the extended runway centerline, an operator does not need to consider those obstacles which have a lateral distance greater than:

Comment/suggestion:

As the text reads now it could be interpreted that multiple track changes, where each track change in itself is limited to 15º, are allowed.

comment *6072* comment by: *DGAC*

- The distinction between horizontal and vertical margins is not clearly made (see JAR/EU OPS 1.495(a)).

- the margin in § 1.b is an option (see JAR/EU OPS 1.495(a) : "…a horizontal obstacle clearance…may be used).

Proposed Text:

Amend text as follows:

"1. Horizontal distances or vertical margins. Operators should ensure that the take-off flight path clears all obstacles by horizontal ~~**or vertical**~~ distances as follow~~**sing**~~:

a. for aeroplanes with a wingspan of 60 m or more, by a horizontal distance of at least 90 m plus 0.125 x D, where D is the horizontal distance the aeroplane has travelled from the end of the take-off distance available or the end of the take-off distance if a turn is scheduled before the end of the take-off distance available;

b. **or at the option of the operator**, for aeroplanes with a wingspan of less than 60 m, by a horizontal distance of half the aeroplane wingspan plus 60 m, plus 0.125 x D;

or by vertical distances as follows:

c. for Performance Class A aeroplanes (Appendix 1 to AMC2 OPS.CAT.327.A), by a vertical margin of at least 35 ft and for any part of the net take-off flight path in which the aeroplane is banked by more than 15° by a vertical margin of at least 50 ft; or

d. for Performance Class B (Appendix 2 to AMC2 OPS.CAT.327.A) and Performance Class C aeroplanes, by a vertical margins of at least 50 ft."

B. II. Draft Decision - Part-OPS - Subpart B - Section III - AMC1 OPS.CAT.327.A Take-off obstacle clearance - Aeroplanes - Appendix 1 p. 299

comment *6074* comment by: *DGAC*

Is this paragraph and (2) of AMC1 OPS.CAT.327.A applicable for all performance classes ?

B. II. Draft Decision - Part-OPS - Subpart B - Section III - AMC2 OPS.CAT.327.A Take-off obstacle clearance - Aeroplanes - Appendix 1 p. 300

comment *5928* comment by: *ERA*

European Regions Airline Association Comment

Operators are surprised that this material is included as it appears to not be consistent with the presentation in CS 25.

Therefore further clarification is required as to the reason for this material to be included.

B. II. Draft Decision - Part-OPS - Subpart B - Section III - AMC2 OPS.CAT.327.A Take-off obstacle clearance - Aeroplanes - Appendix 2 p. 300-304

comment *6075* comment by: *DGAC*

Figures 4 and 5 are unreadable

B. II. Draft Decision - Part-OPS - Subpart B - Section III - AMC2 OPS.CAT.327.A Take-off obstacle clearance - Aeroplanes - Appendix 3 p. 305

comment *1505* comment by: *Airbus*

The subtitle of this appendix indicates that it is applicable to performance class A and class B aeroplanes.

This material is copied from AMC OPS 1.495(d)(1) & (e)(1) in TGL 44, which is applicable to performance class A only. There is no equivalent material in TGL 44 for performance class B.

Is it intentional, and justified, to extend applicability to class B?

The principle should be to accurately transpose OPS 1 & TGL 44 provisions, and nothing more unless clearly justified.

comment *1726* comment by: *ECA - European Cockpit Association*

Comment on Appendix 3 to AMC2 OPS.CAT.327.A : amend title to include category C airplanes as well.

Change as follows:

TAKE-OFF FLIGHT PATH – REQUIRED NAVIGATIONAL ACCURACY FOR PERFORMANCE CLASS A ~~**AND** ,~~ CLASS B **AND CLASS C** AEROPLANES

Justification:

This paragraph does apply to Category C airplanes as well, see AMC OPS 1.570(e)(1) and (f)(1).

B. II. Draft Decision - Part-OPS - Subpart B - Section III - AMC OPS.CAT.340.A(c) En-Route requirements - Aeroplanes p. 306-307

comment *517* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.340.A(c): change as follows:

1. For Performance Class A aeroplanes, the net flight path should take account

of the following criteria:

a. the ~~**flight path**~~ **net flight path** should clear obstacles (Appendix 1 to AMC OPS.CAT.340.A(c)) within 9.3 km (5 nautical miles (nm)) on either side of the intended track ~~**or**~~ by a vertical interval of at least 2 000 ft; and

b. the necessary increase of the width margins of sub-paragraph a. to 18.5 km (10 nm) if the navigational accuracy does not meet the 95% containment level;

c. the engine is assumed to fail at the most critical point along the route;

d. account is taken of the effects of winds on the **net** flight path;

e. fuel jettisoning is permitted to an extent consistent with reaching the aerodrome with the required fuel reserves, if a safe procedure is used; and

f. the aerodrome where the aeroplane is assumed to land after engine failure should meet the following criteria:

i. the performance requirements at the expected landing mass are met; and

ii. weather reports or forecasts, or any combination thereof, and field condition reports indicate that a safe landing can be accomplished at the estimated time of landing.

Justification:

Editorial. Current text does not fit the intent.

comment *771* comment by: *ECA - European Cockpit Association*

Comment: delete paragraph 1. and replace with following text:

1. For Performance Class A aeroplanes, the net flight path should take account of the following criteria:

a. the one engine inoperative en-route net flight path data shown in the Aeroplane Flight Manual, appropriate to the meteorological conditions expected for the flight complies with either (i) or (ii) at all points along the route (Appendix 1 to AMC OPS.CAT.340.A(c))

i. The gradient of the net flight path must be positive at at least 1 000 ft above all terrain and obstructions along the route within 9,3 km (5 nm) on either side of the intended track; or

ii. The net flight path must permit the aeroplane to continue flight from the cruising altitude to an aerodrome where a landing can be made in accordance with OPS 1.515 or 1.520 as appropriate, the net flight path clearing vertically, by at least 2 000 ft, all terrain and obstructions along the route within 9,3 km (5 nm) on either side of the intended track in accordance with subparagraphs 1 to 4 below:

1. the engine is assumed to fail at the most critical point along the route;

2. account is taken of the effects of winds on the flight path;

3. fuel jettisoning is permitted to an extent consistent with reaching the aerodrome with the required fuel reserves, if a safe procedure is used; and

4. the aerodrome where the aeroplane is assumed to land after engine

failure should meet the following criteria:

- the performance requirements at the expected landing mass are met; and

- weather reports or forecasts, or any combination thereof, and field condition reports indicate that a safe landing can be accomplished at the estimated time of landing; and

b. the necessary increase of the width margins of sub-paragraph a(i) and a(ii) to 18.5 km (10 nm) if the navigational accuracy does not meet the 95% containment level;

c. The net flight path must have a positive gradient at 1500 ft above the aerodrome where the landing is assumed to be made after engine failure; and

d. In meteorological conditions requiring the operation of ice protection systems, the effect of their use on the net flight path must be taken into account.

Justification:

The original EU-OPS contains three climb gradient requirements which should be included. To assure a safe landing a minimum climb gradient of the net flight path to be positive above the intended aerodrome of landing is essential and should be included.

The original requirement from EU-OPS 1.500 provides two alternatives (b) and (c) requiring either a positive gradient 1000 ft above all terrain or a drift down procedure clearing all terrain by at least 2000 ft. Both methods are referred to in Appendix 1 to AMC OPS.CAT.340.A(c). The text from EU-OPS 1.500(b) should therefore be explicitly included as an option under 1.a.

Although one could argue that the Essential Requirements would require to consider the effect of anti ice systems, it is explicitly mentioned in AMC OPS.CAT.340.A(d) for aircraft with three or more engines and as such should be included here as well.

comment *1507* comment by: *Airbus*

Paragraph 1 (performance class A): it is unclear why the requirement for a positive gradient at 1500ft above the landing aerodrome [ref. EU OPS 1.500(a)] has been omitted.

OPS 1 & TGL 44 provisions have to be accurately transposed.

comment *1727* comment by: *ECA - European Cockpit Association*

Comment on paragraph 2.a.: delete and replace as follows:

2. For Performance Class B aeroplanes, the flight path should take account of the following criteria:

a. ~~**the relevant minimum altitudes for safe flight should be stated in the OM to a point 1 000 ft above an aerodrome;**~~ **an operator should ensure that the aeroplane is capable of continuing flight above the relevant minimum altitudes for safe flight to a point 1000 ft above an**

aerodrome at which the performance requirements can be met;

Justification:

The current proposed wording under 2.a. is partially copied from EU-OPS 1.540(a) and does not reflect the original intent.

The requirement for publishing of minimum safe altitudes is already included in GM OPS.CAT.340.A(b) and need not be repeated.

B. II. Draft Decision - Part-OPS - Subpart B - Section III - AMC OPS.CAT.340.A(c) En-Route requirements - Aeroplanes - Appendix 1 p. 307-308

comment *5096* comment by: *M Wilson-NetJets*

Original text:

see NPA Appendix 1 AMC OPS.CAT.340.A(c)

Suggested new text:

No suggested text

Comment/suggestion:

Appendix 1 Reference should be Appendix 1 to……. Figure 2 refers to paragraph 3 which does not exist.

comment *6078* comment by: *DGAC*

Amend the title as follows :

« Appendix 1 **to** AMC OPS.CAT.340.A(c) En-Route requirements – Aeroplanes »

(1) :

Proposal : Amend the first sentence as follows

For performance class A and C aeroplanes, the high terrain or obstacle analysis required in AMC OPS.CAT.A.340(c) **should** ~~may~~ be carried out by making a detailed analysis of the route.

Justification :

When applying the AMC and its appendix, there is no option available not to apply this provision. The wording "should" instead of "shall" is only the mark of soft law (AMC) versus hard law (IR)

B. II. Draft Decision - Part-OPS - Subpart B - Section III - AMC OPS.CAT.340.A(d) En-route requirements - Aeroplanes p. 308

comment *1728* comment by: *ECA - European Cockpit Association*

Comment AMC OPS.CAT.340.A(d): change as follows:

1. For Performance Class A **and Class C** aeroplanes:

Justification:

The intent of EU-OPS 1.585 and EU-OPS 1.505 is the same except for the climb gradient reduction specified for Class C aeroplanes and the use of net flight path for Class A aeroplanes. The original text in these requirements is similar but not the same. As the effects of ice protection systems on the flight path are of equal importance to Class C aeroplanes and the requirement to fly level for 15 minutes over the aerodrome of intended landing requires a positive gradient the suggested amendment reflects best practices and is a clarification.

comment *1730* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.340.A(d): add new paragraph 6 as follows:

6. For Class B aeroplanes the available rate of climb of the aeroplane shall be taken to be 150 ft per minute less than that specified.

Justification:A similar statement is included in AMC OPS.CAT.340.A(c) for the one engine inoperative case and should be included for the two engine inoperative case as well and in line with EU-OPS 1.585(e).

comment *2365* comment by: *Dassault Aviation*

Technical comment:

Page 308 AMC OPS.CAT.340.A(d) bullet 3: En-route requirements aeroplanes. This comment is to be read in connection to the comment made above on paragraph OPS.CAT.340(d) of page 69 of the NPA2009-02b. We propose to change the 90 minutes criteria by 180 minutes criteria, taking into account increase engines reliability as well as airframe-engine combination over the past decades, as follows: "The two engines are assumed to fail at the most

critical point of that portion of the route where the aeroplane is more than ~~90 minutes~~ 180 minutes, at the all engines long range cruising speed at standard temperature in still air, away from an aerodrome at which the performance requirements applicable at the expected landing mass are met".

comment *3286* comment by: *AEA*

Relevant Text:

2. For Performance Class A and Class C aeroplanes, the net flight path or flight path respectively should take into account the following:

*a. the net flight path **and flight path** should clear vertically, by at least 2 000 ft all terrain and obstructions along the route within 9.3 km (5 nm) on either side of the intended track; and*

3. The two engines are assumed to fail at the most critical point of that portion of the route where the aeroplane is more than 90 minutes, at the all engines long range cruising speed at standard temperature in still air, away from an aerodrome at which the performance requirements applicable at the expected landing mass are met.

4. Fuel jettisoning is permitted to an extent consistent with reaching the aerodrome with the required fuel reserves, if a safe procedure is used.

5. The expected mass of the aeroplane at the point where the two engines are assumed to fail should not be less than that which would include sufficient fuel to proceed to an aerodrome where the landing is assumed to be made, and to arrive there at least 1 500 ft directly over the landing area and thereafter to fly level for 15 minutes.

Comment:

The text is unclear;

- the beginning 1.505(b) is missing; "**The two engine inoperative flight path must permit the aeroplane to continue the flight** …
- 1.505(a) is missing.

Proposal:

1 a) - delete "and flight path".: ". *the net flight path **~~and flight path~~** should clear vertically*"

3,4,5 - By adding the missing wordings should make the text understandable

Paragraph No:

AMC OPS.CAT.340.A.(d)

Comment:

It is suggested that the improved text which was developed and agreed by the JAA Performance Sub-Committee should be considered in the development of the implementing rules for air operations.

Justification:

Provides clarification of the requirement:-

In paragraph 4, it is proposed to clarify that the "required fuel reserves" which must be available on reaching the alternate aerodrome, are specified in paragraph (5).

It is also proposed to amend paragraph (5) to specify the power or thrust setting which should be assumed when determining the fuel requirements. It is clearly appropriate to specify the thrust or power level when establishing a fuel consumption requirement and the proposed direct reference to a 'cruise' setting instead of an implied setting necessary for level flight represents the same intent. This proposed amendment would in addition harmonise the JAR with the FAR. There are no cost implications associated with this proposal.

Proposed Text (if applicable):

4 Fuel jettisoning is permitted to an extent consistent with reaching the aerodrome with the required fuel reserves ***of paragraph 5 below****, if a safe*

procedure is used.

5. The expected mass of the aeroplane at the point where the two engines are assumed to fail should not be less than that which would include sufficient fuel to proceed to an aerodrome where the landing is assumed to be made, and to arrive there at least 1 500 ft directly over the landing area and thereafter to fly level for 15 minutes ***at cruise power or thrust as appropriate****.*

comment *4652* comment by: *KLM*

Relevant Text:

2. For Performance Class A and Class C aeroplanes, the net flight path or flight path respectively should take into account the following:

a. the net flight path ***and flight path*** *should clear vertically, by at least 2 000 ft all terrain and obstructions along the route within 9.3 km (5 nm) on either side of the intended track; and*

3. The two engines are assumed to fail at the most critical point of that portion of the route where the aeroplane is more than 90 minutes, at the all engines long range cruising speed at standard temperature in still air, away from an aerodrome at which the performance requirements applicable at the expected landing mass are met.

4. Fuel jettisoning is permitted to an extent consistent with reaching the aerodrome with the required fuel reserves, if a safe procedure is used.

5. The expected mass of the aeroplane at the point where the two engines are assumed to fail should not be less than that which would include sufficient fuel to proceed to an aerodrome where the landing is assumed to be made, and to arrive there at least 1 500 ft directly over the landing area and thereafter to fly level for 15 minutes.

Comment:

The text is unclear;

- the beginning 1.505(b) is missing; "**The two engine inoperative flight path must permit the aeroplane to continue the flight** …
- 1.505(a) is missing.

DESTINATION AND ALTERNATE AERODROMES

1. For Performance Class A aeroplanes, the required missed approach gradient may not be achieved by all aeroplanes when operating at or near maximum certificated landing mass and in engine-out conditions. Operators of such aeroplanes should consider mass, altitude and temperature limitations and wind for the missed approach.

Suggested new text:

DESTINATION AND ALTERNATE AERODROMES

1. For Performance Class A aeroplanes, the required missed approach gradient may not be achieved by all aeroplanes when operating at or near maximum certificated landing mass and in One Engine Inoperative conditions. Operators of such aeroplanes should consider mass, altitude and temperature limitations and wind for the missed approach.

Comment/suggestion:

The use of "Engine Out Conditions" terminology might be misinterpreted as more than one engine inoperative.

comment *4039* comment by: *UK CAA*

Page No: 309

Paragraph No:

AMC1 OPS.CAT.345.A(a)(1) (Please see the UK CAA comment on AMC OPS.CAT.316.A(a)(4))

Comment:

It is suggested that the improved text which was developed and agreed by the JAA Performance Sub-Committee should be considered in the development of the implementing rules for air operations.

Justification:

The revised guidance material below complements the proposals in the previous comment and provides further clarification of the requirement.

Proposed Text (if applicable):

~~1. For Performance Class A aeroplanes, the required missed approach gradient may not be achieved by all aeroplanes when operating at or near maximum certificated landing mass and in engine-out conditions. Operators of such aeroplanes should consider mass, altitude and temperature limitations and wind for the missed approach.~~

~~2. As an alternative method, the operator may use an increase in the decision altitude/height or minimum descent altitude/height and/or a contingency procedure (AMC1 OPS.GEN.320.A(b)) providing a safe route and avoiding obstacles.~~

1. The missed approach procedure of an instrument approach as shown on instrument approach charts, is normally based on an obstacle clearance surface which has a minimum slope of 2.5% or more, caused by obstacle, ATC,

noise or other constraints. The intent of the requirement of JAR-OPS 1.510(b) is to ensure that the required missed approach climb gradient will be achieved before reaching the obstacle clearance surface. This may not be achievable by all aeroplanes when operating at or near maximum certificated landing mass, and in engine-out conditions and when significant changes in flap setting and speed are necessary to achieve the missed approach climb configuration. Operators should therefore consider mass, altitude and temperature limitations for the missed approach, at aerodromes which are critical due to obstacles in the missed approach areas. An increase in the decision altitude/ height or minimum descent altitude/height may as a result be required.

2. A missed approach climb gradient other than that required by JAR-OPS 1.510(b), but not less than that required by JAR-OPS 1.510(a), may be used if the operator can demonstrate that the obstacle situation along the intended missed approach flight path does so allow.

comment *7084* comment by: *IACA International Air Carrier Association*

2.

Complies with former IEM JAR-OPS 1.510 (b) and (c), but "alternative method" does not need to be "approved" anymore.

B. II. Draft Decision - Part-OPS - Subpart B - Section III - AMC2 OPS.CAT.345.A(a)(1) Landing requirements - Aeroplanes p. 309-310

comment *520* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.345.A(a)(1): This AMC material is not mature and should be completely revised.

Justification:

AMC2 OPS.CAT.345.A(a)(1) contains a mixture of the requirements from the original EU-OPS 1.515 but contains several errors or incomplete statements and should be completely revised.

2.a. does not specify when the 60% or 70% factors should be applied

2.b should explicitly reference the factors under 2.a.

2 is a repetition of 6.

5. Should be reformatted to indicate when the 70% factor is applicable

7. should be rephrased in accordance with EU-OPS 1.515(c)(2). Additionaly EU-OPS required full compliance with EU-OPS 1.515(a),(b) and (c) for the designated alternate. The current proposal limits this requirement to a safe landing which can be interpreted in various ways. The text should be formatted in line with the original requirement.

8. The original EU-OPS 1.515(d) required two alternates that satisfy the requirements of EU-OPS 1.515(a),(b) and (c). The current proposal limits this to a safe landing which can be interpreted in various ways. As such paragraph 8 should be reformatted in accordance with EU-OPS 1.515(d).

comment *531* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.345.A(a)(1)(5)(a): change as follows:

5. When ensuring that the aeroplane is able to operate a full stop landing from 50 ft above the threshold within 70% of the landing distance available at the destination, an operator should take account of the following:

a. ~~**the altitude at the aerodrome**~~ **The pressure altitude and ambient temperature at the aerodrome**;

comment *532* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.345.A(a)(1)(1): change as follows:

1. To determine the landing distance, the operator should use ~~**either**~~ pressure altitude ~~**or geometric altitude**~~ **and ambient temperature** for the operation and it should be reflected in the OM.

Justification:

Should also be upgraded to OPS.GEN or OPS.CAT

comment *533* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.345.A(a)(1)(2): change as follows:

2. For Performance Class A and B aeroplanes, two considerations ~~**in determining**~~ should be taken into account **in determining** ~~**for**~~ the maximum permissible landing mass at the destination and alternate aerodromes:

Justification:

Rephrased to more proper English.

comment *534* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.345.A(a)(1)(4): change as follows:

4. ~~**Threshold limit of the landing distance available.**~~ An operator of turbo-jet powered aeroplanes should ensure that the landing mass of that aeroplane for the estimated time of landing allows a full stop landing from 50 ft above the threshold within 60% of the landing distance available at the destination aerodrome and at any alternate aerodrome.

Justification:

This first sentence is of no use.

comment *535* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.345.A(a)(1)(5):

Clarify:

5. When ensuring that the aeroplane is able to operate a full stop landing from 50 ft above the threshold within **70 %** of the landing distance available at the destination, an operator should take account of the following:

Justification:

It is not clear where the "70%" applies to.

comment *536* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.345.A(a)(1)8: change as follows:

8. If an operator of a Performance Class A aeroplane~~s~~ is unable to land ~~**on the most favourable runway, in still air,**~~ **in accordance with 2.a above** for a destination aerodrome having a single runway where a landing depends upon ~~**a specified wind component**~~ **the expected headwind**, an aeroplane may be dispatched if 2 alternate aerodromes are designated which **permit a safe landing**. Before commencing an approach to land at the destination aerodrome, the pilot-in-command should ensure that a safe landing can be made.

Justification:

1. "aeroplanes" must be "aeroplane".

2.Clarify that the inability is with respect to expected landing mass and that the 60%-rule is still applicable.

3. To clarify what is meant with "specified wind component", and to assure that the higher allowed landing mass is not based on just any wind but on the expected wind.

4. "permit a safe landing" should be changed into a more strict wording.

comment *537* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.CAT.345.A(a)(1)6: remove pt. "6."

~~**6. When dispatching an aeroplane on a dry runway, an operator should assume that:**~~

~~**a. the aeroplane should land on the most favourable runway, in still air; and**~~

~~**b. the aeroplane should land on the runway most likely to be assigned considering the probable wind speed and direction and the ground handling characteristics of the aeroplane, and considering other conditions such as landing aids and terrain.**~~

Justification:

Point "2." says it all already.

comment *1509* comment by: *Airbus*

Paragraph 2.a says that, for performance class A and B aeroplanes, the aeroplane mass should be such that on arrival the aeroplane can be landed within 60% or 70% (***as applicable***) of the landing distance available (etc.). The applicability criteria for 60%, respectively 70%, should be specified. EU OPS 1.515(a) (Class A) specifies 60% for turbojet, and 70% for turboprop. EU OPS 1.550(a) (Class B) specifies 70%.

comment *1510* comment by: *Airbus*

We assume paragraph 5 applies to all performance classes. If such is the case, replace "within 70% of the landing distance available at the destination" by "within 60% or 70% (as applicable) of the landing distance available at the destination".

comment *1511* comment by: *Airbus*

- Paragraphs 1, 4, 5, 6, and 7 are presumably applicable to all performance classes.
- Paragraph 2 is applicable to performance class A and B aeroplanes.
- Paragraphs 3 and 9 are applicable to performance class B and C aeroplanes.
- Paragraph 8 is applicable to performance class A aeroplanes.

The structure of the performance provisions in OPS 1 and TGL 44, with a clear split between performance classes, is much more user-friendly.

comment *1703* comment by: *Dassault Aviation*

Technical comment.

Page 309 AMC2 OPS.CAT.345.A(a)(1) §5: is the 70% factor for the landing distance also applicable to turbojet motor powered airplanes ? Under JAR/EU-OPS1, we remind that 70% was for turbo-prop, and 60% was for turbo-jet. We suspect that the applicability of the 70% (turboprop) is missing. Another comment is on §2 where we would like EASA underline that the two conditions 2a and 2b are only applicable at flight planning. We understand from the text that there is no requirement for determining in flight the safe margin to add to the landing distance available defined by paragraph OPS.CAT.345.A.

comment *1769* comment by: *claire.amos*

Point 7 'safe landing'

Not specific on factors that dictate a safe landing as previous regulation.

comment *1770* comment by: *claire.amos*

Point 5

Includes the requirement to include the assessment of slope regardless of gradient. Currently only if over +/- 2%.

comment *2792* comment by: *IDRF e.V. (association of regional airports)*

Item 2.a. reads "...60% or 70% (as applicable)..." but misses to specify, when 60% or 70% do apply as the factor unless we assume item 5 is the missing specification.

Item 5 allows a 70% factor for the aeroplanes when the altitude, the wind, the runway conditions and the slopes (local conditions) are considered. To follow the definition of aeroplanes this could be either a turboprop or a jet.

For clarification we suggest to rephrase this AMC.

comment *2883* comment by: *M Wilson-NetJets*

Original text:

the aeroplane mass should be such that on arrival the aeroplane can be landed within 60% or 70% (as applicable) of the landing distance available on the most favorable (normally the longest) runway in still air. Regardless of the wind conditions, the maximum landing mass for an aerodrome/aeroplane configuration at a particular aerodrome cannot be exceeded; and

Suggested new text:

the aeroplane mass should be such that on arrival the aeroplane can be landed within 60% for turbo-jet powered aeroplanes or 70% for turbo-prop aeroplanes of the landing distance available on the most favorable (normally the longest) runway in still air. Regardless of the wind conditions, the maximum landing mass for an aerodrome/aeroplane configuration at a particular aerodrome cannot be exceeded; and

Comment/suggestion:

The paragraph stipulates to use 60% or 70% as a factor for the landing distance but uses the word "as applicable" to use either the 60% or 70%. This applicability is nowhere defined. It is clear from the JAR and EU-OPS history but not from this text.

Page No: 309 of 464

Paragraph No:

AMC2 OPS.CAT.345.A(a)(1)

Comment:

The restructuring of the performance requirements has in general made it very difficult to follow the requirements for a given type of operation and class of aeroplane. The process has resulted in the original JAR-OPS 1 text being incorrectly laid out so that important parts of the landing requirements have been lost. For example, the landing distance parameters specified in paragraph 5 a, b and c should be taken into account when assessing the landing distance regardless of whether a 60% or 70% limit is applicable, but as written it only applies to the 70% case.

Justification:

The layout of the new text contain errors.

Proposed Text (if applicable): Preferably, the structure of JAR-OPS 1 should be retained. Otherwise the existing text should be transferred to rule material and corrected as follows:-

*4. **~~Threshold limit of the~~** Landing distance available. An operator of turbo-jet powered aeroplanes should ensure that the landing mass of that aeroplane for the estimated time of landing allows a full stop landing from 50 ft above the threshold **~~within 60%. of the landing distance available~~***

(i) for turbo-jet aeroplanes within 60%. of the landing distance available

(ii) for propeller driven aeroplanes within 70% of the landing distance available

at the destination aerodrome and at any alternate aerodrome

*5. **~~When ensuring that the aeroplane is able to operate a full stop landing from 50 ft above the threshold within 70% of the landing distance available at the destination~~**, **When showing compliance with paragraph 4 above,** an operator should take account of the following:…;*

comment *4041* comment by: *UK CAA*

Page No: 310

Paragraph No:

AMC2 OPS.CAT.345 A (a)(1) 8

Comment:

Important text has been lost from that in JAR-OPS /EU-OPS 1.515(d), which must be reinstated.

Justification:

The alleviation provided by this paragraph is significant and was only accepted for JAR-OPS 1.515(d) if the compensating inflight recheck of landing compliance in full compliance with all the landing requirements of JAR-OPS 1.510 and 515 are also complied with.

Proposed Text (if applicable): If an operator of a Performance Class A aeroplane~~s~~ is unable to land on the most favourable runway, in still air, for a destination aerodrome having a single runway where a landing depends upon a specified wind component, an aeroplane may be dispatched if 2 alternate aerodromes are designated which permit a safe landing. Before commencing an approach to land at the destination aerodrome, the pilot-in-command ~~*should ensure that a safe landing can be made*~~*. must satisfy himself that a landing can be made in full compliance with OPS.CAT.345.A.*

comment *6691* comment by: *Ryanair*

Paragraph 4

The sentence "threshold limit of the landing distance available " does not make any sense

comment *7209* comment by: *SWISS AERODROMES ASSOCIATION*

Para. 2.a) quotes "60 or 70 %" of the landing distance available. It must be clear that both jets and turboprops can use a factor of 70 %, as specified in Para 5.

comment *7307* comment by: *ANE (Air Nostrum) OPS QM*

The reason for the application of 70% margin is unclear (cf JAR-OPS 1.515(a)(2). Therefore, we would

welcome further clarification.

B. II. Draft Decision - Part-OPS - Subpart B - Section III - AMC OPS.CAT.345.A(a)(2) Landing requirements - Aeroplanes p. 310-311

comment *524* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.345.A(a)(2)1: change as follows:

1. For a Performance Class A aeroplane, the landing distance available in case of wet or contaminated runways **forecasted** at arrival should be at least 115%

of the required landing distance~~, determined in accordance with the type of aeroplane that will operate the landing.~~ **for a dry runway.**

Justification:

The final sentence of the proposed text does not seem to fit the intent.

comment *525* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.345.A(a)(2)5: change as follows:

5. The landing distance available in case~~s~~ of **a** contaminated runway~~s~~ **forecasted** at arrival should ~~in all cases be determined by using appropriate data from the AFM or equivalent data from the aircraft manufacturer.~~ **be at least 115% of the landing distance determined in accordance with approved contaminated landing distance data or equivalent accepted by the Authority.**

Justification:

Landing distances for a forecasted contaminated runway should have at least a 15% margin as required by EU-OPS 1.520.

comment *538* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.345.A(a)(2)(4): change as follows:

4. For a Performance Class B and C aeroplane, the landing distance ~~available~~ **required** in case of wet runways at arrival should be multiplied by a factor of 1.5.

Comment on (a)(2)(5); delete paragraph and replace with following text:

For a Performance Class A aeroplane the landing distance available in case of a contaminated runway at arrival should be at least 115% of the landing distance required determined in accordance with appropriate data from the AFM or equivalent data from the aircraft manufacturer.

Add new paragraph as follows:

For a Performance Class B and Class C aeroplane the landing distance available in case of a contaminated runway at arrival should be at least the landing distance required determined in accordance with appropriate data from the AFM or equivalent data from the aircraft manufacturer.

Justification:

Landing distances for a forecasted contaminated runway should have at least a 15% margin as required by EU-OPS 1.520.

The text under 4 contains a typing error as the required multiplication factor should be 1.15 instead of 1.5 and references the landing distance required, not the landing distance available.

Paragraphs 2 and 6 contain the same requirement and can be combined into a single paragraph applicable to Performance Class A and Class B aircraft.

comment *539* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.345.A(a)(2)(1): change as follows:

1. For a Performance Class A aeroplane, the ~~**landing distance available**~~ **maximum permissible landing mass** in case of wet or contaminated runways at arrival **shall be determined in accordance with AMC2OPS.CAT.345.A(a)(1) where the landing distance available should be** at least 115% of the required landing distance, determined in accordance with the type of aeroplane that will operate the landing.

Justification:

Clarify the fact that the maximum permissible landing mass is affected and to make a relation with dry runway calculations.

comment *1512* comment by: *Airbus*

In paragraph 1, what is the meaning of "determined in accordance with the type of aeroplane that will operate the landing"?

Reference should be made to AMC2 OPS.CAT.345.A(a)(1) instead of "type of aeroplane".

comment *3078* comment by: *M Wilson-NetJets*

Original text:

5. The landing distance available in cases of contaminated runways at arrival should in all cases be determined by using appropriate data from the AFM or equivalent data from the aircraft manufacturer.

Suggested new text:

5. The landing distance available in cases of contaminated runways at arrival should in all cases be determined by using appropriate data from the AFM or equivalent data from the aircraft manufacturer (if available).

Comment/suggestion:

The stipulation of the mandatory and sole use of AFM or manufacturer equivalent data is contradictory to OPS.CAT.345.A (a)(2)(ii). Furthermore, older aeroplane types do not have this data published.

comment *3289* comment by: *AEA*

Relevant Text:

1. For a Performance Class A aeroplane, the landing distance available in case of wet or contaminated runways at arrival should be at least 115% of the required landing distance, determined in accordance with the type of aeroplane that will operate the landing.

European Regions Airline Association Comment

The provisions of JAR-OPS 1.515 (b) and (e) are not properly reflected because AMC OPS.CAT.345.A(a)(2) paragraph 1 combines criteria for wet and contaminated runway. ERA members consider this an error which needs to be corrected

comment *6080* comment by: *DGAC*

Proposed Text:

See appended proposal (new definition of demonstrated landing distance and new AMC OPS.CAT.345.A replacing AMC2 OPS.CAT.345.A(a)(1) and AMC OPS.CAT.345.A(a)(2).

Justification:

- The text of these two AMCs has been copied from various paragraphs of JAR-OPS 1 subparts G, H and I and associated AMCs and has been arranged in manner such that the initial intent and consistency have been lost (even though the requirements in JAR-OPS 1 had a few shortcomings in the way they were written).

