APPENDIX	
Review List of Plants.....	23
ANIMAL INDEX.....	24
PLANT INDEX.....	26
ACKNOWLEDGEMENTS.....	31

These lists have been compiled using the most current information available on the distribution and abundance of plant and animal species native to Oregon. They have been prepared in part to assist public and private land managers and planners in determining which species are of special concern within their given management jurisdictions. They are also intended for use by amateur and professional botanists and zoologists to help focus their attention on those taxa most in need of field searches and data collection efforts. The plant and animal lists are also under study by the Natural Heritage Advisory Council as possible revisions to the Special Species portion of the Oregon Natural Heritage Plan which was approved by the 1981 Legislature (ORS [273.576](1)(b)).

A comprehensive manual and computerized data bank on Oregon's rare, threatened and endangered plants, animals and ecosystems is maintained at the offices of the Oregon Natural Heritage Data Base. Site-specific information is available here. Although this report is based on a large volume of information, it is by no means complete. Much is known about some species, very little about others. The Data Base welcomes additional information on any of the taxa listed herein. Such information, as well as suggestions or data requests should be sent to:

Oregon Natural Heritage Data Base
1234 N.W. 25th Avenue
Portland, Oregon 97210

It is anticipated that this publication will be updated on an annual basis. Additional copies may be obtained at cost (\$2.00) from the above address.

Extinction is a natural process. However, since the large-scale European settlement and physical alteration of the Northwest, beginning in the 1800's and continuing today, the rate of extinction has greatly increased. Once lost, a species can never be recovered and there is no way of telling how useful it may have been. We do know that human beings and many of their industries are still largely dependent on plants and animals that have developed in conjunction with natural ecosystems. For instance, fully fifty percent of all pharmaceuticals have a natural component as an active ingredient, yet only two percent of the world's plants have been chemically analyzed and tested. *Limnanthes floccosa*, or wooly meadow foam, a rare plant that grows in southwest Oregon, is a member of a genus which is currently being studied by the National Aeronautical and Space Administration for its oil-like high temperature lubricative properties. *Gila boraxobius*, the Borax chub, thrives only in an extremely harsh, high temperature alkaline desert hot springs lake. These are the types of unique genetic materials that could benefit science and mankind in the years ahead.

It is hoped that by identifying, monitoring and providing accurate data on species of concern, needless conflicts between conservation and development can be avoided so that the greatest possible diversity of native plants and animals will be passed on to future generations.

The lists are divided into three categories:

List 1 contains taxa that are threatened with extinction or presumed to be extinct throughout their entire range. It is largely consistent with the listed and Category 1 species from the Federal Notice of Review on endangered and threatened wildlife and plants as published by the United States Fish and Wildlife Service. These species are in need of active protection measures to insure their survival.

List 2 contains taxa that are threatened with extirpation or presumed to be extirpated from the state of Oregon. These species are of concern when considering the floral and faunal diversity within Oregon's borders.

List 3 contains taxa that are limited in abundance and/or distribution in Oregon or throughout their range and which may or may not be currently stable. These species are not currently threatened with extinction or extirpation. However, their populations are in need of active monitoring, and all are candidates for List 1 or List 2 if serious declines are documented.

Endangered taxa are those which are in danger of becoming extinct within the foreseeable future throughout all or a significant portion of their range.