- when the text was rearranged, in many places, "landing distance available" is used instead of "landing distance required".

- The two AMC can be gathered in one single AMC, subdivided into dry runways, wet runways and contaminated runways

- The text is difficult to read and understand

- There is a repetition of text between paragraphs 2.a and 4, 5 of AMC2 OPS.CAT.345.A(a)(1)

- The text of paragraphs 5.a to d of AMC2 OPS.CAT.345.A(a)(1) applies in fact

to the <u>whole</u> of the two AMCs

- paragraphs 7 and 8 of AMC2 OPS.CAT.345.A(a)(1) poorly worded: it is not the operator that lands or not on the runway, it is the airplane! The operator is able or not to show compliance with the applicable requirement.

As a consequence, it is suggested to rephrase the text of the two AMCS.

comment *6083* comment by: *DGAC*

(4.) What is this factor 1.5?

<u>Proposal</u>:

Amend the text as follows:

"For a Performance Class B and C aeroplane, the landing distance available in case of wet runways at arrival should be multiplied by a factor of ~~**1.5**~~ **<u>1.15</u>**."

<u>Justification:</u>

EU-OPS 1.520 (for PC-A), 1.555 (for PC-B) and 1.600 (for PC-C) use the percentage 115% or a factor of 1.15 (which is another way to say the same thing) but the factor 1.5 is never used.

comment *6696* comment by: *Ryanair*

<u>Paragraph 1</u>

The sentence "...the landing distance available in case of wet or contaminated runways at arrival should be at least 115% of the required landing distance, determined in accordance with a type of aeroplane that will operate the landing" does not make any sense. It should say *"115% of dry RLD...".*

comment *7308* comment by: *ANE (Air Nostrum) OPS QM*

The provisions of JAR-OPS 1.515 (b) and (e) are not properly reflected because AMC OPS.CAT.345.A(a)(2) paragraph 1 combines criteria for wet and contaminated runway. ERA members consider this an error which needs to be corrected

B. II. Draft Decision - Part-OPS - Subpart B - Section III - GM OPS.CAT.345.A(a)(2) Landing requirements - Aeroplanes p. 311

comment *1514* comment by: *Airbus*

We understand that this GM is applicable to performance class B and C aeroplanes, by reference to AMC OPS.CAT.345.A(a)(2) paragraph 4. This should be specified.

comment *1733* comment by: *ECA - European Cockpit Association*

Comment on GM OPS.CAT.345.A(a)(2): correct as follows:

WET AND CONTAMINATED RUNWAYS

The use of the wet factor (~~**1.5**~~ **1.15**) is, in case of doubt, recommended because it may not be possible for a pilot to determine accurately the degree of wetness (sometimes as much as 60%, 1.6 factor) of the grass, particularly when airborne.

Justification:

The wet factor is erroneously stated as 1.5 instead of 1.15.

The 60% factor indicates the increase in landing distance that is possible on slippery types of grass runways. As the text currently reads it seems to reflect a measure of wetness.

comment *2884* comment by: *M Wilson-NetJets*

Original text:

WET AND CONTAMINATED RUNWAYS

The use of the wet factor (1.5) is, in case of doubt, recommended because it may not be possible for a pilot to determine accurately the degree of wetness (sometimes as much as 60%, 1.6 factor) of the grass, particularly when airborne.

Suggested new text:

WET AND CONTAMINATED GRASS RUNWAYS

The use of the wet factor (1.5) is, in case of doubt, recommended because it may not be possible for a pilot to determine accurately the degree of wetness (sometimes as much as 60%, 1.6 factor) of the grass, particularly when airborne.

Comment/suggestion:

The subtitle does not clearly indicate that the paragraph pertains to grass runways.

comment *3682* comment by: *Civil Aviation Authority of Norway*

Paragraph No:

GM OPS.CAT.345.A (a)(2) Wet and Contaminated Runways

Comment:

The comment on applying a wet factor of 1.5 as read can be taken to apply to all aeroplanes when it only applies to Performance B and C aircraft. Performance A aircraft uses a factor of 1.15. See Page 310.

Justification:

Clarification of application of the rule.

Proposed Text

(if applicable):

Add at the start of the sentence, " For a Performance Class B or C aircraft, the use of the wet factor (1.5) …. 2

comment *4048* comment by: *UK CAA*

Page No: 311

Paragraph No:

GM OPS.CAT.345.A(a)(2)

Comment:

It is not immediately clear that paragraph is refering to landings on wet **grass** runways. This should be made clearer, recognising that JAR/EU-OPS recommended a factor of 1.6.

Justification:

Self-explanatory.

Proposed Text (if applicable):

GM OPS.CAT.345.A(a)(2) Landing on Wet Grass Runways Class B aeroplanes

~~The use of the wet factor (1.5) is, in case of doubt, recommended because it may not be possible for a pilot to determine accurately the degree of wetness (sometimes as much as 60%, 1.6 factor) of the grass, particularly when airborne~~

1 When landing on very short grass which is wet, and with a firm subsoil, the surface may be slippery, in which case the distances may increase by as much as 60% (1.60 factor).

2 As it may not be possible for a pilot to determine accurately the degree of wetness of the grass, particularly when airborne, in cases of doubt, the use of the wet factor (1.15) is recommended.

comment *6084* comment by: *DGAC*

This paragraph only applies to wet grass : il should be clarified in the title.

The correct factor is 1.15 and not 1.5.

Proposed Text:

Amend the text as follows: "The use of the wet factor **(~~1.5~~ 1.15)…"**

Justification:

EU-OPS 1.520 (for PC-A), 1.555 (for PC-B) and 1.600 (for PC-C) use the percentage 115% or a factor of 1.15 (which is another way to say the same thing) but the factor 1.5 is never used.

AMC OPS.CAT.345.A(b) Landing requirements - Aeroplanes

STEEP APPROACH

~~**1. For Steep Approach procedures, the operator should use landing distance data, as appropriate, based on a screen height of less than 50 ft, but not less than 35 ft.**~~

2. For operators of Performance Class A aeroplanes, the following criteria should be considered:

Justification:

The proposed text under 1. Is a repetition of the requirement under OPS.CAT.345.A(b).

comment *1704* comment by: *Dassault Aviation*

Technical comment.

Pages 27, 69 and 311 (resp. OPS.GEN.010 §67, OPS.CAT.345.A §(b) and AMC OPS.CAT.345.A(b)) - Steep Approach and Screen Heights: these operational paragraphs consider that the landing distances data are based on a screen height of less than 50 feet but not less than 35 feet. It is to be noted that this 35-50 feet interval may be inadequate versus some airworthiness certification requirements. For example, NPA 25B-267 dealing with Steep Approach, allows screen heights from 35 feet up to 60 feet for the determination of landing distances data. Although it is a NPA, it is taken as it is through a Certification Review Item (CRI) therefore becoming an airworthiness certification bases on certain programs. The proposal is - if a maximum screen height needs to be mentioned - to increase the 50 feet proposed in the NPA 2009-02 to the value of 60 feet.

comment *4053* comment by: *UK CAA*

Page No: 311

Paragraph No:

AMC OPS.CAT.345.A(b) Para 2

Comment:

EU-OPS 1.550 (a) (1) refers to Appendix 1 to EU-OPS 1.550 (a) (1), which covers Performance Class B aircraft steep approaches. This is a repeat of what is stated for Performance Class A aircraft, but is not included in the AMC.

Amend "Performance Class A" to read "Performance Class A and B".

Justification:

Omission.

Proposed Text (if applicable):

2. For operators of Performance Class A ***and B*** aeroplanes, the following

criteria should be considered:

a. the AFM should state the maximum approved glideslope angle, any other limitations, normal, abnormal or emergency procedures for the steep approach as well as amendments to the field length data when using steep approach criteria;

b. a suitable glidepath reference system comprising at least a visual glidepath indicating system should be available at each aerodrome at which steep approach procedures are to be conducted; and

c. c. weather minima should be specified and approved for each runway to be used with a steep approach. Consideration should be given to the following:

i. the obstacle situation;

ii. the type of glidepath reference and runway guidance such as visual aids, Microwave landing system (MLS), 3D–NAV, Instrument Landing System (ILS), Localiser (LLZ), VHF Omnidirectional Radio Range (VOR), Non-directional Beacon (NDB);

iii. the minimum visual reference to be required at Decision Height (DH) and Minimum Descent Altitude (MDA);

iv. iv. available airborne equipment;

v. v. pilot qualification and special aerodrome familiarisation;

vi. AFM limitations and procedures; and

vii. missed approach criteria.

B. II. Draft Decision - Part-OPS - Subpart B - Section III - AMC OPS.CAT.345.A(c) Landing requirements - Aeroplanes p. 311-312

comment *528* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.345.A(c)2d: change as follows:

d. Additional conditions that are deemed necessary for a safe operation taking into account the aeroplane type characteristics, ~~**topographic**~~ **orographic** characteristics in the approach area, available approach aids and missed approach/baulked landing considerations may be required for type of operations. Such additional conditions may be, for instance, the requirement for Visual Approach Slope Indicator/Precision Approach Path Indicator (VASI/PAPI) – type visual slope indicator system.

Justification:

Orographic effects can be of particular influence to short landing operations. As such the text should be amended to reflect the original text contained in Appendix 1 to EU-OPS 1.515(a)(4).

comment *1705* comment by: *Dassault Aviation*

Technical comment.

Page 312 AMC OPS.CAT.345.A(c) §2.b.i: Short Landings: we suspect that the

technical rationale for a vertical distance of 3 meters maximum between the path of the pilot's eye and the path of the lowest part of the wheel (other than Appendix 1/2 to EU/JAR-OPS 1.515) is the blind area during the approach. An aeroplane equipped with a radio altimeter with associated altitude call outs could positively mitigate this blind area, thus the 3 meters could be increased to 5 meters. We therefore propose a modification to this AMC OPS.CAT.345.A(c) §2.b.i as follows (underlined): "Short landing operation will only be approved for aeroplanes where the vertical distance between the path of the pilot's eye and the path of the lowest part of the wheels, with the aeroplane established on the normal glide path, does not exceed 3 meters. This vertical distance could be increased to 5 meters for those aeroplanes equipped with an operative radio altimeter with associated altitude call outs."

comment *2797* comment by: *M Wilson-NetJets*

Original text:

1.a the use of the safe area should be approved by the airport authority;

Suggested new text:

The safe area used to increase the LDA shall be coordinated with the airport authority and a procedure shall be established with that airport authority so that any changes to that safe area are immediately reported to the operator.

Comment/suggestion:

The use of safe areas for short landing operations (SLO) is essential for short runway aerodromes. The safety of operations at an aerodrome are the mutual responsibility of the aeroplane operator and the airdrome operator. But the final decision to operate or not is with the aeroplane operator based on the information given by the aerodrome operator. Therefore, the text should be revised to reflect the correct chain of responsibility.

comment *2814* comment by: *M Wilson-NetJets*

Original text:

2. The following criteria for operators of Performance Class A may be needed to be applied to be able to conduct short landing operations:
a. Demonstration of the need for Short Landing Operations. There should be a clear public interest and operational necessity for the operation, either due to the remoteness of the airport or to physical limitations relating to extending the runway.

Suggested new text:

Delete all text

Comment/suggestion:

Delete. EASA is mainly responsible for ensuring the safety of aviation within the EU, by simultaneously providing an equal economic opportunity for each operator. "clear public interest" in itself is not an instrument to regulate aviation safety. Furthermore, "a clear public interest" might differ in quantity and quality from operator to operator based on the number and origin of the passengers being transported. This provides per definition an unfair

commercial advantage or disadvantage from operator to operator.

comment *2815* comment by: *M Wilson-NetJets*

Original text:

b. Aeroplane and Operational Criteria.

i. Short landing operation should only be used for aeroplanes where the vertical distance between the path of the pilot's eye and the path of the lowest part of the wheels, with the aeroplane established on the normal glide path, does not exceed 3 m;

Suggested new text:

b. Aeroplane and Operational Criteria.

i. Short landing operation should only be used for aeroplanes where the vertical distance between the path of the pilot's eye and the path of the lowest part of the wheels, with the aeroplane established on the normal glide path, does not exceed 3 m. **Where aeroplanes are equipped with radio-altimeters and the flight crew is provided with automatic and accurate radio-altimeter call-outs from 50 feet to touchdown at intervals of 10 feet, this vertical distance may be increased to 5 m;**

Comment/suggestion:

Falcon and Gulfstream aeroplanes cannot fly SLO because the eye to main wheel height is more than 3 meters. Modern aeroplanes with EGPWS radio-altimeter call-outs provide the flight crew with significantly more awareness of their altitude above the safe area where, in combination with the requirements for a safe area, the level of safety is absolutely guaranteed when such onboard equipment is available and used.

comment *4050* comment by: *UK CAA*

Page No: 312 of 464

Paragraph No:

AMC OPS.CAT.345.A(c)

Comment:

This important text should be reinstated as rule material, because it was contained in an Appendix to a rule in JAR/EU-OPS 1. In addition, in paragraph 2 it is implied that the criteria for short landing operations may or may not be applied. This is the wrong emphasis – the criteria must be applied.

Justification:

The short landing provisions are an alleviation which must be backed up by sufficient justification and compensating criteria.

Proposed Text (if applicable): *2. The following criteria for operators of Performance Class A* ~~***may***~~ ***must*** *be* ~~***needed to be***~~ *applied to be able to conduct short landing operations:*

comment *6460* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Comment

The distance of 3 m is not relevant for some aircrafts including business jets.

Proposal

We propose to change 2.b.i for " Short landing operation should only be used for aeroplanes where the vertical distance between the path of pilot's eye and the path of the lowest part of the wheels, with the aeroplane established on the normal glide path, does not exceed 3 m or have a maximum passenger seating configuration of 19 and a MTOM < 45 360 kg.

Justification

obvious

comment *363* comment by: *AgustaWestland*

GM2 OPS.CAT.355.H 1.b makes reference to AC29-2C MG12.

This MG has been withdrawn. The requirements for OEI HOGE capability are

now defined in AC29-2C,Chg 2 at page D-158 in paragraph (12)

comment *1075* comment by: *REGA*

Human external cargo (HEC) with twin engine helicopters: The requirements do not take into consideration the limitations that could exist for All Engine Operating (AEO) Hover Out of Ground Effect (HOGE), and One Engine Inoperative (OEI) performance. Especially when helicopters are operated at higher altitudes and when higher temperatures exist.

Most of the helicopter (e.g. BK117, EC145) used for HEMS operations are not able to achieve the Performance Class 1 requirements in hover flight (HOGE). Quite none of those helicopters are able to hover out of ground effect OEI at their standard mission weights.

In contrast to the performance requirements for HHO operations (OPS.SPA.025.HHO): The rules do not take into account the mentioned performance limitations.

Proposal

Except for HHO/HEC operations at a HEMS Operating Site, HEC operations performed as Commercial Air Transport (CAT) shall be capable of sustaining a critical power unit failure with the remaining engine(s) at the appropriate power setting, without hazard to the suspended person(s)/cargo, third parties, or property.

Para 2. AMC1 OPS.CAT.355.H 2.a.i. and ii. do not exist. Reference should probably be made to a.and b.

comment *505* comment by: *EHOC*

Paragraph 2.

Text should be that:

"...the requirements of AMC1 OPS.CAT.355.H 2.a. and b. are met."

Paragraph 4.b.i

The text does not work well due the use (in the referenced material) to DPATO it would be better as:

"i. a balked landing can be carried out meeting the provision of AMC1 OPS.CAT.355.H 2.a. and b."

Paragraph 4.c.

The text does not work well due the use (in the referenced material) to DPATO it would be better as:

"c. The part of the landing after which the requirement of b.i cannot be met should be conducted in sight of the surface."

comment *6085* comment by: *DGAC*

Proposed Text:

Amend text as follows: "An operator should ensure that from DPATO or no later than 200 ft above the take-off surface, with the critical power-unit inoperative the requirements of AMC1 OPS.CAT.355.H ~~**2.a.i. and ii.**~~ **2.a and 2.b** are met.

Justification:

Wrong reference. There is no (i) and (ii) in paragraph 2.

When the text of this AMC was copied from JAR-OPS 3 subpart H, the link to the exposure time alleviation has been removed.

Proposed Text:

Amend text as follows:

"1 b. The take-off should be conducted in such a way that a safe forced landing can be executed until the point where safe continuation of the flight is possible, **except as provided in section SPA.SFL**." […]

"2 b.ii. the helicopter can perform a safe forced landing, **except as provided in section SPA.SFL**."

comment *6524* comment by: *ADAC Luftrettung GmbH*

AMC3 OPS.CAT.355.H (2) Take-off Flight Path

Es wird hier auf Bedingungen gemäß AMC1 OPS.CAT.355.H, 2.a.i und ii verwiesen. Falscher Verweis, die Punkte OPS.CAT.355.H, 2.a.i und ii existieren nicht.

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - AMC OPS.CAT.406.A Safety harness - Aeroplanes p. 331

comment *1508* comment by: *British Parachute Association*

We suggest that the following words are added to the end of the sentence "The safety harness should be an upper torso restraint system."

"....except in the case of parachutists who may be secured in accordance with AMC.OPS.COM.406 Restraining Devices."

This will ensure consistency with *AMC.OPS.COM.406* and also ensure that parachutists wearing parachute equipment are not inappropriately restrained.

comment *6131* comment by: *DGAC*

Proposal: Add "and a CRD for a person younger than 24 months".

Justification: in accordance with AMC.OPS.GEN.405 (a)(4)

comment *6897* comment by: *Flybe*

This section does not include a definition of the required shoulder harness. Some aircraft (Dash 8 series) are equipped with a 3 point harness on the jump seat for crew members and this is approved within the aircraft certification.

An additional definition of the type of harness should be include.

"The harness shall be a four point harness for operating crew; however, flight deck jump seats may be equipped with a three point diagonal shoulder strap"

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - AMC OPS.CAT.410 Flight instruments and equipment for VFR flights – Motor powered aircraft & OPS.CAT.415 Flight instruments and equipment for VFR night flights and IFR flights – Motor powered aircraft p. 332

comment *4001* comment by: *HDM Luftrettung gGmbH*

GM OPS GEN 310:

No method of compliance is present; a suggested text is:"AMC OPS.CAT.415(a)(1)MEANS OF INDICATING ALTITUDE. For single pilot operations with helicopters, the additional means of indicating altitude may be a radio altimeter."

comment *4478* comment by: *Directflight Limited*

NPA 2009-2b.

AMC OPS.CAT.410 Flight instruments and equipment for VFR flights – Motor powered aircraft & OPS.CAT.415 Flight instruments and equipment for VFR night flights and IFR flights – Motor powered aircraft, and;

GM OPS.CAT.410.A Flight instruments and equipment for VFR flights – Motor powered aircraft & OPS.CAT.415.A Flight instruments and equipment for VFR night flights and IFR flights – Motor powered aircraft – Aeroplanes.

Table 1A GM OPS.CAT.410. & 415. – Aeroplanes, indicates against item 4 columns (e), (f) and (g), note *****, that "Neither three pointers, nor drum pointer altimeters satisfy the requirement."

At present numerous aircraft are operating with these alternative altimeters under Article 8(2) Regulation (EEC) No 3922/1991 Exemptions. Flights by these (individually designated) aircraft are restricted to flights below 10,000 ft barometric altitude, and are subject to the aircraft being fitted with two fully serviceable sensitive pressure altimeters.

Referring to:-

GM OPS.CAT.410.H Flight instruments and equipment for VFR flights – Motor powered aircraft & OPS.CAT.415.H Flight instruments and equipment for VFR night flights and IFR flights – Motor powered aircraft – Helicopters.

Table 1H GM OPS.CAT.410. & 415. – Helicopters, does not indicate that the altimeters mentioned above are unsuitable. Unpressurised General Aviation aircraft and IFR helicopters share this airspace with similar levels of cruising performance. In operations below 10,000 ft there should not be any distinction between rotary and fixed wing flights regarding altimeter requirements.

The AMC and GM should be modified to align the requirements for aircraft operating solely below 10,000 ft (if necessary using further distinction by MTOM or speed). The mandatory fitting of counter drum-pointer altimeters to fleets of general aviation aircraft which operate predominantly at very low level, but nevertheless must be capable of IFR flight is unwarranted and disproportionate.

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - GM OPS.CAT.410.A Flight instruments and equipment for VFR flights – Motor powered aircraft & OPS.CAT.415.A Flight instruments and equipment for VFR night flights and IFR flights – Motor powered aircraft - Aeroplanes p. 332-333

Paragraph No:

GM OPS.CAT.410.A and GM OPS.CAT.410.H

Comment:

The system of attaching notes by referring to asterisks is unwieldy and subject to error.

Justification:

Clarity.

Proposed Text (if applicable):

Delete asterisks, insert Notes.

* ***(Note 1)*** For single pilot night VFR night operation one sensitive pressure altimeter may be substituted by a radio altimeter.

** ***(Note 2)*** Required for helicopters with a maximum certificated take-off mass (MCTOM) exceeding 3 175 kg or having a maximum passenger seating configuration (MAPSC) of more than 9.

*** ***(Note 3)*** The pilot heater failure annunciation applies to any helicopter issued with an individual Certificate of Airworthiness after 1 August 1999. It also applies before that date when: the helicopter has a MCTOM exceeding 3 175 kg and a maximum approved passenger seating configuration greater than 9.

**** ***(Note 4)*** Required for helicopters with a maximum certificated take-off mass (MCTOM) exceeding 3 175 kg or required for any helicopters when operating over water; when out of sight of land or when the visibility is less than 1500 m .

***** ***(Note 5)***For helicopters with a maximum certificated take-off mass (MCTOM) exceeding 3175 kg, CS-29 1303(g) may require either a gyroscopic rate-of-turn indicator combined with a slip-skid indicator (turn and bank indicator) or a standby attitude indicator satisfying the requirements. (However, the original type certification standard should be referred to determine the exact requirement.)

****** ***(Note 6)*** For IFR operation only

******* ***(Note 7)*** For VFR night operations only.

comment *5817* comment by: *Ph.Walker*

No method of compliance is present; a suggested text is:"AMC OPS.CAT.415(a)(1)MEANS OF INDICATING ALTITUDE. For single pilot operations with helicopters, the additional means of indicating altitude may be a radio altimeter."

comment *6087* comment by: *DGAC*

Proposal : Amend note ***** as follows :

"***** Neither three pointers, nor drum pointer altimeters**, nor counter-pointer altimeter** satisfy the requirement**, unless for non pressurized non complex-motor-powered aeroplanes, operated up to FL 100, when such deviation is authorised by the airspace authority. In such a case, both altimeters should be of the same kind.**."

Justification:

French DGAC has notified to the commission such exemption from § EU-OPS 1.652(c) related to sensitive pressure counter drum-pointer altimeters (as of former TGL 33 R1), according to article 8-2 of Regulation (EEC) 3922/91 for

operators operating in a restricted area within the Caribbean Area (the West Indies) as air traffic in this airspace is less heavy than within European Airspace.

comment *6135* comment by: *DGAC*

Proposal:

Column (d), line 6 "Heated pitot system"

- add "applicable to aeroplanes first issued with an individual certificate of airworthiness on or after 1st april 1999.
- adapt the number according for the number of pilots: 1 for single pilot, 2 when 2 pilots are required.

comment *6136* comment by: *DGAC*

Proposal: columns (c) and (d) could merge as they are similar. This option would require to insert the criteria on a note such as:

****** applicable to MTOM > 5700 kg, maximum pax > 9 with individual certificate of airworthiness issued on or after 1st april 1999.

comment *6142* comment by: *DGAC*

Proposal:

Rewrite note ***** as follows:

"*Three-pointer, drum-pointer and counter-pointer altimeters do not satisfy the requirement, except for non-pressurized aeroplanes, with a MTOW ≤ 5700 kg, operating ≤ FL100 and under the applicable airspace requirement.*"

Justification: avoid excessive cost for retrofit while respecting safety recommendations from accident investigation boards (TGL28, TGL33)

comment *6159* comment by: *DGAC*

comment *2532* comment by: *Aerocorp Limited*

The helicopter types we operate have no facility for the fitment of either pitot heaters or failure indicators. Such regulation would preclude any night VFR operations and training, both of which have been safely carried out for many years. As flight in icing conditions is forbidden, pitot heaters are superfluous, in any event. The writer regularly positions helicopters at night during the long winter nights. This would seriously injure the company's commercial viability.

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - AMC OPS.CAT.417.A Windshield wipers - Aeroplanes p. 335

comment *111* comment by: *Air Southwest*

Is this really necessary

OPS.CAT.417.A and AMC OPS.CAT.417.A use 54 words on 2 widely separated sheets of paper to state exactly the same as EU-OPS 1.645 does in 42 words on one sheet of paper. The AMC is totally unnecessary and should be combined with the basic requirement in OPS.CAT.417.A.

comment *357* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.417.A : change as follows:

~~**The means used to maintain clear a clear portion of the windshield**~~

~~**during precipitation should be windshield wipers or an equivalent**~~

Windshield wipers or an equivalent should be used to maintain a clear portion of the windshield during precipitation.

comment *1847* comment by: *Airbus SAS*

This AMC does not really add valuable information. Further, it has to be kept in mind that, as an AMC for CAT, it is directed to professional operators and equipment manufacturers with an adequate technical knowledge.

==> Airbus proposes to delete this AMC.

comment *3292* comment by: *AEA*

Relevant Text:

The means used to maintain a clear portion of windshield during percepitation should be windshield wipers or equivalent

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - AMC OPS.CAT.418.H Radio altimeters - Helicopters p. 335

comment *98* comment by: *EUROCOPTER*

The first comment is linked to comment n° 97 made on OPS.CAT.418.H. The reason of the proposed modification is explained in comment made on OPS.CAT.418.H

The second comment concerns the fact that the AMC states that *'the audio*

warning should be a voice warning'. This is not what is written in JAR-OPS 3 since JAR-OPS 3.660 states "*audio voice warning, or other means acceptable to the Authority"*. Imposing a voice warning in the published AMC would be too restrictive by imposing a definite technology and would have the consequences of making obsolete already NAA approved definitions based on audio tone warnings. In another hand the idea that operators and NAAs would use the new concept of alternate AMCs proposed by EASA in NPA 2008-22C in order to make audio tone warnings acceptable would be too complicated. Consequently, since audio warnings cover tone warnings and voice warnings, proposal is to use the words 'audio alerting device' and 'audio warning' instead of 'voice warning' in the AMC

Wording modification proposals

AMC OPS.CAT.418.H

AUDIO ***~~VOICE~~*** *ALERTING DEVIC*

The audio warning required in OPS.CAT.418.H should ***~~be a voice warning~~*** ***be active below a preset height***

VISUAL WARNING DEVIC

The visual warning required in OPS.CAT.418.H should be active at a height selectable by the pilot

comment *507* comment by: *EHOC*

Page No: 33

Paragraph No:

AMC OPS.CAT.418.H

Comment:

Reference in text incorrect

Justification:

Typographical error

Proposed Text (if applicable):

AMC OPS.CAT.~~H.~~ 418.***H***

comment *5062* comment by: *SNEH Organisation representing all french commercial helicopters operators*

The first comment is linked to the comment made on OPS.CAT.418.H. The reason of the proposed modification is explained in comment made on OPS.CAT.418.H

The second comment concerns the fact that the AMC states that 'the aufio warning should be a voice warning'. This is not what is written in JAR OPS 3 since JAR OPS 3.660 states "audio voice warning, or other means acceptable to the authority". Imposing a voice warning in the published AMC would be too restrictive by imposing a definite technology and would have the consequences of making obsolete already NAA approved definitions based on audio ton warnings. In another hand the idea that operators and NAAs would use the new concept of alternate AMCs proposed by EASA in NPA 2008-22C in order to make audio tone warnings acceptable would be too complicated. Consequently, since audio warnings cover tone warnings and voice warnings, proposal is to remove the requirement of a 'voice warning' in the AMC

Wording modification proposals :

AMC OPS.CAT.418.H

AUDIO VOICE ALERTING DEVICE

The audio warning required in OPS.CAT.418.H should be a voice warning be active below a preset height.

VISUAL WARNING DEVICE

The visual warning required in OPS.CAT.418.H should be active at a height selectable by the pilot.

comment *6485* comment by: *DGAC*

Proposal:

Delete this AMC.

Justification:

Consistency with JAR-OPS 3.660 which states "audio voice warning or other means acceptable to the Authority". Imposing a voice warning in the published AMC would be too restrictive by imposing a definite technology and would have the consequence of making obsolete already NAA-approved definitions based on audio tone warnings. Consequently, since audio warnings cover tone warnings and voice warnings, we propose to remove the AMC.

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - AMC1 OPS.CAT.420.A(a) Flights over water – Motor powered aircraft p. 335

comment *110* comment by: *Air Southwest*

Paragraph 1 states: Landplanes should be equipped with lifejackets ..... when flying over water at a distance > 50 nm from shore."

OPS.GEN.420(b) requires lifejackets when over water beyond gliding distance from the shore and when taking off or landing over water

It ould appear that AMC1 is less restrictive than the basic regulation (OPS.GEN.420(b)).

EU OPS 1.825 is much clearer and unambiguous.

comment *4062* comment by: *UK CAA*

Page No: 335

Paragraph No:

AMC1 OPS. CAT. 420.A(a)

Comment:

Paragraph 1 does not read as well as it might. A suggested revised version is given.

Justification:

Clarification.

Proposed Text (if applicable):

"**When flight over water at a distance of more than 50 nautical miles from the shore is planned, landplanes should be equipped with life jackets incorporating a survivor locator light**".

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - AMC OPS.CAT.420.H(b) Flights over water - Motor powered aircraft p. 336-337

comment *508* comment by: *EHOC*

General

The ETSO for a liferaft used in 'a hostile environment' was provided/amended by the JAA/EASA recently.

It must therefore be ascertained that this method of compliance does not cut across the ETSO for liferafts specified for use in a hostile environment.

What is the status of this AMC with respect to the ETSO?

Paragraph 4.

It would appear that there is a misunderstanding in this text; the generally accepted meaning of 'equipment used for making distress signals' (mirrors, flares, etc.) does not include the ELT(S). The text in this paragraph should only contain the method of compliance for ELT(S)s.

"4. At least one survival Emergency Locator Transmitter (ELT(S)) for each life-raft carried (but not more than a total of 2 ELTs are required), capable of performing in accordance with AMC OPS.GEN.430."

comment *3688* comment by: *Civil Aviation Authority of Norway*

Comment:

The text is clumsy and should be rewritten.

Justification:

Clarity.

Proposed Text

(if applicable):

4. ~~The equipment for making distress signal~~ ***Each life-raft should*** ~~be~~ ***contain*** at least one survival Emergency Locator Transmitter (ELT(S)) for each life-raft carried (but not more than a total of 2 ELTs are required), capable of performing in accordance with AMC2 OPS.GEN.430.

comment *4065* comment by: *UK CAA*

Page No: 337

Paragraph No:

AMC OPS.CAT.420.H (b) 4

Comment:

The text is confusing and should be rewritten.

Justification:

Clarity.

Proposed Text (if applicable):

4. ~~The equipment for making distress signal~~ ***Each life-raft should*** ~~be~~ ***contain*** at least one survival Emergency Locator Transmitter (ELT(S)) for each life-raft carried (but not more than a total of 2 ELTs are required), capable of performing in accordance with AMC2 OPS.GEN.430.

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - GM OPS.CAT.426.H Crew Survival Suits - Helicopters p. 337-339

comment *6079* comment by: *Irish Aviation Authority*

Comment:

This very important guidance material should be made applicable to both OPS.GEN and OPS.COM operations or as an absolute minimum applicable to OPS.COM.

Justification:

Provision of important potential life saving guidance material.

Proposed text:

Amend text to make it applicable to OPS.GEN and OPS.COM as well as OPS.CAT.

comment *7519* comment by: *Civil Aviation Authority of Norway*

GM OPS.CAT.426.H Crew Survival Suits – Helicopters

ESTIMATING SURVIVAL TIME

Recommendation:

Delete GM OPS.CAT.426.H Crew Survival Suits – Helicopters**.** T

This GM is adopted directly from JAR OPS 3, and was published before ETSO 2C-502, -503 and -504 were issued. This text is not compatible with the use of approved survival suit which is required to be Class B in accordance with the mentioned ETSO.

GENERAL RECOMMENDATION

It should be considered to require use of survival suit which meets the Class A standard on flights in polar conditions or on flights with longer response time.

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - GM1 OPS.CAT.440 High altitude flights - Oxygen requirements - Motor powered aircraft p. 341

comment *509* comment by: *EHOC*

Paragraph 2.