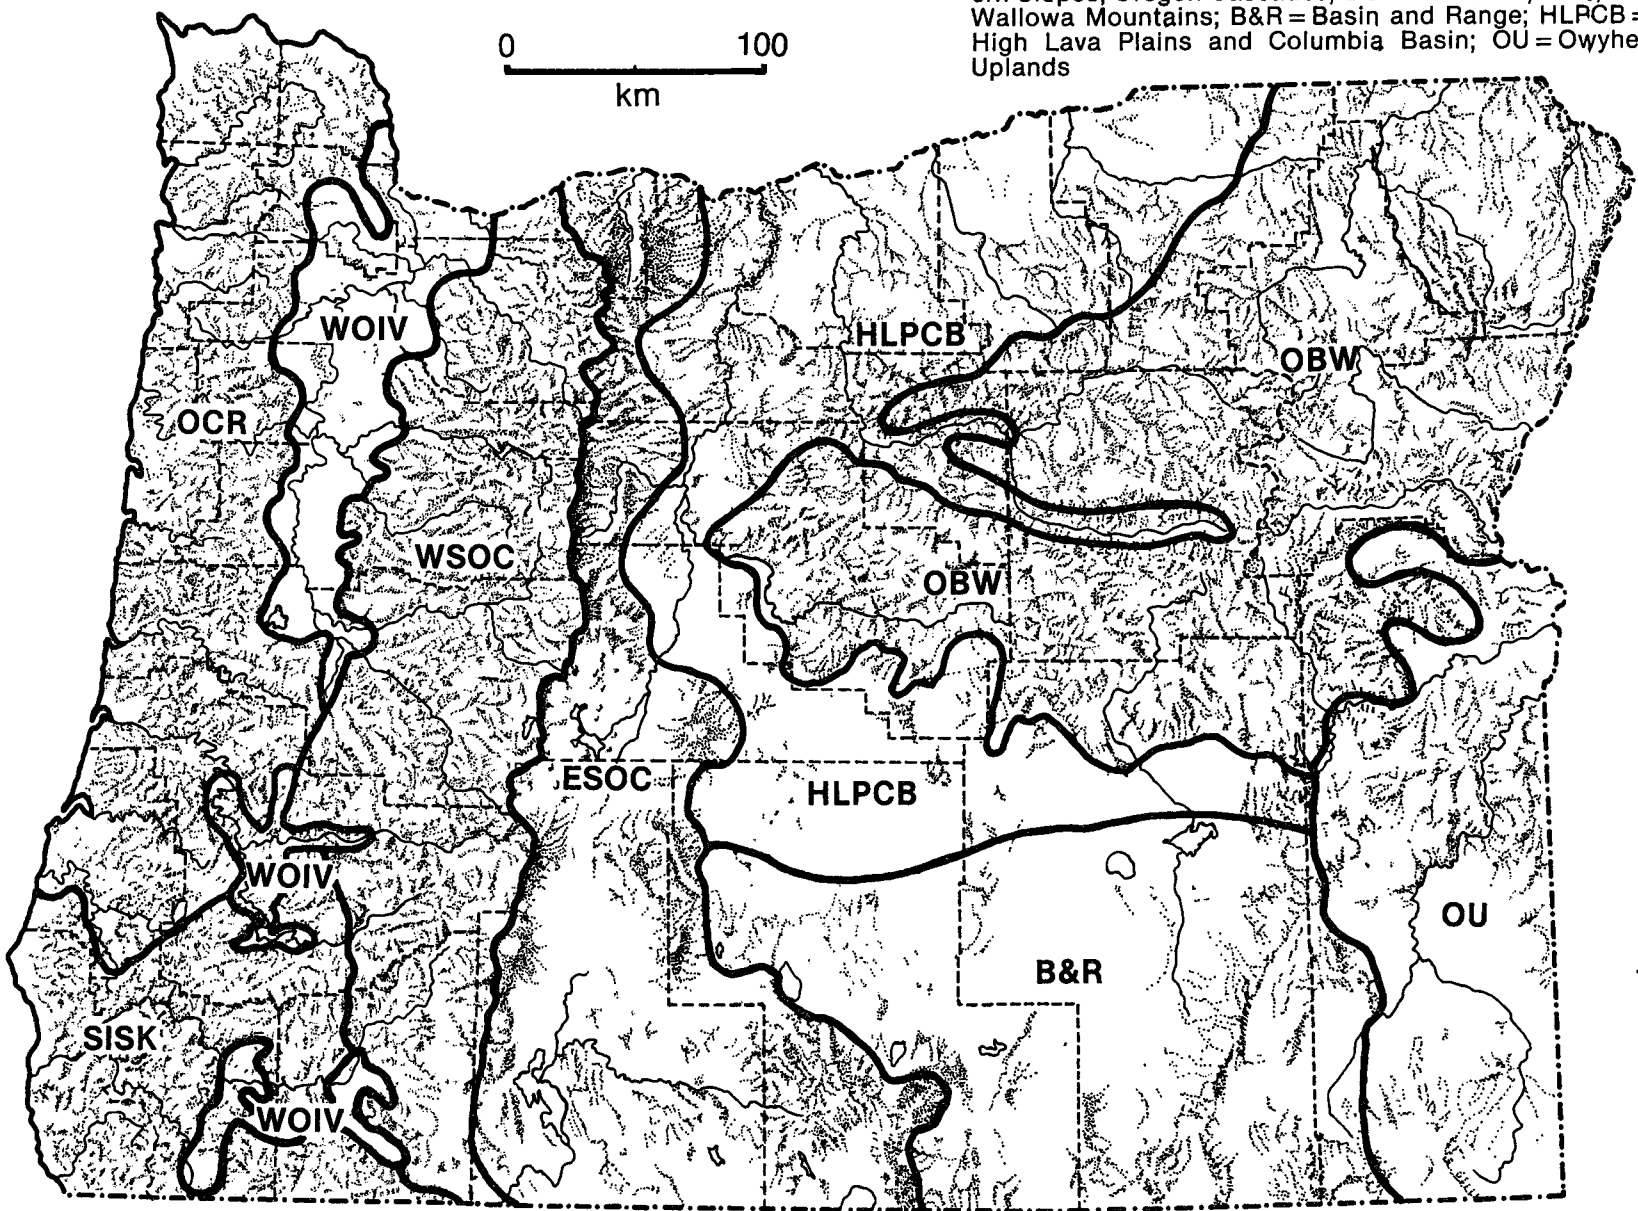

Threatened taxa are those likely to become endangered within the foreseeable future. For purposes of this list, foreseeable is defined as 5-15 years.