Table 2 is applicable to aircraft - if this text is also applicable to helicopters, perhaps the wording should be 'aircraft' not 'aeroplane'.

comment *888* comment by: *Condor Flugdienst GmbH - FRA HO/R*

Looking at oxygen requirements for pressurized aeroplanes only, we find that the requirements of Table 1 OPS.CAT.440 No. 5 (page 78) on the one hand and GM1 OPS.CAT.440 No. 1 appear to contradict each other directly, i.e.:

1. 1.) No. 5 of Table 1 permits the following scenario: emergency descent within the time covered by passenger-oxygen down to 14.000 ft, continuation of flight without any normal passenger-oxygen for another 30 minutes, thereafter descent to 10.000 ft. (Remember this is for planning purposes: emergency escape routings for crossing Greenland/Hindukush/Himalayas/Andes!!)
2. 2.) It is unclear what No. 1 of the GM1 intends to clarify. (After all, Nr.5 of Table 1 basically addresses level flight!!) It could be interpreted as breaking the 30 minutes (in Table 1, No. 5) down to 10 minutes for an emergency descent plus another 20 minutes of …what?...no oxygen required?

Whatever is intended, planning the operation across very difficult terrain may be severly hampered by this "guidance material".

comment *1848* comment by: *Airbus SAS*

The following comment on GM1 OPS.CAT.440 focuses on inconsistencies with the requirement OPS.CAT.440. It is also introduce there as comment no.1849:

The allocation of GM sentences to OPS.CAT.440 Table 1 seem to be incorrect, or table 1 points may at least be insufficiently clarified:

- With reference to Table 1 point 5., GM sentence 1 specifies a quantity of necessary oxygen for a period of 10 min descent from max certified operating altitude to 10000 ft, followed by 20 min at 10000ft.

- OPS.CAT.440 table 1 point 5 specifies oxygen required for 10 % of the passengers for the remainder of the flight between 10000 and 14000 ft , after the initial 30 min at these altitudes.

=> There is a need to better clarify the time/altitude relations.

- With reference to Table 1 point 4., GM sentence 4 specifies the minimum necessary quantity of oxygen for a constant rate of descent from max certified operating altitude to 15000 ft in 10 minutes.

- OPS.CAT.440 table 1 point 4 requires minimum oxygen supply for 30 % of passenger for the entire flight between 14000 and 15000 ft.

=> Also for these details of regulation and GM, the relation is difficult to understand.

==> Airbus proposes to re-investigate OPS.CAT.440 and related GM1 for consistency and clarity of wording.

comment *2390* comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

Comment:

Same comment as under OPS.CAT.440 on untidiness and lack of clarity.

The GM does not provide any guidance, on the contrary, it is confusing .

Clarification is required:

OPS.CAT.440 Table 1 No. 5 permits the following scenario for planning in the event of crossing Greenland/Hindukush/Himalayas/Andes where emergency escape routings are required:

Emergency descent within the time covered by passenger-oxygen down to 14.000 ft, continuation of flight without any normal passenger-oxygen for another 30 minutes, thereafter descent to 10.000 ft.

The GM1 item 1 is unclear: it could be interpreted as breaking the 30 minutes as mentioned in Table 1 of OPS.CAT.440 down to 10 minutes for an emergency descent plus another 20 minutes of …what?...without any oxygen required ? Whatever is intended, planning operations over mountainous terrain is very difficult and may be severely hampered by this "guidance material".

Proposal:

"between" shall be replaced

by "exceeds…but does not exceed"

comment *3293* comment by: *AEA*

Comment:

The guidance material contradicts the rule.

Looking at oxygen requirements for pressurized aeroplanes only, we find that the requirements of Table 1 OPS.CAT.440 No. 5 (page 78) on the one hand and GM1 OPS.CAT.440 No. 1 appear to contradict each other directly, i.e.:

No. 5 of Table 1 permits the following scenario: emergency descent within the time covered by passenger-oxygen down to 14.000 ft, continuation of flight without any normal passenger-oxygen for another 30 minutes, thereafter descent to 10.000 ft. (Remember this is for planning purposes: emergency escape routings for crossing Greenland/Hindukush/Himalayas/Andes!!)

2.) It is unclear what No. 1 of the GM1 intends to clarify. (After all, Nr.5 of Table 1 basically addresses level flight!!) It could be interpreted as breaking the 30 minutes (in Table 1, No. 5) down to 10 minutes for an emergency descent plus another 20 minutes of …what?...no oxygen required?

Whatever is intended, planning the operation across very difficult terrain may be severely hampered by this "guidance material".

Proposal:

Realign with EU-OPS

comment *7092* comment by: *IACA International Air Carrier Association*

1.

Same comment as under OPS.CAT.440 on squalidness, "between" shall be replaced by "exceeds…but does not exceed"

The GM does not provide any guidance, on the contrary, it is confusing:

OPS.CAT.440 Table 1 No. 5 permits the following scenario for planning in the event of crossing Greenland/Hindukush/Himalayas/Andes where emergency escape routings are required: emergency descent within the time covered by passenger-oxygen down to 14.000 ft, continuation of flight without any normal passenger-oxygen for another 30 minutes, thereafter descent to 10.000 ft.

The GM1 item 1 is unclear: it could be interpreted as breaking the 30 minutes as mentioned in Table 1 of OPS.CAT.440 down to 10 minutes for an emergency descent plus another 20 minutes of …what?...without any oxygen required ?

Whatever is intended, planning operations over mountainous terrain is very difficult and may be severely hampered by this "guidance material".

Proposal: replace "Between" by "exceeds…but does not exceed"

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - GM OPS.CAT.440(b)(1) High altitude flights - Oxygen requirements - Motor powered aircraft p. 341

comment *7096* comment by: *IACA International Air Carrier Association*

1.

It should be clarified whether AMC OPS.447.A para.1 is applicable or in which way the mellow wording of the Guidance Material should lower the case. How do we calculate?

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - GM OPS.CAT.447.A First aid oxygen - Aeroplanes p. 342

comment *2394* comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

Comment:

Paragraph 1. Text segment - "when the amount of oxygen has been exhausted" does not specify 'which' oxygen.

EU-OPS only requires First Aid Oxygen 'when a crew member is carried'. This is not specified in the NPA - there is no point in mandating it's carriage if there

is nobody on board to administer it.

Proposal:

Correct the NPA appropriately in accordance with EU-OPS.

comment *7095* comment by: *IACA International Air Carrier Association*

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - AMC OPS.CAT.457.A Emergency medical kit – Aeroplanes p. 342-344

comment *776* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.457.A:

2. The following should be included in the EMKs:

(...)

xviii. Automated external defibrillator.

Clarify:

An automated external defibrillator should be carried in all flights. ECA wonders whether this applies to all kind of operations, irrespective of the size of the aircraft.

comment *1515* comment by: *British Airways*

Comment:

Paragraph 2.a.xiv states a requirement for an intubation set to be included in the Emergency Medical Kit. This is not an ICAO requirement and in our view should not be included in the list. Airlines which choose to include such equipment in their kit are of course able to do so.

Justification: On the advice of international experts on resuscitation, we believe that the risks associated with attempts at intubation in the unsuitable environment of an aircraft (confined space, inadequate lighting, noise and vibration, etc) far outweigh the potential benefits.

Proposed text:

Delete paragraph 2.a.xiv

comment *1518* comment by: *British Airways*

Comment:

Paragraph 2.a.xvi states a requirement for blood glucose testing equipment. While airlines may choose to include such equipment, it is a not an essential requirement and should not be included in a regulatory document. In those situations where hypoglycaemia is suspected, a therapeutic trial of oral or, if necessary, intravenous glucose can be given without the need for testing of blood glucose. Hyperglycaemia cannot be treated onboard a commercial aircraft.

Justification:

The regulatory requirements for an emergency medical kit should be limited to those items which can be justified as essential.

Proposed text:

Delete paragraph 2.a.xvi

comment *1519* comment by: *British Airways*

Comment:

Paragraph 2.a.xviii states a requirement for an automated external defibrillator. While such devices may be lifesaving and many airlines choose to carry them, there is insufficient evidence of benefit to justify their inclusion in a regulatory document. The carriage of an AED is not an ICAO requirement.

Justification:

The regulatory requirement should be limited to those items of medical equipment for which there is clear evidence of benefit in airline operations.

Proposed text:

Delete paragraph 2.a.xviii

comment *1522* comment by: *British Airways*

Comment:

Paragraph 2.c.xii states a requirement for a bronchial dilator in injectable and inhaled form. The requirement for both forms cannot be justified - generally the inhaled form is appropriate for airline use.

Justification:

There is little medical requirement for an injectable bronchial dilator and a regulatory requirement to carry both injectable and inhaled forms in an airline extended medical kit cannot be justified.

Proposed text:

Amend paragraph 2.c.xii to read, "Bronchial dilator - injectable or inhaled form

comment *1523* comment by: *British Airways*

Comment:

Paragraph 2.c.xv states a requirement to carry anti-arrythmic medication. Such medication should not normally be used without adequate monitoring equipment which would not routinely be available on a commercial aircraft.

Justification:

The regulatory requirement for medication to be included in an airline medical kit should be confined to that which can safely be used in an emergency medical event on board a commercial aircraft in flight.

Proposed text:

Delete paragraph 2.c.xv

comment *1525* comment by: *British Airways*

Comment:

Paragraph 2.c.xvi states a requirement for antihypertensive medication. Acute and life-threatening hypertension is rare and its safe and effective management requires the use of medical monitoring equipment which would not be available on a commercial aircraft. Treatment for hypertension which is not life-threatening should not be necessary on an aircraft.

Justification:

The regulatory requirement for medication to be included in an airline medical kit should be confined to that which is required and can safely be used in an emergency medical event on board a commercial aircraft in flight.

Proposed text:

Delete paragraph 2.c.vi

comment *1526* comment by: *British Airways*

Comment:

Paragraph 2.d reitierates a requirement to carry an automated external defibrillator on board the aircraft. While such devices may be lifesaving and many airlines choose to carry them, there is insufficient evidence of benefit to justify their inclusion in a regulatory document. The carriage of an AED is not an ICAO requirement.

Justification:

The regulatory requirement should be limited to those items of medical equipment for which there is clear evidence of benefit in airline operations.

Proposed text:

Delete paragraph 2.d

comment *2359* comment by: *Virgin Atlantic Airways Ltd*

Comment:

Section 2.a.ix states a requirement for urinary catheter (2 sizes) and anaesthetic gel.

Justification:

Stipulating that 2 sizes of urinary catheter should be carried is inappropriate as with the advent of new products airlines have the option to include urinary catheters or intermittent urinary catheter which are one size and can be used for both sexes.

Proposed text:

One or more urinary catheter(s), appropriate for either sex, and anaesthetic gel

comment *2361* comment by: *Virgin Atlantic Airways Ltd*

Comment:

Section 2.a.xi states a requirement for Bag Valve Masks (masks 2 sizes: 1 for adult, 1 for children)

Justification:

Resuscitation Pocket Mask (RPM) have been successfully used on adults and children, are widely available and their use taught to crew universally. Effective BVM ventilation requires a level of skill and is better performed as a 2 person technique – in a confined space this is not practicable. Use of the RPM with overhead CPR is a recognised technique.

Proposed text:

xi. Resuscitation Pocket Masks with oxygen inlet **or** BVM

comment *2363* comment by: *Virgin Atlantic Airways Ltd*

Comment:

Section 2.a.xiv states a requirement for the EMK to hold an intubation set.

Justification:

The resuscitation Council (UK) Edition 5 states "Tracheal intubations should be used only when trained personnel are available to carry out the procedure with a high level of skill and confidence" (http://www.resus.org.uk/pages/als.pdf page 52). The aircraft environment is not suitable due to the confined space, lack of appropriate lighting and noise and poses a potential risk to health (by

delaying ventilation) in unskilled hands. A laryngoscope requires a battery and therefore may not be a reliable tool to use which will require a wide variety of blades appropriate from infants to elderly. To prevent delay oxygenation would suggest that a mask, oropharyngeal or nasopharyngeal airways are sufficient.

Proposed text:

Delete 2.a.xiv

comment *2366* comment by: *Virgin Atlantic Airways Ltd*

Comment:

Section 2.a.xviii states a requirement for an Automated External Defibrillator (AED).

Justification:

The UK's Aviation Health Unit does not support the mandatory carriage of AEDs. http://www.caa.co.uk/default.aspx?catid=923&pagetype=70&gid=924&faqid=929 Though in some individual cases AED use has resulted in succesful resuscitation (3 cases in 10 years at Virgin Atlantic), this is a complex issue and more scientific research needs to be done before AEDs are made compulsory.

Proposed text:

Remove xviii. Automated External Defibrillator and allow airlines to amke their own decision

comment *2368* comment by: *Virgin Atlantic Airways Ltd*

Comment:

Section 2.b states ACLS Cards (summarising and depicting the current algorithm for Advanced Cardiac Life Support) yet the current routine medications are not listed in section c. Medications.

Justification:

ACLS instructions are inappropriate for on board use. They also include some drugs which are not mandatory for carriage on board and are also inappropriate without ability to monitor and analyse rhythms.

Proposed text

Remove "ACLS cards" and (if anything) replace with "instruction in basic life support"

comment *2369* comment by: *Virgin Atlantic Airways Ltd*

Comment:

Section 2.c.xii states a requirement for a bronchial dilator in injectable and inhaled form.

Justification:

Airlines should be required to carry a bronchial dilator, the preparation to be their choice based on local emergency treatment guidelines. The suggestion to carry injectable and inhaled products is not warranted. Following evaluation of in-flight data the preference of inhaled products would be nebules and not an inhaler. An inhaler is available for use by one person only, carrying multiples of the small lightweight nebules for inhalation is more appropriate as aircraft have return sectors and it is the treatment of choice for bronchospasm.

Proposed text:

Amend paragraph 2.c.xii to read, "Bronchial dilator – injectable, inhaled or inhalation preparation.

comment *2371* comment by: *Virgin Atlantic Airways Ltd*

Comment:

section 2.c.xv gives a requirement to include anti-arrhythmic medication. This group of medications should only be administered by appropriately qualified staff in a clinical environment that has adequate monitoring. The aircraft environment does not fulfil this. In addition the term "Antiarrythmic" is too generic and vague to be a useful instruction

Justification:

It is unsafe to administer anti-arrhythmic medication where medical history is relatively unknown in inappropriate surroundings, without the required support by appropriately medically qualified support.

Proposed text:

comment *1528* comment by: *British Airways*

Comment:

This paragraph defines 'qualified personnel' (who may administer drugs from the emergency medical kit) as doctors, nurses or personnel with similar qualifications. Many airlines train some or all cabin crew to administer medication, some of which may be held in the extended medical kit, in specified situations and circumstances.

Justification:

The text as currently written would limit the use of medication from the extended medical kit to those with some form of formal qualification. There is accumulated evidence over many years that cabin crew can safely administer medication provided they have adequate training and information. This capability offers significant safety (health) benefits in a situation where qualified personnel may not be available.

Proposed text:

Amend text to read "Qualified personnel means health professionals acting within the limits of their training and expertise or cabin crew who have received training in administration of specified medication from the extended medical kit.

comment *2375* comment by: *Virgin Atlantic Airways Ltd*

Comment:

This states that "the Commander shall ensure that drugs are not administered except by qualified doctors, nurses or similarly qualified personnel".

Justification:

The text as currently written would limit the use of medication from the extended medical kit to those with some form of formal qualification. There is accumulated evidence over many years that cabin crew can safely administer medication provided they have adequate training and information and/or under the guidance of a specialist provider of ground to air medical advice. This capability offers significant safety (health) benefits in a situation where qualified personnel may not be available.

Proposed text:

Amend text to read "The EMK may only be opened with the permission of the commander to enable medically qualified volunteers, appropriately trained crew or personnel under instruction from a ground to air medical service provider to administer emergency treatments.

European Regions Airline Association Comment

Qualified personnel means doctors, nurses or personnel with similar qualifications.

This is a new requirement which has no justification. Cabin crew should not have similar qualifications as doctors or nurses

Therefore consider adding 'cabin crew; to the list of qualified personnel'

comment *6636* comment by: *KLM Cityhopper*

Comment:

This is a new requirement which has no justification. Cabin crew should not have similar qualifications as doctors or nurses

Proposal:

Add '**cabin crew;** to the list of qualified personnel'

comment *7101* comment by: *IACA International Air Carrier Association*

"Personnel" implies an employment relationship; doctors and nurses on-board are passengers and not employed by the operator. Better is to write "…by qualified individuals."

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - AMC OPS.CAT.457.A(c)(2) Emergency medical kit – Aeroplanes p. 344

comment *360* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.457.A(c)(2):

CARRYING UNDER SECURITY CONDITIONS

Where applicable the emergency medical kit should be carried on the flight deck.

ECA requests clarification:

In many aircrafts there is no room available in the flight deck:

comment *889* comment by: *Condor Flugdienst GmbH - FRA HO/R*

We, Condor Flugdienst GmbH, suggest that emergency medical kit shall **not** be carried on the flight deck.

Reason: Safety, security and "locked cockpit door concept"

comment *1530* comment by: *British Airways*

Comment:

Particularly since the advent of the locked flight deck door, the flight deck may not be the most appropriate place to carry an extended medical kit. Arguably this could even present a security risk, in that a faked medical emergency could be used as a pretext to persuade crew to open the flight deck door in flight. Conversely carriage on the flight deck may delay access to the extended medical kit in a genuine medical emergency. The airline should have the responsibility for determining the appropriately secure stowage for the extended medical kit.

Justification:

The flight deck may not be the most appropriate place to carry the extended medical kit, both in terms of security and accessibility.

Proposed text:

Amend to read: "The airline should determine the most appropriate location for the extended medical kit, taking into account the requirements for security and for accessibility of the kit in an emergency.

comment *2377* comment by: *Virgin Atlantic Airways Ltd*

"..... carried on the flight deck"

Comment:

The flight deck is not an appropriate place to store the EMK, which will result in

delays in gaining access to it. Furthermore it may result in a security risk with potential terrorists using ill health as a means of getting the cockpit door open.

Justification:

Suggest allowing the EMK to be securely stowed in the main cabin as there is nil delay gaining access in a medical emergency and reduces the potential security risk in accessing the flight deck.

Proposed text:

Amend to read: "It is the airlines responsibility to determine the most appropriate stowage for the EMK whereby it is stowed securely yet readily accessible in an emergency medical situation.

comment *2399* comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

Comment:

Considering the "locked cockpit doors" and in-flight security, the rule should not

mandate the stowage of the Emergency Medical Kit in the flight deck, but should

permit alternate secure conditions.

Move to Part M as this is a Maintenance requirement

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - AMC1 OPS.CAT.490.A Flight data recorder – Motor powered aircraft p. 344

comment *1466* comment by: *EHOC*

General

There does not appear to be (in AMC/GM) for Part GEN or CAT text that provides compliance with Attachment D to Annex 6 Part I or Attachment B to Annex 6 Part III; is this perhaps already contained in some other Part?

comment *1706* comment by: *Dassault Aviation*

Technical comment.

Page 344 AMC1 OPS.CAT.490.A (FDR): this AMC1, applicable to CAT operations, refers to AMC1 OPS.GEN.490.A applicable to GEN operations. That means that the level of FDR requirements for aeroplanes with first individual CoA ≥ 01 january 2010 is identical in GEN and in CAT operations. Is it in accordance with ICAO requirements (Annex 6 Part I and Part II) ?

comment *4047* comment by: *Airbus SAS*

In the first sentence of AMC1 to OP.CAT.490.A,

Airbus proposes to introduce an implementation date depending on the effectivity date of the rule instead of a fixed effectivity threshold of 1 January 2010, to read as following:

" LIST OF PARAMETERS TO BE RECORDED FOR AEROPLANES FIRST ISSUED WITH AN INDIVIDUAL CERTIFICATE OF AIRWORTHINESS ON OR AFTER ***[insert date 2 years from the effective date of the final rule]***,…"

Rationale:

To record the parameters listed in Table 1 of AMC1 OPS.GEN.490.A and the additional parameters listed in Table 2 of AMC1 OPS.CAT.490.A shall be considered as a new requirement. These lists provide significant different from the current valid EU-OPS-1.715 requirements (Appendix 1 to OPS 1.715: Tables A1, A2, B, C and ED55). As a consequence, the applicant has to provide significant changes to the aircraft architecture. Not only the Recoding system must be changed, but also a couple of "source systems" (Navigation, Flight Control systems), which deliver the requested parameters, must be modified as well. This requires a significant lead-time to develop and to certify the required changes. Two years after the final introduction of the rule OPS.CAT.490 should be provided to implement the required changes to comply with the AMC1 OPS.CAT.490.A.

Further, AMC1.OPS.GEN.490.A date of effectiveness should correlate with the date of AMC1.OPS.CAT.490.A.

A corresponding comment has been given under CRT comment no. 4340 concerning AMC1 OPS.GEN.490.A.

comment *5725* comment by: *Airbus SAS*

AMC3 OPS.CAT.490.A Flight data recorder - Aeroplanes

and

AMC4 OPS.CAT.490.A Flight data recorder - Aeroplanes

contain following paragraph:

"When determined by the competent authority responsible for type certification or supplemental type certification and agreed by the Agency, the flight data recorder does not need to record individual parameters that can be derived by calculation from the other recorded parameters."

AIRBUS proposes to include the same requirement to "AMC1 OPS.CAT.490.A Flight data recorder – Aeroplanes" and "AMC2 OPS.CAT.490.A Flight data recorder – Aeroplanes".

Rationale:

This requirement is common to all implementations. AIRBUS does not see, why this requirement should be dependent on the condition when an Aeroplane receives its First Issue of INDIVIDUAL CERTIFICATE OF AIRWORTHINESS.

comment *6255* comment by: *Air Accidents Investigation Branch*

As with comments made on previous sections, the specific requirements detailing parameters, ranges, accuracies and resolutions must be part of the rule as opposed to guidance (AMC) if there is to be any standardisation in Europe. It is a retrograde step to change the requirements from a 'must' (under JAR-OPS) to a 'should' (under this NPA).

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - AMC2 OPS.CAT.490.A Flight data recorder – Motor powered aircraft p. 344-347

comment *1707* comment by: *Dassault Aviation*

Technical and editorial comment.

Page 344 AMC2 OPS.CAT.490.A (FDR): since AMC1 OPS.CAT.490.A is for aeroplanes with first CoA ≥ 01 january 2010, this AMC2 OPS.CAT.490.A should read "LIST OF PARAMETERS TO BE RECORDED FOR AEROPLANES FIRST ISSUED WITH AN INDIVIDUAL CERTIFICATE OF AIRWORTHINESS ON OR AFTER 1 APRIL 1998 UP TO AND INCLUDING 31 DECEMBER 2009".

Additionally, there are typo error in §2, and §3.b where it is written AMCx **A** OPS.CAT.490, whereas it should rather read AMCx OPS.CAT.490**.A**.

Also, there should be an "or" at the end of §3.a, because it is an exclusivity between §3.a or §3.b.

Last, §3.b should rather read "The flight data recorder of the aeroplane can comply with AMC3 ~~A~~ OPS.CAT.490**.A** except that parameter**s 14 and** 15b in Table 1 AMC~~2~~**3** ~~A~~ OPS.CAT.490**.A** of this AMC need not to be recorded." Indeed, parameter 14 (OAT or TAT) has to be added here to match EU/JAR-OPS 1.715(g)(2) in which this parameter is actually missing since EU/JAR-OPS 1.715(g)(2) should itself match with EU/JAR-OPS 1.720(d) which contains parameter 14.

comment *2401* comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

3. b. refers to a parameter 15b which does not exist or has been removed.

comment *3262* □ comment by: *Eurocontrol CND*

Table 2 of AMC2 OPS.GEN.490.A

Lines 21 and 22 should contain GLS or be rephrased using XLS

Line 26 should also contain GLS Distance to threshold.

This is also valid for Table 1 of AMC3 OPS.GEN.490.A, Table 1 of AMC4 OPS.GEN.490.A, Table 2 AMC2 OPS.CAT.490.A (P. 346), Table 2 AMC3 OPS.CAT.490.A (P. 349), Table 2 AMC4 OPS.CAT.490.A (P. 351), Table 2 AMC2 OPS.CAT.490.H (P. 354).

In the entire FDR sections a review should be done whether additional parameters, such as selected channel (APV and GLS, S/GBAS ID, etc.) are necessary for GNSS operations.

Redefine all FDR sections after update from EUROCAE about new parameters required for GNSS

following conditions are met", meaning §2.a or §2.b or §2.b. Therefore, the "and" at the end of §2.b should be replaced by "or". A "or" should also be placed at the end of §2.a.

comment *1709* comment by: *Dassault Aviation*

Technical comment.

Page 349 AMC4 OPS.CAT.490.A (FDR aeroplanes). This comment addresses Table 2 AMC4 OPS.CAT.490.A. This table 2 says it is applicable to aeroplanes with MTOM > 27 tons. However, aeroplanes between 5.7 tons and 27 tons first issued with an individual CoA after 01 january 1989 should also record parameters 6 to 15b of this table (see AMC4 OPS.CAT.490.A §1b). Also, parameters 6 to 15b of this table need also to be recorded for aeroplanes with a MTOM > 27 tons and first issued with an individual certificate of airworthiness after 30 september 1969 (see AMC4 OPS.CAT.490.A §1c). We propose therefore to modify the title of Table 2 AMC4 OPS.CAT.490.A as follows: "ADDITIONAL PARAMETERS FOR AEROPLANES WITH A MAXIMUM CERTIFICATED TAKE-OFF MASS EXCEEDING 27 000 KG AND FIRST ISSUED WITH AN INDIVIDUAL CERTIFICATE OF AIRWORTHINESS ON OR AFTER 1 JANUARY 1987 (PARAMETERS 6 TO 15b NEED ONLY BE RECORDED IF INDIVIDUAL CERTIFICATE OF AIRWORTHINESS HAS BEEN ISSUED AFTER 30 SEPTEMBER 1969 UP TO 1 JANUARY 1987). PARAMETERS 6 TO 15b ARE ALSO APPLICABLE FOR AEROPLANES WITH A MAXIMUM CERTIFICATED TAKE-OFF MASS EXCEEDING 5 700 KG BUT NOT EXCEEDING 27 000 KG AND FIRST ISSUED WITH AN INDIVIDUAL CERTIFICATE OF AIRWORTHINESS ON OR AFTER 1 JANUARY 1989".

comment *3262* comment by: *Eurocontrol CND*

Table 2 of AMC2 OPS.GEN.490.A

comment *5728* comment by: *Airbus SAS*

AMC3 OPS.CAT.490.A Flight data recorder - Aeroplanes

and

AMC4 OPS.CAT.490.A Flight data recorder - Aeroplanes

contain following paragraph:

"When determined by the competent authority responsible for type certification or supplemental type certification and agreed by the Agency, the flight data recorder does not need to record individual parameters that can be derived by

calculation from the other recorded parameters."

AIRBUS proposes to include the same requirement to "AMC1 OPS.CAT.490.A Flight data recorder – Aeroplanes" and "AMC2 OPS.CAT.490.A Flight data recorder – Aeroplanes".

Rationale:

This requirement is common to all implementations. AIRBUS does not see, why this requirement should be dependent on the condition when an Aeroplane receives its First Issue of INDIVIDUAL CERTIFICATE OF AIRWORTHINESS.

comment *6259* comment by: *Air Accidents Investigation Branch*

As with comments made on previous sections, the specific requirements detailing parameters, ranges, accuracies and resolutions must be part of the rule as opposed to guidance (AMC) if there is to be any standardisation in Europe. It is a retrograde step to change the requirements from a 'must' (under JAR-OPS) to a 'should' (under this NPA).

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - AMC3 CAT.490.A and AMC4 OPS.CAT.490.A Flight data recorder - Appendix 1 p. 352

comment *3118* comment by: *Dassault Aviation*

Technical comment:

page 352 Appendix 1 to AMC3 CAT.490.A and AMC4 OPS.CAT.490.A (FDR): this Appendix makes reference to Table 1 of Appendix 1 to AMC3 OPS.GEN.490.A and AMC4 OPS.GEN.490.A for the performance specifications of the parameters to be recorded. First comment is editorial, since "OPS" is missing twice in the § references (one in the title to read AMC3 OPS.CAT.490.A, and second one in the text to read AMC3 OPS.GEN.490.A). Second comment is technical: the proposed text makes reference to Table 1 of Appendix 1 to AMC3 OPS.GEN.490.A and AMC4 OPS.GEN.490.A, and should

rather makes reference to the whole Appendix 1 to AMC3 OPS.GEN.490.A and AMC4 OPS.GEN.490.A. We therefore propose the following text: "*The parameters to be recorded should meet the performance specifications (designated ranges, recording intervals and accuracy limits) defined in ~~Table 1 of~~ Appendix 1 to OPS.GEN.490.A and AMC4 OPS.GEN.490.A.*"

comment *6260* comment by: *Air Accidents Investigation Branch*

It is a retrograde step to change the requirements from a 'must' (under JAR-OPS) to a 'should' (under this NPA).

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - AMC1 OPS.CAT.490.H Flight data recorder p. 352

comment *1639* comment by: *EUROCOPTER*

Same comment as for AMC1 OPS.GEN.490.H

Wording modification proposal:

*LIST OF PARAMETERS TO BE RECORDED FOR HELICOPTERS FIRST ISSUED WITH AN INDIVIDUAL CERTIFICATE OF AIRWORTHINESS ON OR AFTER 1 JANUARY ~~**2010**~~ **2016**.*

Justification:

It is explained in page 24, item n° 80, of the Explanatory Note that the date of applicability of the ICAO type IVA FDR is postponed to 01.01.2010 because the ICAO SARP already require helicopters to be equipped with type IVA FDRs after 01.01.2005, and as a compromise solution resulting from the JAA NPA-OPS 67 (which proposed applicability from 01.01.2010).

Eurocopter would like to make the following comments:

- the date of 01.01.2005 written in ICAO Annex 6 Part III has never been realistic and implementable (some suppliers did not have compliant equipment at that time) and should be modified in accordance with the latest work done by the ICAO FLIRECP. Moreover, for most of ICAO States, this requirement and implementation date have not been transferred in in their national Operational Regulations up to now.

- as far as Europe is concerned, the date of 01.01.2010 written in JAA NPA-OPS 67 was proposed at the date of definition of this NPA, so in 2006; nevertheless such a requirement for FDRs Type IVA has never been included in JAR-OPS 3.

- today the implementation date for FDRs type IVA to be included in the future Part OPS cannot be the "copy and paste" of a date (01.01.2010) which was defined by JAA in 2006.

- it has to be noted that operators cannot, or will have big difficulties to modify the helicopters in order to retrofit Type IVA FDRs without the help of helicopter

manufacturers.

- There are important delays for retrofitting Type IVA FDRs on existing aircraft types because of significant technical difficulties to gather the requested data on sub systems (e.g. AFCS, Instrumentation, Navigation) which are:

* Performance of already installed high technology components (e.g. acquisition units) is no longer sufficient to cope with the new requirements. * A new step of technology is necessary (additional inputs, increased update rates, increased computation power).

* New equipment has to be developed and serialized to receive/structure the requested data.

* Installation (new or supplement for the existing one) has to be developed, qualified, certified and introduced into a serial production.

* New software has to be developed for a significant amount of legacy systems, which have to provide the necessary data.

Proposal: Eurocopter propose to postpone the applicability date of Type IVA FDRs to the one proposed by ICAO (Letter to States Ref SP 55/4-09/56 dated 24 July 2009), so 01.01.2016.

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - AMC2 OPS.CAT.490.H Flight data recorder p. 352-355

comment *116* comment by: *tbone aviation a/s*

Propose new wording for section AMC OPS.CAT.515.A Microphones - AEROPLANESGENERAL:

The boom, throat or equivalent microphone should be worn in a position which permits use for two-way radio communications.

This new proposed wording include the "equivalent" phrase to allow the use of other and newer technologies compared to the boom microphone.

comment *1342* comment by: *EUROCOPTER*

The tables of parameters included in this AMC are the same as the tables included in AMC2 OPS.GEN.490.H.

Proposal: to simplify the wording as follows:

§ 1.a.: to replace 'Table 1 AMC2 OPS.CAT.490.H' by **'Table 1 AMC2**

OPS.GEN.490.H'

§ 1.b.: to replace 'Table 2 AMC2 OPS.CAT.490.H' by **'Table 2 AMC2 OPS.GEN.490.H'**

§ 1.d.: to replace 'Table 3 AMC2 OPS.CAT.490.H' by **'Table 3 AMC2 OPS.GEN.490.H'**

+

to delete Table 1 AMC2 OPS.CAT.490.H

to delete Table 2 AMC2 OPS.CAT.490.H

to delete Table 3 AMC2 OPS.CAT.490.H

comment *3262* ☐ comment by: *Eurocontrol CND*

Table 2 of AMC2 OPS.GEN.490.A

Lines 21 and 22 should contain GLS or be rephrased using XLS

Line 26 should also contain GLS Distance to threshold.

This is also valid for Table 1 of AMC3 OPS.GEN.490.A, Table 1 of AMC4 OPS.GEN.490.A, Table 2 AMC2 OPS.CAT.490.A (P. 346), Table 2 AMC3 OPS.CAT.490.A (P. 349), Table 2 AMC4 OPS.CAT.490.A (P. 351), Table 2 AMC2 OPS.CAT.490.H (P. 354).

In the entire FDR sections a review should be done whether additional parameters, such as selected channel (APV and GLS, S/GBAS ID, etc.) are necessary for GNSS operations.

Redefine all FDR sections after update from EUROCAE about new parameters required for GNSS

comment *6262* comment by: *Air Accidents Investigation Branch*

As with comments made on previous sections, the specific requirements detailing parameters, ranges, accuracies and resolutions must be part of the rule as opposed to guidance (AMC) if there is to be any standardisation in Europe. It is a retrograde step to change the requirements from a 'must' (under JAR-OPS) to a 'should' (under this NPA).

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - AMC OPS.CAT.516 Crew member interphone system - Motor powered aircraft p. 355-356

comment *386* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.CAT.516.5.d: The requirement bolded is not clear:

Clarify meaning of text

d. ground personnel and at least two flight crew members. This interphone

system for use by the ground personnel should be, where practicable, **so located that the personnel using the system may avoid detection from within the aeroplane**;

comment *510* comment by: *EHOC*

Paragraph 4.

In the previous rule, the list of requirements was split between those which were applicable to crew members and others which were applicable to cabin crew members; in that text, item 4. was only applicable to cabin crew members; it is suggest that the text be amended to make this clear:

"4. For cabin crew members, have a means..."

comment *1710* comment by: *Dassault Aviation*

Technical comment.

Page 355 AMC OPS.CAT.516 Crew Member interphone system: This proposed AMC gives the characteristics of the crew member interphone system. One characteristic detailed in §5.a of this proposed AMC says that the crew member interphone system should provide a two-way communication between the flight crew compartment and each passenger compartment. Dassault Aviation would like to highlight to EASA that this AMC is not adapted to aeroplanes with small cabin such as business aviation aeroplanes, since the communication between the cockpit and the passenger compartment can easily be done orally and without the mean of a unique system. Dassault Aviation is therefore proposing that §5.a be not applicable to aeroplanes with a MPSC < 20 and MTOM < 45,360 kg. Last, §3 and §4 of this AMC requires the alerting system to incorporate aural or visual signals (§3) and a means to determine if the call is an emergency or a normal call (§4): for the same reasons outlined above - small cabin - aeroplanes with a MPSC < 20 and MTOM < 45,360 kg should be exempted from these sub-paragraphs.

comment *4803* comment by: *Virgin Atlantic Airways*

Relevant Text:

AMC OPS.CAT.516 states: "The cabin crew interphone system **should**:

2. Be operable at required cabin crew member stations close to floor level emergency exits;"

AMC OPS.CAT. 517 states: "The public address system **should**:

3. Have, for each floor level passenger emergency exit which has an adjacent cabin crew seat, a microphone operable by the seated cabin crew member, except that one microphone may serve more than one exit, provided the proximity of exits allows unassisted verbal communication between seated cabin crew members;

4. Be **operable** within 10 seconds by a cabin crew member at each of those stations;"

Comment:

OPs 1.690(b)(4) states: The cabin crew interphone system **must** " be **readily accessible for use** at required cabin crew member stations close to each separate or pair of floor level emergency exits;"

OPs 1.695(b)(3) and (4) state: The PA system **must** "Have, for each floor level passenger emergency exit which ahs an adjacent cabin crew seat, a microphone **operable** by the seated cabin crew member, except that one microphone may serve more than one exit, provided the proximity of exits allows unassisted verbal communication between seated cabin crew members;

Be **capable of operation** within 10 seconds by a cabin crew member at each of those stations in the compartment from which is use is accessible;"

Are we satisfied that the change from **'must'** to '**should'** is enough not to make '**operable'** instead of **'readily accessible'/'capable of operation'** no more onerous than at present? (MEL?)

Proposed Text:

This will depend on the answer to the above.

comment *6621* comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

Comment

The requirement for the independant operation of public adress system and crew membrer ineterphone system should not apply for aeroplanes with a maximum passenger seating configuration < 19 and a maximum take off mass < 45 360 kg.

comment *7326* comment by: *ANE (Air Nostrum) OPS QM*

We request add **or** for clarification and therefore request to change the text 4 as follows:

4. Have a means for the recipient of a call to determine whether it is a normal call or an emergency call as following:

a. Lights of different colours; **or**

b. Codes defined by the operator (e.g. different number of rings for normal and emergency calls); **or**

c. Any other indicating signal acceptable to the competent authority responsible for type certification or supplemental type certification;

B. II. Draft Decision - Part-OPS - Subpart B - Section IV - AMC3 OPS.CAT.525.H Communication and navigation equipment for VFR as controlled flights, night flights and IFR flights – Motor-powered aircraft p. 358

comment *511* comment by: *EHOC*

General

1. Editorial: In the list of document (CRT) this AMC is listed as 'AMC3 OPS.CAT.525.H' in the NPA is is 'AMC2...'

2. This AMC is far less comprehensive than the equivalent one for aeroplanes; whilst the text, on which this AMC was based, was also less comprehensive than for aeroplanes, it still contained enough objective text to ensure that the minimum equipment was specifed. For example, there was previously a requirement for:

"An approach aid suitable for the destination and alternate heliports.";

in the objective text of OPS.GEN.535, this appears to have been replaced by:

"(c) In Instrument Flight Rules (IFR) flights, an aircraft shall be provided with navigation equipment that provides guidance to a point from which a visual landing can be performed. This equipment shall be capable of providing guidance for each aerodrome at which it is intended to land in IFR and for any designated alternate aerodromes.

There is no definition of a 'visual landing' although Cat II and Cat III have a reference to 'visual reference' - the text might have made reference to 'visual reference' except that this term has been removed from the approach requirements for non-precision and Cat I approaches (with the exception of ARA). (See also the comment in OPS.GEN.200.)

Paragraph 1.a.

There needs to be some guidance added on the use of GPS to satisfy the requirement for two VORs.

Paragraph 1.b.

There needs to be some guidance added on the use of GPS to satisfy the

requirement for two ADFs.

Paragraph 1.c.

Can 2 x GPS be used instead of the area nav and/or the other two navigation aids?

Paragraph 2.

This appears to be an objective statement than method of compliance and is therefore more suited to an IR than an AMC. There is a need to provide more comprehensive guidance explaining exactly how to satisfy the objective requirement for "two independent navigation aids" and another to indicate what "each phase of flight" is intended to mean. Most helicopters are now provided with GPS equipment that can satisfy the technical requirements for the objective text carried in the rule and this AMC. That situation needs to be legitimised.

Paragraph 3.

This is rule material under any circumstances and requires an IR. Guidance on compliance might be shown in either Annex 10 of the AEROCAE document.

comment *3686* comment by: *Civil Aviation Authority of Norway*

Comment:

Sub-paragraphs AMC2 OPS.CAT.525.A (6) and AMC2 OPS.CAT.525.H (3) contain the same text.

Justification:

Repetition of requirements.

B. II. Draft Decision - Part-OPS - Subpart C - Section II - AMC OPS.COM.116 Briefing of operational personnel AMC OPS.COM.116 Briefing of operational personnel p. 359

comment *2145* comment by: *Airbus S.A.S.*

AMC OPS.COM.116 refers to OPS.COM.115 "Briefing of operational personnel".

For consistency reasons, the AMC should be renamed as "OPS.COM.115".

If accepted, reference to this AMC should be renamed also in Appendix 1 to AMC.OPS.COM.270 (3)(c)(i).

B. II. Draft Decision - Part-OPS - Subpart C - Section II - AMC1 OPS.COM.270 Standard operating procedures - specialised operations other than the transport of persons, cargo or mail p. 359

comment *663* comment by: *ECA - European Cockpit Association*

Comment on AMC1 OPS.COM.270: This should be also included as AMC in OPS.CAT section.

Justification:

A comprehensive method for developing SOP's is described here. The question is why this is not also referred to Commercial Air transport Operations.

comment *6089* comment by: *DGAC*

COM is not restricted to aerial work (as specified in NPA 2009-02 A in the explanatory note). Some of the paragraphs of Subpart COM refer to "specialized tasks". It is not clear however whether all COM operations are considered as specialized tasks. If specialized task are only a fraction of COM operations, a definition of "specialized task" should be added somewhere. If specialized task and COM operations are the same concept, then the use of the terms "specialized tasks" should be avoided to remove confusion.

§(3) : What is "the procedure described in OR.GEN.005" refered to in §3? Indeed OR.GEN.005 does not exist. If it is intended to refer to the procedure for Acceptable means of compliance, replace "OR.GEN.005" with "OR.GEN.020" all over paragraph 3.

B. II. Draft Decision - Part-OPS - Subpart C - Section II - AMC2 OPS.COM.270 Standard operating procedures - specialised operations other than the transport of persons, cargo or mail p. 360-367

comment *664* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.COM.270: This should be also included as AMC in OPS.CAT section.

Justification:

A comprehensive method for developing SOP's is described here. The question is why this is not also referred to Commercial Air transport Operations.

comment *665* comment by: *ECA - European Cockpit Association*

Comment on AMC2 OPS.COM.270: on the Risk assessment diagram: For a more consistent assessment, some feedback of the implemented SOP should be included.

comment *6092* comment by: *DGAC*

Attachment #19

§(2)(a) : :

The text in this paragraph is derived from the text of A-NPA JAR-OPS 4, which was at that time drafted by the JAA HSC/HSST, with helicopter specific considerations.

A slightly different wording is required to ensure that the text fits all aircraft types used in COM operations.

Proposed Text:

Amend text as follows:

"a. The Aircraft. The category of aircraft to be used for the activity should be indicated (e.g. helicopter/aeroplane**/airship/balloon**, single/multi-engined, **not-powered,** other than complex motor-powered/complex motor-powered, **technologic features impacting handling characteristics – such as the type of antitorque system for helicopters** ~~**classic tail rotor/Fenestron/NOTAR equipped**~~). In particular, for helicopters, the necessary level of performance certification (Category A/B) should be specified."

DIAGRAM 1 - DEVELOPMENT OF A SOP BASED ON A RISK ASSESSMENT (RA)

What case is covered in the diagram when stated : « authority approval (if required) ». Does it mean that in some cases SOP do not have to be approved ?

This part of the diagram seems to cover the case of some COM operations that would not have to be certified and for which declaration of capability would be enough. If so, this case should be addressed in sections III (AOC) and section IV (DEC) of OR.OPS as well as in OPS.COM (see also comment on missing provision in the IR to implement the provision of recital (7) and article 8.2 of R216/2008 which empowers the Commission to develop the conditions for replacement of certification by declaration of capabilities in some cases, "taking into account the risks associated with the different types of operations, such as certain types of aerial works and local flights with small aircraft" (which is the principal of SOP development, and the title of the diagram)

(see pict1.jpg)

B. II. Draft Decision - Part-OPS - Subpart C - Section II - AMC2 OPS.COM.270 Standard operating procedures - specialised operations other than the transport of persons, cargo or mail - Appendix 1 to AMC OPS.COM.270 p. 368-372

comment *625* comment by: *ECA - European Cockpit Association*

Comment on Appendix 1 to AMC OPS.COM.270(2)(a): change as follows (editorial):

2. Helicopter and equipment:

a. The helicopter: The helicopter should be certificated according to CS/JAR/FAR 27 or 29 Category B standards; and for operations over a congested hostile environment according to CS/JAR/FAR 27 **or 29** Category A standards. The helicopter should be operated in accordance with the

performance requirements and applicable AMC OPS.COM material.

comment *843* comment by: *Reto Ruesch*

Check with Foca ECS

Swiss FOCA together with the industry has developed a training standard which is today the minimum requirement needed to achieve a acceptable level of safety. We propose the EASA to compare and adapt HELO ops to the Swiss FOCA standards. Www.ofac.admin.ch

comment *844* comment by: *Reto Ruesch*

HELO CAT A over hostile environment

A more precise definition of hostile and congested is definitely needed / the final decision shall be defined by national authorities following and RIA (Risk impact assessment).

comment *845* comment by: *Reto Ruesch*

HELO CAT A over hostile environment

HELO should be defined in Part Ops 3 and be left out of the Part OPS 1 as it is already complex enough. A mix of the 2 Parts is certainly not the best way to achieve safety and comprehension.

comment *846* comment by: *Reto Ruesch*

Load type 3 and 4 reduction of 10%. Proposition to adopt the Swiss FOCA ECS file.

Switzerland has already a Syllabus system for ECS, HCS, HHO which has proven it's value and safety record. EASA shall adopt the Swiss system. Www.ofac.admin.ch.

comment *847* comment by: *Reto Ruesch*

HELO work. Proposition to adopt the Swiss FOCA ECS file.

3. b.

For the four load types, the experience acquired on other helicopter types is not taken in consideration. We consider that a pilot having experience on a load type don't need so much experience when changing of helicopter type.

Proposal : We suggest to divide by 2 the experience needed on the helicopter type, for pilots having more than 50 hours of flight as pilot-in-command for a load type.

The use of rope operations in HEMS is not mentioned in the text. Experience shows that employing rope operations in HEMS is a more effective way of saving lives during HEMS missions in special conditions. The main advantage of rope operations is the very low equipment weight and this is obvious especially in such demanding environments. Even if the occurrence of these missions is quite rare, we cannot exclude rope operations. Weight is the most essential feature of the majority of helicopters in HEMS operations – light twin-engine category A, 1st class performance certified helicopters.

The second big advantage of the equipment needed for rope operations is its lower price in comparison to hoist equipment.

Where is this document page 372 ?

comment *7374* comment by: *Heli Austria*

1.b. i. Load type 1: short line, 20 metres (m) or less

ii. Load type 2: long line, more than 20 m;

10 metres would be far too short

20 meters should be just for the line (synthetic or steel) not considering the damper and the remote hook and the load attached to the remote hook

2. a. The helicopter:

Just require Category B as standard - the definition of Category B is in AMC OPS.GEN.010

For operations over a congested hostile environment require Category A as per AMC OPS.GEN.010.

In the current NPA you are not considering paragraph 2 of AMC OPS.GEN.010 and also CS/JAR/FAR 29 aircraft

Usually the larger 29 aircraft will be used for HELO in cities.

4.b. the current proposal would mean a reduction of about 800 kg for a helicopter like a Super Puma and 400 kg for a Bell medium.

Usually a reduction of 10%-15% of the mass of the load or 5% reduction of the MTOM is currently used for HELO

Proposal

Delete the last sentence or modify it by :

"Jettisoning the load is only permitted when prior approval is obtained from the owner(s) of property, **the tenant, the beneficiary of an easement or anyone who has the enjoyment of property** under the flight path."

Reason :

1 - In France, one property can belong to a large number of owners and it is often very difficult to find them all. Furthermore, it would be quite impossible to obtain the approval of each of them.

2 - In France, public utility easements can be obtained (e.g. for high-voltage lines) allowing to use a property without the approval of the owners or of the tenants.

B. II. Draft Decision - Part-OPS - Subpart C - Section IV p. 374

comment *6981* comment by: *Christian Hölzle*

Emergency egress : In smaller helicopters without a lot of available space in the cabin, the decision shall be left to the manufacturer to find an acceptable site. Today the regulations are imposing so many requirements that it will be very difficult to fullfil them all without redefining cabin size. In this particular case, a crash axe is useless in most of the small helicopters because of the construction of the cabins (windows).

B. II. Draft Decision - Part-OPS - Subpart C - Section IV - AMC OPS.COM.465.A Terrain Awareness Warning System (TAWS) - Aeroplanes p. 374

comment *373* comment by: *ECA - European Cockpit Association*

B. II. Draft Decision - Part-OPS - Subpart C - Section IV - AMC OPS.COM.487 Crash mitigation equipment p. 374

comment *1582* comment by: *EUROCOPTER*

AMC OPS.COM.487, request that the helicopter is fitted with crash mitigation equipment such as crash-absorbing seats and self-sealing fuel tanks. Comments are:

- This requirement is disproportionate and, if maintained as such, will forbid Aerial Work operations to many helicopter types in Europe because of the dramatic induced development costs for operators to retrofit crash mitigation equipment. As a matter of fact, only a few helicopter types would be compliant to this requirement thanks to having been certificated in accordance with recent certification bases.

- In addition we do not see the befefit of self-sealing fuel tanks in terms of crash mitigation.

Proposal: to delete AMC OPS.COM.487:

~~***AMC OPS.COM.487 Crash mitigation equipment***~~

~~***TYPES OF CRASH MITIGATION EQUIPMENT***~~

~~***Crash mitigation equipment should be certified in accordance with a recognised standard. It should include items which are necessary for reducing the consequences of a crash and should include such items as crash-absorbing seats and self-sealing fuel tanks.***~~

GM1 OPS.SPA.001.SPN

1. Radar Navigation ?

This has to be Area Navigation (RNAV)

comment *14* comment by: *KLM*

Last row in the table says:

Specific requirements concerning the positioning function

Is this in order of priority or else, please specify in the box.

comment *411* comment by: *ECA - European Cockpit Association*

Comment on GM1 OPS.SPA.001.SPN: change as follows:

GENERAL

1. There are two kinds of Navigation Specifications: ~~**Radar**~~ **Area** Navigation (RNAV) specifications and Required Navigation Performance (RNP) specifications. Indeed, a**n** RNP system is an RNAV system which has an onboard navigation performance monitoring and alerting function. This function allows the flight crew to detect when the RNP system is not achieving, or cannot guarantee with a sufficient level of integrity, the navigation performance (both lateral and longitudinal). The navigation performance is characterised by the Total System Error (TSE).

Justification:

RNAV means Area Navigation, not Radar Navigation.

comment *574* comment by: *ECA - European Cockpit Association*

Comment on GM1 OPS.SPA.001.SPN(2): change as follows (editorial):

2. RNAV and RNP specifications are designated as RNAV X (e.g. RNAV 1) or RNP X (e.g. RNP 4). If two Navigation Specifications share the same value for X, they may be distinguished by use of a prefix, e.g. Advanced-RNP 1 and Basic-RNP 1. For both RNAV and RNP designations the expression 'X' refers to the lateral navigation accuracy in nautical miles that is expected to be achieved at least 95 percent of the flight time by the population of aircraft operating within the airspace, route or procedure. The existing navigation specifications ~~**are**~~ **and** the relative requirements are summarised in table 1 and table 2 below.

comment *575* comment by: *ECA - European Cockpit Association*

Comment on GM1 OPS.SPA.001.SPN table 1.: change as follows (editorial):

2 navigation system**s** using: - GNSS - DME/DME - DME/DME/IRS

Justification:

Under minimum equipment, RNAV 1, 'two system'shall be 'two systems'

comment *802* comment by: *KLM*

In table 3 reference is made to AMC 20-16 P-RNAV. This is a non-existing chapter in AMC 20.

Only to valid documentation reference should be made.

comment *966* comment by: *KLM*

Why all this information on PBN while a reference to the ICAO PBN manual would be sufficient.

comment *1539* comment by: *AIRBUS*

The acronym RNAV has been improperly defined as Radar Navigation. The correct definition should be Area Navigation.

comment *2530* comment by: *Royal Aeronautical Society*

Paragraph 1 states incorrectly that the 'R' in 'RNAV' stands for 'Radar'. **It is suggested that the word 'Area' should replace 'Radar' in the first line of subparagraph 1.**

comment *3909* comment by: *Airbus S.A.S.*

Table 3 of GM1 OPS.SPA.001.SPN addresses RNP AR APCH, which is not considered in Table 1 and 2.

Table 1 and 2 should be improved to include provisions for RNP AR APCH.

comment *3912* comment by: *Airbus S.A.S.*

Typo error in Table 1 of GM1 OPS.SPA.001.SPN.

The last column related to PBN Requirements, should read "Error > 2-0.6 NM," instead of "Error > 2-0.6

NM,"

comment *3915* comment by: *Airbus S.A.S.*

Typo error in Table 1 of GM1 OPS.SPA.001.SPN.

The last column related to "On Board Performance Monitoring and Alerting", should read "Error > 2-0.6 NM," instead of "Error > 2-0,6NM,"

comment *3926* comment by: *Airbus S.A.S.*

The wording "Error > 2-0.6 NM" contained in the last column of Table 1 of GM1 OPS.SPA.001.SPN, is not clear.

Airbus understanding is that 2 NM refers to Initial, Intermediate, MA and 0.6

NM refers to final approach.

An explanation or definition for these values would be needed.

comment *3982* comment by: *Airbus S.A.S.*

Paragraph GM1 OPS.SPA.001.SPN states, at bullet 2:

"If two Navigation Specifications share the same value for X, they may be distinguished by use of a prefix, e.g. Advanced-RNP 1 and Basic-RNP 1."

Wording "Advanced-RNP 1 and Basic-RNP 1" is not current.

EASA should provide definitions, or replace "Advanced-RNP 1" and "Basic-RNP 1".

Moreover, RNP value could be below 1 (which is not clear in the proposed text).

In this case, even if RNAV and RNP are using the same specifications, the ording is "RNP APCH" and not "Advnced" or "Basic" RNP.

EASA should amend the proposed text in order to consider these aspects.

comment *3984* comment by: *Airbus S.A.S.*

Table 1 of

GM1 OPS.SPA.001.SPN should be improved with provisions for RNP APCH below 0.3

comment *4085* comment by: *UK CAA*

Page: 376

Paragraph No:

GM1 OPS.SPA.001.SPN GENERAL (See also UK CAA comment on AMC OPS.SPA.001.SPN(c)(3) and GM1 OPS.SPA.001.SPN Tables 1-3)

Comment:

Para 1. RNAV is referred to as "Radar Navigation". This is incorrect. RNAV refers to "Area Navigation". The key difference between RNAV and RNP is the "requirement" for the aircraft to have an onboard navigation performance and alerting system to alert the crew.

Para 2. There are multiple RNAV and RNP standards, which apply to different phases of flight. The operator needs to know how these standards apply to him and which special approvals cover which aspects of flight. Each special approval will need it's own AMC. It is not clear from the guidance material here how the PBN approvals are structured and what AMC material applies to which PBN approval. A very good diagram is provided in the ICAO PBN Manual, DOC 9613, Vol II, Part A, Chapter 1, Table II-A-1-1, Application of Navigation Specification by Flight Phase. This is reproduced as new Table 1 (see UK CAA Comment on GM1 OPS.SPA.001.SPN Tables 1-3) with some additional information regarding EASA guidance material. This new Table 1 describes the

PBN navigation specifications and relates them to the different flight phases, but also defines groupings relationships i.e. "En-route (Oceanic/remote and continental), Arrival, Approach (Initial, Intermediate, Final and Missed) and Departure. Existing Table 3 is a synthesis of this ICAO table, but being a list does not show the structure and mixes current and future standards, which needs to be clarified. The core aspects of Table 3 have been added to this paragraph (Para 2) and into a new Table 1 and the current Table 3 should be deleted. The reader needs to see the structure of approvals from the new Table 1 and be directed to where the AMCs are for the approvals needed. Existing Tables 1 and 2 give detail that is not required in this document and include misleading and incorrect information; they should be deleted.

Further comments on the Tables is provided by a following UK CAA comment.

Justification:

PBN DOC 9613, Abbreviations, Page I-(xviii) defines RNAV as Area Navigation not radar navigation.

Need to improve clarity of general explanation of terminology and its application to the phases of flight.

Reference ICAO DOC 9613 Part A General Chapter 1 Introduction, Table II-A-1-1 Application of navigation specification by flight phase.

Proposed Text (if applicable):

GENERAL

1. There are two kinds of Navigation Specifications: ***Area Navigation*** ~~Radar Navigation~~ (RNAV) ~~specifications~~ and Required Navigation Performance (RNP)***, which are fundamentally similar.*** ~~specifications. Indeed, a RNP system is an RNAV system which has an onboard navigation performance monitoring and alerting function. This function allows the flight crew to detect when the RNP system is not achieving, or cannot guarantee with a sufficient level of integrity, the navigation performance (both lateral and longitudinal). The navigation performance is characterised by the Total System Error (TSE).~~ ***The key difference between them is that RNP specifications require the aircraft to have an on-board performance monitoring and alerting system that provides some automated assurance functions to the flight crew. These functions monitor the system performance and alert the flight crew when the required RNP requirements are not met, or cannot be guaranteed with a sufficient level of integrity. The RNAV and RNP performance is characterised by the Total System Error (TSE). This is the distance between the desired position and the aircraft true position measured in nautical miles, which is expected to be achieved at least 95% of the flight time by the population of aircraft operating within the airspace, route or procedure.***

2. ***The structure of*** RNAV and RNP ***navigation*** specifications ~~are designated as RNAV X (e.g. RNAV 1) or RNP X (e.g. RNP 4). If two Navigation Specifications share the same value for X, they may be distinguished by use of a prefix, e.g. Advanced RNP 1 and Basic RNP 1. For both RNAV and RNP designations the expression 'X' refers to the lateral navigation accuracy in nautical miles that is expected to be achieved at least 95 percent of the flight time by the population of aircraft operating within the airspace, route or procedure. The existing navigation specifications are the relative requirements are summarised in table 1 and table 2 below.~~ ***can be classified by phases of flight as detailed in Table 1*** (new). (New Insert reproduced from PBN manual, ICAO Doc 9613

Table II-A-1-1.)***. There are multiple RNAV and RNP approvals that apply to different phases of flight. Some of these special approvals are in current use, some are under development, and some apply to emerging standards for which AMC have yet to be defined. For each current navigation specification requiring approval by the competent authority, EASA Acceptable Means of Compliance is defined in the EASA AMC 20 series documents as listed below and shown in Table 1.***

Oceanic/Remote. RNAV10 (Designated and Authorised as RNP10). AMC for RNAV10(RNP10) is provided at EASA AMC 20-12, "Recognition of FAA order 8400.12a for RNP10 Operations". It has been agreed that RNAV10 airspace be called RNP10 for historical reasons, though technically it should be RNAV10 as there is no requirement for on-board monitoring and *alerting systems. RNAV10 can support 50nm track spacing. For an aircraft to operate in RNAV10(RNP10) airspace it needs to be fitted with a minimum of 2 independent Long Range Navigation Systems (LRNS). Each LRNS should in principle have a Flight Management System that utilises positional information from either an approved GNSS or an approved IRS or mixed combination. The mix of sensors: pure GNSS, pure IRS or mixed IRS/GPS determines pre-flight and in-flight operation and contingencies in the event of system failure.*

b. Oceanic/Remote. RNP-4. This is an emerging standard. Guidance is provided in ICAO DOC 9613 and EASA AMC material has yet to be defined. RNP-4 is the oceanic/remote navigation specification to support 30nms track spacing. To meet the more accurate navigation requirement 2 independent LRNS are required for which GNSS sensors are mandated. Additional aircraft requirements may also be required other than HF to operate in RNP-4 designated airspace. The requirements may include use of Automatic Dependent Surveillance (ADS) and/or Controller Pilot Direct Data Link Communication (CPDLC). Appropriate country Air Information Publication (AIP) needs to be consulted. Proposed AMC will need to subject to the EASA AMC approval process.

c. RNAV5 (B-RNAV). AMC for RNAV5 is provided in AMC 20-4. Airworthiness Approval and Operational Criteria for the Use of Navigation Systems in European Airspace Designated for the Basic-RNAV Operations.

d. RNAV1 (P-RNAV). AMC for RNAV1 (P-RNAV) is provided in AMC 20-16, " Airworthiness and Operational approval for precision RNAV operations in designated European Airspace."

e. ***Basic –RNP1. Future standard to be implemented. Guidance material is provided in Doc 9613.***

f. Advanced –RNP1 Future standard to be implemented. Guidance material is provided in Doc 9613.

g. RNP APCH. AMC for RNP APCH approaches is provided in AMC 20-27, Airworthiness and Operational approval for RNP approach (RNP APCH) operations.

RNP AR APCH. AMC for RNP AR APCH is provided in AMC20-26 " Airworthiness and operational approval for RNP Authorisation Required Approaches (RNP AR APCH) operations".

3. Guidance material for the global performances specifications, approval process, aircraft requirement (e.g. generic system performances, accuracy, integrity, continuity, signal-in-space, RNP navigation specifications required for the on-board performance monitoring and alerting system), requirements for specific sensor technologies, functional requirements, operational procedures, flight crew knowledge and training and navigation databases integrity requirements, can be found in:

   a. ICAO Doc 9613 Performance Based Navigation Manual, and

   b. EASA AMC 20 as indicated in above and in ***Table 1*** (new).

comment *4086* comment by: *UK CAA*

Page: 376-379

Paragraph No:

GM1 OPS.SPA.001.SPN Tables 1,2 and 3 (see also UK CAA comments on AMC OPS.SPA.001.SPN(c)(3) and GM1 OPS.SPA.001.SPN GENERAL)

Comment:

See comments on Para 1 and 2 at previous UK CAA comment on GM1 OPS.SPA.001.SPN GENERAL. This follows on.

There are multiple RNAV and RNP approvals that apply to different phases of flight. The operator needs to know how these apply to him and which special approvals cover which aspects of flight and each of which will, in turn, need it's own AMC. New Table 1 is based on the ICAO PBN Manual, DOC 9613, Vol II, Part A, Chapter 1, Table II-A-1-1, Application of Navigation Specification by Flight Phase. This new Table 1 describes the PBN navigation specifications and relates them to the different flight phases, but also defines groupings relationships i.e. "En-route (Oceanic/remote and continental), Arrival, Approach (Initial, Intermediate, Final and Missed) and Departure. Existing Table 3 is a synthesis of this ICAO table, but being a list does not show the structure and mixes current and future standards, which needs to be clarified. The core aspects of Table 3 have been added to Para 2 (**see COMMENT B**) and into a new Table 1 and the current Table 3 should be deleted. The reader needs to see the structure of approvals from the new Table 1 and be directed to where the AMCs are for the approvals needed.

Existing Tables 1 and 2 have the same title and give detail that is not required in this document, including misleading and incorrect information: they should be deleted. Tables 1 and 2 describe relative detail of some of the requirements but not all. It is information that is essentially already contained within ICAO PBN Manual, Doc 9613. Unless the terms used are explained the 2 tables are confusing and do not add value. It is trying to do too large a task that cannot be fitted on a single sheet of A4 paper. For example, the AMC and guidance information in the tables needed should be declarative not comparative and should not selectively pick information unless there are associated issues that need describing. It is not clear in Table 1 what Equipment malfunction "Major" means nor Continuity "Major" and "Minor", or that this adds value. The On Board Performance Monitoring and Alerting requirement for RNP has already

been stated. This adds little value and is only looking at one parameter of many. The minimum equipment definition of a Long Range Navigation System (LRNS) ignores the requirement for a Flight Management System (FMS). It is also in conflict with IR statements of minimum equipment. A display is required for RNP-10 because one of the requirements for a LRNS is that it is able to display aircraft position relative to track. Tables 1 and 2 should be deleted.

Justification:

Improved clarity of general explanation of terminology and its application to the phases of flight.

Reference ICAO DOC 9613 Part A General Chapter 1 Introduction, Table II-A-1-1

Distinguish clearly between current AMC guidance and that yet to be provided for future standards.

Deletion of existing tables 1, 2 and 3 is necessary to eliminate superfluous information and avoid confusion.

Proposed Text (if applicable):

Delete Tables 1, 2 and 3. Replace with new Table 1.

Table 1 - Application of navigation specification by flight phase.

~~*NAVIGATION SPECIFICATION*~~	*FLIGHT PHASE*								
	Enroute		**Arrival**	**Approach**				**Departure**	**EASA AMC**
	Oceanic / Remote	**Continental**		**Initial**	**Intermediate**	**Final**	**Missed**		
RNAV10	10								AMC 20-12
RNP 4	4								To be developed.
RNAV 5		5	5						AMC 20-4
RNAV2		2	2					2	Future provision.
RNAV1		1	1	1	1		1	1	AMC 20-16
BASIC-RNP 1			1	1	1		1	1	Future provision.
Advanced–RNP1									Future provision.
RNP APCH				1	1	0.3	1		AMC 20-27
RNP AR APCH				1	1	0.3	1		AMC20-26

Notes:

in NMs.

2. RNAV5 is an en-route navigation specification, which may be used for the initial part of the STAR outside 30nms and above Minimum Safe Altitude.