Physiographic Province(s) of occurrence for each species reflects both current and historical distribution data and is keyed to the base map on page 5.

The basis for inclusion of any given taxon on these lists is determined via the application of several specific criteria. The most important factors are the total number of known extant populations in Oregon and worldwide and the degree to which they are potentially or actively threatened with destruction. Other criteria include the total number of populations *believed* to be extant in Oregon and world-wide and the number of known populations considered to be securely protected. The taxonomic distinctness of each species has been considered also. Hybrids or highly questionable undescribed species have not been included. Finally, the position of Oregon within the species' total range (local endemic, regional endemic, or peripheral) has been considered as has its occurrence pattern and the tendency of the species to persist at a given locality.

Physiographic Provinces of Oregon:

OCR = Oregon Coast Range; WOIV = Western Oregon, Interior Valleys; SISK = Siskiyou Mountains; WSOC = Western Slopes and Crest, Oregon Cascades; ESOC = Eastern Slopes, Oregon Cascades; OBW = Ochoco, Blue, and Willowa Mountains; B&R = Basin and Range; HLPCB = High Lava Plains and Columbia Basin; OU = Owyhee Uplands

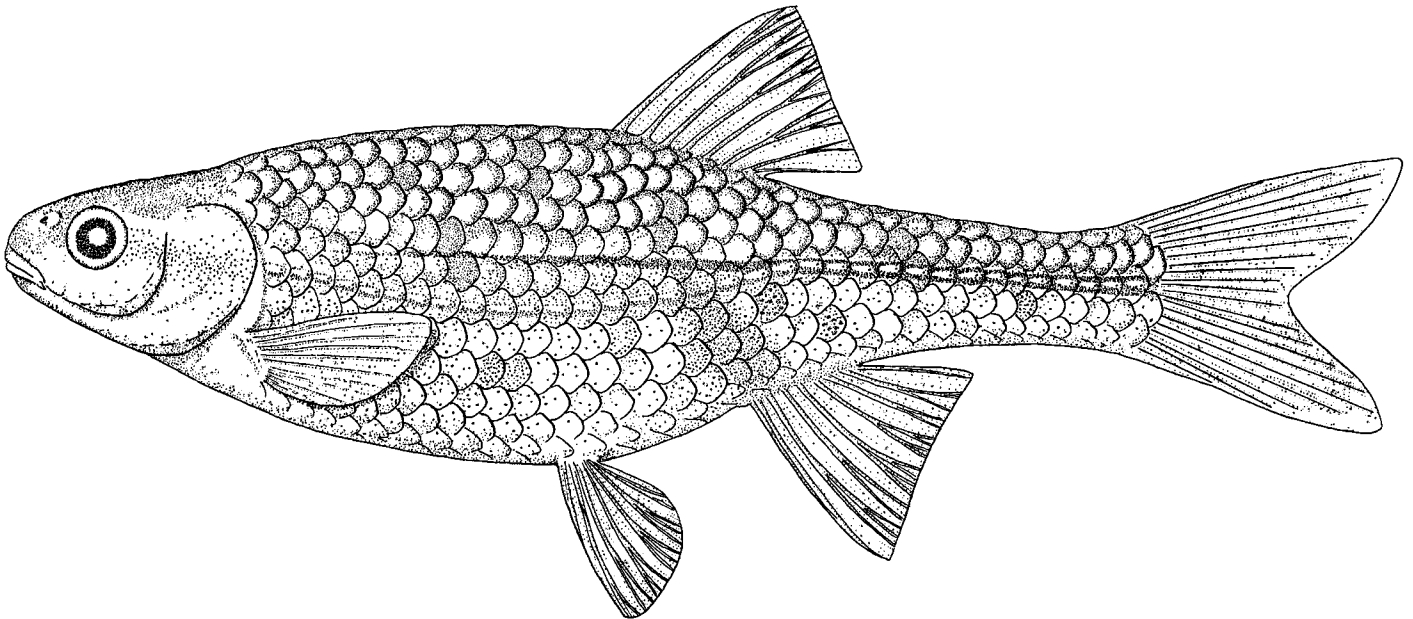

c macdonald 83

The Special Animal Species list includes Vertebrates and Invertebrates. Many experts have been interviewed and consulted in preparation of this publication, and the inclusion and status of each animal has been based in large part on their comments. In general, only species that breed or have critical stop-over locations in Oregon have been included. The listing of many of the birds is based on the status of nesting populations in the state. Some of these species may otherwise be common seasonally. Unless a given animal is of an especially sensitive or vulnerable nature (e.g., gyrfalcon), accidental or transient species have not been considered.

Some animals are of concern due to a serious lack of quantitative data on their actual status. These taxa are found on the Review List. They are either rare in collections, uncommonly observed, or difficult to collect information on and may need management attention. Further research is needed to accurately determine their status and protection needs.

A number of open-ocean mammals occur within Oregon's three mile limit. Because they cannot be protected or monitored based on a system of small geographically fixed areas, they have been excluded from consideration.

Compilation of the Invertebrate list has been especially difficult. Very little is known about the status and distribution of many taxa found in Oregon. If more were known, the list would likely be very different and much longer. Those species which have been studied relatively extensively have received higher priority for inclusion.

Hybopsis crameri (Oregon chub).
Endemic to Willamette and Umpqua River systems.
Drawn by Leonard Coleman.

Scientific Name	Common Name	Physiographic Province
TAXA ENDANGERED THROUGHOUT RANGE		
Fish		
<i>Gila bicolor</i> ssp.	Hutton Springs tui chub	B&R

<i>Triodopsis populi</i>	Hell's Canyon land snail	OBW

*occur as migrants only; all others: breeding

This rare and endangered plant list is an attempt to reflect the very great increase in information on many species since the publication of the 1979 Interim Report, "Rare, Threatened, and Endangered Vascular Plants in Oregon," by Siddall, Chambers, and Wagner. It is based on information from a number of sources. We have attempted to contact all professional and many amateur botanists in Oregon, as well as experts from Washington, Idaho, Nevada, and California. It should be noted that care was taken not to include species on List 1 or 2 which are known to be demonstrably secure or common anywhere in Oregon.

List 1 has 118 taxa, all of which are extremely local species. Of these, 9 are no longer known to be extant in Oregon. List 2 is longer but all of the species have been examined closely. Many of these taxa are known from no more than 3 sites in the state and most are currently known from only 5-10. All of the cryptogams included are found in the second category of List 2. List 3 includes rare species which appear to be stable. These species do not require the same management attention as those on List 1 and 2. However, if significant declines are documented, they will be added to List 1 or 2. Their populations should be periodically monitored.

The Review List is included as an Appendix. This list includes those species for which more information is needed before status can be determined. It is based on current information from the Oregon Rare and Endangered Plant Project and includes updates based on the Spring 1982 Technical Advisory Committee meeting, as well as the Fall 1982 Rare Plant Conference in Corvallis. As new information is obtained regarding all the taxa listed herein, the status of individual species will change and the list will be updated on an annual basis to reflect those changes.

Delphinium leucophaeum (white rock larkspur) at the Camassia Preserve. Currently known from only three sites in the Upper Willamette Valley.

ANIMALS:

We are deeply grateful to the many individuals who have volunteered their time and knowledge. Without their help, this report would not have been possible. While we can't list them all, we would like to mention several who have been especially helpful:

Vertebrates: David Marshall, Dr. Carl Bond, Dr. Robert Storm, Bill Haight, Harry Nehls, Chris Maser, Mark Smith, Otis Swisher, B.J. Verts, Al St. John, Geoff Pampush, Ron Rohweder, Steve Cross, Mike Graybill, Jan Hodder, Mark Perkins, Bill Neitro, and Bob Kindsche.

Invertebrates: Dr. Jack Lattin, Dr. Robert Pyle, Dr. Andrew Moldenke, Paul Johnson, and David Lightfoot.

PLANTS:

Much of the background work for the plant list was done by Dr. David Wagner. Dr. Janet Hohn was extremely valuable in reviewing List 1. Jean Siddall has found time among her myriad obligations to wrestle with this list, and is responsible for much of List 2 and all of the Review List. Both Jean Siddall and Julie Kierstead were part of the Data Base staff for much of the time we were working on this list, and deserve special credit. Dr. Kenton Chambers provided both technical and personal information on many of the taxa included. The comments of the following botanists have been crucial: Joan Seevers, Ginny Crosby, Rick Brown, Charley Johnson, Lee Web, Lois Kemp, Russ Holmes, Berta Youtie, Larry Scofield, Bill Hopkins, Nancy Felix, Joan Fosback, Veva Stansell, Carolyn Wright, Reid Schuller, and Rick York.

The mosses were selected in consultation with Mr. John Christy of British Columbia, and the lichens with the aid of Dr. Larry Pike of Marcola. The liverwort list was prepared by Dr. Wagner.

Compiled by The Oregon Natural Heritage Data Base:

Curt Soper, Data Base Coordinator / Zoologist

Jimmy Kagan, Plant Ecologist / Botanist

Sue Yamamoto, Data Manager

Graphic design by Samy Fouts.

All drawings by Jay Miner except where noted.