Some EASA AMC guidance is under development or earmarked for future provision.

comment *5110* comment by: *M Wilson-NetJets*

Original text:

(1) There are two kinds of Navigation Specifications: Radar Navigation (RNAV) specifications and Required Navigation Performance (RNP) specifications. Indeed, a RNP system is an RNAV system which has an onboard navigation performance monitoring and alerting function. This function allows the flight crew to detect when the RNP system is not achieving, or cannot guarantee with a sufficient level of integrity, the navigation performance (both lateral and longitudinal). The navigation performance is characterized by the Total System Error (TSE).

Suggested new text:

European Regions Airline Association Comment

This may be a typo ? the first sentence in Paragraph 1 should read:

1. There are two kinds of Navigation Specifications: Area Navigation (RNAV) specifications and Required Navigation Performance (RNP) specifications.

comment *6095* comment by: *DGAC*

At the last PBN meeting (april 2009) it has been decided to include in the RNP APCH Nav specs, LPV (or APV SBAS) approach, so that 2012, SBAS Nav specs will be included in the PBN manual, AMC 20-28 defining ops and airworthiness criteria for SBAS operations will be issued. Therefore, the table 3 should include reference to AMC 20-28.

Table 1 and Table 2 are maybe too technical to be included in this AMC.

Furthermore information contained in table 1 and table 2 can be found in the AMC 20's which are introduced in table 3. There is always a risk of inconsistency in duplicating information.

We suggest therefore removing Table 1 and Table 2 from this AMC.

comment *6316* comment by: *Lufthansa CityLine GmbH*

This may be a typo ? Paragraph 1 should read:

There are two kinds of Navigation Specifications: **Area** Navigation (RNAV) specifications and Required Navigation Performance (RNP) specifications.

As GA pilots and aircraft owners, we don't have an operations manual, and don't see a need of it either.

B. II. Draft Decision - Part-OPS - Subpart D - Section II - GM2 OPS.SPA.001.SPN Operations in areas with specified performance based navigation p. 379-380

comment *4087* comment by: *UK CAA*

Page No: 379

Paragraph No:

GM2 OPS.SPA.001.SPN Operations in areas with specified performance based navigation.

Comment:

As with GM1 OPS.SPA.001.SPN, this also mixes PBN concepts with MNPS. Equipment requirements for MNPS are defined at OPS.SPA.010.SPN. This GM2 implies its scope covers equipment requirements for Performance Based Navigation but confuses the issue by mentioning minimum performance specifications (MNPS). Reference to MNPS is inappropriate here.

The GM for aircraft equipment requirements for each PBN approval is too specific and detailed to be covered here. See proposals in the UK CAA comment on GM1 OPS.SPA.001.SPN. For example, equipment requirements for RNP10 are very different from RNAV5. The guidance is also in danger of mixing airspace requirements with PBN equipment requirements. Equipment requirements for PBN approval apply worldwide. There may be additional requirements to operate in specific airspace this is defined in AIP and regional documents. Reference to just Single European Sky and Eurocontrol related documents is inappropriate as they are regional airspace regulations.

The suggested revised guidance already points to equipment requirements via the AMC 20 series. This paragraph is confused, adds no value, and should be deleted.

Justification:

1. Mixing up of PBN requirements with MNPSA, which is not PBN.

2. There are multiple equipment requirements for PBN.

3. Mixing up regional airspace requirements with PBN equipment requirements.

Proposed Text (if applicable):

Delete whole GM2.

B. II. Draft Decision - Part-OPS - Subpart D - Section II - AMC OPS.SPA.010.MNPS Equipment requirements for operations in MNPS areas p. 380

comment *413* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.SPA.010.MNPS: change as follows:

AMC OPS.SPA.010.~~**MNPS**~~ **SPN** Equipment requirements for operations in MNPS areas

Justification:

The designation of this AMC should be AMC OPS.SPA.010.SPN, as the subpart is SPN, and not MNPS.

comment *1362* comment by: *EUROCOPTER*

This AMC is linked to OPS.SPA.010.SPN requirement and should be renamed **'AMC OPS.SPA.010.SPN'** (OPS.SPA.010.MNPS does not exist)

comment *1541* comment by: *AIRBUS*

Except in the Table 1 of GM1 OPS.SPA.001.SPN, the LRNS are not defined in this section.

comment *4089* comment by: *UK CAA*

Page No: 380

Paragraph No:

AMC OPS.SPA.010.MNPS

Comment:

Incorrect Title Reference. The AMC amplifies OPS.SPA.010.SPN.

The scope in the title has been in advertently widened to include potentially all MNPS equipment requirements rather than just navigation equipment requirements. For instance, long-range communications requirements are not mentioned nor are RVSM equipment requirements, or SSR. Amend the name to read, "Navigation Equipment Requirements ...". This follows from the IR.

The title refers to MNPS areas. There is only 1 MNPS area. It is singular and is known as MNPS airspace.

Reverse the order of Para 1 and 2 stating the unrestricted navigation requirement to have 2 LRNS, first. Special route apply to aircraft with just 1 LRNS and short range navigation aids, or short-range navigation aids alone.

Reference is required to the additional MNPS guidance material available. See suggested additional guidance material at: GM OPS.SPA.010.SPN Operations in

MNPS Airspace.

Justification:

Incorrect title reference.

Inappropriate title.

Greater clarity required regarding navigation equipment requirements.

Additional guidance material considered necessary.

Proposed Text (if applicable):

AMC OPS.SPA.010**.SPN Navigation** equipment requirements for operations in MNPS ***Airspace***

GENERAL

1. For unrestricted operations in MNPS airspace, the aircraft should be equipped with two independent Long Range Navigation Systems (LRNS).

2. For operation in MNPS airspace along notified special routes, the aircraft should be equipped with either one Long Range Navigation System (LRNS) ***and normal short-range navigation equipment, or for notified special routes to Iceland, normal short-range navigation equipment alone.***

GM OPS.SPA.010.SPN Operations in MNPS Airspace

Additional guidance material, including details of special routes, can be found in:

a. ICAO Regional Supplementary Procedures, Doc 7030.

b. ICAO Guidance for Air Navigation in the North Atlantic, NAT Doc 001, and

c. ICAO North Atlantic MNPS Airspace Operations Manual.

comment *7041* comment by: *Virgin Atlantic Airways*

Relevant Text:

AMC OPS.SPA.010.MNPS Equipment requirements for operations in MNPS areas

GENERAL

1. For operation in MNPS airspace along notified special routes, the aircraft should be equipped with one Long Range Navigation System (LRNS), unless otherwise specified in the ICAO air navigation agreements.

2. For unrestricted operations in MNPS areas, the aircraft should be equipped with two independent Long Range Navigation Systems (LRNS).

Comment: Swap items 1 and 2. The paragraph covering unrestricted operations should proceed the paragraph describing limited MNPS operations.

Proposed Text:

AMC OPS.SPA.010.MNPS Equipment requirements for operations in MNPS areas

GM2 OPS.SPA.001.LVO Low visibility operations (LVO)

AMC OPS.SPA.001.LVO(b)(1) Low visibility operations (LVO)

Comment:

Such material is in opposition to the concept of "performance-based rulemaking". It is all detailed procedure description, but not a rule to comply with. The flexibility promised by EASA through the "performance-based rulemaking" is odd: It is true that the Implementing Rule **seems** to be leaner now than before, but all the details and in many cases even new texts have been added to the AMC (which are factual rules) and GM (which are factual

audit basis).

As presented, the concept of "performance-based rulemaking" fails to convince.

Proposal:

Keep the **Implementing Rules as close as possible to EU-OPS (as having been tasked),** and refrain from detailed and/or extended procedure descriptions in AMC and GM.

2 a."TVE equal to or greater than ±90 m (±300 ft), b. ASE equal to or greater than ±75 m (±245 ft), and"

TVE and ASE are not defined in the terminology chapter. I don't know them.

B. II. Draft Decision - Part-OPS - Subpart D - Section III - GM OPS.SPA.001.RVSM(b)(2) Operations in RVSM airspace p. 381-384

comment *409* comment by: *ECA - European Cockpit Association*

Comment on GM OPS.SPA.001.RVSM(b)(2):

See previous equipment requirements stated in EU-OPS 1.872. There is a discrepancy between what is required in the Implementing Rule, and the GM, regarding the need for a transponder.

It should therefore be stated clearly that the use of the transponder in RVSM airspace does not depend on the operators' will.

comment *576* comment by: *ECA - European Cockpit Association*

Comment on GM OPS.SPA.001.RVSM(b)(2)2: change text as follows: move 2. c. and d. under new point 3. Pre-Takeoff Procedures:

2. Pre-flight procedures

2.1 The following actions should be accomplished during the pre-flight procedure:

a. Review technical logs and forms to determine the condition of equipment required for flight in the RVSM airspace. Ensure that maintenance action has been taken to correct defects to required equipment;

b. During the external inspection of aircraft, particular attention should be paid to the condition of static sources and the condition of the fuselage skin near each static source and any other component that affects altimetry system accuracy. This check may be accomplished by a qualified and authorised person other than the pilot (e.g. a flight engineer or ground engineer);

~~**c. Before takeoff, the aircraft altimeters should be set to the QNH of the airfield and should display a known altitude, within the limits specified in the aircraft operating manuals. The two primary altimeters should also agree within limits specified by the aircraft operating manual. An alternative procedure using QFE may also be used. Any required functioning checks of altitude indicating systems should be performed. The maximum value for these checks should not exceed 23 m (75 ft).**~~

~~**d. before take-off, equipment required for flight in RVSM airspace should be operative, and any indications of malfunction should be resolved.**~~

3. Pre-Takeoff Procedures:

a. the aircraft altimeters should be set to the QNH of the airfield and should display a known altitude, within the limits specified in the aircraft operating manuals. The two primary altimeters should also agree within limits specified by the aircraft operating manual. An alternative procedure using QFE may also be used. Any required functioning checks of altitude indicating systems should be performed. The maximum value for these checks should not exceed 23 m (75 ft).

b. equipment required for flight in RVSM airspace should be operative, and any indications of malfunction should be resolved.

Justification

The header is preflight procedures, but text also concerns items before take-off, therefore not falling under pre-flight.

comment *580* comment by: *Association of Dutch Aviation Technicians NVLT*

GM OPS.SPA.001.RVSM

During the external inspection of aircraft, particular attention should be paid to the condition of static sources and the condition of the fuselage skin near each static source and any other component that affects altimetry system accuracy. This check may be accomplished by a qualified and authorised person other than the pilot (e.g. a flight engineer a by the 145-organisation authorised pilot or certifying staff);

Explenation: pls. use the formal name "certifying staff B1,A" i.s.o. ground engineer.

If a particular attention should be paid to the condition of static sources and the condition of the fuselage skin near each static source and any other component that affects altimetry system accuracy.

AMC M.A.301 -1- Continuing airworthiness tasks should be altered.

(a) a walk-around type inspection of the aircraft and its emergency equipment for

condition including, in particular, any obvious signs of wear, damage or leakage. In addition, the presence of all required equipment including emergency equipment should be established.

Proposed text:

(a) a walk-around type inspection of the aircraft with particular attention should be paid to the condition of static sources and the condition of the fuselage skin near each static source and any other component that affects altimetry system accuracy and its emergency equipment for condition including, in particular, any obvious signs of wear, damage or leakage. In addition, the presence of all required equipment including emergency equipment should be established.

comment *1542* comment by: *AIRBUS*

Paragraph 4.1.g: The paragraph 4.1 is based on the JAA TGL6, Appendix 4, Paragraph 5. The note related to the possibility to make use of automatic altimeter comparators has disappeared. It should be added in the paragraph 4.1.g.ii.

comment *1543* comment by: *AIRBUS*

Paragraph 7.2: The paragraph 7.2 refers to the wording "State Approval Agencies". For consistency reasons, this wording should be replaced by the terminology "Competent Authorities", as generally used by EASA.

comment *2720* comment by: *AOPA-Sweden*

(b) (2) 2.1.:

If the pilot is notified by ATC of altitude deviation, there has to be a discrepancy between the transponder encoder and the Air Data Computer. ATC can not, without a height monitoring radar make corrections. An item without any value. AOPA-S suggests a withdrawal of these items or a complete revision

comment *2721* comment by: *AOPA-Sweden*

(b) (6): What about "single pilot system" training?

comment *2755* comment by: *The TUI Airlines group represented by Thomson Airways,TUIfly,TUIfly Nordic,CorsairFly,Arkefly,Jet4U,JetairFly*

Para 4.1.b :

Comment:

It is considered unnecessary to wait until Transition Altitude before selecting 1013.2 (hpa)/29.92 if the flight is already cleared to a Flight Level. In addition the necessity of changing the Standby Altimeter at the same time is an unnecessary distraction at a time of high workload. The Standby altimeter should be left on Departure QNH and can be referred to should ATC ask for a passing Altitude and can be changed to 1013.25 (hpa)/29.92 prior to reaching the initial cleared Flight Level when the workload is less.

Proposal:

It is acceptable to change the the altimeters to 1013.2(hpa)/29.92 if the flight is already cleared to a Flight Level. The Standby Altimeter should be left on Departure/local QNH for reference should ATC require an intermediate Altitude readout, and should be changed to 1013.2 (hpa)/29.92 having passed the Transition Altitude and achieved the en route MSA and prior to reaching the initial Flight Level.

comment *3303* comment by: *AEA*

Relevant Text:

3.2 Should any of the required equipment fail prior to the aircraft entering RVSM airspace, the pilot should request a new clearance to avoid entering this airspace.

Comment:

Often, together with a new clearance request, one can still enter or remain in RVSM airspace.

Proposal:

Change text into the following, as it still will allow ATC to refuse entry;

3.2 Should any of the required equipment fail prior to the aircraft entering RVSM airspace, the pilot should request a new clearance.

comment *3304* comment by: *AEA*

Relevant Text:

g. At intervals of approximately one hour, cross-checks between the primary altimeters should be made. A minimum of two will need to agree within ±60 m (±200 ft). Failure to meet this condition will require that the altimetry system be reported as defective and notified to ATC;

i. The usual scan of flight deck instruments should suffice for altimeter crosschecking on most flights.

ii. Before entering RVSM airspace, the initial altimeter cross check of primary and standby altimeters should be recorded.

Comment:

This procedure is not needed for aircraft with automatic monitoring systems

Proposal:

Add the following; "*This cross-check is not mandatory when the aircraft is equipped with an automatic monitoring system for the flight instruments*."

comment *3305* comment by: *AEA*

GM2 OPS.SPA.001.LVO Low visibility operations (LVO)

AMC OPS.SPA.001.LVO(b)(1) Low visibility operations (LVO)

Comment:

Such material is in opposition to the concept of "performance-based rulemaking". It is all detailed procedure description, but not a rule to comply with. The flexibility promised by EASA through the "performance-based rulemaking" is odd: It is true that the Implementing Rule **seems** to be leaner now than before, but all the details and in many cases even new texts have been added to the AMC (which are factual rules) and GM (which are factual audit basis).

As presented, the concept of "performance-based rulemaking" fails to convince.

Proposal:

Keep the **Implementing Rules as close as possible to EU-OPS (as having been tasked),** and refrain from detailed and/or extended procedure descriptions in AMC and GM.

comment *7627* comment by: *AOPA UK*

If the pilot is notified by ATC of altitude deviation, there has to be a discrepancy between the and j transponder encoder and the Air Data Computer. ATC can not, without a height monitoring radar make corrections. AOPA UK suggests a complete revision

comment *7628* comment by: *AOPA UK*

What about "single pilot system" training?

B. II. Draft Decision - Part-OPS - Subpart D - Section IV p. 385-386

comment *6096* comment by: *DGAC*

As a general comment : The huge number of GM or AMC comparing to the 4 requirements in section IV of the subpart D, demonstrates obviously that the organization chosen by the agency is not the most appropriate one. It makes far more difficult to understand what the different operational concepts are and what it entails for the operator to get an approval.

B. II. Draft Decision - Part-OPS - Subpart D - Section IV - GM1 OPS.SPA.001.LVO Low visibility operations (LVO) p. 385

comment *577* comment by: *ECA - European Cockpit Association*

Comment on GM1 OPS.SPA.001.LVO: change sequence of b. and c.

1. Low Visibility Operations include, as applicable:

a. Manual take-off (with or without electronic guidance systems or Head-Up Guidance Landing System (HUDLS)/Hybrid Head-up display (HUD)/HUDLS);

b. ~~**Auto-coupled approach to below Decision Height (DH), with manual flare, hover, landing and roll-out;**~~**Approach flown with the use of a HUDLS/Hybrid HUD/HUDLS and/or Enhanced Vision system (EVS);**

c. **Auto-coupled approach to below Decision Height (DH), with manual flare, hover, landing and roll-out;**~~**Approach flown with the use of a HUDLS/Hybrid HUD/HUDLS and/or Enhanced Vision system (EVS);**~~

d. Auto-coupled approach followed by auto-flare, hover, auto landing and manual roll-out; and

e. Auto-coupled approach followed by auto-flare, hover, auto landing and auto-roll-out, when the applicable Runway Visual Range (RVR) is less than 400 m. Note 1: A hybrid system may be used with any of these modes of operations. Note 2: Other forms of guidance systems or displays may be certificated and approved.

Justification:

Change sequence results in logical order.

comment *611* comment by: *ECA - European Cockpit Association*

Comment on GM1 OPS.SPA.001.LVO(2)(h)and(i): <![endif]-->Remove

definitions (h) Lower than Standard Category I Operations and (i) Other than Standard Category II Operations:

~~**h. Lower than Standard Category I Operation. A Category I Instrument Approach and Landing Operation using Category I DH, with an RVR lower than would normally be associated with the applicable DH;**~~

~~**i. Other than Standard Category II Operation. A Category II Instrument Approach and Landing Operation to a runway where some or all of the elements of the ICAO Annex 14 Precision Approach Category II lighting system are not available.**~~

Justification:These definitions should be in Implementing Rules (OPS.GEN.010) and not in GM.

GM2 OPS.SPA.001.LVO Low visibility operations (LVO)

AMC OPS.SPA.001.LVO(b)(1) Low visibility operations (LVO)

Comment:

Such material is in opposition to the concept of "performance-based rulemaking". It is all detailed procedure description, but not a rule to comply with. The flexibility promised by EASA through the "performance-based rulemaking" is odd: It is true that the Implementing Rule **seems** to be leaner now than before, but all the details and in many cases even new texts have been added to the AMC (which are factual rules) and GM (which are factual audit basis).

As presented, the concept of "performance-based rulemaking" fails to convince.

Proposal:

Keep the **Implementing Rules as close as possible to EU-OPS (as having been tasked),** and refrain from detailed and/or extended procedure descriptions in AMC and GM.

B. II. Draft Decision - Part-OPS - Subpart D - Section IV - AMC OPS.SPA.001.LVO(b)(1) Low visibility operations (LVO) p. 386-393

comment *578* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.SPA.001.LVO(b)(1)4.2.: add text 'low visibility'

4.2 Flight Simulator Training and/or Flight training:

a. A minimum of 6 (8 for HUDLS with or without EVS) **low visibility** approaches and/or landings in a Flight Simulator approved for the purpose. The 8 HUDLS approaches may be reduced to 6 when conducting Hybrid HUDLS operations. See 4.4a. below;

Justification:

It is not mentioned under what conditions the approaches and landings in the simulator should be made. It makes sense to conduct these approaches and landings under simulated low visibility conditions.

comment *612* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.SPA.001.LVO(b)(1)(4): change as follows:

4. Conversion Training provisions to conduct Low Visibility Take-off, Lower than Standard Category I, Other than Standard Category II, Approach utilising EVS and Category II and III Operations. **An operator shall ensure that** ~~**Each**~~ **each** flight crew member ~~**should complete**~~ **completes** the following Low Visibility Procedures training if converting to a new type/class or variant of aircraft in which Low Visibility Take-off, Lower than Standard Category I, Other than Standard Category II Approaches utilising EVS with an RVR of 800 m or less and Category II and III Operations will be conducted. The necessary flight crew member experience to undertake an abbreviated course is prescribed in 1.2, 1.3 and 1.4 above.

Justification:

Main responsibility should be with the operator and not with the crew member.

comment *667* comment by: *ECA - European Cockpit Association*

Comment on paragraphs 4.2.a and 7.1: change as follows:

4.2 Flight Simulator Training and/or Flight training:

a. A minimum of ~~**6 (8 for HUDLS with or without EVS)**~~ **8** approaches and/or landings in a Flight Simulator approved for the purpose. ~~**The 8 HUDLS approaches may be reduced to 6 when conducting Hybrid HUDLS operations.**~~ See 4.4a. below;

[…]

7. Recurrent Training and Checking – Low Visibility Operations

7.1 An operator should ensure that, in conjunction with the normal recurrent training and operator proficiency checks, a pilot's knowledge and ability to perform the tasks associated with the particular category of operation, including Low Visibility Take-Off (LVTO), for which he/she is authorised is checked. The number of approaches to be undertaken in the Flight Simulator within the validity period of the operator proficiency check is to be a minimum of 2 (4 when HUDLS and/or EVS is utilized to touchdown) one of which should be a landing at the lowest approved RVR; in addition 1 (2 for HUDLS and/or operations utilising EVS) of these approaches may be substituted by an approach and landing in the aircraft using approved Category II or III procedures. One missed approach should be flown during the conduct of the operator proficiency check. If the operator is authorised to conduct take-off with RVR less than 150/200 m, at least one LVTO to the lowest applicable minima should be flown during the conduct of the operator proficiency check. (See GM OPS.SPA.001.LVO (b)(1).)

The number of approaches to be conducted during such recurrent training is to be a minimum of ~~**two**~~ **three**, one of which is to be a missed approach and at least one low visibility take-off to the lowest applicable minima. The period of validity for this check should be 6 months including the remainder of the month of issue.

Justification:

ECA cannot agree on the reduction in training requirements from Appendix 1 to JAR-OPS 1.450 [d][2][I] and [g][1].

ECA requests to have the previous requirements from JAR-OPS 1.450 to be restored.

comment *1544* comment by: *AIRBUS*

Paragraph 5.2: The AMC is driven from the EU-OPS 1 Appendix 1 to OPS 1.450. The paragraph (e) 3 of the Appendix has been deleted. This paragraph reads: "The Authority may authorize a reduction in the above command experience requirements for flight crew members who have Category II or Category III command experience." The Agency should explain why this paragraph has been deleted or add this paragraph as a paragraph 5.3 of the AMC.

comment *1545* comment by: *AIRBUS*

Paragraph 7.1: The last part of the paragraph 7.1 reads: "The number of approaches to be conducted during such recurrent training is to be a minimum of two, one of which is to be a missed approach and at least one low visibility take-off to the lowest applicable minima. The period of validity for this check should be 6 months including the remainder of the month of issue." The underlined part of the paragraph is redundant with what is mentioned before in the paragraph 7.1 and should be deleted.

comment *1653* comment by: *Luftfahrt-Bundesamt*

It should be stated that for LVTO-Training (RVR < 400 m) a flight simulator must be used. In our opinion it is not possible to train LVTO on a real aircraft, because the visual scenario can´t be simulated in better weather conditions. Training in real weather conditions with RVR < 400 m would not be safe.

Low visibility operations (LVO) should contain XLS/GLS, notably in sections: 2.a (P. 388), 3.7.b (P.389)

comment *3308* comment by: *AEA*

Relevant Text:

5. Type and command experience.

5.1 Before commencing Category II operations, the following additional

provisions are applicable to the pilot-in-command, or pilots to whom conduct of the flight may be delegated, who are new to the aircraft type/class:

a. 50 hours or 20 sectors on the type, including line flying under supervision; and b. 100 m should be added to the applicable Category II RVR minima when the operation requires a Category II manual landing or use of HUDLS to touchdown until:

i. a total of 100 hours or 40 sectors, including LIFUS has been achieved on the type; or

ii. a total of 50 hours or 20 sectors, including LIFUS has been achieved on the type where the flight crew member has been previously qualified for Category II manual landing operations with a Community operator.

iii. For HUDLS operations the sector requirements in 5.1 and 5.2 a. should always be applicable, the hours on type/class does not fulfil the requirement.

5.2 Before commencing Category III operations, the following additional provisions are applicable to the pilot-in-command, or pilots to whom conduct of the flight may be delegated, who are new to the aircraft type:

a. 50 hours or 20 sectors on the type, including line flying under supervision; and

b. 100 m should be added to the applicable Category II or Category III RVR minima unless he has previously qualified for Category II or III operations with a Community operator, until a total of 100 hours or 40 sectors, including line flying under supervision, has been achieved on the type.

Comment:

Appendix to EU-OPS 1.450 E (3) is missing and should be added/kept in the regulation

Proposal:

Add following EU-OPS text;

{ref EU-OPS 1.450 E (3)}. *The Authority may authorise a reduction in the above command experience requirements for flight crew members who have Category II or Category III command experience.*

5. Type and command experience.

5.1 Before commencing Category II operations, the following additional provisions are applicable to the pilot-in-command, or pilots to whom conduct of the flight may be delegated, who are new to the aircraft type/class:

a. 50 hours or 20 sectors on the type, including line flying under supervision; and b. 100 m should be added to the applicable Category II RVR minima when the operation requires a Category II manual landing or use of HUDLS to touchdown until:

i. a total of 100 hours or 40 sectors, including LIFUS has been achieved on the type; or

ii. a total of 50 hours or 20 sectors, including LIFUS has been achieved on the type where the flight crew member has been previously qualified for Category II manual landing operations with a Community operator.

iii. For HUDLS operations the sector requirements in 5.1 and 5.2 a. should always be applicable, the hours on type/class does not fulfil the requirement.

5.2 Before commencing Category III operations, the following additional provisions are applicable to the pilot-in-command, or pilots to whom conduct of the flight may be delegated, who are new to the aircraft type:

a. 50 hours or 20 sectors on the type, including line flying under supervision; and

b. 100 m should be added to the applicable Category II or Category III RVR minima unless he has previously qualified for Category II or III operations with a Community operator, until a total of 100 hours or 40 sectors, including line flying under supervision, has been achieved on the type.

Comment:

Such material is in opposition to the concept of "performance-based rulemaking". It is all detailed procedure description, but not a rule to comply with. The flexibility promised by EASA through the "performance-based rulemaking" is odd: It is true that the Implementing Rule **seems** to be leaner now than before, but all the details and in many cases even new texts have been added to the AMC (which are factual rules) and GM (which are factual audit basis).

As presented, the concept of "performance-based rulemaking" fails to convince.

Proposal:

Keep the **Implementing Rules as close as possible to EU-OPS (as having been tasked),** and refrain from detailed and/or extended procedure descriptions in AMC and GM.

Before specifying what could be acceptable for the training to be LVO authorized, it would be interesting to define first what are 'LTS cat I', 'OTS cat

II', 'cat II' and 'cat III' (cf AMC 1 OPS.SPA.020.LVO)

comment *6479* comment by: *Konrad Polreich*

AMC OPS.SPA.001.LVO (b)(1)

Nr. 7.1

This paragraph is inconsistent and written in a confusing sequence (training-checking-training-checking).

Sentence 2 states, that there have to be undertaken a minimum of 2 (4 for EVS/HUDLS) approaches in the SIM within the validity period of the OPC. Part 2 of sentence 2 (after the semicolon) states, that 1 (2) of these approaches may be undertaken in an aircraft.

Sentence 5 states that a minimum of 2 approaches have to be conducted during the recurrent training, and no alleviation is mentioned as in sentence 2, which also covers the recurrent training (what else in a simulator??).

Sentence 6 states "...this check" and therefore relating to the previous sentence, which is mentioning training requirements, not checking requirements.

Suggestion:

The last 2 sentences, which have been added to the text from EU-OPS changes the description of the requirements stated above and should be deleted, since they are not necessary.

Alternatively, state clearly the requirements for recency, training and checking.

comment *6481* comment by: *Konrad Polreich*

AMC OPS.SPA.001.LVO (b)(1)

Nr. 7.1

Sentence 6 limits the validity of a check, which is supposed to be the OPC, to 6 month, including the month of issue. This is inconsistend with the OPC requirement stated in OR.OPS.145.FC (b)(3) and its associated AMC1 OR.OPS.145.FC No 2.1.1.3 and 2.4

Suggestion:

Delete the last sentence of this paragraph, since the period of validity is stated in OR.OPS.145.FC and should not be duplicated and definitely not different.

comment *6482* comment by: *Konrad Polreich*

AMC OPS.SPA.001.LVO (b)(1)

Nr. 7.1

This paragraph is built on requirements for commercial operators, which have to do OPC's. This is not required for non-commercial operators. An additional simulator training event is very demanding for smaller operators and not really necessary, taking in account the small number of training approaches required.

This simulator training could be compensated by an adequate recency requirement.

Suggestion:

Change wording of Operator Proficiency Check into Proficiency Check, thus also including the LPC.

Alternatively:

Add at the end of No. 7.1:

Non-commercial operators operating CAT II approaches and LVTO's:

The above mentioned requirements have to be fullfiled during the validity period of the LPC and when conducting the LPC. For non commercial operators, not conducting flight simulator training every 6 months, there is an additional recency requirement for 2 approaches and landings in the aircraft using approved CAT II procedures during the last 90 days.

comment *6508* comment by: *IATA*

3.11 The training programme should include, where appropriate, approach where failures of the HUDLS and/or EVS equipment at low level require either:

a. Reversion to head down displays to control missed approach;

Proposal:

A reversion from head up to head down should

only be trained with a change of PF.

5.Type and Command Experience

The flexibility in EU-OPS should be retained.

Proposal: Add the EU-OPS requirement again

"The Authority may authorise a reduction in

the above command experience requirements

for flight crew members who have Category II or Category III commar experience."

p391

4.4 Line Flying under Supervision. An operator should ensure that each flight cre member undergoes the following line flying under supervision (LIFUS):

a. …..

b. …..

c. …..

5. Type and command experience.

5.1……

5.2…….

Appendix to EU-OPS 1.450 E (3) should be

kept in the regulation.

Proposal:

Add: 5.3 The authority may authorise a reduction concerning the above command experience for flight crew members who have category II or III command experience.

comment *1712* comment by: *Dassault Aviation*

Technical comment.

Page 396 GM OPS.SPA.001.LVO(b)(2) §3.1.b and §4.2: these sub-paragraphs requires a head down view of the EVS image so that the right hand pilot is kept in the loop. We still believe that having two pilots monitoring the aircraft trajectory using information - EVS image - coming from the same sensor - EVS infrared camera - is not "safety-oriented". Our proposal is to remove in this GM §3.1.b and §4.2.

comment *3268* comment by: *Eurocontrol CND*

AMC OPS.SPA.001.LVO (b) (2)

ICAO has agreed to GLS as GBAS landing system (PANS ABC, and PANS-OPS)

Proposed action: Change GNSS landing system by GBAS Landing System

comment *6484* comment by: *Konrad Polreich*

AMC OPS.SPA.001.LVO (b)(2) Table 1

For helicopters equipped with EVS the table should be complemented in the left column with the value 500 corresponding to 300 m in the right column, to reflect the lower standard minima with helicopters.

Add a new line above '550' / 350' and fill in '500' / '300' (helicopters only)

comment *7356* comment by: *FAA*

1. GM OPS.SPA.001.LVO (b)(2), para 3.1.b

Comment:

While the need for monitoring from a second pilot is a valuable addition to safety, the specific requirements levied in this paragraph are too restrictive. A monitoring pilot could be effective through the use of other tools than just "a head-down view of the EVS image, or other means of displaying the EVS-derived information …." For example, the monitoring pilot's tool could be a second heads up display or a heads down display of vertical and horizontal position derived from sources other than the EVS.

Recommendation:

Change paragraph 3.1.b to read

For a two-pilot operation, the monitoring pilot should have a means of readily identifying the vertical and horizontal accuracy of the aircraft position in relation to the runway.

comment *7358* comment by: *FAA*

1. GM OPS.SPA.001.LVO (b)(2), para 4

Comment:

In the US, there are operators that are approved to perform operations as low as CAT II with a single pilot. The requirement to have two pilots below 550 m would stand in conflict with this and not allow operators to take advantage of the safety benefits afforded by the use of EVS. An additional inconsistency with the delineation of a 550m restriction is that it would cut into the realm of the lower-than-standard CAT I operations.

Recommendation:

Recommend removing paragraph 4 in its entirety.

B. II. Draft Decision - Part-OPS - Subpart D - Section IV - AMC OPS.SPA.001.LVO(b)(2)(iii) Low visibility operations (LVO p. 396-397

comment *1711* comment by: *Dassault Aviation*

Technical comment.

Page 396 AMC OPS.SPA.001.LVO(b)(2)(iii): with respect to OPS.SPA.030.LVO(a), the only LVO operations where at least 2 pilots are required are LTS Cat1 and EVS operations. Therefore we propose that the term "flight crew member**s**" contained in §1 of the AMC OPS.SPA.001.LVO(b)(2(iii) be corrected into "flight crew member**(s)**" to take into account LVO operations where 2 pilots are formally required by the IR (i.e. LTS Cat1 and EVS) and LVO operations where there is no formal IR requirement (i.e. OTS Cat2, Cat2, Cat3, …). §2h and §2i do not need correction.

Attachment #22

REF AMC OPS.SPA.001.LVO(b)(3) LVO

3.4 Eligible Aerodromes and Runways

The airline is not responsible of the correct functioning of the ILS equipment.

The airline is responsible to proof the correct functioning of the on board equipment by means of 3.1 continuous monitoring.
If the local authority has approved the ILS for LVO cat ll / lll functionality the airline operator must report any deviation which occurred during operation.

However the item described in 3.4 is an incidental check for any aircraft type /runway combination and has no guarantee for any further developments or functioning of the ILS.

Any malfunction or replacement of any item of the installation can have an influence on "eligible aerodromes and runways".

The required assessment has therefore no meaning for the individual airline operator as approval to use the specific equipment is already under continuous investigation.

All ILS installation must be proven by the local authority by means of flight-check. These check will be performed by other airplanes than normally operate on the airports.

The technology is of such a high standard that there will be no need to perform assessments by a specific airline or aircraft type as the local authority performs their regular flight-checks.

No ILS equipment or on board equipment is sold on the market that is not compliant with each other or the ICAO specifications and so there is no sensible check as required here, that is usefull.

This is an irrealistic burden to airlines that is not adding to structural safety.

Any mistake made in maintenance of the ILS or on board equipment will not be prevented because of this requirement.

The whole requirement has to be deleted

as it is not adding any safety but an administrative burden to operators without any benefit.

The requirement seems incident driven and that can never be a basis for such

demanding regulations.

Alternate airports are because of this excluded from planning and use with CATII/III equipment restricting operators while there is no need. It means more fuel to be carried and burned which means more emission as well.

For this regulation a proof of need has to be given if it will be retained as is, but definetely that will not be possible and those requirements with so much impact should not be demanded.

See also attached file with analysis of ILS reliability from the SREADES database, that shows that this requirement is highly exaggerating the risks.

Comment 3.4 a.

This paragraph has been inherited from JAR-OPS where the impracticalities of the requirement were alleviated by the Operators NAA accepting the Approval of the host NAA responsible for the aerodomes LVO approval as being adequate. This was a practical resolution to this requirement.

With the onset of EU-OPS the NAA's have been removed from this equation and are not permitted to alleviate operators in this way. This is a unneccessary inhibiting requirement. It is impractical both operationally and financially to visit all ETOPS and non ETOPS ERAs solely for the purpose of proving CAT III operations. It would be appropriate for Operators to inform the aerodrome of successful CAT II approaches [with reference to aircraft type/variant and make this available ["publish"] approved combinations.

Proposal:

Remove para 3.4 a. and replace with:

For CAT III approved aerodromes [as authorised by the host NAA] it is acceptable for Operators who have NAA LVO approval in their home state for the aircraft type[s]/variants operated by that Operator to utilise the aerodrome[s] in question within that host state. This pre-supposes that the Operator in question has applied for LVO approval in the host country in accordance with the Operators AOC LVO approval.

comment *3269* comment by: *Eurocontrol CND*

AMC OPS.SPA.001.LVO (b) (2) (iii) Low visibility Operations

j. The requirement for the ILS Sensitive area to be protected

In case of Lower than CAT I operations is this requirement applicable down to 200ft, or to the threshold? In other terms do we have to protect for the signal on the visual segment? This is quite important to know as a CAT I airport does not have CAT II holding positions for example.

At several other places this requirement has been extended to LVP have to be in force. LVPs cover more than ILS signal protection.

Finally ILS is not the only system that can support LVO. Same requirement should apply to the other eligible systems.

There is no section that identifies the requirements when low visibility are in force.

There is no clarification regarding ATM procedures for low visibility take off and the ones for approach and landing.

Proposed action:

Clarify the exact operation requirement vis a vis the protection needed on the ground.

Take into consideration other landing system protection criteria (e.g. MLS)

Add a section for when LVP are in force

Add a section clarifying LVP applicability: for take off or for approach and landing.

comment *6099* comment by: *DGAC*

1. Editorial comment:

This GM2 comes before the AMC/GM's which introduce what cat III operations and cat II operation are, it does not help understanding. It would maybe be more appropriate to introduce first what cat II and cat III are

2. What about operators who do not want to be authorized for SPA LVO, but who operate aircraft certified cat I with autoland (cf airbus has been certified gls cat 1 autoland). Do those operators have to apply this AMC? Do they need a SPA?

3. Chapter 2.a.ii: Lots of Cat 2 are now performed in autoland.

This AMC should take into consideration the following criteria to authorize autoland training:

ILS 2nd digit should be at least D or E (see 3.1.3.4.2 vol I annex 10 ICAO)

Glide performance should meet cat II performance

Operator should check compliance between its Aircraft, autoland system and the runway profile and also profile of the terrain before the runway threshold.

Glide slope should not be higher than 3°.

comment *6514* comment by: *IATA*

3.1 Continuous Monitoring

a. After obtaining the initial authorisation, the operations should be continuous monitored by the operator to detect any undesirable trends before they becon hazardous.

This is a new requirement and totally impractical for a day to day operation.

Proposal: Delete

3.4 Eligible Aerodromes and Runways

a. Each aircraft type/runway combinations should be verified by the successf completion of at least one approach and landing in Category II or bett conditions, prior to commencing Category III operations.

b. For runways with irregular pre-threshold terrain or other foreseeable or know deficiencies, each aircraft type/runway combination should be verified l

§3.4 Eligible Aerodromes and runways

We don't know any figures or incidents showing the need for this "in Category II or better conditions," demonstration. Prior to the implementation of EU OPS, DGAC France didn't require this demonstration and we never had a problem when starting new Cat III opertaions. When an aeroplane, an aerodrome and a crew are CAT III certified they should be allowed to proceed. We suggest to delete this requirement.

If the requirement is maintained we would consider normal that EASA provides a database of the already existing demonstrations (per type of aeroplane/QFU) in order for the operators to take advantage of § 3.4.(e)

Recommendation:

Recommend changing LLZ to LOC.

comment *7363* comment by: *FAA*

GM2 OPS.SPA.001.LVO (b)(2)(iii)

(Para 1. a. Page 398)

Comment:

The statement that the critical areas are protected in the U.S. when the weather is less than 800-2 is not entirely accurate.

ATC issues control instructions to avoid interfering operations within ILS critical areas at controlled airports during the hours the Airport Traffic Control Tower (ATCT) is in operation as follows: (a) Weather Conditions. Less than ceiling 800 feet and/or visibility 2 miles.

(1) Localizer Critical Area. Except for aircraft that land, exit a runway, depart or miss approach, vehicles and aircraft are not authorized in or over the critical area when an arriving aircraft is between the ILS final approach fix and the airport. Additionally, when the ceiling is less than 200 feet and/or the visibility is RVR 2,000 or less, vehicle and aircraft operations in or over the area are not authorized when an arriving aircraft is inside the ILS MM.

(2) Glide Slope Critical Area. Vehicles and aircraft are not authorized in the area when an arriving aircraft is between the ILS final approach fix and the airport unless the aircraft has reported the airport in sight and is circling or side stepping to land on a runway other than the ILS runway.

Operators may incorrectly assume that full protection is provided when the weather is 800-2.

Recommendation:

Recommend changing the last sentence to read:

At US airports the Localisor (LOC) and GP critical area protection will begin when weather at the airport is reported less than 800 feet ceiling and/or visibility is less than 2 miles and will be fully protected when the ceiling is less than 200 feet and/or the visibility is RVR 2,000 or less, when an arriving aircraft is inside the ILS MM.

B. II. Draft Decision - Part-OPS - Subpart D - Section IV - AMC1 OPS.SPA.020.LVO LVO operating minima p. 405-406

comment *614* comment by: *ECA - European Cockpit Association*

Comment on AMC1 OPS.SPA.020.LVO: delete item 4

~~**4. In establishing the aerodrome operating minima which will apply to any particular operation, an operator should take full account of: a. the type, performance and handling characteristics of the aircraft; b. the composition of the flight crew, their competence and experience; c. the dimensions and characteristics of the FATO's/runways which may be selected for use; d. the adequacy and performance of the available visual and non-visual ground aids (see AMC 4 OPS.SPA.020.LVO); e. the equipment available on the aircraft for the purpose of navigation and/or control of the flight path, as appropriate, during the take-off, the approach, the flare, the hover, the landing, roll-out and the missed approach; f. the obstacles in the approach, missed approach and the climb-out areas required for the execution of contingency procedures and necessary clearance; g. the obstacle clearance altitude/height for the instrument approach procedures; h. the means to determine and report meteorological conditions; and i. the flight technique to be used during the final approach.**~~

Justification:

This is already in OPS.GEN.150(p34)

comment *2733* comment by: *EHOC*

General

There is a lack of consistency between the approach taken for 'OPS.GEN.150' and that for 'AMC1 OPS.SPA.020.LVO'.

The calculating methods for 'Aerodrome minima' have been split between Subpart GEN and Subpart SPA (with the exception of LVTO) but the objective requirements, that are contained in IR OPS.GEN.150, are only a method of compliance in AMC1 OPS.SPA.020.LVO.

There are potential issues that arise from this:

1. Apart from the title, there is no objective in OPS.SPA.020.LVO for which this is a method of compliance (in fact the objective is itself contained in the AMC). (The AMC could be promoted to an IR with the title 'Aerodrome Operating Minima - General')
2. The text of the AMC (apart from the substitution of the word 'shall' with

'should') contains the rule objective. This can be seen from the wording (my underlining) "An operator should establish, for each aerodrome planned to be used, aerodrome operating minima that are not lower than the values given in...". Apart from the 'should', this sentence contains an imperative.

3. The second paragraph of the AMC also contains an imperative "Such minima should not be lower than the minima that may be established for such aerodromes by the State in which the aerodrome is located, except where specifically approved by that State". (This is a Standard in ICAO Annex 6 Part 2, Chapter 2.2.2.2, and Part 1, Chapter 4.2.8.1 and might therefore be a rule and not a method of compliance - what other method of compliance could there be?)
4. The text that has been used in GEN and the LVO AMC are not quite the same (the AMC is a more accurate representation of the original text).

Apart from convenience, it is not clear why the text for the methods of establishment of the aerodrome minima has been split in this way. In EU OPS, all of the methods of calculation were in one Appendix - with the objective for that minima set in the single rule. The requirements in Subpart SPA.LVO could have just contained: the elements required for the approval of such operations; the intent of the orginal five rules; and their associated appendices (if required, as AMCs). There is an additional complication that the minima for LVTO are not provided in the Subpart SPA.LVO but, as indicated in Appendix 4 to AMC1 OPS.SPA.020.LVO, are contained in AMC3 to OPS.GEN.150 paragraph 3.

It is suggested that the methods of calculation of Aerodrome Minima be returned to a single Appendix attached to OPS.GEN.150. It is also suggested that the IRs in Subpart SPA.LVO are revisited to decide whether the functional grouping of the rules is as logical as it was in the original.

comment *3272* comment by: *Eurocontrol CND*

OPS.SPA.020.LVO 2):

There is no distinction here regarding low visibility procedures for take off and those for landing. It can be that an airport has only take low visibility procedures that would not necessarily protect for the landing operations.

Proposed action: clarify LVP applicability

comment *7509* comment by: *FINNAIR*

Lower than Standard CAT I (LTS CAT I) and Other than Standard CAT II (OTS CAT II) are missing from Table 1.

Proposal

Add LTS CAT I and OTS CAT II into the Table 1 by adding a new column for LTS CAT I and combining OTS CAT II with CAT II (some additions are needed).

B. II. Draft Decision - Part-OPS - Subpart D - Section IV - AMC1 OPS.SPA.020.LVO LVO operating minima - Appendix 1 to AMC1 OPS.SPA.020.LVO p. 406-407

comment *615* comment by: *ECA - European Cockpit Association*

Comment on Appendix 1 to AMC1 OPS.SPA.020.LVO: This appendix should be an IR, not an AMC.

Justification:

All requirements of DH/RVR should be published as Implementing Rules.

comment *967* comment by: *KLM*

It should be mentioned that equivalent ALS as specified by the FAA is allowed to be used.

comment *3273* comment by: *Eurocontrol CND*

Appendix 1 to AMC1 OPS.SPA.020.LVO operating minima

LTS and OTS are not ICAO procedures

Lower Than Standard CAT I:

For DH 200ft LTS allows a RVR 400m whereas DH 199ft OTS allows 450m. This looks inconsistent. Rationale needs to be checked.

There is no requirement for ILS type to be published in AIP. How does an operator find out that the ILS provided at a specific airport fully meets the requirement for lower than Standard CAT I, in particular the fact that the system has been flight checked to the threshold?

Proposed actions:

Correct inconsistency if recognised or document the rationale for the difference.

Identify AIP requirements and potential phraseology changes requirements

Other Than Standard CAT II

OTS definition needs to be changed if CAT I system can only be used for DH at 200ft. For the moment the definition is clearly an operation below 200ft: we would propose to remove this possibility as OTS definition says DH should be lower than 200ft which can not be achieved by ILS I/T/1.

Additionally the same issue applies as above regarding ILS type publication.

Proposed action: remove a) of the eligible system list

comment *7365* comment by: *FAA*

Appendix 1 to AMC1 OPS.SPA.020.LVO LVO operating minima

Comment:

The performance requirement for the ILS to support CAT I operations appears to be excessive.

Class I/T/1 requires Category III localizer performance to threshold. This will result in an increased burden on the aerodrome and facilities organizations. Operations below 450 m require that the ILS be recertified to a Facility Performance Category II standard. This seemingly defeats the concept of providing more useful CAT I operations.

Requiring dual ILS facilities unless the single ILS facilities are rated at level 2 integrity and continuity, is restrictive.

The number of opportunities afforded pilots to successfully land from an approach under low visibility conditions will be unnecessarily limited by constraining the facility requirements for the lower than standard CAT I operations.

Recommendation:

Change paragraph 2 to read:

…..and the ILS should be certified to class I/A/1.

comment *7375* comment by: *FAA*

Appendix 1 to AMC1 OPS.SPA.020.LVO LVO operating minima

Table 1 - Lower than Standard Category I Minimum RVR/CMV vs. Approach Light System (Page 407)

Comment:

The table allows for lower than standard operations with DH's above 200 ft. We need to reassess whether reductions should be allowed under these circumstances.

There are two basic reasons that a DH is raised above 200 ft: either there is an obstacle problem that needs to be mitigated; or, the ILS glide slope is out-of-tolerance and requires a restriction to its use below a certain altitude. Both situations indicate a less than optimum 3D approach and landing operation.

We know of no studies that would support authorizing lower than standard operations with no lights (NALS) or basic lights (BALS).

Recommendation:

The EASA/FAA All Weather Operations Harmonization Working Group should reexamine the operation. In the meantime, we recommend that the columns for BALS and NALS be removed.

comment *7390* comment by: *FAA*

Appendix 1 to AMC1 OPS.SPA.020.LVO LVO operating minima

Table 1 - Lower than Standard Category I Minimum RVR/CMV vs. Approach Light System (Notes on Page 407)

Comment:

The notes state that the visual aids comprise approach lighting, yet the table above the note allows for NALS. If operations are authorized without approach lighting systems, the note needs to be revised. The note and the table can be confusing as to what is the minimum requirement.

Recommendation:

Revise the note or the table.

comment *7393* comment by: *FAA*

Appendix 1 to AMC1 OPS.SPA.020.LVO LVO operating minima

(**Page 407, para 5 a.)**

Comment:

Lower than standard CAT I operations require autoland or HUDLS to 150 ft. This makes the use of a localizer over the runway mandatory if the operator elects to autoland. The localizer SARPS for Facility Performance Category III might not be met in the touch down zone of the runway. You are only requiring that the ILS has to be certified to class I/T/1 which does not support autoland operations. Many antenna types that support CAT I operations are susceptible to disruptions and it can be difficult to protect an autoland (CAT III) sensitive area.

Recommendation:

Either do not require autoland for CAT I operations; or require that the ILS be certified and protected to at least class I/D/1. Also, if the autoland option is retained, the max height of the ILS reference datum or the achieved ILS reference datum should be limited to 18 meters.

B. II. Draft Decision - Part-OPS - Subpart D - Section IV - AMC1 OPS.SPA.020.LVO LVO operating minima - Appendix 2 to AMC1 OPS.SPA.020.LVO p. 407-409

comment *616* comment by: *ECA - European Cockpit Association*

Comment on Appendix 2 to AMC1 OPS.SPA.020.LVO: This appendix should be an IR, not an AMC.

Justification:

All requirements of DH/RVR should be published as Implementing Rules.

comment *1007* comment by: *CAA-NL*

Comment CAA-NL regarding:

1.c the colon after the lead in sentence should be deleted as well as (i) to continue with the requiements in (ii).

Substantiation: DH's lower than 200ft can not be achieved by ILS I/T/1.

comment *4093* comment by: *UK CAA*

Page No: 408

Paragraph No:

Appendix 2 to AMC1 OPS.SPA.020.LVO (1)(c)

Comment:

(c)(i) Class I/T/1 for the operations down to 450 m RVR and to a DH of 200ft or more;

This is not relevant for CAT II operations and therefore the line 'Single ILS facilities are only acceptable if level 2 performance is provided' is also not needed.

Justification:

Cat II operations refer to a DH of 200 ft or less. Therefore stating an ILS requirement for CAT II operations with a DH of 200 ft or more does not make sense.

Class II/D/2 implies a requirement for level 2 performance.

Proposed Text (if applicable):

c. The ILS/MLS that supports other than a Standard Category II operation should be an unrestricted facility with a straight in course (≤ 3º offset) and the ILS should be certificated to~~:~~ ***Class II/D/2.***

~~i. Class I/T/1 for operations down to 450 m RVR and to a DH of 200 ft or more; or~~

~~Class II/D/2 for operations in RVRs of less than 450m or to a DH of less than 200ft.~~

comment *6100* comment by: *DGAC*

c.i. Class I/T/1 has more to do with Lower than standard cat I

Proposal : Suppress line c.i..

For the RVR, check consistency of Table 2 of this appendix 2 and Table 1 – Lower than standard cat I minimum of Appendix 1 to AMC1 OPS.SPA.020.LVO

comment *7398* comment by: *FAA*

Appendix 2 to AMC1 OPS.SPA.020.LVO LVO operating minima

CAT II AND OTHER THAN STANDARD CAT II OPERATIONS

(para 1.b.ii. - Page 408)

Comment:

The RVR values listed in the paragraph are 350/400 m and refers to table 2. The table 2 values are 300/350.

Recommendation:

Revise the values to reflect 300/350 in the paragraph and the table.

comment *7403* comment by: *FAA*

Appendix 2 to AMC1 OPS.SPA.020.LVO LVO operating minima

CAT II AND OTHER THAN STANDARD CAT II OPERATIONS

(para 1.c. - Page 408)

Comment:

The AMC is indicating that a straight in course ≤ 3^{o} offset is acceptable. This would be unacceptable for low RVR operations and autoland. The localizer course could be outside of the limits of the runway.

Recommendation:

Recommend rewording as follows:

The ILS/MLS that supports other than a Standard Category II operation should be an unrestricted facility with a straight in course aligned with runway centerline…..etc,

comment *7407* comment by: *FAA*

Appendix 2 to AMC1 OPS.SPA.020.LVO LVO operating minima

CAT II AND OTHER THAN STANDARD CAT II OPERATIONS

(para 1.c.i., ii. - Page 408)

Comment:

A Class 1/T/1 ILS and a DH of 200 with an RVR of 450 m is describing a lower than standard CAT I operation. Why would you now want to describe it as an other than standard CAT II operation?

Recommendation:

Recommend deleting i., and incorporating ii., into the main paragraph.

Revised text would then be:

The ILS/MLS that supports other than a Standard Category II operation should be an unrestricted facility with a straight in course aligned with runway centerline and the ILS should be certificated to class II/D/2 or better.

comment *7412* comment by: *FAA*

Appendix 2 to AMC1 OPS.SPA.020.LVO LVO operating minima

CAT II AND OTHER THAN STANDARD CAT II OPERATIONS

Table 1 – RVR for Cat II Operations vs DH - Page 408

Comment:

The first column of the bottom row lists "141 and above." It is inconsistent with the text.

Recommendation:

Recommend changing it to "141 to 199" to be consistent with paragraph 1. b. i., above.

comment *7424* comment by: *FAA*

Appendix 2 to AMC1 OPS.SPA.020.LVO LVO operating minima

CAT II AND OTHER THAN STANDARD CAT II OPERATIONS

Note below Table 2 - Other than Standard Category II Minimum RVR vs. Approach Light System – Page 409

Comment:

The note states that approach lights are required to conduct operations.

Recommendation:

Consider rewriting note to make this conditional since the table authorizes NALS operations.

comment *7425* comment by: *FAA*

Appendix 2 to AMC1 OPS.SPA.020.LVO LVO operating minima

CAT II AND OTHER THAN STANDARD CAT II OPERATIONS

Note below Table 2 - Other than Standard Category II Minimum RVR vs. Approach Light System – Page 409

Comment:

The note states "For operations in RVR of 400 m or less, centre line lights *should* be available." The regulation indicates that it is optional.

Recommendation:

Recommend rewording as follows:

"For operations in RVR of 400 m or less, centre line lights shall be available."

comment *7428* comment by: *FAA*

Appendix 2 to AMC1 OPS.SPA.020.LVO LVO operating minima

CAT II AND OTHER THAN STANDARD CAT II OPERATIONS

Para. 5 - Page 409

Comment:

This AMC states that operators "should" ensure that appropriate low visibility procedures are established, etc. This appears to be inconsistent with Draft

Opinion OPS.SPA.020.LVO which uses mandatory language.

Page 92 of the Draft Opinion OPS.SPA.020.LVO LVO operating minima states in pertinent part that:

(b) An operator shall not use an aerodrome for operations in accordance with this section, unless: (1) the aerodrome has been approved for such operations by the State in which it is located; (2) low visibility procedures (LVP) have been established at that aerodrome where LVO are to be conducted.

(c) The pilot-in-command shall ensure that: (1) appropriate LVPs are in force according to information received from Air Traffic Services, before commencing a Low Visibility Take-off, a Lower than Standard Category I, an Other than Standard Category II, or a Category II or III approach, and (2) the status of the visual and non-visual facilities are sufficient prior to commencing a Low Visibility Take-Off, an Approach utilising EVS, a Lower than Standard Category I, an Other than Standard Category II, or a Category II or III approach.

Recommendation:

Consider changing this language to something more mandatory such as shall or must.

comment *617* comment by: *ECA - European Cockpit Association*

Comment on Appendix 3 to AMC1 OPS.SPA.020.LVO: This appendix should be an IR, not an AMC.

Justification:

All requirements of DH/RVR should be published as Implementing Rules.

comment *816* comment by: *CAA-NL*

In table 1 to

Appendix 3 to AMC1 OPS.SPA.020.LVO LVO operating minima

PRECISION APPROACH - CAT III OPERATIONS

the first line of CATIIIA is set to 200m. According to ICAO, through, amdt 33 to Annex 6 part I, amdt 28 to Annex 6 part II and amdt 14 to Annex 6 part III changing this value to 175m should be considered.

comment *890* comment by: *Condor Flugdienst GmbH - FRA HO/R*

Refering to App. 3 to AMC 1 OPS.SPA.020.LVO, Para 1 (a) (i): Precise the wording: a decision height lower

than 100 ft, or no decision height; and "

comment *891* comment by: *Condor Flugdienst GmbH - FRA HO/R*

Please open a new subparagraph 4.3.stating the following:

"For CAT IIIB operations with no decision height there is no requirement for visual contact with

the runway prior to touchdown." Refer to App. 3 to AMC 1 OPS.SPA.020.LVO Para 5.1.

comment *1100* comment by: *Condor Flugdienst GmbH - FRA HO/R*

According Condor the used term "Rollout system" needs to be specified!

comment *4094* comment by: *UK CAA*

Page No: 409

Paragraph No:

Appendix 3 to AMC1 OPS.SPA.020. LVO (1)

Comment:

Definitions of CAT IIIA and CAT IIIB Operations differ from recent ICAO definition. Modify RVR figures as appropriate.

Delete reference to ILS and MLS.

Justification:

ICAO has recently changed the CAT III definitions to harmonise with those used by the FAA.

ICAO also does not specify the approach aid to be used, currently only ILS and MLS are available for CAT II/III but GLS (GBAS) is under development.

Proposed Text (if applicable):

1. General

   Category III operations are subdivided as follows:

   a. Category III A operations. A precision instrument approach and landing ~~using ILS or MLS~~ with:

      i. A decision height lower than 100 ft; and

      ii. A runway visual range not less than ~~200~~ **175** m.

   b. Category III B operations. A precision instrument approach and landing ~~using ILS or MLS~~ with:

      i. A decision height lower than 100 ft, or no decision height; and

      ii. A runway visual range lower than ~~200~~ **175** m but not less than ~~75~~ **50** m.

Where the decision height (DH) and runway visual range (RVR) do not fall within the same Category, the RVR will determine in which Category the

operation is to be considered.

comment *5686* comment by: *Deutsche Lufthansa AG*

Comment:

GM2 Appendix 3 to AMC1 OPS.SPA.020.LVO LVO operating minima reads:

"5.1 For Category III operations with No Decision Height the pilot is not required to see the runway prior to touchdown. The permitted RVR is dependent on the level of aircraft equipment."

This important concept is missing in this Appendix 3 to AMC1

Proposal:

Insert a new para 4.3:

4.3 For CatIIIB operations with no decision height there is no requirement for visual contact with the runway prior to touchdown.

comment *6101* comment by: *DGAC*

The CS AWO 321 and CS AWO 304 are more accurate than this table regarding installed equipment requirements.

Is there a need to specify the conditions on the roll Out control/guidance system since it is not the only equipment requirement difference between the different cat 3 operations?

Proposal : we suggested deleting the column Roll-Out..

comment *7124* comment by: *IACA International Air Carrier Association*

1.a.1.

Replace "i. A decision height lower than 100 ft; and " by

"i. A decision height lower than 100ft, or no decision height; and"

comment *7125* comment by: *IACA International Air Carrier Association*

4.2.

Para. 4.2. should read: "For Cat IIIB operations with a decision height conducted either..."

Suggest new Paragraph 4.3.:

"For Cat IIIB operations with no decision height there is no requirement for visual contact with the runway prior to touchdown". Justification: common sense, see also :

p.413 ***GM2 Appendix 3 to AMC1 OPS.SPA.020 LVO para.5.1***

5. Category III fail operational operations - with No Decision Height

5.1 For Category III operations with No Decision Height the pilot is not required to see the runway prior to touchdown. The permitted RVR is dependent on the level of aircraft equipment.

AMC2 OPS.SPA.020.LVO LVO operating minima TABLE 1 - Failed or downgraded equipment - effect on landing minima

Scope:

The after the column title "FAILED OR DOWNGRADED EQUIPMENT" mentioned note --> (note 1) is not present.

Text to be added:

Add note as applicable or delete the text (note 1) after the column title "FAILED OR DOWNGRADED EQUIPMENT"

Proof:

Not applicable.

Background:

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. Its services range from providing medical advice to repatriating patients to/from Switzerland or any other point of the world. Swiss air-ambulance is a private, non-profit organisation, which operates in accordance with the guiding priniples of the Red Cross. It comes to the aid of people in distress, without respect of their nationality, religious convections or social status. Swiss air-ambulance operates under the Air Operator Certificate CH-AOC-No.1015 issued by the Federal Office of Civil Aviation Switzerland (FOCA) and is compliant with EU-OPS. comment *1235* comment by: *AUSTRIAN Airlines*

How shall we use the table falied or downgraded equipment for LTS Cat I and OTS Cat II?

The problem:

1) LTS Cat I and OTS Cat II are not shown in table falied or downgraded equipment

2) In GM1 OPS.SPA.001.LVO - Terminology the definition shows:

h. 'Lower than Standard Category I Operation'. A Category I Instrument Approach and Landing Operation using Category I DH, with an RVR lower than would normally be associated with the applicable DH.

i. 'Other than Standard Category II Operation'. A Category II Instrument Approach and Landing Operation to a runway where some or all of the elements of the ICAO Annex 14 Precision Approach Category II lighting system are not available.

that implies, that for the LTS Cat 1 the "standard" Cat I rules (tables) apply (if not otherwise indicated) and for OTS Cat 2 the "standard" Cat II rules (tables) apply (if not otherwise indicated).

Now back to table falied or downgraded equipment: with this interpretation i use Cat I column for LTS Cat I and Cat II column for OTS Cat II.

3) The problem now is that the LTS Cat I requires autoland and the visual references like Cat II and OTS Cat II does NOT require a Cat II approach light

system but can also be used with NALS, IALS, etc ..

Some examples where this does not match in table falied or downgraded equipment:

When i use the Cat I column for LTS Cat I:

- Column "Touchdown zone RVR assessment system": should be the same as Cat 2

When i use the Cat II column for OTS Cat II:

- Column "Approach lights": Should be same as for Cat I (Minima for NALS apply)
- Column "Approach lights except the last 210 m": Should be same as for Cat I (Minima for NALS apply)
- Column "Whole runway light system": Should be same as for Cat I (Minima for NALS apply)
- Column "Centreline lights": Day RVR 300 is not applicable as lowest RVR cat OTS Cat II is 350!
- Column "Touchdown zone lights": Day RVR 300 is not applicable as lowest RVR cat OTS Cat II is 350!

1. Table 1 of AMC12 OPS.GEN.150; *and*

paTable 1 of AMC2 OPS.SPA.020.LVO

Comment:

The tables which describe the affect of failed or downgraded equipment on landing minima only apply to operational requirements. A similar strategy should be applied to navaid facility, aerodromes, and air traffic control requirements. The determination that a facility or instrument approach procedure is not suitable for use negates the intent and the effects of these tables for operators. Similar standards are needed to authorize continued operations in the event of system downgrades or failures. In some circumstances, it may be appropriate for approved operators to continue in the event of component failures if those operators use suitable equipment, training, and procedures to mitigate the failure of specific components.

Recommendation:

Apply similar navaid facility, aerodrome, and air traffic control requirements in the event of component failure.

comment *3595* comment by: *Aero-Club of Switzerland*

The interval proposed by the Agency is much too short. We propose:

6. Training should be conducted at intervals of not longer than 5 years.

Justification: The interval proposed by the Agency represents an unnecessary burden on everyone engaged in the transportation of Dangerous Goods. It would be much cheaper to prepare the contents of the training syllabi accordingly, respecting what Phil Condit of Boeing Aeroplane some years ago said: "Quality has to be built-in, not to be tested-in."

B. II. Draft Decision - Part-OPS - Subpart D - Section V - AMC OPS.SPA.040.DG(b) Dangerous goods information and documentation p. 418

comment *1199* comment by: *CAA-NL*

OPS.SPA.040.DG(b) 2. / AMC OPS.SPA.040.DG(b) 2.

Comment 1: This text should appear in OPS.GEN. In addition, it is inappropriate to refer to handling agents.

Justification: The carriage of dangerous goods in passenger baggage is not related to the holding of a dangerous goods approval, which is for the carriage of dangerous goods in cargo. The implementing rules do not apply to handling agents, only operators and they are required to "ensure" notices are provided (which may be delegated to a handling agent). If this comment is not accepted, reference to handling agent would have to be added everywhere in the text where a particular activity may be delegated to a handling agent.

Proposed Text :

1. Delete OPS.SPA.040.DG (b) and consequentially renumber subsequent paragraphs;

2. Add the following to OPS.GEN.030:

"(e) The operator shall ensure that information is promulgated as required by the Technical Instructions so that passengers are warned as to the types of goods which they are forbidden from transporting aboard an aircraft.

(f) The operator shall ensure that notices are provided at acceptance points for cargo giving information about the transport of dangerous goods."

Comment 2

AMC OPS.SPA.040.DG(b) 2.

Comment 2: It is inappropriate to refer to handling agents.

Justification: The implementing rules do not apply to handling agents, only operators and they are required to "ensure" notices are provided (which may be delegated to a handling agent). If this comment is not accepted, reference to handling agent would have to be added everywhere in the text where a particular activity may be delegated to a handling agent (e.g. in the previous sub paragraph)

Proposed Text:

"An operator ~~and, where applicable, his handling agent~~ should ensure that notices……"

comment *1546* comment by: *AIRBUS*

Paragraph 2: The paragraph 2 reads: "An operator and, where applicable, his handling agent should ensure that notices are provided at acceptance points […]." With this AMC, the requirements of the paragraph OPS.SPA.040.DG(b) become applicable to parties that are not operators. This is not in line with the scope of the regulation given in the paragraph OPS.SPA.005.GEN that reads: "This part establishes the requirements to be met by an operator to qualify for the issue or continuation of specific operational approvals."

comment *1565* comment by: *Luftfahrt-Bundesamt*

Since this is a more general passage it should be required in the General section, e.g. as paragraphs (e) and (f) under OPS.GEN.030 rather than in the AMC.

comment *2002* comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

Concern Detail:

This text should appear in OPS.GEN. In addition, it is inappropriate to refer to handling agents.

Comment:

The carriage of dangerous goods in passenger baggage is not related to the holding of a dangerous goods approval, which is for the carriage of dangerous goods in cargo. The implementing rules do not apply to handling agents, only operators and they are required to "ensure" notices are provided (which may be delegated to a handling agent). If this comment is not accepted, reference to handling agent would have to be added everywhere in the text where a particular activity may be delegated to a handling agent.

Proposal:

1 Delete OPS.SPA.040.DG (b) and consequentially renumber subsequent paragraphs;

2 Add the following to OPS.GEN.030:

"(e) The operator shall ensure that information is promulgated as required by the Technical Instructions so that passengers are warned as to the types of goods which they are forbidden from transporting aboard an aircraft.

(f) The operator shall ensure that notices are provided at acceptance points for cargo giving information about the transport of dangerous goods."

comment *2574* comment by: *Walter Mayer, Heliswiss*

This again is not applicable to mountain operations as the sites are always different and because of weather changes, the routing will also be adapted to the circumstances. Again alleviation shall be permitted for mountain ops after

a risk analysis and approval by the national authority.

comment *4100* comment by: *UK CAA*

Page No: 419

Paragraph No: Title

Comment:

The associated OPS.SPA.SFL applicability has been suggested for change (see UK CAA comment) and therefore the AMC title requires alignment.

Justification:

Editorial and alignment.

Proposed Text (if applicable):

Section VI –Helicopter *Commercial* operations without an assured safe forced landing capability

comment *6643* comment by: *Heliswiss International*

Statistics : From 1968 the Swiss AIB reports 18 flame out occurrences (6 on SP and 12 on SE)(10 CAT - 5 AW - 3GA). Out of these 18, 3 were due to HFACS (ice ingestion and fuel contamination). Concerning the SE, on the remaining 9, five happends on Bell 204,205,206, three on SA315B and one on AS350. Considering 390 occurences and a total of 4 engine failure on the type in use for AW-HEMS-SAR, that represent only 1% of the total occurences.

comment *6645* comment by: *Heliswiss International*

From 1968 the Swiss AIB reports 58 occurrences related to technical or maintenance. 25 cases for SP, 28 cases for SE and 5 cases for ME. If we compare to the number of announced occurrences the figures shows : 25 occurrences for SP over a total of 121 representing 21%. 28 occurences for SE over a total of 240 representing 12%. 5 occurences for ME over a total of 29 representing 17%. Single Engine is according to this database the safest type. More, both IHST and EHEST in their respective analysis and research have not come to a result or any recommendations about the performance class type of helicopters. Therefore the choice of the performance class shall be left to the operator, provided he obtain the National Authority AOC required.

comment *6647* comment by: *Heliswiss International*

comment *515* comment by: *EHOC*

General

The text of GM OPS.SPA.001.SFL(b) belongs to OPS.CAT.360.H; it has nothing to do with operations without SFL. It would better if it were (b) of the IR above:

OPS.CAT.360.H

"(b) The approved performance data contained in the Helicopter Flight Manual is used to determine compliance with the requirements of the appropriate performance class, supplemented as necessary with other data acceptable to the competent authority as may be prescribed in the relevant requirements. When applying the factors prescribed for the appropriate performance class, account should be taken of any operational factors already incorporated in the Helicopter Flight Manual performance data to avoid double application of these factors."

Renumber old (b) to (c).

Statistics : From 1968 the Swiss AIB reports 18 flame out occurrences (6 on SP and 12 on SE)(10 CAT - 5 AW - 3GA). Out of these 18, 3 were due to HFACS (ice ingestion and fuel contamination). Concerning the SE, on the remaining 9, five happends on Bell 204,205,206, three on SA315B and one on AS350. Considering 390 occurences and a total of 4 engine failure on the type in use for AW-HEMS-SAR, that represent only 1% of the total occurences.

From 1968 the Swiss AIB reports 58 occurrences related to technical or maintenance. 25 cases for SP, 28 cases for SE and 5 cases for ME. If we compare to the number of announced occurrences the figures shows : 25 occurrences for SP over a total of 121 representing 21%. 28 occurences for SE over a total of 240 representing 12%. 5 occurences for ME over a total of 29 representing 17%. Single Engine is according to this database the safest type. More, both IHST and EHEST in their respective analysis and research have not come to a result or any recommendations about the performance class type of helicopters. Therefore the choice of the performance class shall be left to the operator, provided he obtain the National Authority AOC required.

This. GM dealing with the use of performance data contained in the Helicopter Flight Manual should not be located in OPS.SPA as it is not restricted to operations without an assured safe forced landing capability but is also

applicable to OPS.COM and OPS.CAT.

AMC OPS.SPA.001.SFL(b)(1) and (b)(2) Operations without an assured

safe forced landing capability

POWERPLANT RELIABILITY STATISTICS

Comment: It is stated in this AMC that sudden power loss events (those exceeding a loss of more than 30% of take-off power) should not exceed a rate of 1 event per 100,000 engine hours, in a 5 year moving window. Therefore, it is not sensible to also state that an in flight shut-down (IFSD) rate of 3 per 100,000 engine hours would also be acceptable. Not only do these figures contradict each other, but a sudden power loss event may not result in an IFSD event. Consequently, the text should be amended as shown below, with deleted text struck through and additional text in bold:

1. Except in the case of new engines, power plant reliability should **not** show sudden power loss **event rates** ~~from the set of in-flight shutdown (IFSD) events not~~ exceeding 1 per 100,000 engine hours in a 5 year moving window. ~~A rate in excess of this value, but not exceeding 3 per 100,000 engine hours, may be accepted by the competent authority after an assessment showing an improving trend.~~
2. New engines should be assessed on a case-by-case basis.
3. After the initial assessment, updated statistics should be periodically reassessed; any adverse sustained trend will require an immediate evaluation to be accomplished by the operator in consultation with the competent authority and the manufacturers concerned. The evaluation may result in corrective action or operational restrictions being applied.

comment *6103* comment by: *DGAC*

This text deals with the eligibility of helicopters to be authorised under SPA SFL. As it is more or less the same philosophy as ETOPS, the provision as regards the sudden power loss rate including the following GM following this AMC (GM OPS.SPA.001.SFL(b)(1) and (b)(2)) should be in an airworthiness text. Otherwise the people from EASA airworthiness will not be aware of their responsibility regarding the eligibility.

in use for AW-HEMS-SAR, that represent only 1% of the total occurences.

From 1968 the Swiss AIB reports 58 occurrences related to technical or maintenance. 25 cases for SP, 28 cases for SE and 5 cases for ME. If we compare to the number of announced occurrences the figures shows : 25 occurrences for SP over a total of 121 representing 21%. 28 occurences for SE over a total of 240 representing 12%. 5 occurences for ME over a total of 29 representing 17%. Single Engine is according to this database the safest type. More, both IHST and EHEST in their respective analysis and research have not come to a result or any recommendations about the performance class type of helicopters. Therefore the choice of the performance class shall be left to the operator, provided he obtain the National Authority AOC required.

comment *6388* comment by: *Trans Héli (pf)*

Statistics : From 1968 the Swiss AIB reports 18 flame out occurrences (6 on SP and 12 on SE)(10 CAT - 5 AW - 3GA). Out of these 18, 3 were due to HFACS (ice ingestion and fuel contamination). Concerning the SE, on the remaining 9, five happends on Bell 204,205,206, three on SA315B and one on AS350. Considering 390 occurences and a total of 4 engine failure on the type in use for AW-HEMS-SAR, that represent only 1% of the total occurences.

B. II. Draft Decision - Part-OPS - Subpart D - Section VI - GM OPS.SPA.001.SFL(b)(1) and (b)(2) Operations without an assured safe forced landing capability p. 419-421

comment *1746* comment by: *Robert R McGregor*

GM OPS.SPA.001.SFL(b)(1) and (b)(2) Operations without an assured safe forced landing capability

DETERMINATION OF SUDDEN POWER LOSS RATE

Comment: 'Applicability factor' and the 'assumptions made on the efficiency of corrective actions' are subjective items and should not be used in the primary statistical analysis. Consequently, the text should be amended as shown below, with deleted text struck through and additional text in bold:

a. Share of roles between the helicopter and engine Type Certificate Holders (TCH).

i. The provision of documents establishing the in-service sudden power loss rate for the helicopter/engine installation; the interface with the operational authority of the State of Design should be the Engine TCH or the Helicopter TCH depending on the way they share the corresponding analysis work.

ii. The Engine TCH should provide the Helicopter TCH with a document including: the list of in-service power loss events~~, the applicability factor for each event (if used), and the assumptions made on the efficiency of any corrective actions implemented (if used)~~;

iii. The Engine or Helicopter TCH should provide the operational authority of the State of Design or, where this authority does not take responsibility, the competent authority, with a document that details the calculation results - taking into account:

A. the events caused by the engine and the events caused by the engine installation;

B. ~~the applicability factor for each event (if used), the assumptions made on the efficiency of any corrective actions implemented on the engine and on the helicopter (if used); and~~

C. the calculation of the power plant power loss rate.

b. Documentation.

The following documentation should be updated every year:

i. The document with detailed methodology and calculation as distributed to the authority of the State of Design;

ii. A summary document with results of computation as made available on request to any competent authority;

iii. A Service Letter establishing the eligibility for such operation and defining the corresponding required configuration as provided to the operators.

c. Definition of the "sudden in-service power loss".

The sudden in-service power loss is an engine power loss:

i. larger than 30 % of the take-off power;

ii. occurring during operation; and

iii. without the occurrence of an early intelligible warning to inform and give sufficient time for the pilot to take any appropriate action.

d. Data base documentation.

Each power loss event should be documented, by the engine and/or helicopter TCH's, as follows:

i. incident report number;

ii. engine type;

iii. engine serial number;

iv. helicopter serial number;

v. date;

vi. event type (demanded IFSD, un-demanded IFSD **or sudden power loss**);

vii. ~~presumed~~ cause;

viii. ~~applicability factor when used;~~ and

ix. reference ~~and assumed efficiency~~ of the corrective actions that will have to be applied (if any).

e. Counting methodology.

Various methodologies for counting engine power loss rate have been accepted by authorities. The following is an example of one of these methodologies:

i. The events resulting from:

A. ~~unknown causes (wreckage not found or totally destroyed, undocumented or unproven statements); or~~

B. ~~where the engine or the elements of the engine installation have not been investigated (for example when the engine has not been returned by the customer); or~~

C. an unsuitable or non representative use (operation or maintenance) of the helicopter or the engine;

are not counted as in-service sudden power loss and the applicability factor is 0%

ii. The events caused by:

A. the engine or the engine installation; or

B. the engine or helicopter maintenance, when the applied maintenance was compliant with the Maintenance Manuals; are counted as engine in-service sudden power loss and the applicability factor is 100 %.

iii. ~~For the events where the engine or an element of the engine installation has been submitted to investigation which did not allow defining a presumed cause, the applicability factor is 50 %.~~

f. Efficiency of corrective actions. The corrective actions made by the engine and helicopter manufacturers on the definition or maintenance of the engine or its installation could be defined as mandatory for specific commercial air transport (CAT) operations. ~~In this case, the associated reliability improvement could be considered as mitigating factor for the event. A factor defining the efficiency of the corrective action could be applied to the applicability factor of the concerned event.~~

g. Method of calculation of the power plant power loss rate. The detailed method of calculation of the power plant power loss rate should be documented by engine or helicopter TCH and accepted by the relevant authority.

Remarks: It is a lesson from history, that measures taken to improve a system do not always have a satisfactory result. The SS Titanic was widely believed to be unsinkable, but in 1912, its system of watertight compartments failed to prevent the ship sinking after a collision with an iceberg. At the inquiry into the disaster, the superior design of the watertight compartments on the SS Mauritania and SS Lusitania was quoted in evidence and the Titanic's sister ship SS Britanic was modified to address this design weakness. Two years later the SS Empress of Ireland, despite being equipped with sections of double hull and watertight compartments, sank after a collision and more than 1,000 fatalities resulted. In 1915, the modified SS Britanic struck a mine and despite the improved design of watertight compartments, sank in less than an hour. Later that year, the SS Lusitania, was hit by a torpedo and despite her 'superior' watertight compartments also sank with colossal loss of life. And in 1956 the 'unsinkable' Andrea Dorea foundered after a collision with the MV Stockholm, despite her modern watertight compartments.

The moral of this story is that one should be conservative when it comes to anticipating how successful a modification to a critical system will be. Only a period of in-service usage with an accompanying reduction in instances of failures can give confidence to an assumption that a problem has been solved.

In the case of helicopter operations, without an assured safe forced landing capability, which are predicated upon very low engine failure rates, the benefits that may follow from changes in design and maintenance practices should not be anticipated. Instead, the statistics of sudden power loss should be used unmodified in order to determine the average failure rate, and the associated trend should be established by means of a linear regression of the primary data.

We think what the Agency proposes is an impossible to follow, especially in mountain areas.

Justification: Not everything can be planned and documented in advance. That is why there is a PiC onboard any aircraft who is able to judge and to decide.

Another remark: After having read all Agency proposals referring to helicopter operations we think that offshore operations at sea level were considered to a very much higher degree than operations in mountain areas where very often helicopter operations contribute greatly to assure everything which can be summarized under the term of "logistics".

comment *4424* comment by: *Helikopter Air Transport GmbH / Christophorus Flugrettungsverein*

Should state: 2. Part C of the Operations Manual should therefore contain for each public interest site a diagram or annotated photograph showing the main aspects, the dimensions, the non-conformance with performance class 1

requirements, the main risks and the contingency plan should an incident occur **or a reference where such information can be found. It is accaptable that such informations are published in an electronic format**.

Diese Forderungen ist zumindest für HEMS vollkommen utopisch und praktisch nicht umsetzbar: Es liegt in der Natur des HEMS-Flugbetriebs, dass nicht vorher bestimmt werden kann, in welches Krankenhaus der Patient geflogen wird. Dies entscheidet sich je nach Art der Verletzung und Verfügbarkeit der medizinischen Leistungen erst während des konkreten Einsatzes. Um gewährleisten zu können, dass jeder transportierte Patient die entsprechende notwendige medizinische Indikation erhält, muss sichergestellt sein, dass jeder einzelne Hubschrauber unserer Flotte im konkreten Bedarfsfall auch jedes Krankenhaus anfliegen kann. Dazu müssten aber für alle vorhandenen Hubschrauberflugplätze an Krankenhäusern, an denen keine Möglichkeit zur Durchführung einer sicheren Notlandung während der Start- und Landephase besteht landeplatz-spezifische Verfahren entwickelt werden. Dies ist bereits allein aufgrund der Vielzahl der existierenden Krankenhauslandesstellen (allein in Deutschland insgesamt über 1.000) praktisch nicht umsetzbar. Außerdem kann dies generell nicht Aufgabe jedes einzelnen Operators sein, sondern ist vielmehr originäre Aufgabe des jeweiligen Landeplatzbetreibers.

Denkbar und auch umsetzbar ist dagegen die Entwicklung und Beschreibung von einigen grundsätzlichen Standardverfahren für den An-/Abflug ohne Möglichkeit zur Durchführung einer sicheren Notlandung. Dies wäre unserer Erfahrung nach auch aus dem Gesichtspunkt der Sicherheit vollkommen ausreichend:

Von 1970 bis Ende 2008 hat die ADAC Luftrettung GmbH über 500.000 Rettungseinsätze durchgeführt. In der Regel sind pro Rettungseinsatz drei Starts und drei Landungen anzusetzen, die, bedingt durch die orographischen Vorgaben und des Einsatzauftrages, regelmäßig nicht auf einem flugplatzähnlichen Gelände durchgeführt werden können. In der Summe der genannten Rettungseinsätze und der daraus resultierenden knapp **3 Millionen** Starts und Landungen hat innerhalb der ADAC Luftrettung GmbH nicht ein einziger Triebwerkausfall zu einem Flugunfall geführt. Insofern sind die derzeit gemäß JAR-OPS 3 deutsch (in der bis zum 31.12.2009 geltenden Fassung) geregelten Anforderungen zur Erreichung eines angemessenen Sicherheitsniveaus vollkommen ausreichend. Eine weitere Verschärfung ist nicht erforderlich. Mit Einführung der JAR-OPS 3 hat die ADAC Luftrettung GmbH mehr als **100.000.000,00 €** für die Modernisierung der Hubschrauberflotte investiert. Alle eingesetzten Hubschrauber sind gemäß Kategorie A zugelassen und nach JAR 27/29 zertifiziert.

Wir beantragen daher, HEMS-Flüge auch zukünftig generell mit Hubschrauber zertifiziert nach Kategorie A in Übereinstimmung mit

Flugleistungsklasse 2 (ohne Exposure Time und UMS) durchführen zu können und von den Anforderungen des Subpart D, Section VI auszunehmen.

B. II. Draft Decision - Part-OPS - Subpart D - Section VI - AMC OPS.SPA.001.SFL(b)(4) and (b)(5) Operations without an assured safe forced landing capability p. 421-423

comment *1206* comment by: *EUROCOPTER*

Comment on § 5.:

The requirement is already covered by OPS.SPA.001.SFL (b)(6). So this requirement should not be listed as one of the set of conditions requested by OPS.SPA.001.SFL (5).

Proposal is to delete § 5.:

~~*5. Establish training for the flight crew which should include the discussion, demonstration, use and practice of th etechniques necessary to minimise the risks;*~~

comment *5709* comment by: *Robinson Helicopter Company*

The requirements for an engine monitoring system given in this AMC are specific to turbine powered helicopters and are not appropriate for piston powered helicopters. The requirements appear to be identical to those of ACJ-2 to Appendix 1 to JAR-OPS 3.517(a). A proposal for revising ACJ-2 to extend its applicability to piston powered helicopters was previously submitted to the JAR-OPS 3 HSST, and the relevant paragraphs are provided below for reference:

2. Conduct the preventive maintenance actions recommended by the helicopter or engine manufacturer as follows:

2.1 Engine oil spectrometric and debris analysis - as appropriate;

2.2 Engine trend monitoring, based on available power assurance checks for turbine engines, or cylinder compression checks for reciprocating engines;

2.3 For turbine engines, engine vibration analysis (plus any other vibration monitoring systems where fitted).

2.4 Oil consumption monitoring.

3. The Usage Monitoring System should fulfil at least the following:

3.1 Recording of the following data:

• Date and time of recording, or a reliable means of establishing these parameters;

• Amount of flight hours recorded during the day plus total flight time;

For turbine engines:

• N1 (gas producer RPM) cycle count;

- N2 (power turbine RPM) cycle count (if the engine features a free turbine);
- Turbine temperature exceedance: value, duration;
- Power-shaft torque exceedance: value, duration (if a torque

B. II. Draft Decision - Part-OPS - Subpart D - Section VI - AMC OPS.SPA.005.SFL(b) and (c) Applicability p. 423

comment *516* comment by: *EHOC*

Paragraph 1.b.

These conditions apply only to the take-off phase; the wording should be:

"b. for operations from a helideck..."

Paragraph 2.b.

These conditions apply only to the landing phase; the wording should be:

"b. for operations to a helideck..."

comment *1361* comment by: *EUROCOPTER*

Proposal: In order to restore the original JAR-OPS 3 text (JAR-OPS 3.520 (a)(3)(ii) for take-off; JAR-OPS 3.535(a)(3)(ii) for landing), Eurocopter propose the following wording modifications:

§ 1 b.: write: *"for operations* ~~***to /***~~ ***from*** *a helideck,* ***either when located*** *in a hostile environment* ~~***and***~~ ***or with a helicopter that has a MPSC of more than 19***, ~~***a non-hostile environment,***~~ *the take-off mass …"*

§ 2 b.: write: *"for operations* ***to*** ~~***/ from***~~ *a helideck,* ***either when located*** *in a hostile environment* ***or with a helicopter that has a MPSC of more than 19*** *,* ~~***a non-hostile environment,***~~ *the landing mass …"*

Rationale:

In JAR-OPS 3.520 (a)(3)(ii) and JAR-OPS 3.535(a)(3)(ii), the additional requirements (so called 'Enhanced PC2') are applicable either to helicopters located in a hostile environment whatever the MPSC is (condition B) or to helicopters with MPSC of more than 19 (condition A).

comment *4101* comment by: *UK CAA*

Page: 423

Paragraph No:

AMC OPS.SPA.005.SFL(b) and (c)

Comment:

Minor editorial change to correct text to align with sense of the context of take-off conditions in 1(b) and landing conditions in 2(b).

Justification:

Editorial.

Proposed Text (if applicable):

1b. for operations ~~to/~~from a helideck in a hostile environment …

2b. for operations to~~/from~~ a helideck in a hostile environment …

comment *6106* comment by: *DGAC*

(1)(b) and (2)(b) : We have reservations regarding the use of "Enhanced Performance Class 2" as we are not sure that the data will be made available to the operator by the manufacturer.

comment *6318* comment by: *Heliswiss International*

Applicability : This alleviation has been incorporated into Part OPS.SPA. Most of the clauses have been bound up into the requirement but the original guidance on when it might be applicable is missing. It might be clearer if there was guidance attached to OPS.SPA.005.SFL paragraph (d)(3).JAR guidance was as follows: IEM to Appendix 1 to JAR-OPS 3.005 Helicopter operations over a hostile environment located outside a congested area 1 The subject Appendix has been produced to allow a number of existing operations to continue.

comment *6330* comment by: *Heliswiss International*

Applicability : This alleviation has been incorporated into Part OPS.SPA. comment *6331* comment by: *Heliswiss International*

It is expected that the alleviation will be used only in the following circumstances: 1.1 Mountain Operations; where present generation multi-engined aircraft cannot meet the requirement of Performance Class 1 or 2 at altitude. 1.2 Operations in Remote Areas; where existing operations are being conducted safely; and where alternative surface transportation will not provide the same level of safety as single-engined helicopters; 2 The State issuing the AOC and the State in which operations will be conducted should give prior approval .3 If both approvals have been given by a single State, it should not withhold, without justification, approval for aircraft of another State. See TGL 43 HEMS.Performance Class 2 and 3 shall have no restrictions provided the operator obtain the AOC validated by the National Authority.

B. II. Draft Decision - Part-OPS - Subpart D - Section VI - GM1 OPS.SPA.005.SFL(b) Applicability p. 424-426

comment *1116* comment by: *EUROCOPTER*

Comment on § 7. Variation of wind speed:

It is not correct to write that 10 kts wind increases by 5 ft the deck edge clearance. This result is depending on the helicopter type. There are even cases where the wind will reduce the deck-edge margin.

Wording modification proposal:

7. Variation of wind speed

*...**For certain helicopter types,** simulation has shown that a 10 knot wind can give an extra 5 ft deck edge clearance compared to a zero wind condition.*

B. II. Draft Decision - Part-OPS - Subpart D - Section VI - GM2 OPS.SPA.005.SFL(b) Applicability p. 426-433

comment *4654* comment by: *Bristow Helicopters*

In JAR OPS 3 the operator was required to "take account of deck edge miss" when complying with PC2e. In this section the word "assure" is used in the context of deck edge miss, which is a fundamental change to the requirement, i.e. a hardening of the requirement. In the case of a moving deck it is not possible to "assure" a deck edge miss of 15 feet as the deck is also moving and its position (both absolute and relative to the helicopter) cannot be known by the crew and therefore the value of deck edge miss cannot be assured.

Due to deck motion, sea motion and the uncertainty over helicopter trajectory, absolute values of a 15 feet deck edge miss or 35 feet sea miss distance cannot be applied in practice

comment *6530* comment by: *ADAC Luftrettung GmbH*

GM OPS.SPA.005.SFL(c)

Auch nach vielfacher Bearbeitung erschließt sich mir die Begründung eines absoluten Limits der Exposure bei 200 ft **<u>überhaupt nicht!!</u>**

OPS.SPA.005.SFL muss angewendet werden, wenn z.B. an einer HEMS Operating Site die Voraussetzungen für PC 1 nicht erfüllt werden (können). Unter diesen Umständen kann man aber nicht davon ausgehen, dass nach einem Start gemäß CAT A, in 200 ft automatisch PC1 und obstacle clearance erreicht ist.

Bei HEMS-Flügen muss geländebedingt oft in Senken (HEMS Operating Site) gelandet werden. Da bei CAT A-Verfahren Rückenwind verboten ist, ist die Startrichtung durch den Wind bereits vorgegeben. In solchen Fällen (Senken) bereits in 200 ft OEI die in GM OPS.SPA.005.SFL(c) geforderte obstacle clearance zu haben ist nicht immer gegeben.

Ich bin seit vielen Jahren TRI(H) und TRE(H) und fliege seit knapp 20 Jahren HEMS, aber von einem absolutem Limit der Exposure in 200 ft habe ich noch nie etwas gehört. Und nochmal, es ergibt keinen Sinn. Es würde sehr viel mehr Sinn machen, wenn für solche Fälle ein vertikales Startverfahren unter Ausnutzung des höchstzulässigen kritischen Zeitraums (maximum permitted eposure time) entworfen wird. Für was gibt es die Maximum Permitted Exposure Time, wenn ich sie unter Umständen nicht ausnutzen kann.

Im Übrigen hier die Definition eines CAT A Startes von Eurocopter, welche sich unwesentlich von der Definition PC 1 unterscheidet.

DEFINITIONS

Category A Takeoff is determined so that, if one engine fails at any time after the start of takeoff, the aircraft can

- prior to TDP return to and stop safely on the takeoff area, or
- – after TDP continue the takeoff and climb out and attain single-engine forward flight.

Was in allen FM fehlt ist ein Startverfahren nach Exposure Time. In einem solchem Startverfahren sollte anhand einer Tabelle die vertikale Steighöhe bei den vorhandenen Umgebungsbedingungen (PA, Temp, Wheight, Wind) innerhalb der m. p. Exposure Time zu ermittlen sein. Mit der ermittelten Höhe kann der Pilot schon vor der Landung an der HEMS Operating Site abschätzen, ob er unter Anwendung der m. p. Exposure Time von der ausgewählten HEMS Operating Site wieder starten kann.

Paragraph 5.

The original text 'per se' has been translated as 'such as' instead of retaining the original, or using the more correct 'as such'.

That this (trivial attempt at a revision) was observed is somewhat of a minor miracle; why has text that was supposed just to be 'transposed' from JAR-OPS been subject to (apparently random) revision without: (1) quality control; (2) notification of the change; and (3) justification?

It is not sufficient to make a statement in the Explanatory Text that changes have been made to provide clarity or legal certainty.

To find this change required that a large number of highly qualified personnel be removed from essential safety duties to undertake a task (reading and finding every single change of wording and phrasing - both of JAR-OPS and EASA OPS - and comparison of the resulting text) that could have been simplified by the use of an appropriately constructed quality control system. There does not appear to have been adequate justification of this burden on industry.

Proposal is to delete § 6:

~~***6. Specifically, the use of this exception to the requirement for a safe forced landing (during take-off or landing) does not permit semi-continuous operations over a hostile environment such as a forest or hostile sea area. It can therefore be seen as a limited alleviation from AMC4 OPS.CAT.H.355 1.a. which states that: "operations are only conducted to/from those aerodromes/operating sites and over such routes, areas and diversions contained in a non-hostile environment…".***~~

Reason: consistency with our proposal to introduce the DGAC alleviation "50 % 5 minutes" en-route in OPS.SPA005.SFL (d)(4) (see our comment n° 1106).

Comment:

Subparagraphs 3 and 4(a) & (b) requires amending as detailed below

Justification:

ACJ OPS 3.540 b) 3 and 4 includes the additional proviso "before reaching Vy" when considering the take-off condition.

Proposed text:

3. Take-off flight path is not used in performance class 3 and, consequently, the term 'take-off and landing phases' is used to bound the limit of exposure. For the purpose of performance class 3, the take-off and landing phases are considered to be bounded by: a. for the take-off no later than **Vy or** 200 ft above the take-off surface; and

4. Ground level exposure – and exposure for elevated FATO's or helidecks in a non-hostile environment – is permitted for operations under an approval in accordance with section OPS.SPA.SFL. Exposure in this case is limited to the 'take-off and landing phases'.

What is the practical effect of this bounding of exposure? Consider a couple of examples: a. A clearing: an operator may consider a take-off/landing in a clearing when there is sufficient power, with all engines operating, to clear all obstacles in the take-off path by an adequate margin (this, in ICAO, is meant to indicate 35 ft). Thus, the clearing may be bounded by bushes, fences, wires and, in the extreme, by power lines, high trees etc. Once the obstacle has been cleared – by using a steep or a vertical climb (which itself may infringe the HV diagram) - the helicopter reaches **Vy or** 200 ft, and from that point a safe forced landing must be possible. The effect is that whilst operation to a clearing is possible, operation to a clearing in the middle of a forest is not (except when operated in accordance with OPS.SPA.005.SFL (d)(3)).

b. An aerodrome surrounded by rocks: the same applies when operating to a landing site that is surrounded by rocky ground. Once **Vy or** 200 ft has been reached, a safe forced landing must be possible.

comment *6107* comment by: *DGAC*

There used to be an IEM in JAR OPS 3 explaining the reason for the exposure time for operations in the mountain and in remote areas? There is no more explanation. To help standardisation, we suggest to add a GM which could be the same as the IEM of JAR OPS 3 on the subject.

comment *6490* comment by: *DGAC*

Proposal:

Delete 6.

Justification:

Consistency with the DGAC proposal to introduce the alleviation en-route.

B. II. Draft Decision - Part-OPS - Subpart D - Section VI - AMC OPS.SPA.005.SFL(e) Applicability p. 434

comment *1079* comment by: *REGA*

8%-requirement

The requirement will be an issue at higher altitudes and/or higher temperatures. This leads to an obligation to reduce mission weight, e.g. fuel quantity.

Example (EC145)

To achieve the 8% climb gradient in respect of the fuel requirement, the endurance will be limited to 55 minutes under day condition and 42 minutes at night.

Proposal

If it is not possible to comply at all time with the requirement of the 8% climb gradient due to performance or operational reasons, take-off may be carried out with multi-engine helicopters (Category A certified), in performance class 2 providing that these deviations are described in the operations manual and have been approved by the competent authority.

comment *3019* comment by: *REGA*

The following paragraph is to delete without replacement

4.6.2, d. For helicopter operations, IR landing or searchlight (page 442)

Reasons for an application

In civil NVIS OPS there is no need for covered missions like military or police OPS. Using a conventional landing or searchlight in praxis is no problem at all. Far from it – it increases the situational awareness. The perception with a conventional landing or searchlight (combined with NVG) is closer to the prevalent atmospheric conditions when changing later on from aided to unaided NVIS flight during approach.

As long as we are not conducted below the VFR weather minima for the type of night operations being conducted (see OPS.SPA.020.NVIS operating minima), IR landing or searchlight should not be required.

Rega (Swiss Air-Ambulance Ltd.) is operating with this culture since 1988 in civil use of NVIS and we never had any problems.

Remarks

Without tactical aspects civil NVIS OPS is much easier than military or police OPS. So keep the system simple. Most of the military NVIS accidents happened close to ground "on NVG". This is the reason why Rega is not using NVG cloth to ground.

There are some requirements and experiences of military or police OPS, as shown to the subject "IR landing or searchlight", they are not applicable to civil NVIS OPS. Civil OPS should learn about military or police OPS but also has do develop "the civil use on NVIS".

Shown in "4.8 Training References" there are no civil experiences influences the subject NVIS – not just yet.

comment *7366* comment by: *ADAC Luftrettung GmbH*

Please add: than the provision is more flexible

4.5.3 has logged at least one hundret NVIS flights **or 30 hrs. Flight time under NVIS** as pilot-in-command

B. II. Draft Decision - Part-OPS - Subpart D - Section VII - AMC OPS.SPA.010.NVIS(a) Equipment requirements for NVIS operations p. 451-452

comment *1080* comment by: *REGA*

Attachment #23

In the EC 145 the Radio Altimeter - digital type - is integrated in the primary flight display screen. This Radio Altimeter provides the pilot with visual altitude information, not only numbers, and an audio/visual warning.

see attachement, page 25.

There is no obvious reason to demand for NVIS operation an analogue type

Proposal 1.1

The radio altimeter should:

a. be of ~~an analogue~~ type display providing graphical visual altitude information..

comment *1081* comment by: *REGA*

1.1

d. No obvious reason why require more than for IFR- and NVFR-flights

comment *2196* comment by: *Heliswiss*

1.3 Recency 3 night NVIS in 90 day

1.3 : Not applicable. Therefore the minimum acceptable requirement would be 1 NVIS mission with 3 landings in 90 days and can be combined with other check or training like HHO.

comment *2497* comment by: *Catherine Nussbaumer*

20 hours PIC : It is nonsense as NVIS is a safety device. Not permitting the usage of such a device is unacceptable. The minimum requirement to use NVIS is to have completed night training. The use of NVIS is then left to the authority and responsibility of the flight ops manager of the company in accordance with the national authority

Paragraph 1.

Because of the conditional text contained in OPS.SPA.025.HHO, it will be necessary to make the following addition:

"The operations manual should contain the criteria for establishing the appropriate performance standard."

Paragraph 3.

This would work much better if the objective requirement for a supplement is already specified (see the comment to OPS.SPA.001.HHO(b)(3).

Switzerland has a long tradition and large experience in this field of operations. Most of the commercial activities in Switzerland today are focused on aerial work, especially transport of cargo.

After a lot of accidents the last 3 decades the Swiss authority toghether with the helicopter industry decided to develop a training syllabus for external sling operations. This syllabus bases on the accident analysis and the large experience from the industry.

Since the authority requires those more demanding instruction and experience before beginning hook (or hoist) operations, Switzerland experiences significantly less helicopter accidents!

Please see the attached training program and syllabus.

2.3 Recency

REGA has a large experience within the field of operations.

The HEMS crew (pilots and technical crew members) are checked out once a year for skill (standard and emergency procedures). Medical passengers (medic) will be checked every month on ground training; independently if they had performed real hoist operations or not. Pilots will not be able to perform hoist operations before they have a large transport experience. Please see the attachment.

Regarding proportionality - safety versus economic and environmental aspects - a recency required according 2.3. is not adequate.

For instance: In summer times night begins after 10 p.m.. According the national law aerodromes are closed down for training activies between 10 p.m. and 6 a.m.. Even when flying outside of aerodromes at nights, noise will be accompanied by neighborhood protest.

REGA requires the attached syllabus for their own pilots. Based on this company policy, pilots should be able to operate at a high level of safety, even with less restrective recency requirements: One check and training per year.

comment *6082* comment by: *Irish Aviation Authority*

Comment:

Operating Procedures 1. - Within the text the phrase "at **the** appropriate power setting" is used. This too prescriptive without "the appropriate power setting" being further defined.

Justification:

Provision of appropriate guidance material.

Proposed text: Amend text to include a definition of "the appropriate power setting" or change the text to read "an appropriate power setting".

comment *6086* comment by: *Irish Aviation Authority*

Comment:

Crew Composition 2.4.2 - The text refers to the requirement for two pilots to be employed when operations are carried out below the VFR minima. This should be reviewed as by definition operations carried out below the VFR minima would have to be carried out under IMC and as such IFR minima should be applied.

Justification:

Provision of appropriate guidance material that complies with flight rules minima.

comment *6109* comment by: *DGAC*

Proposal : Renumber this AMC "AMC.OPS.SPA.001.HHO (b)(3)" instead of "AMC.OPS.SPA.001.HHO (b)(4)".

2.2 : The minimum shall be defined by the National authority / depending on the kind of work, environement and usage.

2.2.2 Grundsätzlich ist es problematisch die notwendige Erfahrung an bestimmte Werte (Flugstunden, Cycles etc.) festzumachen. Wir sind zur Erkenntnis gekommen, dass es in erster Linie von den fliegerischen Fähigkeiten des einzelnen Piloten abhängt, wie schnell oder langsam ein Erfahrungsschatz aufgebaut wird, der zu einer sicheren Flugdurchführung - auch in kritischen Einsätzen - führt.

Deshalb sollte es dem Betreiber (Fachbereichsleiter Flugbetrieb) überlassen werden, festzustellen, ob ein Pilot für die vorgesehene Tätigkeit geeignet ist (Eigenverantwortung)!!!

Daneben beantragen wir höchstvorsorglich folgende Änderungen:

The minimum experience level for a pilot-in-command conducting HHO flights should not less than:

a. Offshore

i: 1000 hours pilot-in-command of helicopters or 700 hours as pilot-in-command of helicopters and 300 hours as co-pilot in HHO of which 50 hours is as pilot-in-command under supervision

ii: 40 hoist cycles conducted offshore, of which 20 cycles should be at night if night operations are being conducted.

b) Onshore

i. 1000 hours pilot-in-command of helicopters or 700 pilot-in-command of helicopters and 300 hours as co-pilot in HHO of which 50 hours is as pilot-in-command under supervision

ii. ~~200 hours operating experience in helicopters gained in an operational environment similar to the intended operation;~~ **Diese Formulierung ist unklar, was ist damit gemeint? 200 Stunden in HEMS oder 200 Stunden HHO, oder 200 Stunden im Gebirge/auf See? Deshalb sollte diese Formulierung gestrichen werden.**

and

iii. 40 hoist cycles, of which 20 cycles should be at night if night operations are being conducted.

2.3 Recency

The risk in comparison to efficiency is too high and shall be left to operators approved by National authority / day hoist cycles should be taken into consideration for the ria. (?)

B. II. Draft Decision - Part-OPS - Subpart D - Section VIII - AMC OPS.SPA.010.HHO(a) Equipment requirements for HHO p. 455-456

comment *1112* comment by: *EUROCOPTER*

It is proposed the following new Guidance Material related to AMC OPS.SPA.010.HHO(a):

GM OPS.SPA.010.HHO(a), § 2.(a) CRITERIA FOR A SATISFACTORY SERVICE HISTORY

The judgement whether the in-service history of a hoist-installation can be deemed acceptable by the competent authority should be based on clearly defined criteria.It is proposed that the basis for the judgement should be a in-service history exceeding a minimum time-span and a minimum of hoist installations in-service.

It is proposed to deem the in-service history of a hoist-installation acceptable if no incident classified as hazardous or catastrophic has occurred during the to be defined time-span and amongst all the hoist installations in-service which have to exceed a to be defined number.

Any incident being attributable to mis-use or operation/ maintenance not in accordance with the applicable documentation issued by the TC/ STC holder shall not be part of the in-service history representing the baseline for the authority's decision.

comment *1113* comment by: *EUROCOPTER*

It is proposed to delete § 2.b.v.:

~~***v; Any airworthiness issue reported from incidents or accidents and not addressed by i., ii., and iv. should be addressed.***~~

Reason: Each incident/ accident has to be investigated and protective/ corrective measures have to be taken by the TC/ STC holder in the frame of the continued airworthiness process.

The TC/ STC holder is in charge of implementing changes to the design and/ or documentation in order to eliminate the possibility of repeated occurance of the encountered incident/ accident.

Operators are not able to address airworthiness issues within their area of discretion. Therefore it is proposed to cancel point v

Attachments #32 #33

(a) (1) Following the EASA's definitions of "congested" and "hostile" area: most of the HEMS operations begin at and end at an aerodrome/operating site located in a congested hostile environment.

Considerations:

Definition: *'Congested area' means in relation to a city, town or settlement, any area which is substantially used for residential, commercial or recreational purposes.* (...)

As commented on page 23, this definition covers quite every area in Europe. An unchanged definition of "congested area" will seriously curtail a number of existing HEMS-operations.

H**: HEMS-Base**: Even with modern twin helicopters (e.g. EC135; EC145; BK117), due to variable operational conditions (e.g. weight; temperature; altitude), operations on HEMS-bases/-aerodromes meeting the requirements of ICAO Annex 14 are not able to guarantee the operation within Performance Class 1 at any time.

HEMS-bases not meeting the requirements of ICAO Annex 14: Like the situation of hospital sites, the problems are historical as well related to geographical aspects (e.g. mountainous terrain providing small places for constructions; obstacles). If EASA or national authorities or used at such a low weight that critical power unit failure performance is assured, it would seriously curtail a number of existing HEMS-operations.

The HEMS Operating Bases, builded before 1 July 2002, should treated like the public interest sites

HEMS-Operating Sites: Meeting the Performance Class 2 requirement at HEMS-operating sites is even with modern twin helicopters (e.g. EC145; EC135) not possible at all time: Due to the "character" of HEMS-missions and their operating sites (e.g. within a forest or a mountainous terrain; wind, temperature) twin helicopters (CAT A certified) are operating within all three performance classes; even for short period in Performance Class 3 without the assurance of a safe forced landing (see examples below).

Operations at hospitals

Throughout Europe HEMS operators used and use landingsites at hospitals that do not meet design criteria nor can be approached in the required PC. This issue was identified and adressed in JAR-OPS 3. A solution was provided by creating Public Interes Sites. Unfortunately many NAAs have neither implemented this regulation, nor have been willing to accept landingsites, existing prior to 1 July 2002, as Public Interes Sites as a consequence. Implementation of PIS regulation under present days conditions will result in a degradation of HEMS patient care because numerous Hospitals would no longer be available for doctor/patient pickup or delivery. Throughout Europe various National regulations exist. The common denominator in these regulations is the fact that unofficial landing sites at hospitals are treated as HEMS operating sites. This especially holds true for landing sites at smaller hospitals which are visited infrequently. In this respect reconsideration of the HEMS philosophy,

and the related requirements, is necessary.

Proposal 1:

(a) (3) *operations to/from a HEMS-aerodrome/-base or a Public Interest Site in a congested hostile environment; or operations to/from a helideck conducted with a helicopter having a MPSC of more than 19, may be operated in performance class 2.*

(a) (4) *HEMS-operations to/from an HEMS Operating Site may be operated in performance class 2 or 3.*

(f) *Helicopters HEMS-missions operated in:*

Performance class 1, 2 or 3 shall be certificated in Category A.

or

Proposal 2:

(a) Except as specified in (f) below, helicopters shall be operated in performance class 1 when:

(...)

~~*(a) (3)*~~

(f) *HEMS-operations: If it is not possible to comply with the requirement of performance class 1 due to performance or operational reasons, HEMS operations may be carried out with multi-engine helicopters (Category A certified), in performance class 2 or 3 providing that these deviations are described in the operations manual and have been approved by the competent authority.*

(g) *Helicopters operated in performance class 1 or 2 not meeting entirely the Category A certification standards should not be operated beyond 2015.*

Examples (CAT A - Limitation VTOL)

BK117 B-2 (Lycoming)

Mission weight (without patient) = 3'000 kg

Max. CAT A weight at 1'000ft/30° = 2'860 kg

Max. CAT A weight at 2'200ft/20° = 2'870kg

Max. CAT A weight at 3'500ft/20° = 2'740 kg

Max. CAT A weight at 8'500/10° = 2'360 kg

BK117 C-1 (Arriel)

Mission weight (without patient) = 3'000 kg

Max. CAT A weight at 1'000ft/30° = 3'100 kg

Max. CAT A weight at 2'200ft/20° = 3'070 kg

Max. CAT A weight at 3'500ft/20° = 2'960 kg

Max. CAT A weight at 8'500/10° = 2'525 kg

BK117 C-2 (EC145)

Mission weight (without patient) = 3'150 kg

Max. CAT A weight at 1'000ft/30° = 3'150 kg

Max. CAT A weight at 2'200ft/20° = 3'130 kg

Max. CAT A weight at 3'500ft/20° = 3'000 kg

Max. CAT A weight at 8'500/10° = 2'550 kg

EC135 P2+

Mission weight (with patient) = 2'858 kg

Max. CAT A weight at 1'000ft/30° = 2'825 kg

Max. CAT A weight at 2'200ft/20° = 2'800 kg

Max. CAT A weight at 3'500ft/20° = 2'630 kg

Max. CAT A weight at 8'500/10° = - kg

7. Operations at hospitals.

Throughout Europe HEMS operators used and use landingsites at hospitals that do not meet design criteria nor can be approached in the required PC. This issue was identified and adressed in JAR-OPS 3. A solution was provided by creating Public Interes Sites. Unfortunately many NAAs have neither implemented this regulation, nor have been willing to accept landingsites, existing prior to 1 July 2002, as Public Interes Sites as a consequence.

Implementation of PIS regulation under present days conditions will result in a degradation of HEMS patient care because numerous Hospitals would no longer be available for doctor/patient pickup or delivery.

Throughout Europe various National regulations exist. The common denominator in these regulations is the fact that unofficial landing sites at hospitals are treated as HEMS operating sites. This especially holds true for landing sites at smaller hospitals which are visited infrequently. In this respect reconsideration of the HEMS philosophy, and the related requirements, is necessary

Zusätzliche Stellungnahme in deutsch:

Es liegt in der Natur des HEMS-Flugbetriebs, dass nicht vorher bestimmt werden kann, in welches Krankenhaus der Patient geflogen wird. Dies entscheidet sich je nach Art der Verletzung und Verfügbarkeit der medizinischen Leistungen erst während des konkreten Einsatzes. Um gewährleisten zu können, dass jeder transportierte Patient die entsprechende notwendige medizinische Indikation erhält, muss sichergestellt sein, dass jeder einzelne Hubschrauber unserer Flotte im konkreten Bedarfsfall auch jedes Krankenhaus anfliegen kann. Dazu müsste jeder einzelne Betreiber jedoch, entsprchend den Vorgaben der NPA 2009-02, für alle vorhandenen Hubschrauberflugplätze an Krankenhäusern, an denen keine Möglichkeit zur Durchführung einer sicheren Notlandung während der Start- und Landephase besteht landeplatz-spezifische Verfahren entwickeln! **Dies ist bereits allein aufgrund der Vielzahl der existierenden Krankenhauslandesstellen (allein in Deutschland insgesamt über 1.000) praktisch nicht umsetzbar. Außerdem kann dies generell nicht Aufgabe jedes einzelnen Operators sein, sondern ist vielmehr originäre Aufgabe des jeweiligen Landeplatzbetreibers.**

Denkbar und auch umsetzbar ist dagegen die Entwicklung und Beschreibung von einigen grundsätzlichen Standardverfahren für den An-/Abflug ohne Möglichkeit zur Durchführung einer sicheren Notlandung. Dies wäre unserer Erfahrung nach auch aus dem Gesichtspunkt der Sicherheit vollkommen ausreichend: die (mehrmotorigen) Hubschrauber der ADAC-Luftrettung GmbH haben seit 1970 bis Ende 2008 über 500.000 Rettungseinsätze durchgeführt. In der Regel sind pro Rettungseinsatz drei Starts und drei Landungen anzusetzen, die bedingt durch die orographischen Vorgaben und des Einsatzauftrages regelmäßig nicht auf einem flugplatzähnlichen Gelände durchgeführt werden können. In der Summe der genannten Rettungseinsätze und der daraus resultierenden Starts und Landungen (>3 Millionen) hat kein Triebwerkausfall zu einem Flugunfall geführt. Insofern sind die derzeit gemäß JAR-OPS 3 deutsch (in der bis zum 31.12.2009 geltenden Fassung) geregelten Anforderungen zur Erreichung eines angemessenen Sicherheitsniveaus vollkommen ausreichend. Eine weitere Verschärfung ist überflüssig.

B. II. Draft Decision - Part-OPS - Subpart D - Section IX - AMC OPS.SPA.001.HEMS(b)(4) Helicopter emergency medical service operations (HEMS) p. 460-463

comment *526* comment by: *EHOC*

Paragraph 1.4.b

Originally this was to be subject to the satisfaction of the Authority; now that this element has been removed from the concept, it would be appropriate to provide more guidance on the limitations including the 'geographical area', 'cultural lighting' and 'terrain'.

Paragraph 1.4.b.i

This might be better changed to 'adequate cultural lighting to permit flight by visual reference to objects outside the aircraft'.

Paragraph 1.5.

It would be logical to take out the elements contained in 1.5 of AMC OPS.SPA.010.HEMS and place them into separate AMC OPS.SPA.001.HEMS(b)(3) (to achieve consistency with HHO).

"CREW TRAINING AND CHECKING"

comment *626* comment by: *ECA - European Cockpit Association*

Comment on AMC OPS.SPA.001.HEMS: JAR-OPS 3 Pilot and HEMS Crewmember training should be inserted in Section IX.

1.5.1 checking

Due to the high number of checks it shall be possible to combined with PPC or other related checks in accordance with the National Authority.Flight crew undergo 14 checks : HELO recency, NVIS (3 missions in 90 days), HHO (3 night hoist cycle in 90 days), HEMS (30 minutes IFR in 6 months), HEMS VMC prof check, HEMS Night prof check, HEMS line check, Recurrent training on each type, CRM annual check, OPS prof. check (check valid 6 months), Emergency and safety check (annual), Ground training (annual), Commercial OPS other than CAT (annual check), dangerous check (2 years).

comment *1084* comment by: *REGA*

1.2 Experience

b. Using flight hours as the base for decide if the pilot is allowed to conducting HEMS flight is delicate. According the experience a case to case assessment and a specific training program would be more adequate regarding the safety targets. Finally, after the authority approval, the operator has to decide and to take the responsibility.

HEMS operations, if the are well supervised, flown under good conditions (e.g. weather, altitude, open sites) are often less challenging than commercial flights (e.g. hook missions, heliskiing).

Proposal (1.2., a., iii.)

In addition to the provisions regarding the amount of the flight hours a training program may be described in the operations manual. This must be approved by the competent authority and the flight operator manager.

comment *1088* comment by: *REGA*

1.4 Crew composition

A second pilot does not automatically mean in case a safety benefit.

A well trained, experienced and assessed (e.g. medical examination) HEMS technical crew member is often more adequate.

The specific areas shall not be defined by distance. Instead, each HEMS Operating Base shall have a defined specific area for night flights. Those areas, which are defined by the Flight Operations Manager and the competent authority, shall be a part of the Operation Manual.

Reqiurements shall also be based on the helicopter's equipment. REGA helicopters are equipped with EVS; Moving Map; Radio Altimeter; NVIS (pilot and HEMS technical crew member); GIS; Autopilot etc..

Proposal (1.4; Night flight*)*

The minimum crew by night should be two pilots or one pilot and one HEMS technical crew member. The specific geographical operation area shall defined by the operator in the operations manual a taking into account the following: .....

comment *1093* comment by: *REGA*

3.1

To have to (should) take all reasonable measures - as the operator - to ensure that ground emergency service personnel are familiar with a. to e. is very delicate: Quite at every HEMS Operating Site, other mission, the involved service personnel change. Operators are not able to guarantee a familiarization of all ground service personnel and/or organisations.

Proposal (3.1)

The requirement should address those organisation and personnel which are a part of the planned and organized rescue chain by the operator.

comment *2348* comment by: *Austro Control GmbH*

1.2.

to clarify add in brackets of the 1st sentence:

(... Hoist operations, human external cargo, etc)

The minimum experience level before conducting HEMS operations in Single Pilot operations should be raised.

Proposal for (a)

(i) ***1500 hours pilot-in-command on helicopters*** *~~of aircraft of which 500 hours is as pilot-in-command on helicopters~~.... or*

(ii) ...*and ~~100~~* ***300 hours*** *pilot-in-command ~~of~~* ***on*** *helicopters.*

Justification:

Delete aircraft, because the exerperience should be gained only on pilot-in-command of helicopters!

Furthermore HEMS pilots do not only need flight hours for experience, but also "life-experience" and maturity with human aspects.

In (ii) 300 hours are the minimum of experience. 100 hours are not acceptable as praxis (especially in mountinous areas) shows.

Suggestion:

also add to 1.2. (b)

"500 hours operating experience in helicopters gained in an operational environment ***and 30 hours supervision flights*** *similar to the intended operation;"*

Justificiation:

For safety reasons the local environmental conditions should be considered with a minimum of Supervision flights required.

AMC OPS.SPA.001.HEMS(b)(4) Helicopter emergency medical service operations (HEMS)

OPERATING PROCEDURES

1.2 Experience.

The minimum experience level for a pilot-in-command conducting HEMS flights should take into account the geographical characteristics of the operation (sea, mountain, big cities with heavy traffic, etc.) and should not be less than:

a. Either:

i. 1 000 hours ~~pilot-in-command of aircraf~~t on helicopters of which 500 hours is as pilot-in-command on helicopters; or

ii. 1 000 hours as co-pilot in HEMS operations of which 500 hours is as pilot-in-command under supervision; and 100 hours pilot-in-command of helicopters.

1.2 (a) (i) & (ii). A combination of i and ii should also be possible i.e. a minimum experience of 1000hrs (or even 1500hrs) on helicopters of which 500hr as a pilot in command. At present there is no recognition of helicopter experience gained other than as PIC (even in aeroplanes) or co-pilot in HEMS only!.

comment *5074* comment by: *SNEH Organisation representing all french commercial helicopters operators*

1.4 Crew composition

In France, HEMS operations don't require a HEMS crew member or a second pilot. For years, many of HEMS flight have been conducted between 2 hospitals by single pilot crews (assisted with an Auto Pilot or SAS helicopter equipment for night operations). Operations on Operating sites are also conducted with single pilot crews without hoist operations (Hoist operations are realized by State aircrafts).

It is not possible to require a crew composition change compared to French's present regulation that is adapted to French HEMS operations requirements.

The HEMS crew member or 2nd pilot in France will have heavy consequences : Loss of range due to the new crew composition (necessity of heavier helicopters) and increase of personal charges will have a heavy financial impact on our customers that is not justified compared with present operations and needs of the States.

We ask tht crew composition in HEMS operations can be studied by the local authority in order to be in compliance with the local operations.

1.2 (a) (i) & (ii). A combination of i and ii should also be possible i.e. a minimum experience of 1000hrs (or even 1500hrs) on helicopters of which 500hr as a pilot in command. At present there is no recognition of helicopter experience gained other than as PIC or co-pilot in HEMS only!.

comment *5741* comment by: *ADAC Luftrettung GmbH*

1.2

Experience: 500 hrs as PIC in an operational environment similar to the intended operation and a 1000hr total helicopter experience should suffice. or

500 hrs total helicopter experience and 500 hrs as Co-Pilot under Supervision in HEMS and Trainingsprogramm provided by the operator.

comment *5831* comment by: *Ph.Walker*

1.3 : Owing to the high number of checks it should be possible to combine with PPC or other related checks in accordance with the National Authority.Flight crew undergo 14 checks : HELO recency, NVIS (3 missions in 90 days), HHO (3 night hoist cycle in 90 days), HEMS (30 minutes IFR in 6 months), HEMS VMC prof check, HEMS Night prof check, HEMS line check, Recurrent training on each type, CRM annual check, OPS prof. check (check valid 6 months), Emergency and safety check (annual), Ground training (annual), Commercial OPS other than CAT (annual check), dangerous check (2 years)

1.2 : It would be logical to take out the elements contained in 1.5 of AMC OPS.SPA.010 and place them into separate AMC OPS.SPA.001.HEMS(b)(3) (to achieve consistency with HHO).“CREW TRAINING AND CHECKING"

1.5 : It would be logical to take out the elements contained in 1.5 of AMC OPS.SPA.010 and place them into separate AMC OPS.SPA.001.HEMS(b)(3) (to achieve consistency with HHO).“CREW TRAINING AND CHECKING”

Paragraph 1.3

It should be précised who is entitled to supervise the training with sole reference to instruments.

Proposal:

We suggest that it should be a FI and that the description of the training should be in the ops manual

It is suggested to align the validity of the training with the validity of the OPC (operator proficiency check) as the check and the training could be done on the same flight.

Proposal:

"When the flight with sole reference to instrument is undertaken within the last 3 months of the validity period, new validity period shall be counted from the original expiry date"..

AMC OPS.SPA.001.HEMS(b)(4) Helicopter emergency medical service operations (HEMS)

OPERATING PROCEDURES

1.2 Experience.

The minimum experience level for a pilot-in-command conducting HEMS flights should take into account the geographical characteristics of the operation (sea, mountain, big cities with heavy traffic, etc.) and should not be less than:

a. Either:

i. 1 000 hours ~~pilot-in-command of aircraf~~t on helicopters of which 500 hours is as pilot-in-command on helicopters; or

ii. 1 000 hours as co-pilot in HEMS operations of which 500 hours is as pilot-in-command under supervision; and 100 hours pilot-in-command of helicopters.

1.2 (a) (i) & (ii). A combination of (i) and (ii) should also be possible i.e. a minimum experience of 1000hrs (or even 1500hrs) on helicopters of which 500hr as a pilot in command. At present there is no recognition of helicopter experience gained other than as PIC (even in aeroplanes) or co-pilot in HEMS only!.

comment *7317* comment by: *new European Helicopter Association*

1.2 Experience: The requirements mentioned under 1.2 i & ii do not recognise any helicopter experience other than as PIC or co-pilot in HEMS (which is rare),

but do recognise PIC hrs on aeroplanes. The requirement should be changed to enable pilots with a minimum of 1000hrs helicopter experience, of which at least 500hrs as PIC.

comment *7322* comment by: *new European Helicopter Association*

1.4 Crew Composition, (b) Night Flight:" …one pilot and one HEMS technical crew member may be employed in specific geographical areas defined by the operator in the operations manual…" The original text required the satisfaction of the Authority with respect to these kinds of operations. A general rule will be unable to take into account all the factors that could influence the decision on the size of the specified geographical area. This could result in either to strict or to liberal rulemaking. It is recommended that the (local) Authority maintains its role.

B. II. Draft Decision - Part-OPS - Subpart D - Section IX - GM1 OPS.SPA.001.HEMS(b)(4) Helicopter emergency medical service operations (HEMS) p. 463

comment *6455* comment by: *HSD Hubschrauber Sonder Dienst*

Flight following system:

"providing contact" should be clarified in the sense of either radio contact or contact by electronic information system in regard to position, track,ectr.

b.

For safety reasons it has to be clarified that on the flight to the HEMS operating site the technical crew member has to be placed on the front seat and not on the stretcher, which is not a certificated seat and therefore a safety concern!

Solution:

delete b for safety reasons or change requirement b):

"After arriving at the HEMS Operating Site, the installation of the stretcher may preclude the technical crew member from occupying the front seat; ***during the flight to the HEMS operating site the strechter may not be used as front seat".***

e)

Change the text to:

With the exception....assisting from the ~~front seat (co-pilot seat)~~ ***co-pilot-seat***

Justification.

Co-pilot-seats are certified and this proposed text grants clarification.

comment *6090* comment by: *Irish Aviation Authority*

Comment:

Within the text the term "short period" needs to be defined or guidance offered as to what is deemed to be an acceptable interpretation of the phrase. This is to try and prevent any tendency for a pilot to continue flight in conditions that are unsuitable thereby unnecessarily increasing the risk factor.

Justification:

Provision of appropriate guidance material.

Proposed text:

Amend text to include "Since every situation is different it was not felt appropriate to define the short period in terms of absolute figures, however, for guidance a period of 60 seconds at Vy should be considered as a possible maximum".

comment *6340* comment by: *Heliswiss International*

Operating minima : Visibility may be reduced to 500 m for short periods when in sight of land if the helicopter is manoeuvred at a speed that will give adequate opportunity to observe any obstacle and avoid a collision.

Site dimensions

This is not applicable for mountain operations due to the site diversity.

comment *1018* comment by: *Michael Kroell*

2 D during day seems to be to restrictive especially in city areas.

During day it should be the pilots discretion with a minimum distance to obstacles which allows safe operations.

At night, when the operating site is illuminated from the ground, the 4D could be reduced to 2D also at pilots discretion provided the illumination is from a

professional entity(from the operator or fire-brigade, fire-department, civil defence, military-unit etc.).

An equivalent level of safety has to be ensured.

comment *1114* comment by: *EUROCOPTER*

Comment on § 1 (minimum dimensions of the HEMS operating site):

It is not clear if the minimum dimension regards to a solid (flat) area on ground or to an obstacle free area (which can include air or water). If the dimensions describe an area on ground, a landing i.e.on a top of a hill will no longer be possible.

Proposed solutions:

1. (Preferred): to delete this § 1. and leave the decision, to land or not on the specific site, to the pilot. The pilot's decision will be done based on the general impression of the landing site (dimensions, kind of surface, obstacles (height and distance), safety to people on ground, etc), and not only by the size of the site. The size of the site can only be estimated by the pilot.

2. Change wording: "*1. When selecting a HEMS operating site it should have a minimum **obstacle free** dimensions of at least 2D. For night operations, unsurveyed HEMS operating sites shaould have **obstacle free** dimensions of at least 4D in length and 2D in width*;

comment *1115* comment by: *EUROCOPTER*

Comment on § 2: Illumination of the HEMS operation site

Proposed solutions:

1. (Preferred) To delete this § 2. Night operations for all type of aircraft and on all sites require a sufficient illumination. This is not different for HEMS operating sites.
2. Change (2) wording: "*For night operations, the illumination may be either from the ground **in combination with the helicopter lighting**, or from the helicopter."*

OPS.SPA.025 (b) (2) proposed text states:Helicopters conducting operations to/from an HEMS operating site located in a hostile environment shall be operated in accordance with Performance Class 2This Para which is a change from JAR-OPS 3.005(d) (c) (2) (b) which states Helicopters conducting operations to/from a HEMS operating site located in a hostileenvironment shall as far as possible be operated in accordance with Subpart G (Performance Class 1). The commander shall make every reasonable effort to minimise the period during which there would bedanger to helicopter occupants and persons on the surface in the event of failure of a power unit (See ACJThe rationale behind this change is explained in Attachment D to Appendix 1 and gives 4 options1, 2(a), 2(b) and 2 (c)The preferred option is 2(b) which would leave HEMS Operations as they are today without the requirement to show compliance with JAR-OPS 3.517(a) - Operations without a safe forced landing capability.The justification for this is that European HEMS Operations are now mature and have shown little incidence, if any, of critical power unit failure at the HEMS operating site

comment *4431* comment by: *Helikopter Air Transport GmbH / Christophorus Flugrettungsverein*

comment *5078* comment by: *SNEH Organisation representing all french commercial helicopters operators*

1. When selecting a HEMS operating site it should have a minimum dimension of at lease 2D. For night operations, unsurveyed HEMS operating sites should have dimensions of at least 4D in length and 2D in width.

It is not clear if the minimum dimensions are the ground solid area or the free obstacles zone area (that is preferred).

2. For night operations, the illumination may be either from the ground or from the helicopter

We think the helicopter illumination is always required ; so, it would be better to specify that the illumination may be either from the ground in combination with the helicopter's lighting, or from the helicopter.

Perf class 3 : According to the GM OPS SPA 020 HEMS page 464 the ability to reduce the visibility for short periods has been included. The pilot is allowed tpo asses the risk of flying temporarily into reduced visibility against the need to provide emergency medical service and according to the limitations of the AFM.Mountain operations shall be considerated as SAR.In first priority CAT A or equivalent Helicopter shall be operated for HHO. If the use of a CAT A helicopter is not appropriate for operational reasons, or if a CAT A helicopter is not available within an appropriate time frame, the HHO operation with a CAT B helicopter should be enabled.

From 1968 the Swiss AIB reports 22 occurrences for SAR and HEMS over a total of 390 which represents only the 5.6%. 22 occurrences for more than

325'000 missions accomplished represents only 0,0068%. Seven happened on ME and fifthteen on SE and only 2 are related to Technical or maintenance (vibrations and hoist failure both on ME). Considering this, Helicopter Class choice shall be left to the operator, provided he obtain the National Authority AOC required.

OPS.SPA.025(b)(2) proposed text states: helicopters conducting operations to/from a HEMS-operating site in hostile environment shall be operated in PC 2. This §, which is a change from JAR-OPS 3.005 (d)(c)(2)(b), which states, that helicopters at a HEMS-operating site in a hostile environment shall be operated as far as possible in PC 1. The commander has to make every effort to minimize the period, during which there is danger to the helicopter occupants and persons on the surface in the event of an engine failure (see ACJ, the rational behind this change is explained in Attachment D to Appendix 1 and gives four options: 1, 2a, 2b and 2c. Our prefered option is 2b, which would leave HEMS-operations as they are today without the requirement to comply with JAR-OPS 3.517(a) "Operations without assured safe forced landing capability". The justification for this is, that European HEMS-operations are now mature and show very few incidence and accidents, if any, of critical power unit failures during the takeoff and landing phase.

OPS.SPA.025 (b) (2) proposed text states:Helicopters conducting operations to/from an HEMS operating site located in a hostile environment shall be operated in accordance with Performance Class 2

This paragraph which is a change from JAR-OPS 3.005(d) (c) (2) (b) which states Helicopters conducting operations to/from a HEMS operating site located in a hostileenvironment shall as far as possible be operated in accordance with

Subpart G (Performance Class 1). The commander shall make every reasonable effort to minimise the period during which there would bedanger to helicopter occupants and persons on the surface in the event of failure of a power unit (See ACJThe rationale behind this change is explained in Attachment D to Appendix 1 and gives 4 options1, 2(a), 2(b) and 2 (c)The preferred option is 2(b) which would leave HEMS Operations as they are today without the requirement to show compliance with JAR-OPS 3.517(a) - Operations without a safe forced landing capability.The justification for this is that European HEMS Operations are now mature and have shown little incidence, if any, of critical power unit failure at the HEMS operating site.
